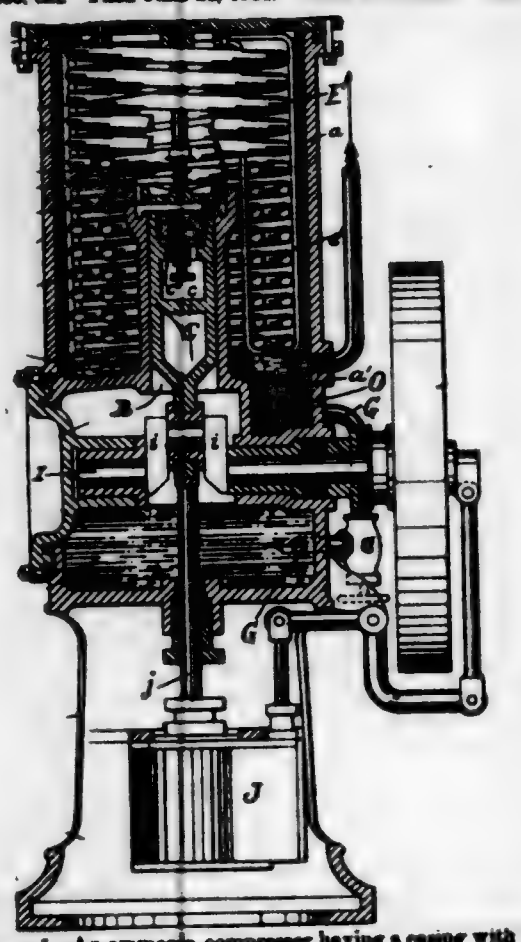
704,062. **AMMONIA-COMPRESSOR.** JAMES T. LUDLOW, San Francisco, Cal. Filed June 28, 1901. Serial No. 66,378. (No model.)



Claim.—1. An ammonia-compressor having a casing with an upper compartment, to receive the condensed ammonia, and a lower compartment, to hold the lubricating-oil, a compressing mechanism in the upper compartment, adapted to receive the ammonia-gas from the evaporating-circuit and to compress and discharge it into said upper compartment, means within said upper compartment for condensing the gas therein, driving connections in the lower compartment for the compressing mechanism, said connections working in the oil contained therein, a communication between the upper and lower compartment, to draw back again into the lower compartment, any oil which may be carried by the compressing mechanism into the upper compartment, and an outlet for the condensed ammonia, to the evaporating-circuit.

2. An ammonia-compressor having a casing with an upper compartment, to receive the condensed ammonia, said compartment having a depression in its floor to form an oil-collecting well, and said casing having also a lower compartment to hold the lubricating-oil, a compressing mechanism in the upper compartment, adapted to receive the ammonia-gas from the evaporating-circuit and to compress and discharge it into said upper compartment, means within said upper compartment for condensing the gas therein, driving connections in the lower compartment for the compressing mechanism, said connections working in the oil contained therein, a communication between the oil-collecting well of the upper compartment and the lower compartment, to draw back again into the lower compartment, any oil which may be carried by the compressing mechanism into the upper compartment, and an outlet for the condensed ammonia, to the evaporating-circuit

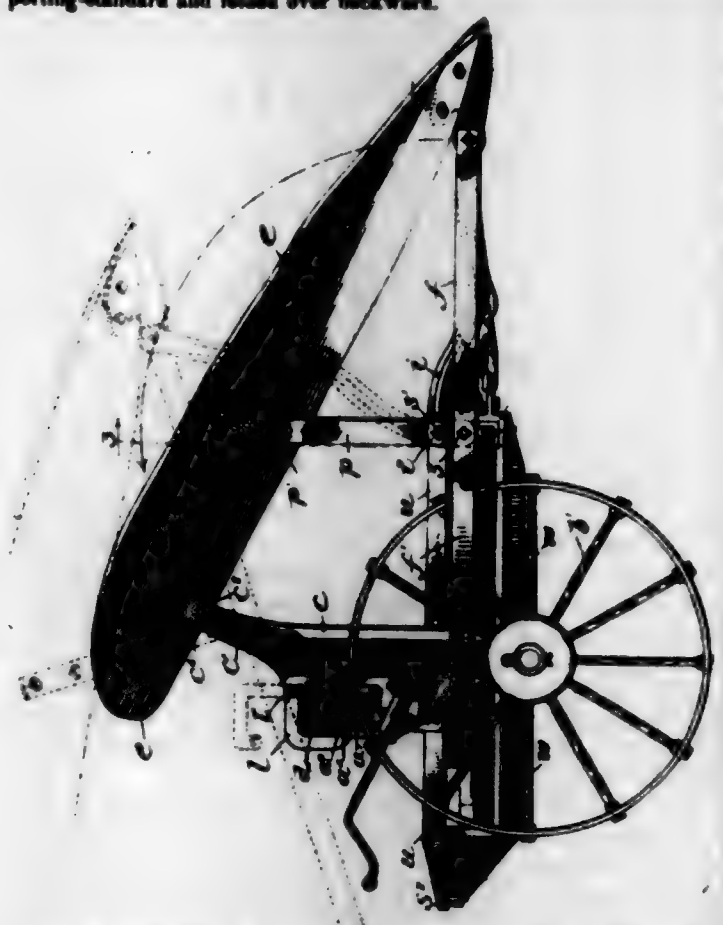
---

704,068. **DIVIDER FOR HARVESTERS.** JAMES MACPHAIL, Blue Island, Ill., assignor to the McCormick Harvesting Machine Company, Chicago, Ill. Filed Dec. 17, 1900. Renewed Apr. 29, 1902. Serial No. 105,235. (No model.)

Claim.—1. In a harvester, the combination with the cutting apparatus and the platform, of an outside divider, projecting normally in advance of the cutters, and a radius-bar that is pivoted to the frame and has the divider pivoted to it so as to permit the divider to be folded over backward.

2. In a harvester, the combination with the cutting apparatus and the platform, of an outside divider, projecting normally in advance of the cutters, a radius-bar that is pivotally connected to the frame at its rear end and has the divider pivoted to it at its outer end, so as to permit the divider to be folded over backward.

2. In a harvester, the combination with the cutting apparatus and the platform, of an outside divider, projecting normally in advance of the cutters, and a radius-bar that is pivotally connected to the frame at its rear end, and has the divider pivoted to it at its outer end said divider being also detachably connected at its rear to a supporting-standard rising from the machine-frame, whereby it may be detached from its rear supporting-standard and folded over backward.



4. In a harvester, the combination with the cutting apparatus and the platform, of an outside divider, projecting normally in advance of the cutters, a radius-bar that is pivoted to the frame at its rear end and having the divider pivoted to it at its outer end, a supporting-standard rising from the machine-frame in rear of the pivot of the radius-bar, and means for securing the rear end of the divider to the standard, whereby its rear end is supported and its front end held rigidly in working position, said means being such as to permit the detachment of the divider from the standard and folding it over backward.

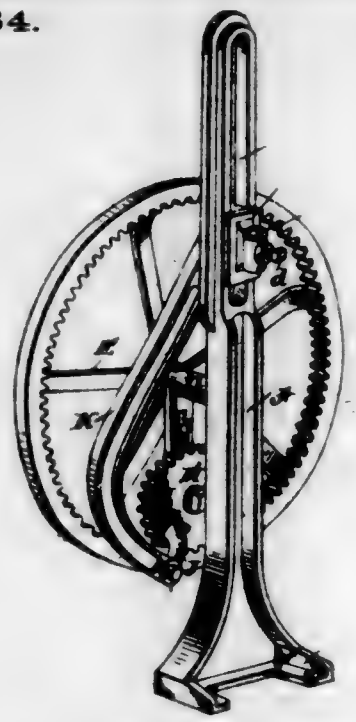
5. In a harvester, the combination with the platform, of an outside divider projecting normally in advance of the platform, and a radius-bar that is pivoted to the frame, and has the divider pivoted to it so as to permit the divider to be folded over backward.

704,084. CHURN-POWER. JOHN A. MADDOX, West Union, Ohio, assignor to Harvey J. Thompson, West Union, Ohio. Filed Oct. 5, 1901. Serial No. 77,671. (No model.)

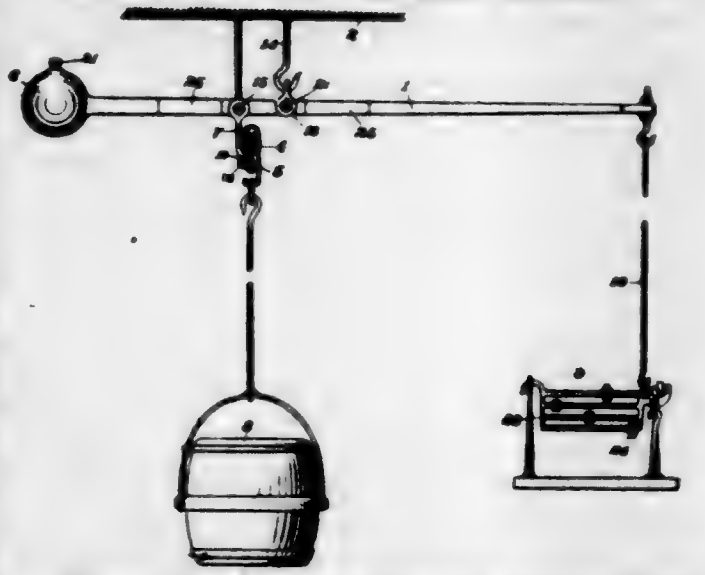
Claim.—1. A compact churn-power, comprising a standard having in its upper end an elongated slot, a horizontal arm extending from the standard at a point below the lower end of the slot, an outwardly-dished internal gear journaled to the outer end of the said arm, a depending arm connected with the said horizontal arm, the depending arm located within the dish of the said gear-wheel, a pinion journaled to the inner side of the said depending arm and meshing with the said internal gear, a slide in said slot, the pitman having its inner end loosely connected with the slide at a point between the gear-wheel and the said standard, the lower end of the pitman loosely connected with the said pinion, and said pitman being curved to prevent interference with the said horizontal arm, substantially as described.

2. A compact churn-power, comprising a vertical standard having in its upper end an elongated slot, an arm projecting horizontally from the standard at a point below the lower end of the slot, a dish internal gear-wheel journaled to the outer end of the said arm, a depending arm connected with the outer end of the horizontal arm, and located within the dish of the internal gear-wheel, a pinion journaled to the inner side of the lower end of said depending arm and in mesh with the internal gear, the pinion provided with an inwardly-projecting arm, a pitman pivotally connected to the said projecting arm, and a slide in the said slot, the upper end of the pitman being loosely connected with the slide at a point between the standard and the internal gear, substantially as described.

704,064.



704,065. WEIGHING APPARATUS. JOHN MAHR, San Francisco, Cal. Filed Oct. 28, 1901. Serial No. 80,393. (No model.)



Claim.—1. In weighing apparatus, a main scale-beam, integrally formed with a divided or dual intermediate section, provided with fulcra and knife-edges on said dual members, means for adjusting the balance of said beam at one extremity thereof, a compound auxiliary scale-beam at the other extremity thereof, suitably connected thereto, a trolley-way, a vertically-movable trolley-section suspended from said knife-edges of the main scale-beam, and adjustable means for guiding said movable trolley-section relatively to said trolley-way, substantially as specified.

2. In weighing apparatus, a main scale-beam, integrally formed with a divided or dual intermediate section, fulcra and knife-edges on said dual members, a trolley-way, a vertically-movable free section of said trolley-way suspended from the knife-edges of said main scale-beam, suspensory links having transverse stems 18 adjustable longitudinally on said trolley-section, and slotted guides on the fixed portions of the trolley-way cooperating with said transverse stems to permit free vertical movement thereof, substantially as specified.

3. In weighing apparatus, a main scale-beam having fulcra and knife-edges, a trolley-way beneath, a vertically-movable section of said trolley-way suspended from said knife-edges, a roller-carriage or trolley adapted to traverse upon said trolley-way and its movable section, guides 20 on the fixed portions of said trolley-way, and longitudinally-adjustable stems 18 on said movable section, coöperating with said guides 20 to limit lateral and longitudinal movement while permitting free vertical movement of said trolley-section relative to the fixed portions of the trolley-way, substantially as specified.

704,066. BUILDING MATERIAL. MARK W. MARSDEN, Philadelphia, Pa. Filed Sept. 24, 1901. Serial No. 76,251. (No specimens.)

Claim.—1. Material for building purposes, consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and adapted and arranged for the reception of plaster.

2. Material for building purposes, consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and waterproofed.

3. Material for building purposes consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound, and adapted and arranged for the reception of plaster.

4. Material for building purposes, consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound, said sheets or plates having spaces for the reception of plaster.

5. Material for building purposes consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound, said sheets or plates having perforations for the reception of plaster.

6. A partition, ceiling or wall, consisting of sidings, which are separated by an air-space and composed of fire and water proof fibrous sheets or plates which are perforated for the reception of plaster, and provided at their edges with tongues, which overlap the edges of adjoining plates, and tie or distance pieces extending transversely of said air-space and rigidly connecting said sidings, substantially as described.

7. A partition, ceiling or wall, consisting of fibrous sheets or plates impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound and adapted and arranged for the reception of plaster, and a layer of plaster applied to said plates.

8. A partition or wall, consisting of fibrous sheets or plates perforated and impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound, and plaster applied to said plates and keying through the perforations.

9. A partition or the like consisting of fibrous sheets or plates perforated and impregnated with a solution of silicate of soda and sulfate of magnesia and coated with a waterproof compound, tie or distance pieces for spacing said plates, and plaster applied to said plates and keying through the perforations.

10. A partition, ceiling or like construction, consisting of overlapping fibrous plates impregnated with a solution of silicate of soda and sulfate of magnesia, and adapted and arranged for the reception of plaster.

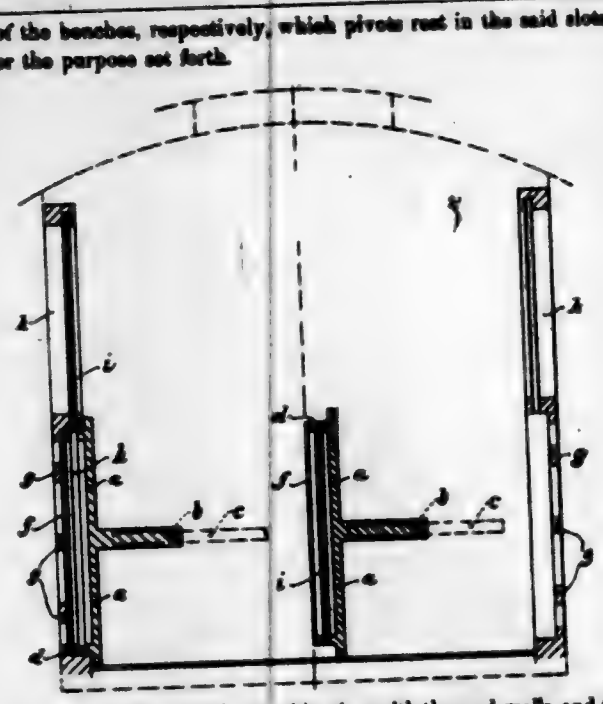
11. A partition, ceiling or wall, consisting of fire and water proof fibrous sheets or plates provided at their edges with tongues, which overlap the edges of adjoining plates, said fibrous sheets or plates having spaces for the reception of plaster, and transversely-extending tie or distance pieces for rigidly securing the plates, substantially as described.

12. A partition, ceiling or like construction, consisting of sidings separated by an air-space and composed of one-ply fire and water proof fibrous sheets or plates perforated for the reception of plaster and provided at their edges with tongues, which overlap the edges of adjoining plates, and tie or distance pieces extending transversely of said air-space and rigidly connecting the sidings, substantially as described.

704,067. TRAMWAY-CAR. ADOLF MAURER, Ehrenfeld, near Cologne, Germany. Filed Mar. 3, 1902. Serial No. 96,562. (No model.)

Claim.—1. Benches for tramway-cars having seats and backs directed not only upward but also exactly symmetrically-arranged seats and backs directed downward, and pivots provided at the ends of the benches respectively which pivots are connected with the end walls of the car, as and for the purpose set forth.

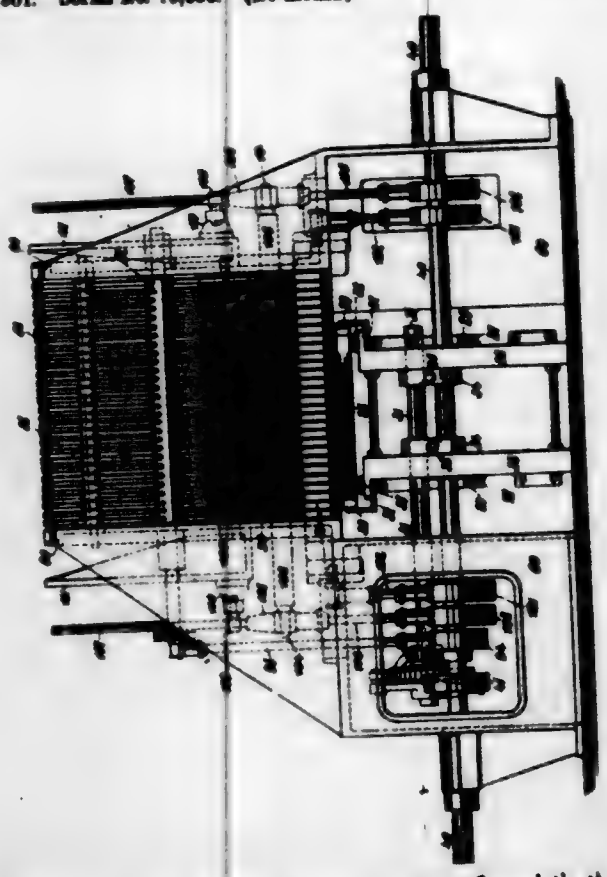
2. In tramway-cars the combination with the end walls of the car, having horizontal slots *c* arranged in each end walls of benches *a*, having seats and backs directed not only upward but also exactly symmetrically-arranged seats and backs directed downward and pivots *b* attached to the ends of the benches, respectively, which pivots rest in the said slots *c*, as and for the purpose set forth.



3. In tramway-cars the combination with the end walls and the side walls having recesses at their under parts of benches having seats and backs directed not only upward but also exactly symmetrically-arranged seats and backs directed downward, pivots provided at the ends of the benches and turnably attached to the end walls, respectively, frames *d* forming part of the backs of the benches and projecting into the said recesses of the side walls, the plates *f* of the latter being rigidly fastened to such frames, and stays *g* placed outside of the plates *f*, as and for the purpose set forth.

4. In tramway-cars the combination with the end walls and the side walls having recesses at their inner parts of benches having seats and backs directed not only upward but also exactly symmetrically-arranged seats and backs directed downward, pivots provided at the ends of the benches and turnably attached to the end walls, respectively, frames *d* forming part of the backs of the benches and projecting into the said recesses of the side walls, the plates *f* of the latter being rigidly fastened to such frames, grooves *h* let into the frames *d*, windows *i* movably arranged in the upper part of the side walls and adapted to be lowered into said grooves *h*, and stays *g* placed outside of the plates *f*, as and for the purpose set forth.

704,068. MACHINE FOR THE MANUFACTURE OF INLAID LINOLEUM. DAVID H. MELVIN, Lincolnville, N. Y. Filed Oct. 22, 1901. Serial No. 79,686. (No model.)



Claim.—1. In a machine for use in making floor-cloth, the series of spools for the composition ribbons, and a feed-plate over which said

ribbons are moved, combined with means for feeding predetermined lengths of said ribbons to and upon a foundation, means for severing such lengths from the ribbons, and means for pressing the same upon said foundation; substantially as set forth.

2. In a machine for use in making floor-cloth, the series of spools for the composition ribbons, a feed-plate over which said ribbons are moved, and means for imparting a step-by-step movement to a foundation, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for severing such lengths from the ribbons, and means for pressing the same upon said foundation; substantially as set forth.

3. In a machine for use in making floor-cloth, the series of spools for the composition ribbons, and a feed-plate over which said ribbons are moved, combined with means for feeding predetermined lengths of said ribbons to and upon a foundation, means for determining when said ribbons shall be fed upon said foundation in accordance with the pattern to be produced thereon, means for severing such lengths from said ribbons, and means for pressing the same upon said foundation; substantially as set forth.

4. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, and means for imparting a step-by-step movement to a foundation to receive the tesserm, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

5. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, and means for imparting a step-by-step movement to a foundation to receive the tesserm, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for determining when said ribbons shall be fed upon said foundation in accordance with the pattern to be produced thereon, means for severing such lengths from said ribbons, and means for pressing the same upon said foundation; substantially as set forth.

6. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, and means for moving by a step-by-step movement a foundation through the machine, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for determining when said ribbons shall be fed upon said foundation in accordance with the pattern to be produced thereon, and means for severing such lengths from said ribbons; substantially as set forth.

7. In a machine for use in making floor-cloth, means supporting a series of the composition ribbons in horizontal edge-to-edge order, combined with means for feeding simultaneously predetermined lengths of said ribbons beyond a given line, and means for severing such lengths simultaneously from said ribbons to form the tesserm; substantially as set forth.

8. In a machine for use in making floor-cloth, means supporting a series of the composition ribbons in horizontal edge-to-edge order, combined with means for feeding predetermined lengths of said ribbons beyond a given line, means for determining when and which of said ribbons shall be fed in accordance with the pattern to be produced, and means for severing such lengths from said ribbons to form the tesserm; substantially as set forth.

9. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, and means for moving by a step-by-step movement a foundation through the machine, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for determining when and which special ones of said ribbons shall be fed upon said foundation in accordance with the pattern to be produced thereon, and means for severing such lengths from said ribbons; substantially as set forth.

10. In a machine for use in making floor-cloth, the series of spools for the composition ribbons, a feed-plate over which said ribbons are moved to and upon a foundation, and means for moving by a step-by-step movement said foundation through the machine, combined with means for feeding predetermined lengths of said ribbons from over said feed-plate and to and upon said foundation, means for determining when said ribbons shall be fed upon said foundation in accordance with the pattern to be produced thereon, and means for severing such lengths from said ribbons; substantially as set forth.

11. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, and means for imparting a step-by-step movement to a foundation, combined with a series of yielding feet operable from the power-shaft for feeding predetermined lengths of said ribbons to and upon said foundation, a knife for severing such lengths from said ribbons to form the tesserm, and a yielding plunger for pressing the tesserm upon said foundation; substantially as set forth.

12. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the pivotally-mounted bars 81 carrying the feet 80 for feeding predetermined lengths of the said ribbons to and upon a foundation, means for imparting vertical and oscillatory motion to said bars 81, for causing said feet 80 to feed said ribbons, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

13. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the series of bars 81 having the feet 80 for feeding predetermined lengths of said ribbons to and upon a foundation, means for actuating said bars 81 to cause said feet to effect such feeding, means for throwing some of the said bars 81 out of operation when such result is desired in accordance with the pattern to be produced, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the tesserm upon said foundation; substantially as set forth.

14. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the series of bars 81 having the feet 80 for feeding predetermined lengths of said ribbons to and upon a foundation means for actuating said bars 81 to cause said feet to effect such feeding, a perforated pattern device 82 for determining the pattern to be formed upon said foundation, means intermediate said pattern device and said bars 81, for determining by means of said pattern device when said bars 81 shall act to feed said ribbons, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the tesserm upon said foundation; substantially as set forth.

15. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the series of pivotally-mounted and vertically-slidable bars 81 having the feet 80 for engaging and feeding predetermined lengths of said ribbons to and upon a foundation, the bar 103 engaging said bars 81 and adapted by its motion to impart the proper feeding action to said bars 81, the pivoted arms 90 carried by said bars 81 and adapted to lock said bars 81 to said bar 103, the perforated pattern-roller 82, the series of levers 83 having ends adapted to enter the apertures of said roller 82 and being in coöperative engagement with said arms 90 for unlocking said arms 90 from said bar 103, when it is desired that said bars 81 shall not act to feed said ribbons, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

16. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the series of feet for feeding predetermined lengths of said ribbons to and upon a foundation, means for actuating said feet, a perforated pattern device 82 for determining the pattern to be formed upon said foundation, means intermediate said pattern device 82 and said feet for controlling by means of the said pattern device when said feet shall act to feed the linoleum ribbons, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

17. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, combined with the series of bars 81 having the feet 80 for feeding predetermined lengths of said ribbons to and upon a foundation, the pivotally-mounted bar 100 upon which said bars 81 are mounted and upon which they are adapted to have vertical and pivotal movement, the bar 103 upon which said bars 81 are also mounted, means for imparting vertical and oscillatory motion to said bar 103 for actuating said bars 81, springs 102 suspending said bars 81, springs 92 secured to said bars 81, the arms 90 pivotally secured to said bars 81 and having their lower ends 91 normally locking said bars 81 to said bar 103, the perforated pattern-roller 82, means for imparting an intermittent rotary motion to said pattern-roller, the pivotally-mounted levers 83 having portions adapted to contact with said arms 90 and also having pointed ends to enter at the proper time the perforations in said roller 82, the springs 93 normally operating to relieve the levers 83 from the roller 82 and to press the lower portions of said levers 83 against the upper portion of said arms 90 in contact with said springs 92, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation, the said perforated roller 82 with the devices coöperating therewith, determining the pattern which shall be formed upon said foundation; substantially as set forth.

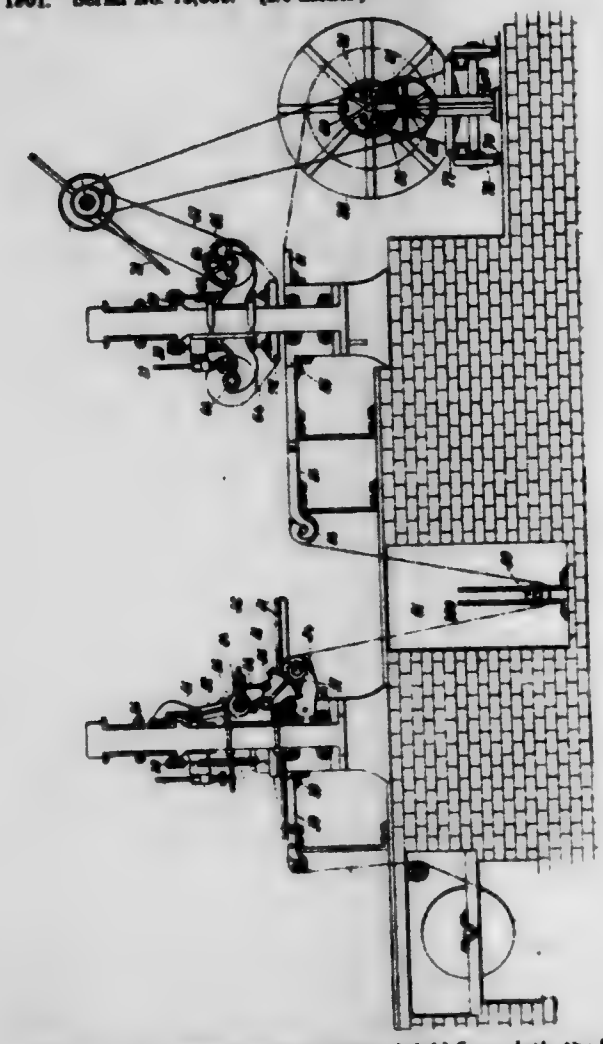
18. In a machine for use in making floor-cloth, the series of spools supporting the composition ribbons, the feed-plate over which said ribbons are led, a casing inclosing said spools and feed-plate, and means for maintaining the chamber within said casing at a low temperature, combined with means for feeding predetermined lengths of said ribbons to and upon a foundation, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

19. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, a feed-plate over which said rib-

bons are fed to a foundation, and the superposed frame above said feed-plate and comprising the longitudinal strips carrying partitions for separating said ribbons, combined with means for feeding predetermined lengths of said ribbons to and upon said foundation, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

20. In a machine for use in making floor-cloth, means for supporting a series of the composition ribbons, a feed-plate over which said ribbons are led, and means for chilling said feed-plate, combined with means for feeding predetermined lengths of said ribbons to and upon a foundation, means for severing such lengths from said ribbons to form the tesserm, and means for pressing the same upon said foundation; substantially as set forth.

704,069. MACHINE FOR THE MANUFACTURE OF INLAID LINOLEUM. DAVID H. MELVIN, Lincolnville, N. Y. Filed Oct. 23, 1901. Serial No. 79,698. (No model.)



Claim.—1. In a machine for making inlaid floor-cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to and to receive between them the pattern-blocks carrying the tesserm for transference to said fabric by said press, and means for automatically stripping the tesserm from said pattern-blocks after said press has caused the tesserm to adhere to said fabric, whereby the tesserm leave said blocks and remain attached to said fabric, combined with the second press through which said fabric with the tesserm thereon thereupon passes and wherein it is subjected to heat and pressure for finishing the floor-cloth, and means for effecting the intermittent travel of said fabric through said presses; substantially as set forth.

2. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the pin-roller at the rear of said bed-plate for engaging and feeding the said fabric, and means for imparting an intermittent rotary motion to said roller; substantially as set forth.

3. In a machine for making inlaid floor-cloth, the first press having the heated bed and cold platen between which the foundation fabric is fed and which are adapted to and to receive between them the pattern-blocks carrying the tesserm for transference to said fabric by said press, combined with the second press having the heated bed and heated platen between which the said fabric with the tesserm thereon is fed and wherein it is subjected to heat and pressure for finishing the floor-cloth, and means for effecting the intermittent travel of said fabric through said presses; substantially as set forth.

4. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with tables extending to the front and rear of said bed-plate beyond the vertical plane of the said platen, and adapted to receive the pattern-blocks used for carrying the tesserm, and means for drawing said fabric through said press, said fabric on its movements through the press serving to carry one of said pattern-blocks from below the platen and the next following pattern-block to position below the platen; substantially as set forth.

5. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the pin-roller in rear of said bed-plate and over which said fabric travels and which causes the said fabric to turn downwardly as it is fed onward, the table in rear of said roller, and means for imparting intermittent rotary motion to said roller and through it to said fabric; substantially as set forth.

6. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with means at the rear of said bed-plate for engaging the said fabric and turning the same downward therefrom as it is fed onward, and the rear table, adapted to receive one after another the pattern-blocks used for carrying the tesserm, said means while turning said fabric downward serving to strip the tesserm from said pattern-blocks and move the latter upon said rear table; substantially as set forth.

7. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with means at the rear of said bed-plate for turning the said fabric downward as it feeds onward, said means while turning said fabric downward serving to strip the tesserm from the pattern-blocks; substantially as set forth.

8. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the table at the rear of said bed-plate and between which and said bed-plate said fabric feeds downward, and means for feeding said fabric, said fabric with the tesserm thereon being stripped from said pattern-blocks as the fabric turns downward, while said blocks move onto said table; substantially as set forth.

9. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the second press through which said fabric with the tesserm thereon travels and which subjects the same to further pressure, and the well intermediate said presses into which the fabric with the tesserm thereon is looped; substantially as set forth.

10. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the second press through which said fabric with the tesserm thereon travels and which subjects the same to further pressure, the well intermediate said presses into which the fabric with the tesserm thereon is looped, and the tension-roller resting loosely within the loop of said fabric; substantially as set forth.

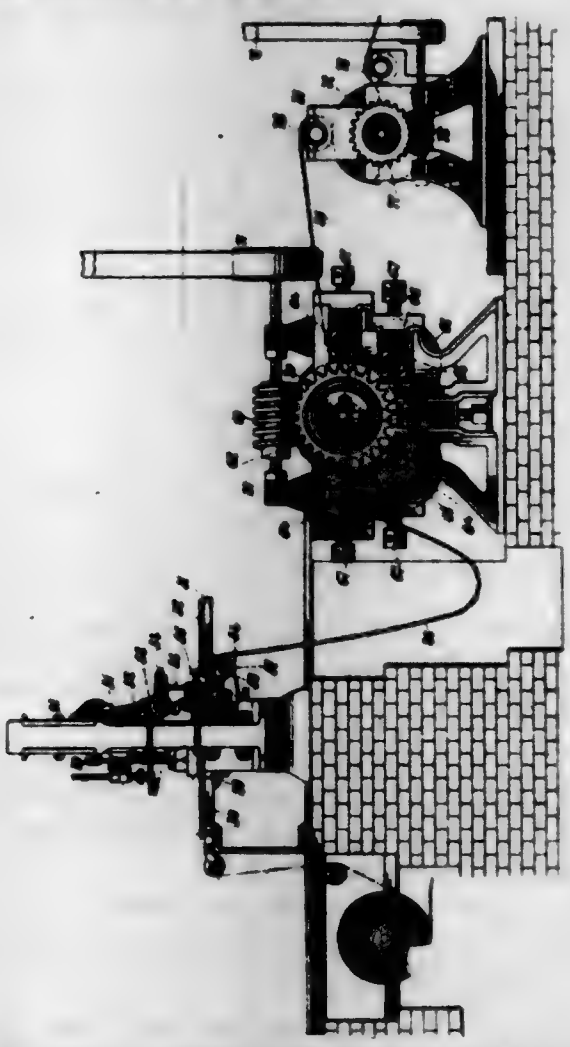
11. In a machine for making inlaid floor-cloth, the press having the bed-plate over which the foundation fabric may travel, the platen for exerting the pressure to cause the tesserm to adhere to said fabric, and means for operating said platen, combined with the second press through which said fabric with the tesserm thereon travels and which subjects the same to further pressure, the well intermediate said presses into which the fabric with the tesserm thereon is looped, the tension-roller resting loosely within the loop of said fabric, and the vertical guides for said roller; substantially as set forth.

12. In a machine for making inlaid floor cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to and to receive between them the pattern-blocks which carry the tesserm for transference to said fabric under the action of said press, combined with the second press having the bed and platen between which said fabric with the tesserm thereon travels and therein is subjected to heat and pressure for finishing the floor-cloth, and means for effecting the intermittent travel of said fabric through said presses; substantially as set forth.

13. In a machine for making inlaid floor-cloth, the first press having the heated bed and cold platen between which the foundation fabric is fed, and by means of which platen the tesserm are caused to adhere to said fabric, combined with the second press having the heated bed and heated platen between which the said fabric with the tesserm thereon is

fed to receive finishing pressure therefrom, and a smooth sheet carried below the platen of said second press; substantially as set forth.

704,070. MACHINE FOR THE MANUFACTURE OF INLAID LINOLEUM. DAVID H. MELVIN, Linoleumville, N. Y. Filed Oct. 23, 1901. Serial No. 79,760. (No model.)



Claim.—1. In a machine for making inlaid floor-cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to receive between them the pattern or pin blocks carrying the tesseræ to be transferred to said fabric, combined with the second press which receives said fabric with the tesseræ thereon and subjects the same to heat and finishing pressure, said second press comprising the heated roller and the series of smaller rollers encompassing the same and between which and said heated roller said fabric passes, said smaller rollers pressing the floor-cloth against said heated roller; substantially as set forth.

2. In a machine for making inlaid floor cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to receive between them the pattern or pin blocks carrying the tesseræ to be transferred to said fabric, combined with the second press which receives said fabric with the tesseræ thereon and subjects the same to heat and finishing pressure, said second press comprising the heated roller, the series of smaller rollers encompassing the same and between which and said heated roller said fabric passes, the series of sliding bearings for said smaller rollers, the springs pressing said smaller rollers toward said heated roller, and means for controlling said springs; substantially as set forth.

3. In a machine for making inlaid floor-cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to receive between them the pattern or pin blocks carrying the tesseræ to be transferred to said fabric, and means for feeding said foundation fabric through said press, combined with the heated press through which said fabric with the tesseræ thereon passes and which subjects the same to finishing pressure, and the cold roller over which the floor-cloth is carried after leaving said heated press; substantially as set forth.

4. In a machine for making inlaid floor-cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted to receive between them the pattern or pin blocks carrying the tesseræ to be transferred to said fabric, and means for feeding said foundation fabric through said press, combined with the heated press through which said fabric with the tesseræ thereon passes and which subjects the same to finishing pressure, and the cold-roller mechanism through which the floor-cloth passes after leaving said heated press, said cold-roller mechanism comprising the large roller and the smaller roller with means for driving the said large roller; substantially as set forth.

5. In a machine for making inlaid floor-cloth, the first press by which the tesseræ are pressed upon and attached to the foundation fabric, combined with the second or heated press through which said fabric with the tesseræ thereon passes and which subjects the same to finishing pressure, and the cold roller over which the floor-cloth is carried after leaving said heated press; substantially as set forth.

6. In a machine for making inlaid floor-cloth, the first press having the bed-plate and platen between which the foundation fabric passes and which are adapted receive between them the pattern or pin blocks carrying the tesseræ to be transferred to said fabric, and means for feeding said foundation fabric through said press, combined with the heated press, through which said fabric with the tesseræ thereon passes and which subjects the same to finishing pressure, and the cold roller over which the floor-cloth is carried after leaving said heated press, said heated press comprising the large heated roller and the series of encompassing smaller rollers with means for driving said rollers; substantially as set forth.

704,071. WASHING-MACHINE. EDWARD F. MILLER, Lenark, Ill. Filed Dec. 27, 1901. Serial No. 87,409. (No model.)

Claim.—1. In a washing-machine, a rod having a pounder at one end, and means for operating said rod, comprising a lever pivoted to the other end thereof, a support for said rod, a sleeve rigidly secured to the support, a pivot-block surrounding said sleeve and held in place by a collar, and a link pivoted to said lever at one end, and at the other end to said pivot-block, substantially as specified.

2. In a washing-machine, a rod having a pounder at one end and means for operating said rod, comprising a lever pivoted to the other end thereof, a support for said rod, a sleeve rigidly secured to said support, a pivot-block mounted to rotate on said sleeve but held against longitudinal movement thereon, and a link connected to the lever and to the pivot-block, substantially as specified.

704,072. METALLIC LATHING. PERRY A. MITCHELL, New York, N. Y. Filed Sept. 25, 1901. Serial No. 76,477. (No model.)

Claim.—1. A lath consisting of a metallic plate having a plurality of keepers stamped up therefrom so that the opposite edges thereof will lie above the plane of the body of the plate and substantially parallel therewith throughout their length, and each keeper having a flaring and a contracted opening respectively formed on its opposite sides, substantially as described.

2 A lath consisting of a metallic plate having a plurality of open keepers stamped up therefrom so that the opposite edges thereof will lie above the face of the plate and in different planes, the arrangement being such that the openings on the opposite sides of the keepers will differ in depth throughout substantially their entire length, substantially as described.

3. A lath consisting of a metallic plate having a plurality of keepers stamped up therefrom, each keeper having a flaring and a contracted opening respectively formed on its opposite sides, the highest portion of said keeper being flat and straight and disposed parallel to the plane of the body of the lath, and thence inclined toward the said contracted opening, substantially as described.

4. A lath consisting of a metallic plate having a plurality of rows of parallel slits arranged in pairs, the slits of each pair being of unequal length and the metal between each pair of slits being stamped up to form an open keeper, the arrangement being such that each keeper has a flaring and a contracted opening respectively formed on its opposite sides said openings differing both as to length and width.

5. A lath consisting of a metallic plate having a plurality of keepers stamped therefrom and open on opposite sides, each of said keepers being inclined for a portion of its width and said inclined portion terminating in a flat edge wall that lies parallel with the plane of the plate.

6. A lath consisting of a metallic plate having a plurality of rows of keepers stamped therefrom and open on opposite sides, the keepers of each row being alternately inclined in opposite directions relatively to the plane of the body of the lath.

704,073. CLOTHES-LINE PROP-HEAD. JOHN G. HOLE, Batavia, Ill. Filed Mar. 10, 1902. Serial No. 97,622. (No model.)

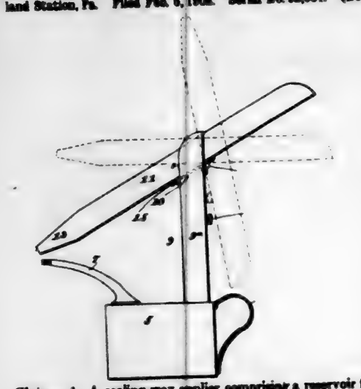
Claim.—1. A prop-head for clothes-lines, comprising a hollow body part, having a vertical lug provided with companion horizontal binding-pins projecting in the same direction from one side thereof and adapted to grip the line, and the retaining-hooks inclining in opposite directions, substantially as set forth.

2. The combination with a prop-head, comprising a hollow body part provided with a vertical lug extension and horizontal binding-pins having hooks set at different angles, of a prop on which said head is mounted, and means for securing said head in its mounted position, substantially as set forth.

704,074. CARPENTER'S FOLDING SQUARE. EDWARD J. MORRELL, Quincy, Mass. Filed Aug. 26, 1901. Serial No. 73,273. (No model.)

Claim.—A folding square composed of two members, one member consisting of one entire arm and a right-angle projection integral therewith, said projection and the end of the arm adjacent thereto being recessed, the free ends of said arm being diagonal to its length, the other member maintaining the same width as said projection but having a portion of less thickness adapted to enter said recess, said reduced portion having its upper outer edge recessed and its under outer edge chamfered a pivot connecting the two parts, a spring-latch secured to the first member in the path of said chamfered edge and adapted to be engaged and forced outwardly thereby and to automatically engage said recess in the second member and lock it when in operative position, diagonal abutting shoulders adjacent to the reduced portion adapted to engage the diagonal ends of the other member, the portion of said folding member beyond the pivot being of greater length than the width of the projection from the pivot-point to the edge thereof, whereby, when folded, angles of ninety degrees are formed on the outside thereof and an angle of more than ninety degrees on the inside thereof.

704,075. TIN SEALING-WAX CAN. WILSON R. MOYER, Richland Station, Pa. Filed Feb. 6, 1902. Serial No. 92,931. (No model.)



Claim.—1. A sealing-wax applier comprising a reservoir for an inflammable fluid, a burner, and an upward-extending post secured thereto, and a sealing-wax holder pivoted to said post, adapted to swing toward and away from the burner, substantially as shown and described.

2. A sealing-wax applier comprising a reservoir for an inflammable fluid, a burner removably secured thereto, an upward-extending post secured to the reservoir, and a sealing-wax holder hinged to said post, adapted to swing toward and away from said burner, substantially as shown and described.

3. A sealing-wax applier comprising a reservoir for an inflammable fluid, a burner and an upward-extending post secured thereto, an inclined ledge on the post, and a sealing-wax holder secured to the post and normally supported by said ledge, adapted to swing away from the burner, substantially as shown and described.

704,076. VENTILATOR AND MIRROR-PROTECTOR. WILLIAM C. MCBRIDE, Hillsboro, Tex. Filed Sept. 28, 1901. Serial No. 76,899. (No model.)

Claim.—1. A mirror-protecting and ventilating device, comprising a series of streamers arranged on an endless band, means to support and move longitudinally the band and streamers in front of a mirror, and a fan pendent in front of the streamers, air from the fan being adapted to agitate the streamers.

2. A mirror-protecting and ventilating device, comprising a pendent fan in front of a mirror, pulleys held to rotate at opposite side edges of the mirror, an endless flexible connection on the two opposite pulleys, streamers pendent from the endless connection, a pulley on the fan, a pulley affixed to and above one of the pulleys supporting the endless connection, and an endless belt connecting the uppermost pulley with the pulley on the fan.

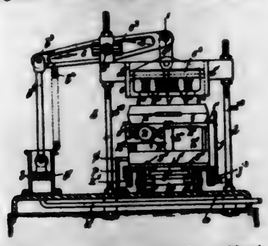
704,077. HINGE. CHARLES H. MCCAMLEY, Baltimore, Md., assignor to the Glen Rock Stamping Company, Glenrock, Pa., a Corporation. Filed June 22, 1901. Serial No. 65,041. (No model.)

Claim.—1. A hinge comprising two leaves each having an outwardly-bent wing, said wings being arranged face to face and pivotally connected and having their free outer edges yieldingly pressed together, one of said wings having a series of depressions arranged in the arc of a circle whose center is at the pivotal point of the hinge, and the other wing having one or more elevations adapted to engage said depressions.

2. A hinge comprising two leaves each having an outwardly-bent spring-metal wing, said wings being arranged face to face and pivotally connected, one of said wings having a series of depressions arranged in the arc of a circle whose center is at the pivotal point of the hinge, and the other wing having one or more elevations adapted to engage said depressions.

3. A hinge comprising two leaves each having an outwardly-bent spring-metal wing united thereto by a contracted portion, said wings being arranged face to face and pivotally connected near their junction with the leaves, one of said wings having a series of depressions arranged in the arc of a circle whose center is at the pivotal point, and the other wing having one or more elevations adapted to engage with said depressions.

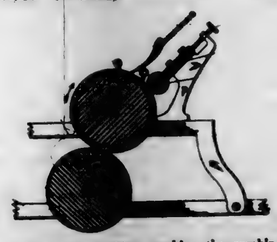
704,078. SAND-MOLDING MACHINE. JOHN J. MCCLELLAND, London, England. Filed Mar. 8, 1900. Serial No. 7,776. (No model.)



Claim.—1. In a sand-molding machine, the combination with a bed, of a railway carried by the bed, an extension of the railway adjacent thereto mounted upon a bed disconnected from the first-mentioned portion of the railway, a mold box or flask carriage mounted on the railway, a frame carried by the bed, a rammer carried by the frame, means for reciprocating the rammer, a mold box or flask carried by the mold box or flask carriage and provided with perforated lugs i^3, upright standards K having pins K^3 adapted to enter the perforations i^3 carried by the carriage, and a lever for reciprocating the standards K, substantially as shown and described.

2. In a sand-molding machine, the combination with a bed, of a railway carried by the bed, an extension of the railway adjacent thereto mounted upon a bed disconnected from the first-mentioned portion of the railway, a mold box or flask carriage mounted on the railway, a motor carried by the mold box or flask carriage, and mechanism also carried by the mold box or flask carriage and actuated by the motor for vibrating such carriage, a frame carried by the bed, a rammer carried by the frame, means for reciprocating the rammer, a mold box or flask carried by the mold box or flask carriage, and mechanism carried by the mold box or flask carriage for lifting the mold box or flask from the completed mold, substantially as shown and described.

704,079. SUCTION-BOX ATTACHMENT FOR PAPER-MACHINES. FRANK B. MALLORY, Wrentwright, Mass. Filed Feb. 17, 1902. Serial No. 94,208. (No model.)

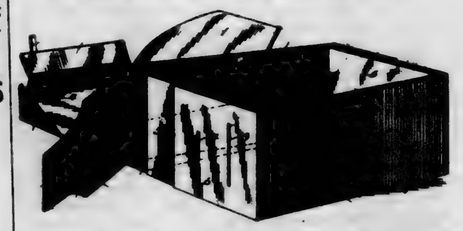


Claim.—1. In a paper-making machine, the combination of the couch-roll, and a cleaning-roll arranged to engage the couch-roll and to turn at a different peripheral speed from that of the couch-roll, so as to have a combing action thereon.

2. In a paper-making machine, the combination of the couch-roll, a cleaning-roll, a driving-gear turning with the couch-roll and engaging a pinion turning with the cleaning-roll, said gears being proportioned so that the peripheral speed of the cleaning-roll will be less than that of the couch-roll.

3. In a paper-making machine, the combination of the couch-roll, an adjustable guard-board, a cleaning-roll journaled in the guard-board and having a surface of flexible material, a driving-gear turning with the couch-roll and meshing with a pinion turning with the cleaning-roll, said gears being proportioned so that the peripheral speed of the cleaning-roll will be less than that of the couch-roll, a supplemental scraper or doctor, and two spraying devices for the couch-roll, one for spraying the surface of the couch-roll in front of the drying-roll.

704,080. FOLDING BOX. BENJAMIN B. MCFADDEN, Binghamton, N. Y. Filed Sept. 12, 1901. Serial No. 75,216. (No model.)



Claim.—1. A box, formed in two separate blank members, the main blank having four main sections, a front side section at one end of the blank, a cover-section at the opposite end of the blank, a bottom section at the inner edge of the front section, and a back section between the bottom and cover sections, the front and back sections corresponding in size and the bottom and cover sections corresponding in size, each of the front, bottom and cover sections having opposite end flaps, which are substantially coextensive with the end of the box, and the other blank member comprising an intermediate body corresponding to the back section, and having opposite terminal flaps which fit against the ends of the box.

2. A box, comprising two separate members, the main member having a bottom section, a front section, a back section, a cover-section carried by the back section and provided with opposite end flaps, the bottom and front sections also being provided with end flaps, of which the front flaps lie upon the outer sides of the bottom flaps, and the other member embracing the rear edges of the bottom flaps and having its opposite ends folded across and connected to the front flaps, the spaces between the bottom flaps and the front flaps forming pockets for the reception of the respective cover-flaps.

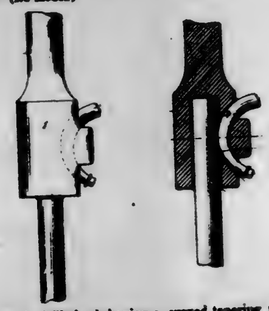
3. A box formed in two separate foldable members, the main box member having a bottom, a front, opposite ends, a back, and a cover carried by the back, and the other member having an intermediate body portion embracing the rear edges of the ends of the box between said ends and the back portion of the main blank, and also provided with opposite end flaps which are connected to the box, whereby the back portion of the main blank is foldable away from the box with the cover to fully expose the open top of the box.

4. A box formed in two separate foldable members, the main member having a bottom, a front, opposite ends, a back, and a cover carried by the back, and the other member being applied to the rear edges of the ends of the box to form a back normally lying between the ends of the box and the back of the main blank and thereby to complete the body of the box, whereby the back of the main section is foldable rearwardly with the cover to fully expose the open top of the box.

5. A box formed in two separate members, the main member having a bottom section, front and back sections carried thereby, a cover-section hinged to the back section, the cover, bottom and front sections being provided with opposite end flaps, each of the front flaps being provided with a pair of transverse slits, and the other box member having an intermediate body portion corresponding to the front and back of the main member and provided with opposite end flaps, the outer end of each flap being reduced to form a tongue, and the intermediate portion of the flap having a tongue cut and bent therefrom and projected toward one end thereof.

6. A box formed in two separate members, the main box member having upstanding bottom flaps, opposite side flaps folded across the outer sides of the bottom flaps, and a cover provided with opposite end flaps to fit within the pockets formed by the adjacent bottom flaps and side flaps, and the other box member having an intermediate body portion applied to one side of the box and provided with opposite end flaps embracing the respective ends of the box and connected to the adjacent side flaps thereof.

704,081. ROCK-DRILL CHUCK. MARTIN MCHALE, Phœnix, and JOSEPH TRAHERN, Rhoik, Canada. Filed Oct. 10, 1901. Serial No. 78,319. (No model.)



Claim.—1. A drill-chuck having a curved tapering passage communicating with the drill-chamber, said passage having its ends leading out through the wall of the chuck at separate and distinct points one above the other, and a curved and tapering key in said passage, as set forth.

2. A drill-chuck having a curved tapering passage communicating with the drill-chamber, said passage being circular in cross-section and having its ends leading out through the wall of the chuck at separate and distinct points one above the other, and a curved tapering key circular in cross-section and fitting in said passage, as set forth.

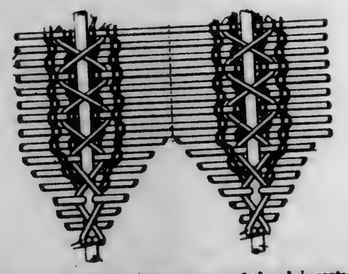
3. A drill-chuck having a curved tapering passage communicating with the drill-chamber, said passage being circular in cross-section and having its ends leading out through the wall of the chuck at separate and distinct points, one above the other, and a round curved and tapering key fitting in the said passage, said key being provided with a longitudinal groove in its outer periphery, as set forth.

704,082. VARNISH FOR MAKING ENAMEL AND PATENT LEATHERS. HARRY C. MCKAY, Huntington, Pa., assignor, by mesne assignments, to American Patent Kid Company, a Corporation of New Jersey. Filed Dec. 28, 1900. Serial No. 41,461. (No specimens.)

Claim.—1. A preparatory varnish for the purpose described, composed essentially of boiled linseed-oil admixed with a solution of guncotton in amyl acetate.

2. A mordanting varnish for the purpose described, composed essentially of boiled linseed-oil admixed with a solution of guncotton in amyl acetate, and a coloring-matter dissolved in methyl alcohol.

704,083. WOVEN CHENILLE. THOMAS F. HAYLOR and ARTHUR HAYLOR, Kidderminster, England. Filed July 12, 1901. Serial No. 68,052. (No specimens.)

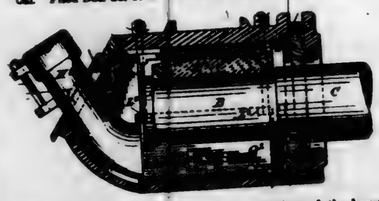


Claim.—A chenille consisting of a core, weft-threads in contact with the core, warp-threads woven with the weft-threads and a pair of dog-threads woven with the weft-threads and crossing from one side of the core to the other to hold the weft-threads up in the form of tufts, substantially as described.

704,084. FLY-SCREEN ATTACHMENT. ANDREW M. NELSON, Lockport, Ill. Filed Nov. 11, 1901. Serial No. 81,795. (No model.)

Claim.—A screen attachment, comprising an overhead screen secured to a wire rod, the ends of said wire rod being bent downward at right angle in such a manner that the screen may readily be attached to the door-casing, a side screen secured to a wire rod, the ends of said rod being bent to form hooks, by which the said side screen is attached to the overhead screen, substantially as shown and described.

704,085. CAR-AXLE BOX. CESAR NEWBURG, San Francisco, Cal. Filed Dec. 28, 1900. Serial No. 41,418. (No model.)



Claim.—1. The combination with a car-axle, and the box thereof, of a device adapted to feed lubricating matter to the axle-journal, and means extending through the top of the box for adjusting said feed device, substantially as described.

2. The combination with a car-axle and box therefor provided with a suitable inlet, of a tray adapted to hold a lubricant under the journal in said box, a feed-tube at the outer end of the box extending through the cover thereof and operating to deliver the lubricant through said inlet to the box and into the tray therein, and a pressure-cap at the end of the tube bearing on the lubricant therein, substantially as described.

3. In a car-axle box, the combination with the journal and bearing therein, of a tray adapted to hold a lubricant under said journal and bearing, a feeder arranged to supply the lubricant to said tray, a cap fitted to said feeder so as to press on the lubricant, and means extending upwardly through the top of the box for positively drawing up the tray and its contents toward the journal and bearing, substantially as described.

4. In combination with the axle-journal, and the bearing therefor, of a feeder adapted to discharge lubricating matter into said bearing, means suspended from the upper portion of the bearing for supporting the feeder, and means extending through the top of the box for adjusting said suspended means, substantially as described.

5. In combination substantially as described, a journal, a bearing-box therefor, a tray beneath the journal, a curved tube leading from the outside of the box and connected with one end of the tray constituting therewith a continuous unobstructed passage for a lubricant material, and a cup-shaped cap held at the end of said tube and adapted to press directly upon the lubricant material therein.

6. In combination with the axle-journal and the bearing therefor, of a feeder adapted to discharge lubricating matter to said bearing comprising an open-top tray, its outer wall extending beyond the end of said axle and its inner wall being cut away to permit an extended vertical adjustment of the tray and means adjacent the top of the box for adjusting said tray, substantially as described.

7. In combination substantially as described, a lubricant-holding tray comprising a body portion having an open top, a tubular inlet at one end of said body portion, and a pressure-exerting device at the end of the tube, the inner end of the said body portion being cut away for the purpose described.

8. The combination with a car-axle its box and the cover therefor, of a feed-tube adapted to discharge lubricating matter into said box through said cover so that the same will reach the axle-journal, a cap fitted to said tube having a smooth hollow interior and arranged to press on the lubricant matter, and means for advancing said cap and retaining the same in such advanced position, substantially as described.

9. The combination with a car-axle and its box, of a feed-tube at the lower portion of said box adapted to discharge lubricating matter beneath the axle-journal, and means for feeding the lubricating matter through said tube comprising a flanged cap slidably engaging the exterior surface of the tube, and means in engagement with said cap for forcing the same inwardly, substantially as described.

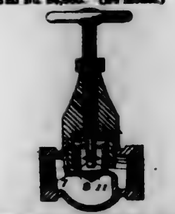
704,086. FIRE-ESCAPE. GILBERT P. HINE and EDWARD F. LARDNER, Williamsport, Pa. Filed June 7, 1901. Serial No. 62,640. (No model.)

Claim.—1. In a ladder, the combination of parallel ropes or cables and a rung having peripheral grooves therein to receive the cable, of clamping-links, each comprising a wire bent at each end to form loops or eyes to receive the cable above and below the rung, said clamping-links bent between their ends and disposed in the peripheral grooves therein to partly surround the rung and clamp the cable and itself in the grooved portion of the rung.

2. The combination with a supporting-plate and a ladder having rope or cable uprights and rungs, of clamping-sleeves on the plate, the upper rung and upper ends of the cables being clamped in said clamping-sleeves.

3. The combination with a plate adapted for attachment to a window-sill, of a second plate hinged to the lower edges of the first-mentioned plate, sleeves on said second plate, a flexible ladder having cables and rungs, the upper ends of said cables inserted into the sleeves and means for clamping said cables in the sleeves.

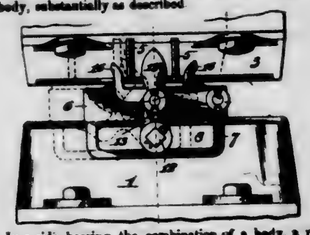
704,087. VALVE. NOVA S. HENDERSON, Hammond, Ind. Filed Jan. 2, 1902. Serial No. 88,668. (No model.)



Claim.—The combination with a valve casing and seat, and a cap for the casing having bars projecting therefrom forming a cage above and around the valve-seat, of a valve comprising connected upper and lower disks, the former having an axial opening and the latter fitting the valve-seat, and an axially-adjustable valve-stem extending loosely through the upper disk and having stops above and below the upper disk to engage the disk and hold the valve to or from the seat.

704,088. KEG SHARING FOR RAILWAY-CARS. SAMFORD HORTHROP and ANDREW G. SCHNEIDEWIND, St. Louis, Mo. Filed Nov. 21, 1901. Serial No. 83,073. (No model.)

Claim.—1. In a side bearing, the combination of a body, a roller-carriage movably mounted on said body and having sides provided with apertures, a rock-shaft mounted in said body and extending through said apertures, and means carried by said rock-shaft for moving said carriage on said body, substantially as described.



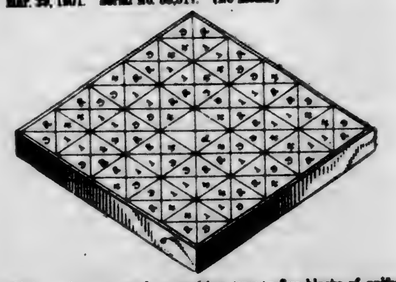
2. In a side bearing, the combination of a body, a roller-carriage movably mounted on said body and having sides provided with apertures, a rock-shaft mounted in said body and extending through said apertures, and a rocker-arm fixed to said rock-shaft and arranged to move said carriage, substantially as described.

3. In a side bearing, the combination of a body, a roller-carriage movably mounted on said body, a rocker-arm supported by said body, a central finger and a pair of outer fingers carried by said rocker-arm, a bolster-plate, and ribs carried by said bolster-plate adapted to receive the engagement of said rocker-arm fingers, substantially as set forth.

4. In a side bearing, the combination of a body, a carriage movably mounted on said body, rollers mounted in said carriage, and wings interior of said carriage adapted to rest on said body to support it and relieve the spindles of said rollers from strain, substantially as described.

5. In a side bearing, the combination of a body, a carriage movably mounted on said body and having apertured sides, wings interior of said carriage adapted to rest on said body to support it, means in said body for holding said carriage thereto, and rollers loosely positioned in said carriage, substantially as described.

704,089. PUZZLE. JOSHUA H. O'BEES, New Brighton, Pa. Filed Mar. 29, 1901. Serial No. 53,517. (No model.)

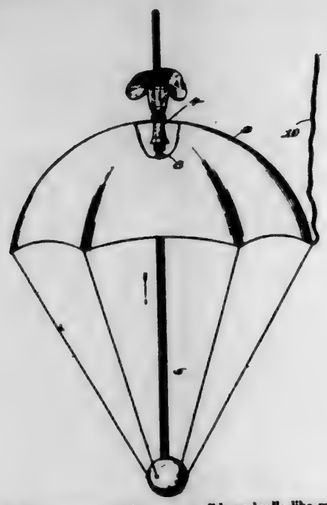


Claim.—A game-puzzle comprising twenty-five blocks of uniform size formed into a square having five blocks at each edge, each of the blocks being divided into four triangular spaces by diagonal lines, the center block having its four spaces blank, the remaining twenty-four blocks having the numerals "1," "2," "3" and "4" in vertical position, six of the blocks having the numeral "1" in the bottom space, six in the right-hand space, six in the left-hand space and the remaining six in the top space, the numeral "2" appearing in the right-hand space of six blocks, in the left-hand space of six other blocks, in the top space of another six and in the bottom space of the last six blocks, the numeral "3" being provided on each of the blocks in the bottom space of six, in the top space of six, in the right-hand space of six and in the left-hand space of the remaining six, and the numeral "4" in the right-hand space of six of the blocks, in the left-hand space of six other blocks, in the bottom space of another six blocks and in the top space of the last six blocks, substantially as set forth, whereby the numerals of adjacent spaces of contiguous blocks may match in vertical and horizontal lines when the blocks are arranged in square form, substantially as herein shown and described.

704,090. AERIAL TOY. FREDERICK M. GREEN, Manchester, N. H. Filed Jan. 29, 1902. Serial No. 91,667. (No model.)

Claim.—1. In an aerial toy, a stick, an expansible member carried by said stick and free to slide thereon, said member when expanded operating to retard the movement of the toy through the air, and means connecting said member to a fixed point on the stick, the construction being

such that as the member is expanded it has a sliding movement on the stick.



2. In an aerial toy, a stick, an expansible umbrella-like member of flexible material slidably mounted on said stick, and flexible members connecting the outer edge of said umbrella-like member to a fixed point on the stick.

3. In a toy, a stick, an umbrella-like member of flexible material having an eye in its central portion through which the stick is free to move, and flexible connections between the outer edge of said member and a fixed point on the stick.

4. In a toy, a stick, an umbrella-like member having an eye in its central portion through which the stick is free to slide, connections between the outer edge of said member and a fixed portion of the stick, and means to hold the expansible member furled during its ascent, said member, when expanded, operating to retard the movement of the toy through the air.

5. A stick, a counting balance-weight, an expansible umbrella-like member slidingly mounted on said stick, flexible members fixed to the stick and connected to said expansible member, and means to maintain said expansible member folded as the stick is started in motion, said member automatically opening as the stick begins to descend and when open operating to retard the movement of the device through the air.

6. In a toy, an expansible umbrella-like member of flexible material, a stick extended loosely through said member whereby said member can move relatively to the stick, a directing-weight carried by the stick, and connections between said member and a fixed point on the stick, the construction being such that as the member is expanded it slides upon the stick.

7. In an aerial toy, an expansible, umbrella-like member of fibrous material, a stick passing freely therethrough, and capable of a movement independent of the umbrella-like member, and flexible connections between the outer edge of the umbrella-like member and a fixed point on the stick.

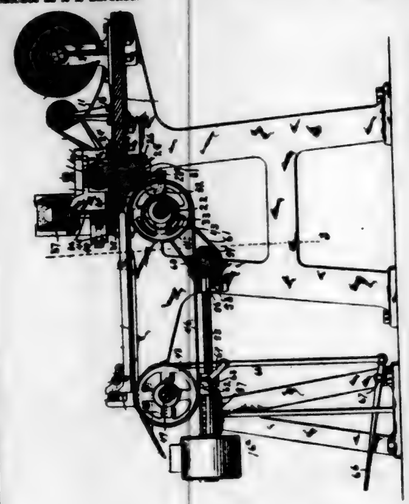
704,091. PROCESS OF MAKING MATCHES. WILLIAM H. PARKER, Melrosville, N. Y., assignor, by mesne assignments, to Parker Match Company, a Corporation of New Jersey. Filed Sept. 23, 1901. Renewed June 9, 1902. Serial No. 110,998. (No specimens.)

Claim.—1. The herein-described process of making matches which consists in affixing to the outer edge of a strip of material suitable for matches so as to cover and envelop the said edge, a firing composition and then cutting the strip transversely into individual matches.

2. The herein-described process of making matches which consists in rolling a strip of material suitable for matches, separating the adjacent edges so that the banded parts cannot touch, providing the edges with a firing composition, and then cutting the strip into matches.

3. The herein-described process of making matches which consists in forming into a roll a strip of flexible material suitable for matches, rolling up with the match material a substance which will separate the edges of the said material, dipping the separated edges into the necessary composition to form a firing composition along the said edges, and then cutting the strip of material into matches.

4. The herein-described process of making matches which consists in rolling up with a strip of veneer a belt or substance which will cause the edge portions of the strip to be separated, dipping the said separated edge portions into a firing composition, permitting the said composition to set, and then unrolling the said strip of veneer and cutting it into matches as it is unrolled.



704,092. CONTACT SYSTEM FOR ELECTRIC RAILWAYS. THEODORE B. PAYNE, North Cambridge, Mass. Filed Nov. 29, 1901. Serial No. 84,033. (No model.)

Claim.—1. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track in such a manner as to present only its under side to an upward-bearing shoe of sufficient length to contact with two of said plates simultaneously, said contact-plates being insulated from said standards and connected to a source of power.

2. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, a cap covering each of said contact-plates, except upon the under side of said plate, and insulating material between said cap and plate, said plates being connected to a source of power.

3. In a contact system for electric railways, a standard provided with a vertical chamber extending therethrough, an insulating-sleeve in said chamber, and a contact-plate having a stem projecting downwardly therefrom into said insulating-sleeve.

4. In a contact system for electric railways, a standard provided with a vertical chamber extending therethrough, an insulating-sleeve in said chamber, a contact-plate having a stem projecting downwardly therefrom into said insulating-sleeve, a cap covering said contact-plate, and insulating material between said cap and plate.

5. In a contact system for electric railways, a standard provided with a vertical chamber extending therethrough, an insulating-sleeve in said chamber, a contact-plate triangular in cross-section having a stem projecting downwardly into said insulating-sleeve, an angle-shaped cap covering said plate, and insulating material between said cap and plate.

6. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, a cap covering each of said contact-plates, except upon the under side of said plate, and insulating material between said cap and plate, said plates being connected to a source of power; in combination with an electric-car truck and an upward-bearing shoe supported upon said truck and arranged to engage the under side of two of said contact-plates simultaneously.

7. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending laterally therefrom toward said track, a cap covering each of said contact-plates, except upon the under side of said contact-plate, and insulating material between said cap and plate, said plates being connected to a source of power; in combination with an electric-car truck and an upward-bearing spring-supported shoe supported upon said truck and arranged to engage the under side of two of said contact-plates simultaneously.

8. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, a cap covering each of said contact-plates, except upon the under side of said plate, and insulating material between said cap and plate, said plates being connected to a source of power; in combination with an electric-car truck, a bracket fast to said truck, a spring-controlled arm pivoted to said bracket, and a shoe fast to said arm and arranged to engage the under side of two of said plates simultaneously.

9. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, a cap covering each of said contact-plates, except upon the under side of said plate, and insulating material between said cap and plate, said plates being connected to a source of power; in combination with an electric-car truck, a bracket fast to said truck, a spring-controlled arm pivoted to said bracket, a shoe fast to said arm and arranged to engage the under side of two of said plates simultaneously, and means to adjustably limit the upward movement of said shoe.

704,093. CONTACT SYSTEM FOR ELECTRIC RAILWAYS. THEODORE B. PAYNE, North Cambridge, Mass. Filed Apr. 4, 1902. Serial No. 101,321. (No model.)

Claim.—1. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, and a shoe supported upon said shoe-support and arranged to engage two of said contact-plates simultaneously.

2. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, a cap covering each of said contact-plates, except upon the under side of said plate, and insulating material between said cap and plate, said plates being connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, and a shoe supported upon said shoe-support and arranged to engage two of said contact-plates simultaneously.

3. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of plates, one of said plates fast to each of said standards and extending therefrom laterally in such a manner as to present only its under side to an upward-bearing shoe of sufficient length to contact with two of said plates simultaneously, said contact-plates being insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, and a shoe supported upon said shoe-support and arranged to engage two of said contact-plates simultaneously.

4. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, a shoe supported upon said shoe-support, and a spring supporting said shoe and arranged to engage two of said contact-plates simultaneously.

5. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, and a shoe pivotally supported upon said shoe-support and arranged to engage two of said contact-plates simultaneously.

6. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, and a shoe pivotally and spring supported upon said shoe-support and arranged to engage two of said contact-plates simultaneously.

7. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, a shoe supported upon said shoe-support, and links pivotally connected to said shoe and to said shoe-support.

8. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, a shoe supported upon said shoe-support, links pivotally connected to said shoe and to said shoe-support, and a torsional spiral spring operatively connected to one of said links and acting to press said shoe against said contact-plates.

9. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks and having a sliding engagement with the other of said trucks, a shoe supported upon said shoe-support, a link pivotally connected to said shoe-support at one end, and a slide upon said shoe to which the other end of said link is pivotally connected.

10. In a contact system for an electric railway, a series of standards located outside the tracks of said railway, a series of contact-plates, one of said plates fast to each of said standards and extending therefrom laterally toward said track, said plates insulated from said standards and connected to a source of power; in combination with two car-trucks, a shoe-support pivoted to one of said trucks, a swivel rotary block supported upon the other of said trucks, with which block said shoe-support has sliding engagement, and a shoe supported upon said shoe-support.

11. In a contact system for an electric railway, a series of standards located between two tracks of a double-track system, a series of contact-plates, two of said plates fast to and extending laterally from each of said standards in opposite directions toward said tracks, said plates insulated from said standards and connected to a source of power.

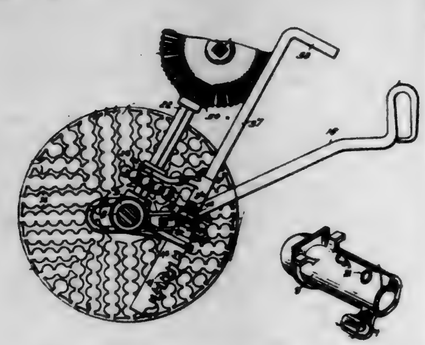
12. In a contact system for an electric railway, a series of standards located between the two tracks of a double-track system, a series of contact-plates, two of said plates fast to and extending laterally from each of said standards in opposite directions in such a manner as to present only their under sides to an upward-bearing shoe of sufficient length to contact with two plates upon two of said standards simultaneously, said contact-plates being insulated from said standards and connected to a source of power.

13. In a contact system for an electric railway, a series of standards located between the two tracks of a double-track system, a series of contact-plates arranged in pairs, each pair of said plates fast to and extending laterally from each of said standards in opposite directions toward said tracks, a cap covering each of said pairs of contact-plates, except upon the under side of said plates, and insulating material between said cap and plates, said plates being connected to a source of power.

704,094. SHARING. CHARLES H. PIELDS, Springfield, Ohio. Filed Jan. 2, 1901. Serial No. 41,203. (No model.)

Claim.—1. A driving-disk for fertilizer-distributors provided on its face with a plurality of ribs, each rib having recesses in its opposite sides, and the recesses of the adjacent ribs being located opposite each other,

whereby concentric series of laterally-defined recesses are formed, substantially as described.



2. In a fertilizer-distributer, the combination, with an axle, of a driving-disk mounted thereon and provided with a plurality of ribs on its working face, each rib having recesses in its opposite sides, and the recesses of the adjacent ribs being opposite each other, whereby concentric series of laterally-defined recesses are formed, a shaft arranged at right angles to the axle and suitably connected with the feeding devices, and a pinion rotating with and slidable longitudinally on said shaft and provided with spherical teeth to engage the recesses of the driving-disk, substantially as described.

3. The combination, with a rotating axle, of a shaft at right angles thereto provided with a pinion, a driving-disk loosely mounted on the axle and provided with a hub having a longitudinal groove or slot, a collar fixed on the axle and having a longitudinal flange extending over the end of the hub of the disk and provided with a rib or key to enter the slot or groove thereof, an exposed spring surrounding the hub and bearing against the disk and collar, and means for moving the disk toward and from the collar, substantially as described.

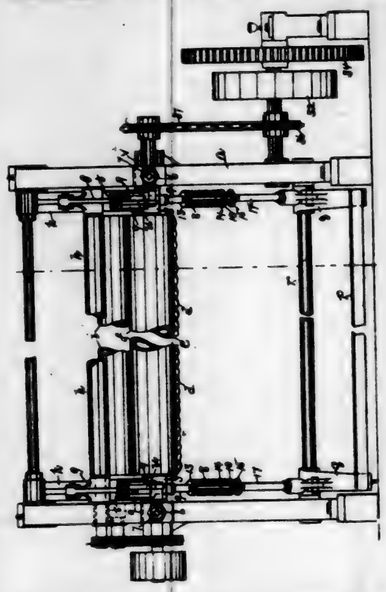
4. In a variable-speed gear for fertilizer distributers, &c, the combination, with a shaft, and a pinion rotating with and slidable on said shaft, of a shifting device for the pinion comprising an arm engaging the pinion and provided with a sleeve, a rod passing through said sleeve and adapted to rotate therein and to move the sleeve longitudinally, a second sleeve secured to the lower end of the rod and provided with teeth, and a fixed lug having an aperture to receive said last-mentioned sleeve and a radial slot for the passage of the teeth, said lug being of a thickness to engage between the teeth, substantially as described.

5. In a variable-speed gear for fertilizer-distributers, &c., the combination, with a driving-disk mounted to rotate with and move longitudinally of the axle and provided with concentric series of gear-teeth, of a shaft arranged at right angles to the axle, a pinion mounted to slide longitudinally of and rotate along with said shaft, a rod provided with an arm engaging said pinion, a fixed locking-lug, and an extension of said rod provided with locking-teeth to engage the locking-lug, the connection between said rod and its extension being adjustable, so that the locking-points may be adjusted to correspond to the engaging points of the pinion, substantially as described.

6. A variable-speed gear for fertilizer-distributers, &c., comprising an axle, a driving-disk mounted thereon and provided with concentric circular rows of gear-teeth, a shaft at right angles to the axle and having a pinion mounted to rotate therewith and slidable thereon, an arm engaging said pinion and provided with a sleeve threaded at its lower end, a rod passing loosely through said sleeve and provided with a locking-sleeve at its lower end, means for engaging said locking-sleeve at predetermined intervals, and a cap rotatably mounted on said locking-sleeve and threaded to engage the threaded lower end of the shifting arm-sleeve, substantially as described.

7. The combination, with a rotating shaft or axle and a fixed bearing therefor, of a driving-disk mounted to slide on and rotate with the axle, a spring to press said disk normally toward said fixed bearing, a shaft mounted in said fixed bearing and provided with a pinion adapted to slide thereon and rotate therewith, the fixed bearing being provided with a cam-incline and with a separate locking-recess at the end of the incline, and a longitudinally-sliding cam-bar interposed between the fixed bearing and the driving-disk and provided with a cam-incline to cooperate with that of the bearing, and with a separate locking projection at the end of said incline to engage with the locking-recess of the bearing, substantially as described.

704,095. MACHINE FOR TREATING HIDES OR SKINS. FRANKLIN J. PERKINS, Woburn, and FREDERIC A. PARKHURST, Peabody, Mass., assignors to Vaughn Machine Company, Boston, Mass., a Corporation of West Virginia. Filed Oct. 1, 1901. Serial No. 77,248. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a roll mounted in fixed bearings, and a bed-roll, of a feed-roll coöperating with said bed-roll to hold the hide or skin in contact therewith, means to support said feed-roll and bed-roll normally separate from each other on opposite sides of a plane substantially through the center of the rolls when in their operative position, and means for moving said feed-roll and bed-roll toward each other and into their operative position with their axes substantially in the same plane.

2. In an apparatus of the class described, the combination with a bed-roll, and levers in which said bed-roll is mounted, of a feed-roll, and separate levers in which said feed-roll is mounted, and means to connect the said levers on opposite sides of their pivots, whereby the bed-roll and feed-roll may be moved simultaneously toward and away from each other, substantially as and for the purpose specified.

3. In an apparatus of the class described, the combination with a bed-roll, and levers in which said bed-roll is mounted, toggle-levers to which said levers are connected, of a foot-treadle, and a yielding connection between the said foot-treadle and the said toggle-levers, the latter being out of line with each other when the bed-roll is in its operative position, for the purpose specified.

4. In an apparatus of the class described, the combination with a bed-roll, and levers in which the said bed-roll is mounted, of toggle-levers having one end connected to the levers carrying the bed-roll and the other end to a fixed pivot, a foot-treadle, and a yielding connection between the said toggle-levers and the said foot-treadle, said toggle-levers being out of line with each other when the bed-roll is in its operative position, for the purpose specified.

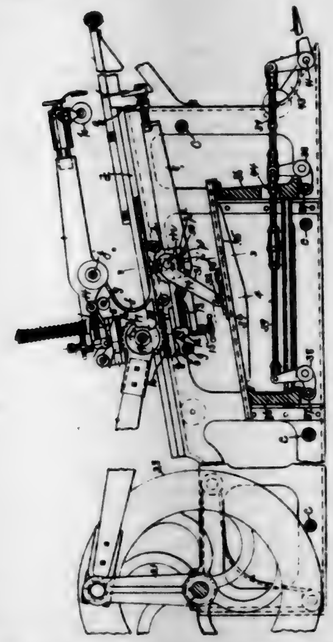
5. In an apparatus of the class described, the combination with an operating-tool, of a bed-roll movable toward and from said tool, and a feed-roll cooperating with said bed-roll and movable toward and from the same, said feed-roll and bed-roll being normally separated and located on opposite sides of a plane substantially through the center of the rolls when in their operative position, and means for moving said feed-roll and bed-roll toward each other and into their operative position with their axes substantially in the same plane.

6. In an apparatus of the class described, the combination with a bed-roll and a movable support therefor, of toggle-levers connected at one end to said movable support and at their other end to a fixed support, said fixed support, a lever for moving said toggle-levers toward a straight line through their pivots, and a yielding mechanism connecting said lever with said toggle-levers, said toggle-levers being out of line with each other when the bed-roll is in its operative position, for the purpose specified.

7. In an apparatus of the class described, the combination with a bodily-movable bed-roll, of a bodily-movable feed-roll coöperating with said bed-roll to hold the hide or skin in contact therewith, and levers in which said feed-roll is mounted having their pivots in an inclined plane substantially through the center of the bed-roll when the latter is in its operative position, and supporting said feed-roll with its axis slightly at one side of said inclined plane, substantially as described.

8. In an apparatus of the class described, the combination with a bed-roll, levers in which said bed-roll is supported, and adjustable boxes or blocks, means to secure said boxes or blocks in their adjusted position, toggle-levers having one end pivoted to said adjustable boxes or blocks and their other end to said levers, a foot-treadle and a yielding connection between said foot-treadle and said toggle-levers, the latter being out of line with each other when the bed-roll is in its operative position, for the purpose specified.

704,096. STAKING-MACHINE. FRANKLIN J. PERKINS, Woburn, Mass., assignor to Vaughn Machine Company, Boston, Mass., a Corporation of West Virginia. Filed Dec. 21, 1901. Serial No. 86,752. (No model.)



Claim.—1. In a machine of the class described, in combination, a reciprocating cross-head or support, upper and lower tool-carrying levers pivoted thereto, sliding cam plates or bars provided with cams which coöperate with said levers to turn the same on their pivots, guides in said cross-head for said sliding cam-plates, means intermediate of said cam plates or bars for moving the same in opposite directions to each other and into and out of operative relation with said levers, and means for reciprocating said cross-head or support.

2. In a machine of the class described, in combination, a reciprocating cross-head or support, upper and lower tool-carrying levers pivoted thereto, cam plates or bars provided with cams which coöperate with said levers to turn the same on their pivots, rack-bars attached to said cam plates or bars, a gear in mesh with said rack-bars, and means for oscillating said gear, substantially as described.

3. In a machine of the class described, in combination, a reciprocating cross-head, a pivoted lever carried by the cross-head, sliding boxes movable in said cross-head in a direction transversely of the length of said lever and in which the pivot for said lever is mounted, and means for moving said sliding boxes, substantially as described.

4. In a machine of the class described, in combination, a reciprocating cross-head, a pivoted lever carried by the cross-head, sliding boxes movable in said cross-head and in which the pivot for said lever is mounted, means for moving said sliding boxes, a vertically-movable table, means supported by said table for sustaining said sliding boxes in their adjusted position, and means for raising and lowering said table, substantially as described.

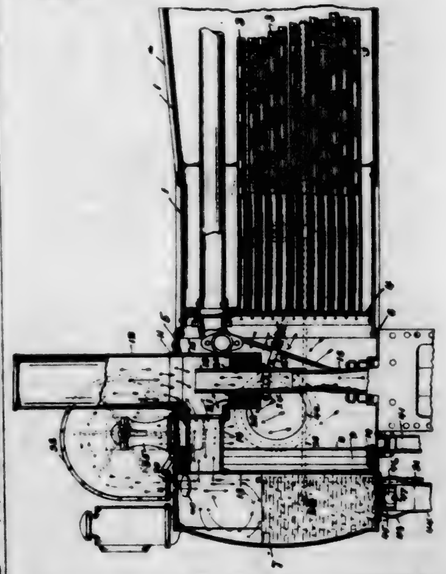
5. In a machine of the class described, in combination, a reciprocating cross-head, a pivoted lever carried by said cross-head, sliding boxes movable in said cross-head and supporting the pivot for said lever, a vertically-movable table, means supported by said table for sustaining said pivoted lever, a foot-treadle, and bell-crank levers supporting said table and operatively connected with said foot-treadle to be turned thereby to raise said table, substantially as and for the purpose specified.

6. In a machine of the class described, in combination, a reciprocating cross-head or frame, upper and lower tool-carrying levers pivoted thereto, independent cams for operating said levers bodily movable in opposite directions to each other, guides on the cross-head for said bodily-movable cams, and means for moving said cams, substantially as described.

7. In a machine of the class described, in combination, a reciprocating cross-head or frame, upper and lower tool-carrying levers pivoted thereto, arms pivoted to said levers, independent cams movable in opposite directions to each other, guides on the cross-head for said bodily-movable cams, means to adjust said arms with relation to said cams, and means for moving said cams in opposite directions, substantially as described.

8. In a machine of the class described, in combination, a reciprocating cross-head comprising side frames or uprights provided with guideways, upper and lower tool-carrying levers pivotally connected to said cross-head to move therewith, reciprocating cam plates or bars movable in said guideways, cams on said plates or bars coöperating with said levers and oppositely arranged, means for simultaneously moving said cam plates or bars in opposite directions to each other, and means for reciprocating said cross-head, substantially as described.

704,097. FURNACE. COLUMBUS PHILLIPS, Meridian, Miss. Filed Apr. 16, 1901. Serial No. 56,414. (No model.)



Claim.—1. The combination with a boiler; of a smoke-stack having a direct and indirect connection with the smoke-box; an adjustable pipe concentric with said smoke-stack for conveying a jet-draft thereto; and a valve adapted when in one position to close the said direct communication between the smoke-box and smoke-stack, substantially as described.

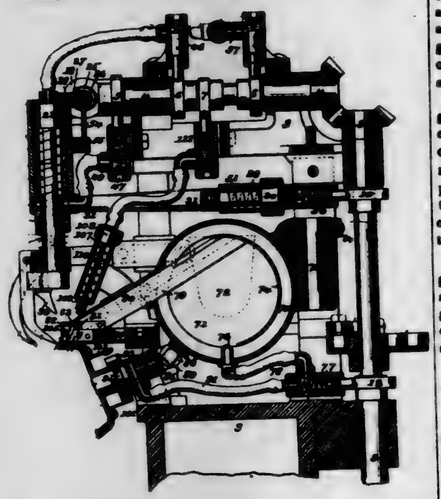
2. The combination with a boiler; of a smoke-stack having a direct and indirect connection with the smoke-box; an adjustable exhaust-pipe carrying a valve adapted when in one position to close said direct communication between the smoke-box and smoke-stack; a draft-inducing means; and a spark-arresting compartment in said indirect connection, substantially as described.

3. The combination with a boiler having a smoke-box therein and

a spark-arresting compartment; of a smoke-stack having a direct communication with said smoke-box and an indirect connection therewith through said spark-arresting compartment; a draft-inducing means forming the sole medium of connection between said smoke-box and spark-arresting compartment; an adjustable pipe for conveying a jet-draft into said smoke-stack and having a valve connected therewith; and means for adjusting said pipe, so that said valve will cover or uncover the said direct communication between said smoke-box and smoke-stack, substantially as described.

4. In a boiler having a smoke-box therein and a spark-arresting compartment 7; of a smoke-stack connected therewith; means, as a dust 14 and T 15, for connecting said spark-arresting compartment with said stack; an exhaust-pipe 16 having an extension-pipe 19 movable thereon; and a valve 21 fixed to said extension-pipe and adapted to cover and uncover the opening into said stack from said smoke-box, all constructed and operating substantially as described.

704,098. PNEUMATIC LASTING-MACHINE. CHAS. K. PICKLES, St. Louis, Mo., assignor to himself, Louis Bry, St. Louis, Mo., and Ike Block, Memphis, Tenn. Filed May 13, 1901. Serial No. 60,844. (No model.)



Claim.—1. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with a motor-engine having operative connection with said pincers mechanism and adapted to impart a pulling motion to such mechanism, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

2. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

3. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a motor-engine for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, and a pair of automatically-operated valves controlling said motor-engines, substantially as set forth.

4. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

5. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, and a pair of automatically-operated valves controlling said motor-engines, substantially as set forth.

6. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a single-acting motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, a spring tending to move the pincers-jaws into an open condition, and a pair of automatically-operated valves controlling said motor-engines, substantially as set forth.

7. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with a motor-engine having operative connection with said pincers mechanism and adapted to impart a pulling motion to said mechanism, a valve controlling said motor-engine, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with the said valve, substantially as set forth.

8. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, a valve controlling said motor-engine, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

9. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a motor-engine for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, a pair of valves controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and cams carried by said shaft and having operative connections with said valves, substantially as set forth.

10. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a valve controlling said motor-engine, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

11. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, a pair of valves controlling said motor-engines, a cam-shaft revolubly mounted on the main frame, and cams carried by said shaft and having operative connections with said valves, substantially as set forth.

12. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pair of jaws capable of movement in common and one of which jaws is movable with relation to the other, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a single-acting motor-engine having operative connection with the independently-movable jaw of the pincers mechanism, a spring tending to move the pincers-jaws into an open condition, a pair of valves controlling said motor-engines, a cam-shaft revolubly mounted on the main frame, and cams carried by said shaft and having operative connections with said valves, substantially as set forth.

13. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

14. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, and an automatically-operated valve controlling the flow of motive fluid to said cylinders, substantially as set forth.

15. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, an automatically-operated valve controlling said motor-engine, and a manually-operated reversing-valve for governing the direction of the pincers mechanism, substantially as set forth.

16. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, an automatically-operated valve controlling motive fluid to such cylinders, and a manually-operated reversing-valve for governing the direction of the turning movement of the pincers mechanism, substantially as set forth.

17. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, and an automatically-operated valve controlling motive fluid to said cylinders, substantially as set forth.

18. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

19. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central position, and an automatically-operated valve controlling motive fluid to said cylinders, substantially as set forth.

20. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, and an automatically-operated valve controlling the flow of motive fluid to said cylinders, substantially as set forth.

21. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a valve controlling said motor-engine, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

22. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a valve controlling the flow of motive fluid to said cylinders, a cam-shaft revolubly mounted on the machine-frame, a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

23. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to said mechanism, a valve controlling the flow of motive fluid to said cylinders, a cam-shaft revolubly mounted on the machine-frame, a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

24. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, a valve controlling said motor-engine, a cam shaft revolubly mounted on the machine-frame, a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

25. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central relation, a valve controlling the flow of motive fluid to said cylinders, a cam-shaft revolubly mounted on the machine-frame, a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

26. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a valve controlling the flow of motive fluid to said cylinders, a cam-shaft revolubly mounted on the machine-frame, a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

27. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same, means for returning the pincers mechanism to a central position and an automatically-operated valve controlling said motor-engine, substantially as set forth.

28. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders and having operative engagement with the pincers mechanism and adapted to impart a lateral movement to the same, and an automatically-operated valve controlling the flow of motive fluid to said cylinders, substantially as set forth.

29. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same, means for returning the pincers mechanism to a central position and an automatically-operated valve mutually controlling said motor-engines, substantially as set forth.

30. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders and having operative engagement with the pincers mechanism and adapted to impart a lateral movement to the same, an automatically operated valve controlling supply of motive fluid to said cylinders, and a manually-operated reversing-valve for governing the direction of the turning and lateral movements of the pincers mechanism, substantially as set forth.

31. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart lateral movement to the same, means for returning the pincers mechanism to a central position, an automatically-operated valve mutually controlling said motor-engines, and a manually-operated reversing-valve for governing the direction of the turning and lateral movements of the pincers mechanism, substantially as set forth.

32. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same, means for returning the pincers mechanism to a central position and an automatically-operated valve mutually controlling the said motor-engines substantially as set forth.

33. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same, means for returning the pincers

mechanism to a central position and an automatically-operated valve controlling the said motor-engines, substantially as set forth.

34. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, means for returning the pincers mechanism to a central position and an automatically-operated valve mutually controlling the motor-engines, substantially as set forth.

35. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, means for returning the pincers mechanism to a central position and an automatically-operating valve mutually controlling the motor-engines, substantially as set forth.

36. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, means for returning the pincers mechanism to a central position, an automatically-operating valve mutually controlling the motor-engines, and a manually-operated reversing-valve for governing the direction of the turning and lateral movements of the pincers mechanism substantially as set forth.

37. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism, and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, means for returning the pincers mechanism to a central position, an automatically-operating valve mutually controlling the motor-engines, and a manually-operated reversing-valve for governing the direction of the turning and lateral movements of the pincers mechanism, substantially as set forth.

38. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, means for returning the pincers mechanism to a central position and an automatically-operated valve mutually controlling the motor-engines, substantially as set forth.

39. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

40. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine having operative connection with the pincers mechanism and adapted to impart lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

41. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts adapted to impart a turning movement to said mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

42. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

43. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

44. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to said mechanism, a spring adapted to return the parts to a central normal position, a motor-engine having operative connection with the pincers mechanism and adapted to impart a lateral movement to the same in one direction, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, means for returning the pincers mechanism to a central position and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

45. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, and an automatically-operated valve mutually controlling said motor-engines substantially as set forth.

46. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, and an automatically-operated valve mutually controlling said motor-engines, substantially as set forth.

47. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, and an automatically-operated valve mutually controlling said motor-engines, substantially as set forth.

48. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal and central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, substantially as set forth.

49. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, and an automatically-operated valve mutually controlling said motor-engines, substantially as set forth.

50. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, and an automatically-operated valve mutually controlling said motor-engines, substantially as set forth.

51. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

52. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to the same, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

53. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts adapted to impart a turning movement to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

54. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart a turning movement to the same, a spring adapted to return the parts to a normal central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

55. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

56. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, a piston common to both cylinders and having operative engagement with the pincers mechanism by engaging recesses and projections on the respective parts and adapted to impart a turning movement to such mechanism, a spring adapted to return the parts to a normal central position, a motor-engine comprising a pair of single-acting motor-cylinders arranged transversely of the machine, individual pistons in said cylinders connected to opposite sides of the pincers mechanism and adapted to impart lateral motion to the same, a valve mutually controlling said motor-engines, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

57. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart an outward overmovement to the same, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

58. A lasting-machine having a pincers mechanism adapted to engage the upper combined with a motor-engine for imparting a pulling motion to such mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart an outward overmovement to the same, and automatically-operated valves controlling said motor-engines, substantially as set forth.

59. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with a single-acting motor-engine for imparting a pulling motion to such mechanism, a single-acting motor-engine having operative connection with the movable jaw of the pincers mechanism, a spring tending to move the pincer-jaws into an open condition, a motor-engine having operative connection with the pincers mechanism and adapted to impart an outward overmovement to the same, and automatically-operated valves controlling said motor-engines, substantially as set forth.

60. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a single-acting motor-engine adapted to impart an outward overmovement to said mechanism, a spring adapted to impart an inward overmovement to said mechanism, and an automatically-operated valve controlling said motor-engine, substantially as set forth.

61. A lasting-machine having a pincers mechanism adapted to engage the upper combined with means for imparting a pulling motion to said mechanism, a motor-engine having operative connection with the pincers mechanism and adapted to impart an outward overmovement to the same, a valve controlling said motor-engine, a cam-shaft revolubly mounted on the machine-frame, and a cam carried by said shaft and having operative connection with said valve, substantially as set forth.

62. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the companion-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a pair of automatically-operated valves con-

trolling the supply of motive fluid to actuate said mechanisms, substantially as set forth.

63. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a spring tending to move said piston-head upward, and a pair of automatically-operated valves controlling the supply of motive fluid to actuate said mechanisms, substantially as set forth.

64. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder and provided with a stop-cap at its upper end, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger, and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a pair of automatically-operated valves controlling the supply of motive fluid to actuate said mechanisms, substantially as set forth.

65. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger, and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, and a series of valves operating in unison to control the supply of motive fluid to actuate said mechanisms, substantially as set forth.

66. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, a pair of transversely-arranged motor-engines adapted to impart lateral movement to the pendent cylinder, and a series of valves operating in unison to control the supply of motive fluid to actuate said mechanisms, substantially as set forth.

67. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger, and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, a series of valves controlling the supply of motive fluid to actuate said mechanism, cam-shafts revolubly mounted in the machine-frame, and a series of cams carried by said shafts and having operative connection with said valves, substantially as set forth.

68. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, a pair of transversely-arranged motor-engines adapted to impart lateral movement to the pendent cylinder, a series of valves controlling the supply of motive fluid to actuate said mechanisms, cam-shafts revolubly mounted in the machine-frame, and a series of cams carried by said shafts and having operative connection with said valves, substantially as set forth.

69. A lasting-machine having a pincers mechanism adapted to engage the upper and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger, and a companion pincer-jaw secured to the lower end of the piston-rod, combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, a pair of transversely-arranged motor-engines adapted to impart lateral movement to the pendent cylinder, a manually-operated reversing-valve for governing the direction of the turning movement of the pincers mechanism, and a series of valves operating in unison to control the supply of motive fluid to actuate said mechanisms, substantially as set forth.

70. A lasting-machine having a pincers mechanism adapted to engage the upper, and comprising a pendent cylinder constituting the suspension-hanger of the mechanism, a tubular plunger arranged in said cylinder, a piston arranged in the bore of said plunger and having a downwardly-extending piston-rod, a pincer-jaw secured to the lower end of the plunger and a companion pincer-jaw secured to the lower end of the piston-rod combined with a transversely-arranged motor-engine having operative connection with said tubular plunger and adapted to impart a turning movement to the same, a pivot-yoke supporting said pendent cylinder and motor-engine, pivot-legs on the pendent cylinder having pivotal connection with the transversely-arranged motor-engine, a motor-engine adapted to impart a forward overmovement to the pincers mechanism, a pair of transversely-arranged motor-engines adapted to impart lateral movement to the pendent cylinder, a manually-operated reversing-valve for governing the direction of the turning movement of the pincers mechanism, and a series of valves operating in unison to control the supply of motive fluid to actuate said mechanisms, substantially as set forth.

71. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, means for feeding and driving the tacks, the forwardly-moving tack-driving mechanism comprising a motor-cylinder, a piston within said cylinder, a tack-driving plunger forming part of such piston, an automatically-operated valve controlling the supply of motive fluid to said motor-cylinder, and a reciprocating slide having a forward movement in unison with the tack-driving mechanism and provided with a tack-holder in line with the tack-driving plunger, substantially as set forth.

72. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, means for feeding and driving the tacks, the tack-driving mechanism comprising a motor-cylinder, a piston within said cylinder, a tack-driving plunger forming part of said piston, an automatically-operated valve controlling the supply of motive fluid to said motor-cylinder, and a reciprocating slide carrying said motor-cylinder and provided with a tack-holder in line with the tack-driving plunger, substantially as set forth.

73. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, means for feeding and driving the tacks, the forwardly-moving tack-driving mechanism comprising a motor-cylinder, a piston within said cylinder, a tack-driving plunger forming part of such piston, an automatically-operated valve controlling supply of motive fluid to said motor-cylinder, a reciprocating slide having a forward movement in unison with the tack-driving mechanism and provided with a tack-holder in line with the tack-driving plunger, a cam-shaft revolubly mounted on the machine-frame, and a cam on said shaft having operative connection with the controlling-valve, substantially as set forth.

74. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, means for feeding and driving the tacks, the forwardly-moving tack-driving mechanism comprising a motor-cylinder, a piston within said cylinder, a tack-driving plunger forming part of such piston, an automatically-operated valve controlling supply of motive fluid to said motor-cylinder, a reciprocating slide having a forward movement in unison with the tack-driving mechanism and provided with a tack-holder in line with the tack-driving plunger, a cam-shaft revolubly mounted on the machine-frame, and a cam on said shaft having operative connection with the reciprocating slide, substantially as set forth.

75. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to such mechanism, means for feeding and driving the tacks, the forwardly-moving tack-driving mechanism comprising a motor-cylinder, a piston within said cylinder, a tack-driving plunger forming part of such piston, an automatically-operated valve controlling the supply of motive fluid to said motor-cylinder, a reciprocating slide having a forward movement in unison with the tack-driving mechanism and provided with a tack-holder in line with the tack-driving plunger, substantially as set forth.

76. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box, and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a motor-engine an automatic controlling-valve, a manually-operated reversing-valve and means for returning the tack-box to a central position, substantially as set forth.

77. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, a tack-driving mechanism, a reciprocating slide carrying the tack holding and driving mechanism, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box, and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a motor-engine, an automatic controlling-valve, a manually-operated reversing-valve and means for returning the tack-box to a central position, substantially as set forth.

78. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box, and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a pair of single-acting motor-engines arranged transversely, an automatic controlling-valve and a manually-operated reversing-valve, substantially as set forth.

79. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, a tack-driving mechanism, a reciprocating slide carrying the tack holding and driving mechanism, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box, and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a pair of single-acting motor-engines arranged transversely, an automatic controlling-valve, and a manually-operated reversing-valve, substantially as set forth.

80. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a motor-engine, an automatic controlling-valve, a reversing-valve, and a duplex side rest or abutment for the last having operative connection with the reversing-valve, substantially as set forth.

81. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments, duplicate tack-races secured to the tack-box and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a pair of single-acting motor-engines arranged transversely, an automatic controlling-valve, a reversing-valve, and a duplex side rest or abutment for the last having operative connection with the reversing-valve, substantially as set forth.

82. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having a curved conduit extending from the lower to the upper portion of the tack-box compartment, a tack-race secured to the tack-box, a jet-head arranged at the lower end of such conduit and adapted to discharge a jet of motive fluid into such conduit and means for controlling such jet, substantially as set forth.

83. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments and duplicate curved conduits extending from the lower to the upper portions of such compartments, duplicate tack-races secured to the tack-box, and jet-heads arranged at the lower ends of said conduits and adapted to discharge jets of motive fluid into such conduits, substantially as set forth.

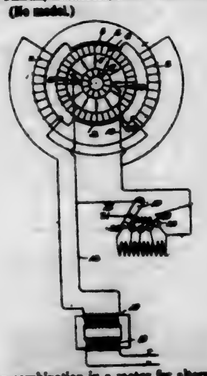
84. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments and duplicate curved conduits extending from the lower to the upper portions of such compartments, duplicate tack-races secured to the tack-box, jet-heads arranged at the lower ends of said conduits and adapted to discharge jets of motive fluid into such conduits, and means for imparting lateral movement to the tack-box to one side or the other of a central line substantially as set forth.

85. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box pivoted at its rear end and having duplicate tack-compartments and curved conduits extending from the lower to the upper portions of such compartments, duplicate tack-races secured to the tack-box, and jet-heads arranged at the lower ends of said conduits and adapted to discharge jets of motive fluid into such conduits, substantially as set forth.

86. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments and duplicate curved conduits extending from the lower portions of such compartments, duplicate tack-races secured to the tack-box, jet-heads arranged at the lower ends of said conduits and adapted to discharge jets of motive fluid into such conduits, and means for imparting lateral movement to the tack-box to one side or the other of a central line, the same comprising a motor-engine, an automatic controlling-valve, a manually-operated reversing-valve, and means for returning the tack-box to a central position, substantially as set forth.

87. A lasting-machine having a pincers mechanism adapted to engage the upper, combined with means for imparting a pulling motion to said mechanism, a central tack-holder, means for driving the tacks, a tack-box having duplicate tack-compartments and duplicate curved conduits extending from the lower to the upper portions of such compartments, duplicate tack-races secured to the tack-box, jet-heads arranged at the lower end of said conduits and adapted to discharge jets of motive fluid into such conduits, and means for imparting lateral movement to the tack-box to one side or the other of a central line the same comprising a pair of single-acting motor-engines arranged transversely, an automatic controlling-valve and a manually-operated reversing-valve, substantially as set forth.

704,099. ELECTRIC-MOTOR REGULATION. OSCAR H. PIEPER and ALPHONSE F. PIEPER, Rochester, N. Y. Filed Mar. 24, 1898. Serial No. 710,266. (No model.)



Claim.—1. The combination in a motor for alternating currents, of field-windings, armature-coils, commutator and commutator-brushes arranged at the neutral point, all connected in series, as customary in constant-current motors, and a regulating device for controlling the speed of the motor consisting of a variable resistance permanently in shunt across the armature.

2. The combination in a motor for alternating currents, of a field-winding with relatively high self-induction and armature-coils with relatively low self-induction, commutator and commutator-brushes arranged on the neutral point, all connected in series, as customary in continuous-current motors, and a variable resistance in shunt with the armature.

3. The combination in a motor for alternating currents, of field-windings with relatively high self-induction and armature-coils with relatively low self-induction, commutator and commutator-brushes arranged on the neutral point, all connected in series as customary in continuous-current

motors, and a regulating device consisting of resistance-coils in shunt to the armature.

4. The combination in a motor for alternating currents, of field-windings with relatively high self-induction, and armature-coils, commutator and commutator-brushes arranged at the neutral point, all connected in series, as customary in constant-current motors, a permanent shunt across the armature-terminals and means for short-circuiting the armature-brushes to arrest the motion of the armature.

5. The combination in a motor for alternating currents, of field-windings and armature-coils adapted for alternating currents, commutator and commutator-brushes arranged at the neutral point, all connected in series, as customary in constant-current motors, and a permanent shunt across the armature.

6. The combination in a motor for alternating currents, of field-windings and armature-coils adapted for alternating currents, commutator and commutator-brushes arranged at the neutral point, all connected in series, as customary in constant-current motors, and a permanent shunt and a variable resistance arranged between the armature-terminals.

7. The combination in a motor for alternating currents, of field-windings designed for a relatively high electromotive force, and armature-coils designed for a relatively low electromotive force, commutator and commutator-brushes arranged on the neutral point as customary in continuous-current motors, and a variable resistance arranged between the armature-terminals.

8. The combination in a motor for alternating currents, of field-windings designed for relatively high self-induction or high electromotive force, armature-coils designed for relatively low self-induction or low electromotive force, commutator and commutator-brushes at the neutral point and all arranged in series, and a variable resistance in shunt across the armature-terminals.

704,100. PERPETUAL-REMINDER SYSTEM. BERTHOLD PERSON, Chicago, Ill. Filed Feb. 28, 1902. Serial No. 96,092. (No model.)

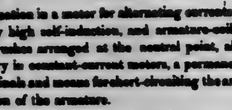
Claim.—1. A reminder system comprising a series of receptacles, being one receptacle for each unit of time of a recurring cycle, and a plurality of memorandum-blanks adapted to be filed in said receptacles, substantially as described.

2. A reminder system comprising a pocket-case provided with one pocket for each unit of time of a recurring succession of days, and a plurality of reminder-cards adapted to be temporarily filed in any of said pockets, substantially as described.

3. A reminder system comprising a pocket-case provided with one pocket for each day of a recurring succession of days, and a plurality of reminder-cards bearing the figures 1 to 31, inclusive, and having space for memoranda to be written thereon, substantially as described.

4. A reminder system comprising a pocket-case consisting of a flexible back provided on its face with seven pockets, and a plurality of reminder-cards bearing on one face the figures 1 to 31, inclusive, and having on their opposite face space for memoranda to be written thereon, each of said cards being adapted to be filed in each of said pockets in succession, substantially as described.

704,101. NUT-LOCK. FELIX K. POPPLEWELL, Bronte, Tex. Filed Oct. 29, 1901. Serial No. 80,347. (No model.)



Claim.—In combination with a member having a circular recess, of a bolt and nut for clamping said member in position, a locking-pin E provided with a head *e* circular in cross-section and adapted to be inserted in said recessed member and rotated therein, and a shank portion integral with said head *e* and flattened on the side adjoining the head, substantially as and for the purpose described.

704,102. STEERING AND CONTROLLING DEVICE FOR ROAD-VEHICLES. MASON D. PERKINS, New York, N. Y., assignor to Clarence F. Jewett, trustee, New York, N. Y. Filed Feb. 11, 1902. Serial No. 93,593. (No model.)

Claim.—1. In an automatic controlling and steering mechanism for vehicles, the combination substantially as described of the vertical transmission rock-shaft, the steering-arm pivotally connected to the head thereof, a grip connected to a rod or bar rotatable in or on said arm, a spool or block rotatable in bearings in the head of the vertical transmission-shaft, means for detachably connecting said spool and rotatable rod and power-controlling mechanism having intermediate connections with said spool to permit the power to be turned on or off by the rotation of the spool or block.

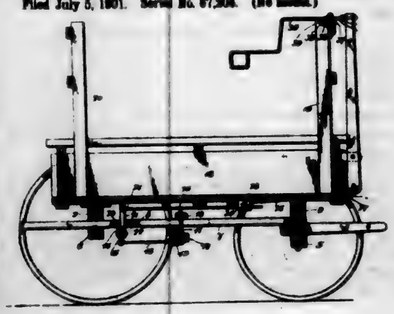
2. In an automatic controlling and steering mechanism for vehicles, the combination substantially as described with the vertical transmission rock-shaft connected with the steering mechanism, of a block or sheave adapted to move vertically thereon and connected with the throttle or other power-controlling device, a spool or block rotatable in bearings on the head of the vertical rod or bar, a cord adapted to be wound thereon and connected with the sleeve which imparts movement to the throttle, and a spring which tends to unwind said cord and shut off the power.

3. In a combined steering and power-controlling mechanism, the combination substantially as described of a hollow vertical transmission rock-shaft, a steering-arm pivotally connected to the head thereof and adapted to swing in a vertical plane, a grip adapted to rotate on said arm, a spool or block rotatable in the head of the rock-shaft, and an automatic clutch connecting the grip and spool as and for purpose described.

4. In a combined steering and power-controlling device for vehicles, the combination substantially as described, of the hollow transmission rock-shaft, a steering-arm pivotally connected to the head thereof, a grip or handle adapted to rotate on said arm, a spool or block adapted to rotate in the head of the shaft and connected with said rotatable grip, a block guided on the vertical shaft, means for imparting motion thereto by the rotation of the spool in the head of the shaft, and a spring within said shaft connected to said block for automatically shutting off the power when the operator releases the grip or handle.

5. In a combined steering and controlling device for vehicles, the combination substantially as described, of a hollow vertical shaft 4, and hollow steering-arm 1, pivotally connected to the shaft 4, a rod 2 adapted to rotate in the arm 1, a grip or handle 3, secured to the shaft 2, a spool or block 6 mounted to rotate in the head of the vertical shaft, a sheave or block 8 guided on said shaft, means for connecting the same with the rotatable spool, and a spring actuating on the block 8 when the grip is released, as and for the purpose described.

704,103. BRAKE MECHANISM. OSCAR F. RANDALL, Davis, Ill. Filed July 5, 1901. Serial No. 67,206. (No model.)



Claim.—In combination with a hay-wagon having front and rear ladders of a brake mechanism including a lever pivoted to the front of the wagon and extending above the front ladder, an operating-rod pivoted to the upper end of the lever and extending rearwardly over the forward ladder, said rod having racks upon its upper and lower faces adjacent to the ladder, and the free end of the rod being offset in a vertical plane to project above or below the ladder, and a knife-edge removably connected to the upper end of the forward ladder for reversal and to permit engagement of either rack of the bar from above or below.

704,104. SHEET-MUSIC RETAINER. JOHN RAWLINS, St. Louis, Mo. Filed Oct. 7, 1901. Serial No. 77,857. (No model.)

Claim.—1. In an article-supporting device, the combination with a pivotally-supported horizontal arm, of article-supporting means carried by said arm, and indicating means extending at different angles to the arm and carried by said supporting means relative to each particular article all of said indicating means being visible from a single point of observation, substantially as described.

2. In an article-supporting device, the combination of a plurality of supporting-rods, means pivotally supporting the same, means at one end of each of said rods for receiving the article to be supported, and means carried by said rods for indicating the particular article supported by the respective rod, said indicating means extending at varying angles relative to said rods, substantially as described.

3. In a sheet-music support, the combination with a horizontally-arranged arm, of supporting-rods carried thereby, tab-carrying means at the upper ends of said rods, and a tab carried by each of said rods provided with means for indicating the particular sheet carried by its respective rod, the said tab-carrying means of the various rods extending at varying angles from said arm, whereby all of said tabs are simultaneously exposed, substantially as described.

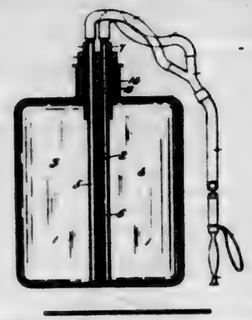
4. In a support for sheet-music and other articles, the combination with a suitable upright, of a vertical standard pivoted thereto, a horizontally-arranged arm secured to said standard, means carried by said arm for supporting a plurality of said sheets or other articles, and means above each of said sheets for indicating the same, the said indicating means being so arranged that all of the same will be visible at the same time, substantially as described.

5. In an article-supporting device, the combination with a suitable upright, of a vertical standard pivoted thereto, means carried thereby for supporting a plurality of articles, and means carried by the supporting means for indicating the respective articles, all of the indications being simultaneously visible, substantially as described.

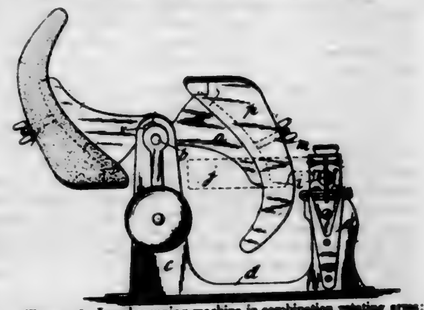
6. In an article-supporting device, the combination with a suitable upright, of a vertical standard supported thereby, a horizontally-arranged arm carried by said standard, means connecting the outer end of said arm with said standard, rods supported by said arm, means at one end of each of said rods for supporting an article, and a tab carried at the opposite end of each of said rods for indicating its respective article supported, the said connecting means between the outer end of the arm and the standard being spaced a sufficient distance above said arm, except at the point of contact, to permit said tabs to extend from said arm in the direction of the said connecting means, substantially as described.

704,105. BOTTLE OR FLASK. ELIAS D. REAR, Pittsburg, Pa. Filed Nov. 29, 1901. Serial No. 84,053. (No model.)

Claim.—A bottle of the class described, having a stopper, and having separate compartments, a tube extending from each compartment through the stopper and connected on the outside thereof to the branch of a bifurcated flexible tube having a mouthpiece and means for admitting air to each of the said compartments, substantially as described.



704,106. SHARPENING-MACHINE. FERDINAND A. REINHARDT, Elizabeth, and HENRY WILSON, Newark, N. J.; said Wilson assignor to said Reinhardt. Filed July 24, 1901. Serial No. 69,484. (No model.)



Claim.—1. In a sharpening-machine, in combination, rotating arms; removable blocks provided with abrading or polishing surfaces on their sides and detachably secured to the arms; a blade-holder adapted to hold a blade in the paths of rotation of the abrading or polishing surfaces of the blocks; and means for rotating the arms.

2. In a sharpening-machine, in combination, arms adapted to be rotated in two circular planes at an angle to each other; removable blocks provided with abrading or polishing surfaces on their sides and detachably secured to the arms, so arranged as to cause the opposed active surfaces of the blocks to be rotated in the two circular planes; a blade-holder adapted to hold a blade in the paths of rotation of the active surfaces of the blocks; and means for rotating the arms.

3. In a sharpening-machine, two blocks each having on one side a stone or honing material and on their other sides leather or stropping material; two rotating arms and means for the interchangeable attachment of the blocks to the arms, so that their opposed side surfaces will be of the same character; means for holding a blade in the paths of rotation of the active surfaces of the block; and means for rotating the arms.

4. In a sharpening-machine of the character herein described: a blade-holder; a block provided on each of its sides with an abrading or polishing material differing in quality or character from that on the other side; and means for holding and moving the block so that either of its sides having the active material thereon will be caused to rub over one of the sides of the blade.

5. In a sharpening-machine, two arms carried by a rotating shaft having flat flanges at their peripheries, two blocks each having a groove in its inner edges corresponding to and adapted to fit over either of the flat flanges of the arms, the opposite sides of the two blocks being provided with an abrading or polishing surface of similar character; and means, as threaded rods and nuts for holding the blocks on the arms.

6. In a sharpening-machine, a compound shaft comprising two parts fitted to rotate in angularly-arranged bearings one of said parts having a groove formed in its inner end and the other part having at its inner end a projecting flange and side springs extending into said groove, whereby rotary motion of one part will be imparted to the other part with substantial uniformity; arms carried by the two parts of the shaft; abrading or polishing surfaces attached to the arms; means for holding a blade in the paths of the abrading or polishing surfaces; and means for rotating the shaft.

7. In a sharpening-machine, a rotatable shaft; arms carried thereby provided with abrading or polishing surfaces; a blade-holder constructed to hold a blade in the path of the active surfaces of the arms; and an operating crank-handle attached to the shaft by means of quick or coarse pitch screw-thread, and a stop-arm projecting from the shaft against which the crank-arm contacts only when said crank is moved in one direction so as to be locked thereon and is released therefrom when the crank-handle is moved in the other direction.

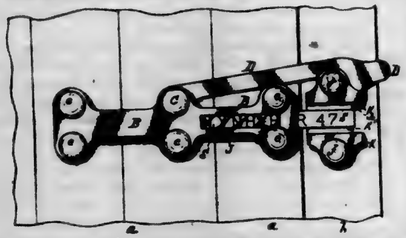
8. In a sharpening-machine; a blade-holder comprising a pair of vise-jaws, means for moving them, one of said jaws having formed in face lateral angular grooves, and a third jaw or holding-down device formed to extend over the opening between the jaws and down the side of laterally-grooved jaw, said part having counterpart grooves, which are so shaped that when pressure is applied between these parts the upper part of this third jaw is moved downwardly, thereby constituting, with the vise-jaw, a three-side grip on the device placed between the jaws.

9. In a sharpening-machine, a rotatable shaft; arms carried thereby provided with abrading or polishing surfaces, a blade-holder constructed to hold a blade in the path of the active surfaces of the arms; said holder consisting of a pair of clamping-jaws adapted to be moved toward and from one another, and a holding-clamp attached to one of the jaws arranged to extend over the opening between the jaws and having angular grooves formed in its side adjacent to said jaw, formed to engage with counter-grooves laterally formed in the front of said jaw.

10. In a sharpening-machine, a blade-holder comprising clamping-jaws; a slide carrying the jaws; a guideway in which the slide works; parallel links horizontally arranged, connected at one end to the slide and at the other to the guideway-frame; and springs acting on the slide to hold it in central position.

11. In a sharpening-machine, a rotatable shaft; arms carried thereby provided with abrading or polishing surfaces, a blade-holder constructed to hold a blade in the path of the active surfaces of the arms; said holder consisting of a pair of clamping-jaws adapted to be moved toward and from one another, and a holding-clamp attached to one of the jaws arranged to extend over the opening between the jaws and having angular grooves formed in its side adjacent to said jaw, formed to engage with counter-grooves laterally formed in the front of said jaw; a slide carrying the jaws; a guideway in which the slide works; parallel links horizontally arranged, connected at one end to the slide and at the other to the guideway-frame; and springs acting on the slide to hold it in central position.

704,107. SEAL-LOCK. CHARLES J. REYNOLDS, Boston, Mass. Filed Oct. 2, 1901. Serial No. 77,252. (No model.)

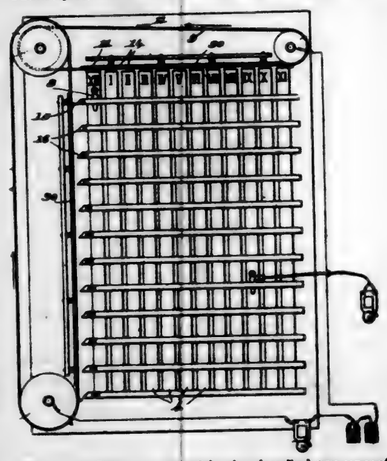


Claim.—1. In a seal-lock of the character described, the bottom or rear plate A provided with the inwardly-extending spur F, F', F''; and the upper or front plate B provided with the inwardly-extending spur H, H', H'', said plates facing each other and secured together and provided with a passage between them for the seal, and the said plate B being furthermore provided with the inwardly-extending shoe I, I' between the spur F, F', F'' and the outer or rear ends of the plates, whereby a double protection is provided by pressing the seal toward the plate A and preventing the passage of a thin piece of metal into the lock, substantially as set forth.

2. In a seal-lock of the character described, the bottom or rear plate A provided with the inwardly-extending spur F, F', F''; and the upper or front plate B provided with the inwardly-extending spur H, H', H'', said plates facing each other and secured together and provided with a passage between them for the seal, said plate A being formed on its inner surface with the groove E having a straight or level bottom, and located between the spur F, F', F'' and the rear end of said plate A, and the plate B being provided on its inner surface with the shoe I, I' extending up into said groove in the opposite plate, whereby the seal is pressed toward the straight surface formed by said groove, and the passage of a wire or piece of metal inserted at the rear end of the device beyond said shoe is prevented, substantially as described.

3. In a seal-lock of the character described, locking-plates adapted to be secured to the door of a freight-car; a plate adapted to be secured to the jamb thereof; a strip or seal S adapted to extend from the plate on the jamb and be engaged by the locking-plates; the cam-lock P, P'; a rotative bolt upon which said cam-lock is rigidly secured, said bolt being supported by the plate on the jamb; and the latch D pivotally connected at one end to the locking-plates and formed at its opposite end into hook shape D'' whereby it may be engaged by said cam-lock and released by the rotation of the bolt, substantially as set forth.

704,108. PROGRAM-CLOCK. OTIS D. RICE, Winthrop, Mass. Filed July 30, 1901. Serial No. 70,946. (No model.)



Claim.—1. In an apparatus of the class described, two series of bars, means to electrically connect any bar of one series with any bar of the other series, a circuit including two endless conductors, means to put one conductor in electrical contact with the successive bars of one series at predetermined intervals of time, and to put the other conductor in electrical contact with the successive bars of the other series at fractional portions of such intervals of time.

2. In an apparatus of the class described, two series of bars, means to electrically connect any bar of one series with any bar of the other series, a circuit including two endless conductors, means to put one conductor in electrical contact with the successive bars of one series at predetermined intervals of time, and to put the other conductor in electrical contact with the successive bars of the other series at fractional portions of an hour.

3. In an apparatus of the class described, two series of bars, means to electrically connect any bar of one series to any bar of the other series, a circuit including two endless conductors, each having a contact-piece, means to move said conductors to bring the contact-piece on one conductor in electrical contact with the successive bars of one series at predetermined intervals of time, and to bring the contact-piece on the other conductor in contact with the successive bars of the other series in fractional portions of such interval.

4. In an apparatus of the class described, two series of bars, means to put any bar of one series in electrical contact with any bar of the second series, a circuit including two endless conductors, means to put one of said conductors in electrical contact with each successive bar of one series for a predetermined interval of time and to momentarily put the other conductor into electrical contact with the successive bars of the other series at fractional portions of such interval of time.

5. In an apparatus of the class described, two series of bars, means to put any bar of any series in electrical contact with any bar of the other series, a circuit including two endless conductors each having a contact-piece thereon, means to put one of said contact-pieces in electrical contact with each successive bar of one series for a predetermined interval of time, and to momentarily put the other contact-piece into electrical contact with the successive bars of the other series at fractional portions of such interval of time.

6. In an apparatus of the class described, two series of bars, means to put any bar of one series in electrical contact with any bar of the second series, a circuit including two endless conductors, each of said conductors having a plurality of contact-pieces, means to move said conductors continuously in one direction, the movement of the conductors bringing each contact-piece on one conductor into electrical contact with the successive bars of one series at predetermined intervals of time, and each contact-piece on the other conductor into electrical contact with the successive bars of the other series at fractional portions of such intervals of time, each contact-piece coming into contact with the first bar of the series as the preceding contact has moved out of contact from the last bar of the series.

7. In an apparatus of the class described, two series of bars, means to put any bar of one series in electrical contact with any bar of the other series, an electrical circuit including two endless conductors each having a contact-piece, means to move said conductors continuously in one direction, the movement of said conductors bringing each contact-piece on one conductor into electrical contact with the successive bars of one series for a predetermined interval of time, and each contact-piece on the other conductor momentarily into electrical contact with the successive bars of the other series at fractional portions of such intervals.

8. In an apparatus of the class described, two series of bars, means to put any bar of one series in electrical contact with any bar of the other series, an electrical circuit including two endless conductors, one of said conductors having a contact-piece adapted to move across the ends of the bars in the other series, means to move said conductors with such speeds that one contact-piece is brought into contact with the ends of the successive bars in one series at predetermined intervals of time, and the other series is brought into electrical contact with the ends of the successive bars of the other series in fractional portions of such intervals of time.

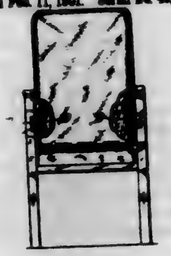
9. In an apparatus of the class described, two series of bars, the ends of the bars of one series being flat and those of the other series being pointed, means to put any bar of any series in electrical contact with any bar of the other series, a circuit including two endless conductors, one of said conductors having a contact-piece adapted to move across the flat ends of the successive bars in the first-mentioned series, and the other bar having a contact-piece adapted to momentarily contact with the pointed ends of the successive bars of the other series, and means to move said conductors with such speeds that one contact-piece is put in contact with the ends of the successive bars in one series at predetermined intervals of time, and the other contact-piece is brought into electrical contact with the pointed ends of the successive bars of the other series in fractional portions of such intervals of time.

10. In an apparatus of the class described, two series of bars, each bar of both series being normally electrically insulated from all the other bars, means to electrically connect any bar of one series with any bar of the other series, a circuit including two moving conductors, means to put one conductor in electrical contact with the successive bars of one series at predetermined intervals of time, and means to put the other conductor in electrical contact with the separated bars of the other series in succession at fractional portions of such intervals of time.

11. In an apparatus of the class described, two series of bars, the bars of each series being electrically independent, means to electrically connect any bar of one series with any bar of the other series, a circuit including two movable contacts, means to move one contact across the bars of one series to bring said contact directly into engagement with the successive bars of said series at predetermined intervals of time, and means to move the other contact across the bars of the other series to bring said last-mentioned contact directly into engagement with the successive bars of the second series at fractional portions of such intervals of time.

12. In an apparatus of the class described, two series of bars, the bars of each series being electrically independent from each other, means to electrically connect any bar of one series with any bar of the other series, a circuit including two movable contact-points, means to put one contact-point in mechanical contact with the successive bars of one series at predetermined intervals of time, and means to put the other contact-point in mechanical contact with the successive bars of the other series at fractional portions of such intervals of time.

704,109. ATTACHMENT FOR CHAIRS. ARTHUR H. RICHARDS, Chicago, Ill. Filed Feb. 11, 1901. Serial No. 46,933. (No model.)



Claim.—1. An attachment for chairs, comprising a panel-plate and a chair-plate pivotally attached to each other, spring-engaging means upon said plates, a leaf-spring surrounding the connecting-pivot and adjacent to said spring-engaging means so as to yieldingly resist the pivotal movement of either plate across the face of the other plate, substantially as described.

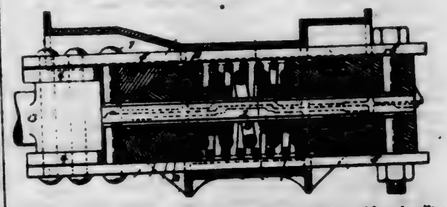
2. An attachment for chairs, comprising a plate provided with a boss upon one face thereof, a reduced extension upon said boss, a second plate pivotally mounted upon said extension of said boss, spring-engaging means upon said plates, and a leaf-spring interposed between said plates and adjacent to said spring-engaging means so as to yieldingly oppose the pivotal movement of either of said plates across the face of the other of said plates, substantially as described.

3. An attachment for chairs, comprising a plate, a boss upon one face of said plate, means upon said plate for engaging a spring, a second plate pivotally mounted upon said first plate, means upon said second plate for engaging a spring, a leaf-spring interposed between said plates and around said boss and adapted to coact with said spring-engaging means upon each of said plates, so as to yieldingly resist the pivotal movement of either plate across the face of the other plate, substantially as described.

4. In an attachment for panel-back chairs, the combination of a plate provided with an angular portion constituting a face-plate for attachment to one part of a chair, a boss upon one face of said first-named plate, a spring-engaging lug upon the same face of said plate, a second plate pivotally mounted upon said boss, a spring interposed between said plates mounted upon said boss and adapted to engage said spring-engaging lug, a lug upon said second plate also adapted to engage said spring, screw-holes in said second plate for receiving attaching-screws and larger holes in said first plate registering with said screw-holes in such a manner that screws may be passed entirely through said first plate into the screw-holes in said second plate so that said second plate may be attached thereby to the chair, substantially as described.

5. An attachment for chairs comprising a pair of plates pivotally attached to each other, a spring interposed therebetween, surrounding the connecting-pivot, means upon each of said plates for engaging said spring, perforations through one of said plates for the passage of attaching devices, and smaller perforations in the other of said plates for receiving and engaging said attaching devices, substantially as described.

704,110. FRICTION DRAFT-GEAR. OLIVER P. RITTER, Chicago, Ill. Filed Mar. 10, 1902. Serial No. 97,496. (No model.)



Claim.—1. In a friction draft-gear, the combination with a plurality of movable elements which alternately act as friction elements and as followers, of an interposed resilient element, a plurality of seats for said movable elements upon which seats the said elements are at rest when acting as friction elements and from which they are displaced when acting as followers, and a coacting friction element movable with relation to the first-named elements, substantially as and for the purposes specified.

2. In a friction draft-gear, the combination with a plurality of movable elements which alternately act as friction elements and as followers, of an interposed resilient element, a plurality of seats for said movable elements upon which seats the said elements are at rest when acting as friction elements, a coacting friction element movable with relation to the first-named elements, and means for causing a translation of the said first-named elements equal in displacement to that of the transmission element, substantially as and for the purposes specified.

3. In a friction draft-gear, the combination with a transmission element, of a yielding resistance element; a plurality of friction elements having inclined faces, a plurality of correspondingly-inclined seats independent of said friction elements, a friction element coacting therewith and relatively movable with relation to the first-named friction elements, and means for displacing said first-named friction elements from their seats, substantially as and for the purposes specified.

4. In a friction-gear, the combination with a load-transmission element, of a plurality of bodies or inclines movable with said transmission element, a plurality of inclines independent of said transmission element,

a plurality of follower friction draft-blocks adapted to be seated on either end of inclines independently of the other set, a friction element relatively movable with relation to said follower friction-blocks and coacting therewith, and means for creating yielding pressure between the coacting friction elements, substantially as and for the purposes specified.

5. In a friction draft-gear, the combination with a centrally-disposed element having parallel friction-faces, of a plurality of oppositely-disposed friction elements in opposition therewith, a spring interposed between the last-named friction-elements, oppositely-disposed seats for said last-named friction elements, and displacers for seating the oppositely-disposed friction elements, substantially as and for the purposes specified.

6. In a friction draft-gear, the combination with a centrally-disposed friction element having parallel friction-faces, of a plurality of oppositely-disposed friction elements in opposition therewith, a spring interposed between the last-named friction elements, oppositely-disposed seats for said last-named friction elements, displacers for seating the oppositely-disposed friction elements and straps connecting said displacers, substantially as and for the purposes specified.

7. In a friction draft-gear, the combination with a centrally-disposed friction element, coacting friction elements in opposition therewith, a spring interposed between said last-named elements, seats for said last-named elements, and a strap which includes said friction elements and is connected with the central friction element, substantially as and for the purposes specified.

8. In a friction draft-gear, the combination with a centrally-disposed friction element, and coacting friction elements having suitable seats, of a spring interposed between the last-named friction elements, and displacers, substantially as and for the purposes specified.

9. In a friction draft-gear, the combination with a housing having a longitudinal opening therethrough and internally-disposed converging inclined seats at opposite ends thereof, of spring-pressed friction elements at rest upon said seats, and a coacting friction element longitudinally movable in said housing, substantially as and for the purposes specified.

10. In a friction draft-gear, the combination with a coacting friction element having friction-faces parallel to the line of applied force, of a plurality of friction elements movable toward and from each other and having inclined seats, correspondingly-inclined seats on which said last-named friction elements are relatively at rest when acting as friction elements, and means for creating pressure between the coacting friction elements, substantially as and for the purposes specified.

11. In a friction draft-gear, the combination with a coacting friction element, of friction elements having friction-faces parallel to the line of applied force and relatively movable longitudinally with a displacement equal to the displacement of the load-transmission element, a yielding resistance element interposed between said last-named friction elements, a load-transmission element, and means for creating pressure between the coacting friction elements, substantially as and for the purposes specified.

12. In a friction draft-gear, the combination with a load-transmission element, of a friction element having friction-faces parallel to the line of applied force, coacting friction elements having a motion of translation equal in displacement to that of the load-transmission element, and a spring interposed between said last-named elements, substantially as and for the purposes specified.

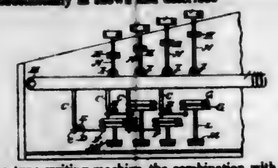
704,111. CUFF-HOLDER. FELIX J. ROSSETT, Tunis, W. Va. Filed Feb. 14, 1901. Serial No. 47,263. (No model.)

Claim.—As an article of manufacture, a cuff-holder consisting of an integral member including a body portion having a narrowed neck at one end and a transverse head thereabeyond and provided with teeth at one end and upwardly-directed and perforated ears at the sides of the head, a stud fixed upon the body of the member, the neck of the member having spaced openings and an intervening web, a second integral member having a terminal hook engaged through the opening of the first member and around the web thereof, the second member having a spring-casket to receive the stud, a jaw pivotally connected with the ears of the first member, and a spring disposed and constructed to hold the jaw yieldably against the teeth of the first member.

704,112. TYPE-WRITING MACHINE. THEODORE B. ROSSBERG, Albany, N. Y. Filed Jan. 26, 1902. Serial No. 91,170. (No model.)

Claim.—1. In a type-writing machine, the combination with a series of finger-keys, of a series of type-operating bars, a series of sounding devices, and a series of striking devices adapted to produce predetermined sounds by the operation of said finger-keys and type-operating bars, substantially as shown and described.

2. In a type-writing machine, the combination with a series of finger-keys, of a series of type-operating bars, a series of striking and sounding devices each sounding device having a distinct relation with a particular type so that each key will produce a predetermined sound for each character, substantially as shown and described

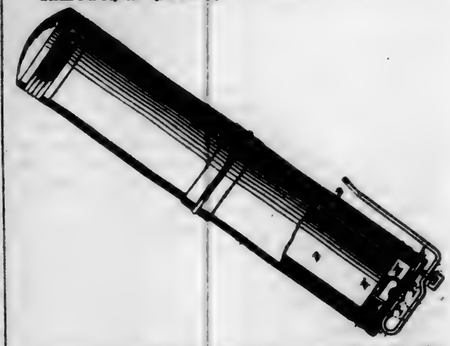


3. In a type-writing machine, the combination with a series of finger-keys, of a series of type-operating bars, and a series of striking and sounding devices adapted to produce a predetermined sound distinguishing each character or type operated by said bars, substantially as shown and described.

4. In a type-writing machine, the combination with a series of finger-keys, of a series of type-operating bars, a series of sounding devices, and a series of pivoted levers connected with said operating-bars and adapted to strike said sounding devices, substantially as shown and described.

5. In a type-writing machine, the combination with a series of finger-keys, of a series of type-operating bars, a series of sounding devices arranged in sets in varying horizontal planes, striking devices connected with said operating-bars and adapted to come in contact with said sounding device, substantially as shown and described.

704,118. CIRCUIT-CLOSER FOR PORTABLE ELECTRICAL APPARATUS. WILLIAM ROSSI, Jersey City, N. J. Filed Dec. 5, 1901. Serial No. 84,749. (No model.)



Claim.—1. In a circuit-closer for electric apparatus, the combination of a conducting cap or carrier with a circuit-closer carried by said cap, but insulated therefrom and provided with an attached end portion, a spring-bend at one end of said attached portion, a return member extending substantially parallel with the end portion and provided with a contact arranged to engage the end surface of the cap or carrier, and a handle portion connected with said return member and extending along the side of the cap or carrier out of contact therewith.

2. In an electric-circuit closer the combination of a cap or carrier with a circuit-closer carried by said cap but insulated therefrom, said circuit-closer comprising an attached end portion, a spring-bend at one end of said end portion, a return member extending along the end surface of the cap, a handle portion extending along the side of the cap, and a contact-screw carried by the return member and adapted to engage the end surface of the cap.

3. In an electric-circuit closer the combination of a conducting-cap having a slot, an insulating-plate secured on the inside of the cap, a circuit-closer secured to said plate within the slot of the cap, but out of contact with the cap, said circuit-closer having a spring-bend adjacent to its attached end, a return member connected with said spring-bend and adapted to effect contact with the end surface of the cap, and a handle portion extending along the side of the cap.

4. The combination with the battery-casing, a conducting-cap therefor adapted for connection with one pole of the battery, a circuit-closer carried by the cap, but insulated therefrom and adapted for contact with the cap, and a spring carried by the cap and connected with the circuit-closer, said spring being adapted to engage with pole of the battery.

5. The combination of the battery-casing, a conducting-cap therefor adapted for connection with one pole of the battery and provided with a slot in its end surface, an insulating-plate secured to the inside of the cap, a circuit-closer arranged on the outside of the plate within the slot of the cap and adapted for contact with the cap, a contact making spring arranged on the inside of the insulating-plate and adapted for engagement with the other pole of the battery, and conducting fastening devices extending through the insulating-plate and forming an electric connection between the circuit-closer and the spring.

6. The combination of the conducting cap or carrier, with a circuit-closing arm comprising a spring portion secured to said carrier but insulated therefrom, a contact member extending from said spring portion substantially parallel with the end surface of the cap and movable toward the cap to engage the end surface thereof, against the tension of the spring portion, and a handle member extending from the outer end of the contact member lengthwise at the side of the cap and out of contact therewith.

7. The combination of the conducting cap or carrier, with a circuit-closing arm having one of its ends secured to said carrier but insulated therefrom, and provided with a transverse member extending across the end surface of the cap and having a contact portion which is nearer the said end surface than the remainder of said member, and a handle member extending from the outer end of said cross member lengthwise at the side of the cap and out of contact therewith.

704,114. COMPUTING-MACHINE. EDWARD ROSSITER, Grand Rapids, Wis. Filed Apr. 17, 1901. Serial No. 56,298. (No model.)

Claim.—1. A computing-machine comprising the casing provided at its ends with upwardly-extending arms and having a central transversely-curved top section 10 forming an exterior groove or depression, said casing being provided at opposite sides of the central top section with opposite longitudinal apertures, rolls located within the casing at opposite sides thereof, a result-sheet arranged on the rolls and exposed at the apertures of the casing, the longitudinal feed-screws arranged on the exterior of the casing in the longitudinal grooves or depression of the top section 10, gearing arranged at one end of the casing and connecting the feed-screws with the rolls, the slide arranged on the feed-screws and adapted to extend across the casing and provided with pointers or indicators extending to the said apertures, and the longitudinal rod connecting the said arms and located directly above and adjacent to the feed-screws and adapted to facilitate the operation of the machine and forming a guard for the screws and the slide, substantially as described.

2. A computing-machine comprising a casing provided at its ends with centrally-arranged supporting-arms and having a groove or depression extending between the arms at the top of the casing, said casing being provided at opposite sides with longitudinal apertures, rolls located within the casing, a result-sheet arranged on the rolls and exposed at the said apertures, the longitudinal feed-screws arranged on the exterior of the casing between the said arms at the groove or depression, the pinions 21 and 22 connected with the rolls, the pinion 26 mounted on the feed-screws, the gear-wheel 24 meshing with the pinions 22 and 26, the pinion 28 meshing with the gear-wheel 24 and with the pinion 21, the exteriorly-arranged slide mounted on and adapted to rotate the feed screws, and provided with transversely-disposed pointers or indicators, and the rod fixed to the arms and located directly above the feed-screws and forming a grip and a guard, substantially as described.

3. A computing-machine comprising a casing provided at opposite sides with apertures and having centrally-arranged upwardly-extending arms, a rod connecting the arms and forming a handle, rolls arranged within the casing, a result-sheet mounted on the rolls, a longitudinal feed shaft or screw located beneath the rod, gearing connecting the shaft or screw with the rolls, and a slide mounted on the feed shaft or screw and connecting the same and provided with oppositely-disposed pointers or indicators arranged to move longitudinally of the apertures, substantially as described.

4. A computing-machine comprising a casing provided at opposite sides with apertures and having a top composed of central and side portions, arms depending from the side portions of the top, rate-bars mounted on the arms and spaced from the said side portions to provide longitudinal openings, rolls arranged within the casing, a result-sheet disposed on the rolls, a longitudinal feed shaft or screw mounted above the central portion of the top of the casing, gearing connecting the feed shaft or screw with the rolls, and a slide mounted on and engaging the feed shaft or screw and provided with oppositely-disposed pointers or indicators extending beneath the side portions of the top and projecting through the longitudinal openings and arranged on the exterior of the rate-bars, substantially as described.

704,115. THERMOSTAT. ALFRED ROSSEL, Bridgeport, Conn., assignor to Davis & Rossel Temperature Controlling Company, New York, N. Y., a Corporation of New Jersey. Filed Jan. 14, 1901. Serial No. 43,188. (No model.)

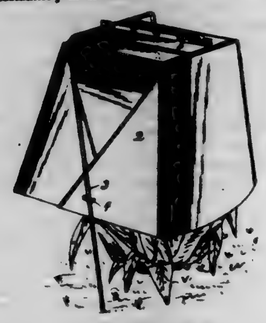
Claim.—1. In a thermostat, the combination with a base and a lever having a pivotal connection, near one of its ends, with said base, of a metallic strip whose coefficient of expansion is greater than that of the base, secured at one end to the base, and at its other end linked to the lever adjacent to its pivotal point, whereby contraction of the said strip relatively to the base will move the lever in one direction; a spring between the lever and the base opposing such movement, and adapted to move the lever in the opposite direction upon the relative expansion of such strip and a regulator adapted to bear laterally against said strip.

2. In a thermostat, the combination with a base and a lever having a pivotal connection, near one of its ends, with said base, of a metallic strip whose coefficient of expansion is greater than that of the base, secured at one end to the base, and at its other end linked to the lever adjacent to its pivotal point, whereby contraction of the said strip relatively to the base will move the lever in one direction, a spring between the lever and the base opposing such movement and adapted to move the lever in the opposite direction upon the relative expansion of such strip, and a regulating-screw adapted to bear laterally against the said strip.

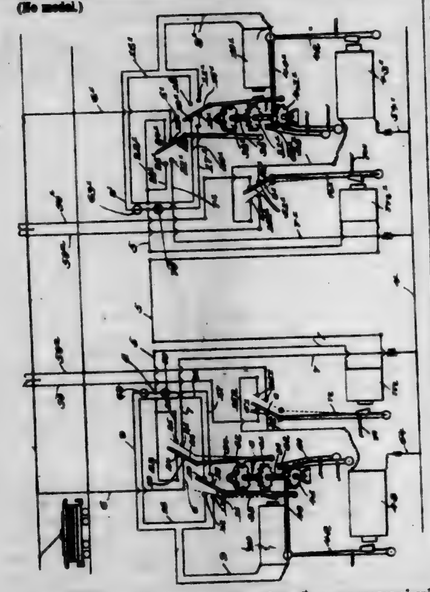
704,116. PLANT-PROTECTOR. JESSE W. ROSS, Alma, Ill. Filed Feb. 18, 1902. Serial No. 94,254. (No model.)

Claim.—1. In a plant-protector the combination with a hood and an inverted-U-shaped anchor, of means carried on said hood for engaging said anchor at any point along the side of said anchor, whereby the entire protector may be raised and tilted at any point, substantially as described.

2. In a plant-protector the combination of a hood, an anchor secured therein, and a notched flap on the top of said hood adapted to engage said anchor, substantially as described.



704,117. SIGNALING SYSTEM. JOHN J. RUSSELL, Newton, Mass., assignor to United States Electric Signal Company, Watertown, Mass., a Corporation of Maine. Filed July 26, 1901. Serial No. 69,808. (No model.)



Claim.—1. In a block-signal system for railways, a power-circuit including a main conductor and a return-wire, a single signal-circuit including a signal, said signal-circuit normally having both ends thereof connected to the same side of the power-circuit, means operated by a car entering the block to connect one end of said signal-circuit to the opposite side of the power-circuit and means operated by the same car leaving the block to connect the other end of said signal-circuit to said opposite side of the power-circuit.

2. In a block-signal system for railways, a power-circuit including a main conductor and return-wire, a signal-circuit extending the length of the block and having a signal therein, said signal-circuit normally having both ends thereof connected to the same side of the power-circuit, and means operated by a car entering either end of the block to connect one end of said signal-circuit to the opposite side of the power-circuit, whereby the signals are displayed, and means operated by said car as it leaves the block to connect the other end of said signal-circuit to the opposite side of the power-circuit.

3. In a block-signal system for railways, a power-circuit including a main conductor and a return-wire, a single signal-circuit including a signal, said signal-circuit extending the length of the block and having both ends thereof normally connected with the same side of the power-circuit, means operated by a car entering the block to connect the signal-circuit at the entering end of the block to the opposite side of the power-circuit whereby the signal is displayed, and means operated by the same car leaving the block to connect the other end of said signal-circuit to said opposite side of the power-circuit.

4. In a block-signal system for railways, a power-circuit including the main conductor and return-wire, a signal-circuit extending the length of the block and having a signal therein, said signal-circuit normally having both ends thereof connected to the same side of the power-circuit, means operated by a car entering either end of the block to connect the corresponding end of said signal-circuit to the opposite side of the power-circuit whereby the signal is displayed, and means operated by said car as it leaves the block to connect the other end of said signal-circuit to the opposite side of the power-circuit.

5. In a block-signal system for railways, a power-circuit including a main conductor and a return, a signal-circuit having a signal therein, means actuated by successive cars entering the block to connect one end of said signal-circuit alternately with the main conductor and the return, and means actuated by the said cars leaving the block to connect the other end of said signal-circuit alternately with the main conductor and return, the construction being such that when a car is in the block the ends of the signal-circuit are connected to opposite sides of the power-circuit, and when the block is empty both ends of the signal-circuit are connected to the same side of the power-circuit.

6. In a block-signal system for railways, a power-circuit including a main conductor and return-circuit, a signal-circuit extending the length of the block, a signal operated thereby, switches at each end of the signal-circuit and normally connecting said circuit with the same side of the power-circuit, means rendered operative by a car entering the block to throw the switch at the entering end of the block to connect the corresponding end of the signal-circuit with the opposite side of the power-circuit, and means rendered operative by a car leaving the block to throw the switch at that end of the block from which the car leaves to connect said end of the signal-circuit with the said opposite side of the power-circuit.

7. In a block-signal system for railways, a power-circuit including a main conductor and return-circuit, a signal-circuit having a signal therein, switches at each end of the signal-circuit and normally connecting both ends of said circuit to the same side of the power-circuit, means rendered operative by a car entering either end of the block to throw the switch at the entering end of the block to connect the corresponding end of the signal-circuit to the opposite side of the power-circuit, and means rendered operative by the car leaving the block in either direction to throw the switch at that end of the block from which the car leaves to connect the corresponding end of the signal-circuit to the same side of the power-circuit as the opposite end of said signal-circuit.

8. In a block-signal system, a power-circuit including a main conductor and a return-wire, a signal-circuit extending the length of the block, a signal therein, and means actuated by cars entering the block to put one end of said signal-circuit alternately in connection with opposite sides of the power-circuit, and means actuated by the cars leaving the block to put the other end of the signal-circuit alternately in connection with the opposite side of the power-circuit.

9. In a block-signal system, a power-circuit including a main conductor and a return-wire, a signal-circuit extending the length of the block and having a signal therein, vibrating switches at each end of said signal-circuit, said switches normally connecting both ends of the signal-circuit to the same side of the power-circuit, means actuated by a car entering the block to throw one of said switches to connect one end of said signal-circuit to the opposite side of the power-circuit, and means actuated by the car leaving the block to throw the other of said switches into a corresponding position.

10. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, means operated by a car entering the block to connect the signal-circuit across from the main conductor to the return-wire, and means rendered operative by the current traversing in the signal-circuit to prevent a second car entering the block from affecting the signal while the preceding car is in the block.

11. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, said signal-circuit having both ends thereof normally connected to the same side of the power-circuit, switch devices rendered operative when a car enters an empty block to connect one end of said signal-circuit to the opposite side of the power-circuit, and means to lock said switch devices against movement while the car is in the block, whereby a second car entering the block before the preceding car leaves the same does not affect the signal.

12. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, switches normally connecting both ends of said signal-circuit to the same side of the power-circuit, a signal-setting circuit including an actuating-magnet, switch-operating devices controlled by said actuating-magnet, and means actuated by a car entering the block to momentarily close the setting-circuit, whereby one of the switches is operated to connect the signal-circuit across from the main conductor to the return-wire.

13. In a block-signal system, a signal-circuit, a signal therein, signal-actuating mechanism including an electromagnet, a signal-setting circuit and a signal-suppressing circuit, said signal-actuating mechanism being normally connected to the signal-setting circuit, means rendered operative when the signal is set to connect said signal-actuating mechanism to the signal-suppressing circuit, and means for automatically closing said signal-setting circuit when a car enters the block, and said signal-suppressing circuit when a car leaves the block.

14. In a block-signal system, a signal, signal-actuating mechanism at each end of the block, a signal-setting circuit and a signal-suppressing circuit at each end of the block, the signal-actuating mechanism at each end of the block being normally connected to the corresponding signal-setting circuit, means rendered operative by the setting of the signal to connect each of said signal-actuating mechanisms to the corresponding signal-suppressing circuit, and means for automatically closing one of said signal-setting circuits when a car enters the block, and means for automatically closing one of said signal-suppressing circuits when a car leaves the block, whereby the signal is set by a car entering the block from either direction and is restored to normal when the car leaves the block from either direction.

15. In a block-signal system, a signal, signal-actuating mechanism including an actuating-magnet, a signal-setting circuit and a signal-suppressing circuit, said signal-setting circuit normally including the coils of said actuating-magnet, means rendered operative by the signal-actuating mechanism when operated to set the signal to connect said actuating-magnet with the signal-suppressing circuit, and means for automatically closing said signal-setting circuit when a car enters a block and said signal-suppressing circuit when the car leaves the block.

16. In a block-signal system, a signal, a signal-actuating mechanism at each end of the block and including an actuating-magnet, a signal-setting circuit and a signal-suppressing circuit at each end of the block, said signal-setting circuits each normally including the coils of the corresponding actuating-magnet, means to connect said actuating-magnet with the signal-suppressing circuit, said means being rendered operative when the signal is set, and means operated by a car entering the block in either direction to close one of said signal-setting circuits and by a car leaving the block in either direction to close one of the signal-suppressing circuits.

17. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, switches at each end of the signal-circuit, and normally connecting both ends thereof to the same side of the power-circuit, a signal-setting circuit and a signal-suppressing circuit at each end of the block, each of said signal-setting circuits normally including the coils of an actuating-magnet, a switch-operating device controlled by each of said actuating-magnets, means to connect the actuating-magnets with the signal-suppressing circuits when a car is in the block, means actuated by a car entering the block to momentarily close the signal-setting circuit at the entering end of the block, and means actuated by a car leaving the block to close the signal-suppressing circuit at that end of the block, whereby when the car is in the block, the signal can only be operated through one of the signal-suppressing circuits.

18. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, switches at each end of the signal-circuit, and normally connecting both ends thereof, to the same side of the power-circuit, a signal-setting circuit and a signal-suppressing circuit at each end of the block, each of said signal-setting circuits normally including the coils of an actuating-magnet, a switch-operating device controlled by each of said actuating-magnets, means operated when the signal is set to connect the actuating-magnets with the signal-suppressing circuits, means actuated by a car entering the block from either direction to momentarily close one of said setting-circuits, and means actuated by a car leaving the block in either direction to close one of said signal-suppressing circuits, whereby when the car is in the block, the signal can only be operated through one of the signal-suppressing circuits.

19. In a block-signal system, a power-circuit including a main conductor and return-wire, a signal-circuit having a signal therein, switches at each end of the signal-circuit, and normally connecting both ends of the signal-circuit with the same side of the power-circuit, a signal-setting circuit and a signal-suppressing circuit, said signal-setting circuit normally having an actuating-magnet therein, means actuated by a car entering the block to momentarily close the setting-circuit whereby the magnet is energized and the signal is set, means operated when the signal is set to connect said actuating-magnet with the signal-suppressing circuit, and means operated by a car leaving the block to close said signal-suppressing circuit, whereby when a car is in the block the signal can only be operated by a car leaving the block.

20. In a block-signal system, a single signal-circuit extending the length of the block and having a pair of differently-distinguished signals at each end thereof, a signal-actuating circuit at each end of the block, said signal-actuating circuits being independent from each other, means whereby as the car enters the block it closes the signal-actuating circuit at the entering end of the block and renders the signal-circuit operative to set a signal of one character or kind at one end of the block and a signal of the other character or kind at the opposite end of the block, and means whereby as the car leaves the block it closes the signal-actuating circuit at that end of the block from which it leaves to thereby restore the signal-circuit to its normal condition, the construction being such that the signals when set always indicate the direction in which the car has entered the block.

21. In a block-signal system, a single signal-circuit extending the length of the block and having a plurality of signals at each end of the block connected thereto, a signal-actuating circuit at each end of the block, said signal-actuating circuits being independent from each other, and means whereby as the car enters the block it closes the signal-actuating circuit at the entering end of the block and thereby renders the signal-circuit active to set the signals, the signals when set indicating the direction in which the car has entered the block, and means whereby as the car leaves the block the signal-actuating circuit at that end of the block from which the car leaves is closed to thereby restore the signal-circuit to its normal condition.

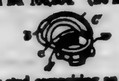
22. In a block-signal system, a single signal-circuit extending the length of the block and having a plurality of signals therein, a signal-setting circuit, and a signal-suppressing circuit, each adapted to be closed by a car entering or leaving the block, respectively, means whereby as the signal-setting circuit is closed the signals in the signal-circuit are set, and means whereby when the signal-suppressing circuit is closed by a car leaving the block the signals in the signal-circuit are suppressed or restored to normal, these signals being of such a character that when set they indicate the direction in which the car has entered the block.

23. In a block-signal system, a power-circuit, including a main conductor and a return, a signal-circuit extending the length of the block, said signal-circuit being branched at each end, one branch at each end having a white signal therein, and the other branch having a red or differently-colored signal therein, the two branches having the red lights therein being normally connected to the same side of the power-circuit, means operated by a car entering the block to open the branch at the entering end of the block having the red signal therein, and connect that branch at said entering end of the block which has the white signal therein with the opposite side of the power-circuit, whereby a white signal is displayed at the entering end of the block and a red signal at the opposite end thereof.

24. In a block-signal system, a power-circuit, including a main conductor and a return, a signal-circuit extending the length of the block, said signal-circuit being branched at each end, one branch at each end having a white signal therein, and the other branch having a red or differently-colored signal therein, the two branches having the red lights therein being normally connected to the same side of the power-circuit, means operated by a car entering the block to open the branch at the entering end of the block having the red signal therein, and connect that branch at said entering end of the block which has the white signal therein with the opposite side of the power-circuit, whereby a white signal is displayed at the entering end of the block and a red signal at the opposite end thereof, and means whereby as the car leaves the block the signals are restored to normal.

25. In a block-signal system for railways, a power-circuit, including a main conductor and return-wire, a single signal-circuit including a plurality of signals, said signal-circuit having both ends thereof connected to the same side of the power-circuit, means operated by a car entering the block to connect one end of the signal-circuit to the opposite side of the power-circuit, means operated by a car leaving the block to connect the other end of said signal-circuit to said opposite side of the power-circuit, and means whereby the signals indicate the direction in which the car has entered the block.

704,118. LACING-STUD. LEON L. RUSSELL, Grouse, Iowa. Filed Apr. 24, 1902. Serial No. 104,554. (No model.)



Claim.—1. A lacing-stud comprising an eyelet, and a spring-hook connected at one end to the eyelet and overhanging the same, whereby,

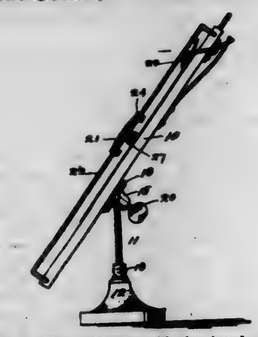
when the blight of the hook is subjected to death, the free end thereof will be drawn down into the eyelet.

2. A lacing-stud comprising an eyelet adapted for connection to a shoe-upper or other article to be laced, and a hook overhanging the eyelet; the said hook being formed of spring-metal, and having one end fixed to the eyelet, and its other end free, and also having the loop *a*, the blight *b* disposed in rear of and below the loop, and the movable blight *c* also disposed in rear of and below the loop, and normally in advance of the blight *b*.

3. A lacing-stud comprising an eyelet adapted for connection to a shoe-upper or other article to be laced, and a hook overhanging the eyelet; the said hook being formed of spring-metal, and having one end fixed to the eyelet, and its other end free, and also having the loops *a*, a portion of which is of reduced thickness, the blight *b* disposed in rear of and below the loop, and the movable blight *c* also disposed in rear of and below the loop, and normally in advance of the loop *b*.

4. The combination of a shoe-upper or other article to be laced, a spring-hook connected at one end thereto, and means on the upper or other article to be laced, fixed with respect to the hook, and adapted when the hook is placed under tension to guard the free end thereof.

704,119. COPY-HOLDER FOR TYPE-WRITERS USE. AXEL ERMES, Chicago, Ill., assignor to Chicago Writing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Sept. 14, 1901. Serial No. 75,288. (No model.)



Claim.—1. The combination with the slotted plate or holder 10, of the block adjustable in the slot of the plate and a standard for the holder having a rod hinged to the block, substantially as specified.

2. The combination with the slotted plate or holder 10, of the block adjustable in the slot of the plate, and having a rear projecting portion receiving the bent end of the rod 11 of the holder-standard, the standard, and the rod having its end bent and inserted in the block, substantially as specified.

3. The combination with the slotted plate or holder 10, of the block adjustable in the slot of the plate and having a rear projection with an elongated slot receiving the bent end of the rod, a washer controlling said projection, a rod having its bent end inserted in the slot of the block, and a pressure-exerting device bearing on said bent end, substantially as specified.

4. In a copy-holder, the combination with the slotted plate, of a supporting-block adjustable in the slot of the plate and having a rear projection, and also a front flange bearing on the plate, a washer loosely encircling said projection and bearing on the plate, a rod 11 for retaining the washer on the projection, and a screw for tightening the washer, substantially as specified.

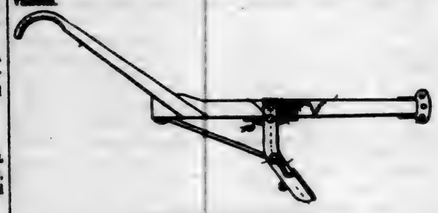
5. In a copy-holder, a copy-holding plate and a supporting-block adjustably attached to the plate, in combination with a standard having a rod the upper end of which is bent to a horizontal position and passes through an opening in the block, and a cut-screw crossing friction upon said horizontal part of the rod, substantially as specified.

6. The presser 20 for holding the copy, having its ends bent to form pivots and crank-arms as set forth and combined with clips for the pivots and springs for holding the presser both in its casing and in its raised position, substantially as specified.

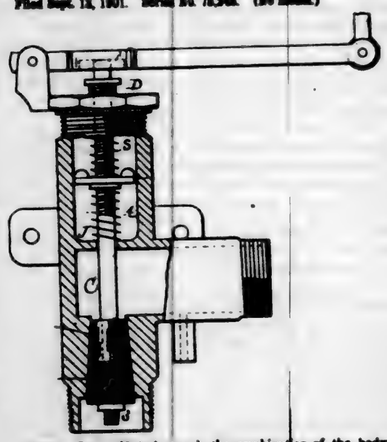
7. The combination with a copy-holder of a spring 26 located at the top of the holder and having its free end resting on a stationary part thereof, substantially as specified.

704,120. WEEDING IMPLEMENT. ISAAC SAMUEL, Thompson, Miss. Filed Mar. 20, 1902. Serial No. 98,958. (No model.)

Claim.—A weeding implement comprising a beam having a depending perforated web, a standard consisting of a plate bent upon itself and disposed to straddle the web with its blight lying against the upper face of the beam, a bolt passed through the sides of the standard for engagement with the perforations of the web interchangeably, a second bolt passed through the sides of the standard below the first-named bolt, a brace secured to the beam and having its forward end engaged with the bolt between the sides of the standard, a blade having a bolt passed therethrough and between the sides of the standard and having a champing-nut for engagement with the rear edges of the standard to hold the blade at different elevations, and spring-arms attached to the ends of the blade and to the ends of the second bolt to hold the blade yieldably against pivotal movement and to permit of adjustment of the blade to different elevations.

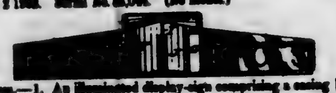


704,121. SELF-CLOSING COCK. PETER SCHWEER, Dayton, Ohio. Filed Sept. 13, 1901. Serial No. 75,248. (No model.)



Claim.—In a self-closing cock the combination of the body having suitable inflowt and effluent orifices, the bearing-ledge and a cone-shaped seat, the closing-cap provided with ears and a packing-gland, the stem with its metallic and rubber rings forming the valve, the threaded adjusting-nut held on said stem, the spiral spring for closing said valve, the spiral spring for staying said adjusting-nut, substantially as described.

704,122. ILLUMINATED DISPLAY-SIGN. CHARLES G. SCOTT, Boston, Mass., assignor to Alfred C. Fulkin and Mario L. Fulkin, co-partners under firm-name of A. C. and M. L. Fulkin, Boston, Mass. Filed Jan. 2 1902. Serial No. 88,044. (No model.)



Claim.—1. An illuminated display-sign comprising a casing having a face provided with open or translucent characters or designs and a rear wall provided with a corrugated reflector, a light within said casing, and a screen having a reflecting-surface upon its outer or front side toward said characters or designs, so disposed as to intercept all the direct rays from the light to said characters or designs, whereby said characters or designs shine only by reflected light, and all the surfaces within the range of vision through said characters or designs are reflecting-surfaces.

2. An illuminated display-sign comprising a casing having a face provided with open or translucent characters or designs, the entire interior of said casing being covered with a reflecting-surface, a light within said casing, and a screen having a reflecting-surface upon its outer or front side toward said characters or designs, so disposed as to intercept all the direct rays from the light to said characters or designs, whereby said characters or designs shine only by reflected light, and all the surfaces within the range of vision through said characters or designs are reflecting-surfaces.

3. An illuminated display-sign comprising a casing having a face provided with open or translucent characters or designs, a reflecting-surface upon the interior walls of said casing, a light within said casing, and a screen having a reflecting-surface upon its outer or front side toward said characters or designs, so disposed as to intercept all the direct rays from the light to said characters or designs, whereby said characters or designs shine only by reflected light, and all the surfaces within the range of vision through said characters or designs are reflecting-surfaces, and a revolving drum surrounding said light, comprising a series of segments adapted to control the passage and character of the rays from the light to the reflectors.

4. An illuminated display-sign, comprising a casing having a face provided with open or translucent characters or designs, a rear wall angularly disposed with relation to said face and covered with the reflecting substance, a light within said casing, the direct rays of which are wholly screened from said characters or designs by means of a screen having a reflecting-surface upon its outer or front side toward said characters or designs, a revolving drum surrounding said light provided with a series of light-controlling segments, and a power-fan at the top of said drum adapted to be driven by the ascending current of hot air from said light and to rotate said drum.

704,123. LADDER. ROBERT L. SCOTT, Arlington, Cal. Filed Nov. 7, 1901. Serial No. 81,512. (No model.)

Claim.—1. A ladder consisting of two rails, rounds pivoted to the rails respectively, steps on said rails for the rounds, the steps on one of the rails being above their respective rounds and steps on the other rail being below their respective rounds, a combined foot-rest and catch near the bottom of one of the rails and a hook pivoted to the other rail near the bottom thereof to extend obliquely upward to hook over the catch when the ladder is in an expanded position.

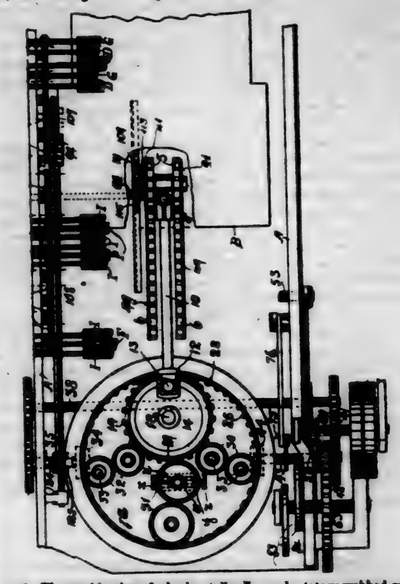
2. A ladder provided with recessed side rails or bars having shoulders, rounds movably mounted within said recesses on opposite sides of said shoulders, a hook movably connected with one of the side bars and a device upon the other side bar constructed to be engaged by said hook in one position to prevent the collapsing of the ladder and in another position to prevent the expansion thereof.

3. A ladder provided with recessed side rails or bars having shoulders, rounds movably mounted within said recesses on opposite sides of said shoulders, a hook movably connected with one of the side bars and a bracket upon the other side bar constructed to be engaged by said hook in one position to prevent the collapsing of the ladder and in another position to prevent the extension thereof, said bracket being constructed to receive the pressure from the foot of the user to expand the ladder.

4. A ladder provided with rails or bars, rounds movably connected therewith and a foot rest or bracket secured upon one of said bars or rails, constructed to receive the pressure of the foot of the user to expand the ladder.

704,124. PRINTING-PRESS. WALTER SCOTT, Plainfield, N. J. Filed June 13, 1898. Serial No. 683,918. (No model.)

Claim.—1. The combination of a horizontally-disposed rotatory gear, a plurality of gears meshing therewith to drive the same, a planet-gear journaled thereon, a fixed gear meshing with and rotating the planet-gear, a reciprocatory bed connected with and operated by the planet-gear, and a casing surrounding the first-named gear.



2. The combination of a horizontally-disposed rotatory webbed gear, gears meshing therewith at opposite points thereof for driving the same, a planet-gear journaled on the first-named gear, a fixed gear meshing with and rotating the planet-gear, a reciprocatory bed connected with and operated by the planet-gear, and a casing surrounding the first-named gear.

3. The combination of a rotatory gear, means for driving it, a planet-gear journaled on said gear, a fixed internal gear meshing with said planet-gear, a casing surrounding the first-named gear and to which the said internal gear is fixed, bearers on the said fixed, planet, and first-named gears for transmitting the pressure to said casing, and a reciprocating bed connected with and operated by said planet-gear.

4. The combination of a bevel-gear, means for driving it, a planet-gear journaled on said gear, a fixed internal gear meshing with the planet-gear, a casing surrounding the first-named gear and to which the internal gear is fixed, bearers on said fixed, planet and bevel gears for transmitting pressure to the casing, and a reciprocatory bed connected to and driven by said planet-gear.

5. The combination of a fixed casing provided with a flaring race or track, a bevel-gear within said casing and having its teeth bearing on said raceway or track, a planet-gear journaled on said bevel-gear, an internal gear fixed to said casing and meshing with said planet-gear, a to-and-fro movable bed, and mechanism intermediate and connecting said planet-gear and said bed.

6. The combination of a fixed casing provided with a flaring ring, a bevel-gear within the casing and having its teeth above said flaring ring, bevel-gears at opposite sides of said casing passing through openings therein and driving said first-named bevel-gear, a planet-gear connected to said first-named bevel-gear, an internal gear meshing with said planet-gear and fixed to said casing, and a reciprocatory bed connected to and driven by said planet-gear.

7. The combination of a driven bevel-gear, a bevel-gear for driving it, a spur-gear journaled on said driven bevel-gear eccentrically thereof, an internal gear meshing with said spur-gear, a fixed casing inclosing said driven bevel-gear and said spur and internal gears, a bearing-ring, said ring, casing and internal gear being fast together, a bearing-ring fast on said spur-gear and coacting with said first-named bearing-ring, bearing-wheels journaled on the driven bevel-gear and coacting with said bearing-rings, and a bed connected with said spur-gear and driven thereby.

8. The combination of a reciprocatory bed, a rack thereunder, a rolling gear meshing with said rack and with a fixed rack on the frame, a head pivotally connected with the horizontal axis of said gear, a vertical pivot on said head, a rod connected with said vertical pivot, a planet-gear having a vertical axis and provided with a stud or pent to which said rod is pivotally connected, and a fixed gear meshing with said planet-gear.

9. The combination of a casing provided with a flaring part and with a cylindrical portion above said part and with a shoulder or offset above said cylindrical portion and with a flanged cylindrical part above said shoulder, a webbed bevel-gear within said casing and having its teeth over said flaring part and its top flush with or below said shoulder, an internal gear seated in said casing and resting on said shoulder, a spur-gear journaled on said bevel-gear concentrically thereof and meshing with said internal gear, bearing-rings on said internal and said spur gears, and bearing-wheels journaled on said bevel-gear and coacting with said rings, with means for driving said bevel-gear.

10. The combination of a reciprocatory bed, a casing having a flaring ring with a cylindrical part above said ring and a shoulder or flange above said cylindrical part and a flanged cylindrical top above said shoulder, a webbed bevel-gear within said casing with its teeth above said flaring ring and its top flush with or below said shoulder, an internal gear fast to said casing and resting on said shoulder, a spur-gear journaled on said bevel-gear concentrically thereof and meshing with said internal gear, driving bevel-gears symmetrically placed about said casing and engaging with the first-named bevel-gear through openings in said casing, and a reciprocatory bed connected to and driven by said spur-gear.

11. The combination of a reciprocatory bed, a casing having a flaring ring, a cylindrical part above said ring, a shoulder or flange above said cylindrical part, and a flanged cylindrical top above said shoulder, a webbed bevel-gear within said casing with its teeth above said flaring ring and its top flush with or below said shoulder, an internal gear fixed within said casing and resting on said shoulder, a spur-gear journaled on said bevel-gear concentrically thereof and meshing with said internal gear, driving bevel-gears placed symmetrically about said casing and engaging with the first-named bevel-gear through openings in said casing, bearing-rings on said internal and said spur gears, bearing-wheels journaled on said webbed bevel-gear and coacting with said rings, and connections between said bed and said spur-gear for driving the bed.

12. The combination of a two-revolution step impression-cylinder, a mutilated gear thereon, a rack fixed on said bed for coaction with said gear, a segment-gear on said cylinder opposite the mutilated part of said gear, a movable rack of said bed for coaction with said segment-gear, a movable cam on said bed for operating said movable rack, and means on the framework of the machine for operating said cam, said means being connected with and operating or controlling said cam at all points in the motion of the bed.

13. In a two-revolution step-cylinder press in which the impression-cylinder is "carried over" from the first to the second revolution by means of a segment-gear and a movable rack, the combination of the cylinder, a segment-gear, a movable rack, means on the bed for operating said rack, said means being provided with an arm, a channel-bar for coaction with said arm, and means for moving said bar at right angles to its length.

14. In a two-revolution step-cylinder press, in which the impression-cylinder is "carried over" from the first to the second revolution thereof by means of a segment-gear and a movable rack, the combination of the cylinder, a segment-gear, a movable rack, a movable cam on the bed for coaction with said rack, and means on the framework of the machine for operating said cam, said means controlling said cam at all points in the traverse of the bed.

15. In a printing-press, the combination of a rising and falling cylinder, a gear connected thereto, a reciprocating bed, and a rack on said bed for coaction with said gear, said rack having an end section thereof inclined upwardly to coact with said gear as the cylinder is moved in a vertical direction.

16. In a printing-press, the combination of a rising and falling cylinder, a gear connected thereto, a reciprocating bed, and a rack on said bed for coaction with said gear, said rack having each end section thereof inclined upwardly to coact with said gear as the cylinder is moved up and down.

17. The combination of a two-revolution impression-cylinder, a mutilated gear thereon, a reciprocating bed, a rack fixed on said bed for coaction with said gear, a segment-gear on said cylinder opposite the mutilated part of said gear, a movable rack on said bed for coaction with said segment, and positive means for operating said movable rack, said positive means being continuously connected with and preventing accidental motion of said movable rack.

18. The combination of a two-revolution impression-cylinder, a mutilated gear thereon, a reciprocating bed, a fixed rack on said bed for coaction with said gear, a segment-gear on said cylinder opposite the mutilated part of said gear, a rack movable on the bed for coaction with said segment-gear, a controlling-bar on the fixed frame, and connections from said controlling-bar to said movable rack, with means for operating said controlling-bar.

19. The combination of an impression-cylinder which turns twice while the bed travels in one direction and is at rest while the bed is returning in the other direction, a reciprocating bed, and mechanism for raising the cylinder as the bed nears the end of its printing stroke and lowering the cylinder after the bed begins its printing stroke.

20. In a printing-press in which the impression-cylinder is raised and lowered, the combination of the impression-cylinder, slides in which it is journaled, a rock-shaft journaled in said slides, toggle-joints connecting said slides and the fixed framework, adjusting-screws on the fixed framework, springs 51, cams 62, and connections from said cams to said shaft for rocking it.

21. In a printing-press in which the impression-cylinder revolves twice during one stroke of the bed and stops during the return stroke of the bed, the combination of the impression-cylinder, a gear thereon a portion of which is cut away or omitted, means for raising and lowering the cylinder, a reciprocating bed, a rack on said bed for coaction with said gear, said rack having its end portions inclined upwardly to conform to the rise and fall of the cylinder, and means for carrying over the cylinder from the first to the second revolutions thereof.

22. In a printing-press, the combination of an impression-cylinder, means for raising and lowering said cylinder relatively to the fixed framework, a reciprocating bed, a rack on said bed having an end portion thereof inclined upwardly, a mutilated gear on said cylinder, and means for starting and stopping said cylinder.

23. In a two-revolution step-cylinder printing-press, the combination of the impression-cylinder, a segment-gear thereon, a rack movable up and down on the bed, said rack being provided with an overhang, a cam for coaction with said overhang, an arm connected with said cam, a channel-bar for operating said arm, and means for operating said channel-bar.

24. The combination of a horizontally-disposed rotatory gear, a planet-gear thereon, a fixed gear meshing with said planet-gear, a reciprocating bed, a pitman connected through a vertical axis with said bed, and a post or stud on said planet-gear, wholly within the pitch-circle thereof, with which said pitman is connected, whereby the pitman lies closely above the planet and the fixed gears.

25. The combination of a rotating carrier, a planet-gear journaled thereon, a fixed gear meshing with the planet-gear, a reciprocating bed connected to and operated by the planet-gear, coacting bearing-rings on said planet and said fixed gears, bearing-wheels journaled on said carrier and coacting with said rings, and means for adjusting the position of certain of said bearing-wheels to take up wear and play.

26. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed gear meshing with said planet-gear, a reciprocatory bed connected to and operated by said planet-gear, and coacting bearing-rings on said fixed and said planet gears.

27. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed gear meshing with said planet-gear, a reciprocatory bed connected to and operated by the planet-gear, coacting bearing-rings on said planet and fixed gears, and bearing-wheels journaled on said carrier and coacting with said rings.

28. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed gear meshing with said planet-gear, a reciprocatory bed, a pitman connected through a vertical axis with said bed, a post on said planet-gear wholly within the pitch-circle thereof and with which said pitman is connected pivotally, coacting bearing-rings on said fixed and planet gears, and bearing-wheels journaled on said carrier and coacting with said rings.

29. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed internal gear meshing with said planet-gear, a reciprocatory bed, a pitman connected through a vertical axis with said bed, a post on said planet-gear wholly within the pitch-circle of the planet-gear, said pitman being pivotally connected with said post, and coacting bearing-rings on said fixed and planet gears.

30. The combination of a horizontally-disposed driven bevel-gear, a circular raceway rigidly connected with the fixed framework, the teeth of said bevel-gear sliding on said raceway, an internal gear rigidly connected to the fixed framework, a planet-gear journaled on said bevel-gear, a reciprocatory bed, a post on said planet-gear wholly inside the pitch-circle thereof, means having a vertical pivot interposed between and connecting said post and bed, and coacting bearing-rings on said planet and internal gears.

31. The combination of a horizontally-disposed driven bevel-gear, a circular raceway rigidly connected with the fixed framework, the teeth of said bevel-gear sliding on said raceway, an internal gear rigidly connected with the fixed framework, a planet-gear journaled on said bevel-gear, a reciprocatory bed, a post on said planet-gear wholly within the pitch-circle thereof, means having a vertical pivot interposed between and connecting said post and bed, coacting bearing-rings on said planet and internal gears, and bearing-wheels journaled on said bevel-gear and coacting with said rings.

32. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed gear meshing with said planet-gear, a reciprocatory bed having a rack thereon, a rolling gear meshing with said rack and with a rack on the fixed frame of the machine, a head in which said rolling gear is journaled, a post on said planet-gear wholly within the pitch-circle thereof, a pitman pivotally connected with said post and also connected with said head by a vertical pivot, and coacting bearing-rings on said planet and fixed gears.

33. The combination of a carrier rotating in a horizontal plane, a planet-gear journaled thereon, a fixed gear meshing with said planet-gear, a reciprocatory bed, a rolling gear meshing with racks on the bed and framework of the machine, a head in which said rolling gear is journaled, a post on said planet-gear wholly within the pitch-circle thereof, a pitman pivotally connected with said post and with a vertical axis on said head, coacting bearing-rings on said planet and fixed gears, and bearing-wheels journaled on the said carrier and coacting with said rings.

34. The combination of a rotating gear, a planet-gear carried thereby, a gear fixed to the frame of the machine and meshing with the said planet-gear, a reciprocatory bed connected to and operated by said planet-gear, a bearer fixed on the frame concentrically with the said fixed gear, and a bearer fixed on the planet-gear concentrically thereof and contacting with the first-named bearer.

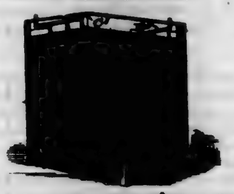
35. The combination of a casing fixed to the framework of the machine, a rotating gear therein, a planet-gear journaled on the said gear, a fixed gear fastened to said casing, a fixed bearer concentric with said fixed gear and fastened thereto, a bearer concentric with and fast on the planet-gear, and a reciprocatory bed connected to and operated by the planet-gear, whereby the thrust of the bed when turning or reversing is sustained by the fixed bearer.

36. The combination of a rotating gear, a planet-gear journaled thereon, a gear fixed to the framework of the machine and meshing with the planet-gear, a stud on the planet-gear, a reciprocatory bed, a rod connecting the bed and stud, a bearer fast to the framework concentric with the fixed gear, and a bearer fast on the planet-gear concentrically thereof and coacting with the bearer first named, whereby the thrust of the bed in turning or reversing is taken by the fixed bearer on the framework of the machine.

37. The combination of a rotary gear, two driving-gears set opposite each other and meshing with said gear, a planet-gear carried by the first-named gear, a gear fixed to the framework of the machine, and meshing with said planet-gear, a reciprocatory bed connected to and operated by said planet-gear, a bearer fixed to the framework of the machine concentric with said fixed gear, and a bearer on the planet-gear and concentric therewith and coacting with the first-named bearer.

38. The combination of a fixed casing provided with a race or track, a gear running on said race or track, a planet-gear journaled on said running-gear, an internal gear fixed to said casing and meshing with said planet-gear, a to-and-fro movable bed, and means interposed between and connecting said bed and planet-gear.

704,125. BATTERY. WILLIAM T. SUMNER, Minersville, Pa. Filed July 30, 1901. Serial No. 69,112. (No model.)

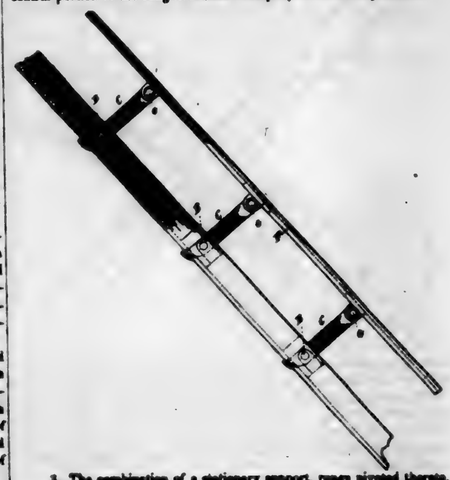


Claim.—In a battery the combination with a cell or case having vertically-grooved strips arranged upon opposite sides, of the zinc plates arranged in the said groove and having shoulders at their upper ends adapted to rest upon the strips, and the carbon electrodes having shoulders at their upper ends, said carbon electrodes being hollow and adapted to receive a depolarizing solution, substantially as set forth.

704,126. FIRE-ESCAPE. CHARLES SUMNER, Irvington, N. J., assignor of one-half to Gustav Gunzle, borough of Brooklyn, New York N. Y. Filed Oct. 1, 1901. Serial No. 77,189. (No model.)

Claim.—1. The combination of the fixed support, the rungs pivoted thereto, the upright connected with the free ends of the rungs, and a locking device comprising two coöperating members, one secured to a fixed part and the other to the upright, one of said members being mounted to slide and to turn about an upright axis, the sliding movement serving to lock or unlock the two members, while the turning movement serves to throw the upright outward by bringing said member in operative contact with it.

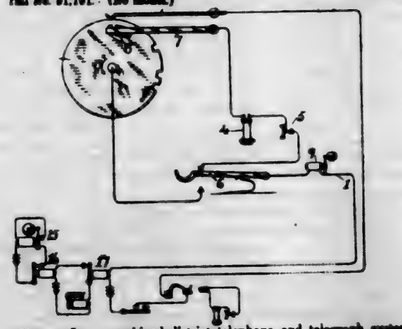
2. The combination of the stationary support, the upright arranged to move in a plane at one side of the support, brackets located upon the support at the other side thereof, and parallel therewith, and rungs each having one end portion extended between a bracket and the adjacent portion of the support and pivotally connected therewith, while the other end portion of the rung is pivotally connected with the upright, and the central portion of the rung is disposed obliquely to said end portions.



3. The combination of a stationary support, rungs pivoted thereto, an upright connecting the outer ends of the rungs, and a locking device comprising two coöperating members secured respectively to the support and to the upright, one of said members being mounted to slide on the part carrying it and also to turn on the said part about an upright axis so as to cause the upright to be swung away from the support.

4. The combination of the stationary support, the rungs having their inner ends pivoted to one side of said support, the upright arranged to fold against the said support, means for pivotally connecting the outer ends of the rungs with the upright at the opposite side to their pivotal connection with the support, and a compressible waterproof lining arranged to form a joint between the upright and the support when the former is folded against the latter the lining being carried by one of said parts.

704,127. COMBINED DISTRICT TELEGRAPH AND TELEPHONE SIGNAL. CHARLES SELDEN, Baltimore, Md. Filed Jan. 20, 1902. Serial No. 91,161. (No model.)



Claim.—In a combined district telephone and telegraph system, the combination with the apparatus at the central office for recording the box-signals designating the number of the box, of a vibrating receiver adapted to produce a prolonged vibratory signal of varying duration, a district-telegraph box having the usual circuit-breaking wheel and contact-brush, and a supplemental contact-brush adapted to bear upon the face of the wheel and in line with one or more prolonged breaks in the surface of the wheel for the purpose of sending a signal adapted to produce in the vibratory receiver a prolonged sound indicating audibly to the central-office operator that telephonic communication is desired.

704,128. UMBRELLA-RUNNER RETAINER. WILLIAM S. BEYNON, Philadelphia, Pa., assignor to Pennsylvania Tube Company, Philadelphia, Pa., and Camden, N. J., a Corporation of New Jersey. Filed Apr. 11, 1901. Serial No. 55,267. (No model.)

Claim.—1. An umbrella-runner retainer for use with hollow umbrella-sticks, said retainer having two long, curved arms, the combined width of said arms being less than the internal diameter of the tube, one of said arms having an undercut leg extending into the slot of the stick, the other arm having a leg forming a fulcrum for engaging the opposite wall of the stick, and a portion joining said arms and curved so that its end will engage the wall opposite the fulcrum and below the latter, substantially as described.

2. As a new article of manufacture, an umbrella-runner retainer made of a single piece of metal and having the curved spring-arms *a* and *d* of less width than the internal diameter of the tube, said arm *a* having a projecting retaining portion for the spring-arm *d*, said arm *d* having an undercut retaining-leg for engagement with the wall of the slot, said retainer having bearing portions *e* and *f*, the bearing portion *e* being carried by the spring-arm *a* and the other formed by the end of the curved metal piece from which the two arms spring, said bearing portions engaging opposite walls of the tube at some distance from each other, substantially as described.

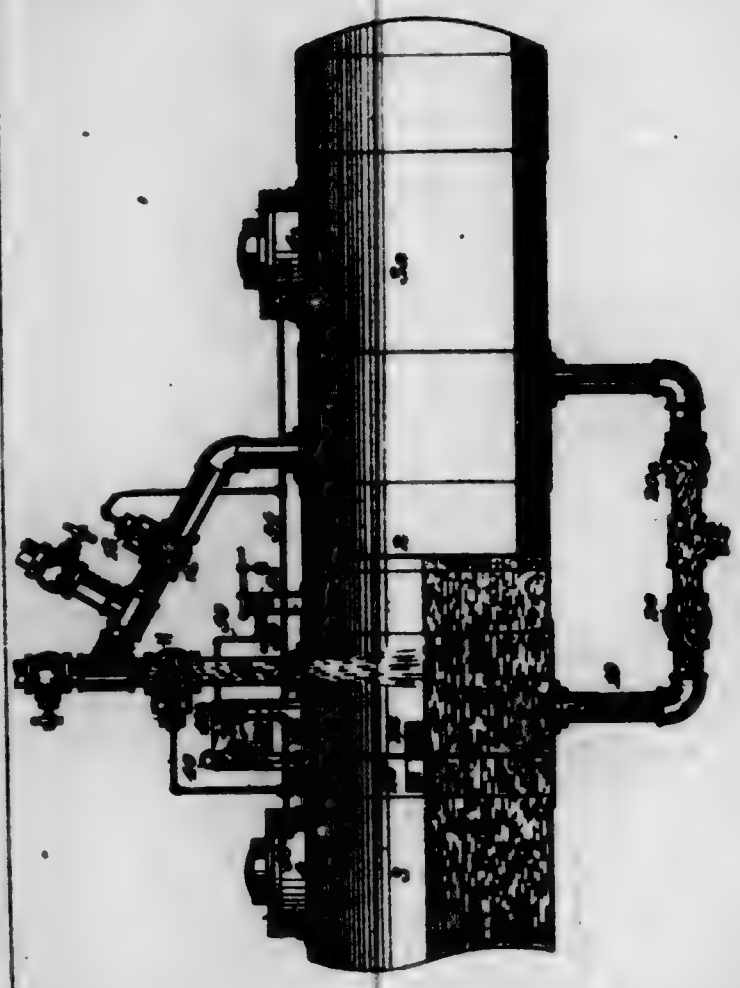
704,129. LIQUID-DELIVERY APPARATUS. PATRICK SHERRY and ALEXANDER CAMPBELL, Los Angeles, Cal. Filed Nov. 22, 1901. Serial No. 83,230. (No model.)

Claim.—1. In a liquid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, liquid-supply pipes leading into each compartment, a pressure-actuated supply-valve controlling each pipe, a fluid-pressure pipe leading into each compartment and having branches conducting fluid-pressure to operate said supply-valves, a pressure-valve controlling said fluid-pressure pipe and an automatic device in one compartment for shifting said pressure-valve.

2. In a liquid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, a liquid-supply pipe having a branch leading into each compartment, supply-valves controlling the supply of liquid through each branch pipe, liquid-delivery pipes leading out of said compartments, fluid-pressure-supply pipes leading into each compartment and having branch pipes leading to said supply-valves, means actuated by said pressure and controlling the supply-valves, a pressure-valve controlling the supply of fluid-pressure to each compartment, and an automatic device in one compartment for shifting said pressure-valve.

3. In a liquid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, liquid-supply pipes leading into said compartments, inwardly-opening check-valves governing said supply-pipes, controlling-pistons, each fitted to work in a fluid-pressure cylinder and to hold one of said check-valves to its seat, liquid-delivery pipes leading out of said compartments, fluid-pressure-supply pipes leading into said compartments, each communicating with one of the controlling-piston cylinders, a valvular mechanism controlling communication between each of said compartments and its fluid-pressure pipe, and between said compartment and an exhaust-opening, a float which rises and falls with the liquid-level in one of the compartments, and means, actuated by the float, through which the valvular mechanism is operated at the limit of traverse of the float in each direction.

4. In a liquid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, liquid-supply pipes leading into said compartments, inwardly-opening check-valves, each governing one of said supply-pipes, fluid-pressure pistons, each controlling one of said check-valves, liquid-delivery pipes leading out of said compartments, outwardly-opening check-valves controlling said delivery-pipes, fluid-pressure-supply pipes leading into said compartments, a valvular mechanism controlling communication between each of said compartments and its fluid-pressure pipe, and between said compartment and an exhaust-opening, a float which rises and falls with the liquid-level in one of the compartments, and means, actuated by the float, through which the valvular mechanism is operated at the limit of traverse of the float in each direction.

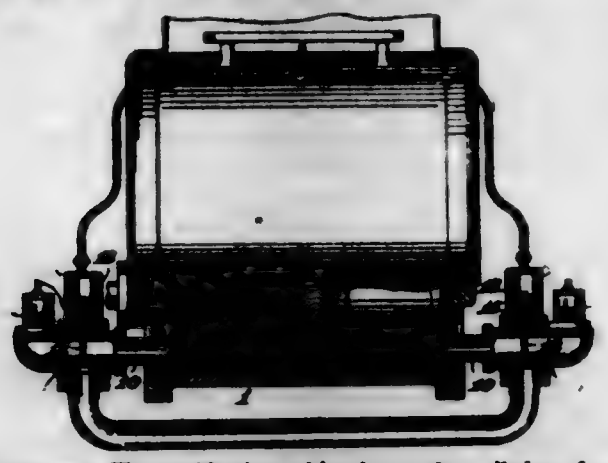


5. In a fluid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, a supply-pipe leading into each compartment, pressure-actuated valves controlling the flow of liquid through said supply-pipes, a fluid-pressure system connected with each compartment and with each supply-valve, and automatic means alternately admitting pressure to each compartment and to operate each supply-valve while venting it from the other compartment and its supply-valve.

6. In a liquid-delivery apparatus, the combination of a liquid-receptacle divided into two compartments, liquid-supply pipes leading into said compartments, supply-valves controlling said pipes, liquid-delivery pipes leading out of said compartments, fluid-pressure-supply pipes leading into said compartments and to said supply-valves, a distribution-valve controlling communication between each of said compartments and its fluid-pressure pipe, and between said compartment and an exhaust-opening, a float which rises and falls with the liquid-level in one of the compartments, a vertically-movable rod carrying collars against which the float abuts at the upper and lower limits of its traverse, a vibratory valve-actuating lever adapted to impart movement, in opposite directions, to the distribution-valve, and trippers connected to the vertically-movable rod, by which movement is imparted to the valve-actuating lever at the limit of traverse of the float in each direction.

7. In a liquid-delivery apparatus, the combination of a distribution-valve, a vibratory valve-actuating lever of bell-crank form, having a weight on its upper arm and opposite cam-faces on its lower arm, a reciprocating bar carrying upper and lower tripper-pins adapted to abut against the cam-faces of the valve-lever, said pins being placed at a greater distance apart than the maximum distance between the cam-faces of the valve-actuating lever, a vibratory lever-arm journaled concentrically with the valve-actuating lever and coupled to the stem of the distribution-valve, and pins fixed to the upper arm of the valve-actuating lever, one of said pins abutting against the lever-arm and imparting movement to the stem of the distributing-valve in one by the traverse of the valve-actuating lever in either direction.

704,180. CIRCULATOR FOR LOCOMOTIVE-CYLINDERS. PATRICK SHEEDY and ALEXANDER CAMPBELL, Los Angeles, Cal. Filed Dec. 18, 1901. Serial No. 86,473. (No model.)



Claim.—1. The combination, with a locomotive-cylinder, of a circulating-pipe, cut-out valves, each seating at one end of said pipe and subject to steam-pressure in closing direction only, and controlling communication between said end of said pipe and the adjacent end of the cylinder, pistons, each fitting in a piston-chamber and connected to one of the cut-out valves, steam-supply pipes leading from the piston-chambers to a connection with the steam-supply passage of the cylinder, and means for automatically unseating the cut-out valves when pressure is relieved in the steam-supply passage.

2. The combination, with a locomotive-cylinder, of a circulating-pipe, cut-out valves, each seating at one end of said pipe and subject to steam-pressure in closing direction only, and controlling communication between said end of said pipe and the adjacent end of the cylinder, pistons, each fitting in a piston-chamber and connected to one of the cut-out valves, springs bearing on said pistons in direction to unseat the cut-out valves, and steam-supply pipes leading from the piston-chambers, on the sides of the pistons opposite the springs, to a connection with the steam-supply passage of the cylinder.

3. The combination, with a locomotive-cylinder, of a circulating-pipe, cut-out valves, each controlling communication between one end of said pipe and the adjacent end of the cylinder, pistons, each fitting in a piston-chamber and connected to one of the cut-out valves, steam-supply pipes leading from the piston-chambers to a connection with the steam-supply passage of the cylinder, and a check-valve controlling the flow of steam through said supply-pipes, said check-valve opening in the direction of the piston-chambers and having a discharge-passage for the exhaust of steam therefrom.

4. The combination, with a locomotive-cylinder, of a circulating-pipe, cut-out valves, each controlling communication between one end of said pipe and the adjacent end of the cylinder, pistons, each fitting in a piston-chamber and connected to one of the cut-out valves, a tubular connection leading into the steam-supply passage of the cylinder and having its open end therein facing the flow of steam through said passage, and steam-supply pipes leading from said tubular connection to the piston-chambers.

5. The combination, with a locomotive-cylinder, of two valve-chambers, each connected to and open into one end of said cylinder, a circulating-pipe connected, at its opposite ends, to said valve-chambers, cut-out valves, each seating at one end of the circulating-pipe and subject to steam-pressure in closing direction only, and controlling communication between said end of said pipe and the connected valve-chamber, piston-chambers, each connected to one of the valve-chambers, pistons, each fitting in one of the valve-chambers and connected to a cut-out valve, steam-supply pipes leading from the piston-chambers to a connection with the steam-supply passage of the cylinder, and means for automatically unseating the cut-out valves when pressure is relieved in the steam-supply passage.

6. The combination of a locomotive-cylinder, cylinder-heads secured removably to and closing the ends thereof, two valve-chambers, each connected to one of the cylinder-heads and open to the cylinder through the same, a circulating-pipe connected, at its opposite ends, to said valve-chambers, cut-out valves, each seating at one end of the circulating-pipe and subject to steam-pressure in closing direction only, and controlling communication between said end of said pipe and the connected valve-chamber, piston-chambers, each connected to one of the valve-chambers, pistons, each fitting in one of the valve-chambers and connected to a cut-out valve, steam-supply pipes leading from the piston-chambers to a connection with the steam-supply passage of the cylinder, and means for automatically unseating the cut-out valves when pressure is relieved in the steam-supply passage.

7. The combination, with a locomotive-cylinder, of two valve-chambers, each connected to and communicating with one end of said cylinder, a circulating-pipe connected, at its opposite ends, to said valve-chambers, cut-out valves, each controlling communication between one end of the circulating-pipe and the connected valve-chamber, piston-chambers, each connected to one of the valve-chambers, pistons, each fitting in one of the piston-chambers and connected to a cut-out valve, steam-supply pipes leading from the piston-chambers to a connection with the steam-supply passage of the cylinder, and atmospheric relief-valves each connected to one of the valve-chambers.

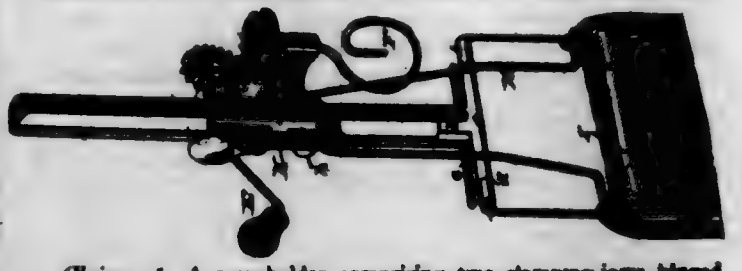
704,181. CULTIVATOR. CHARLES W. SLEETER, Decatur, Ill. Filed Nov. 16, 1901. Serial No. 82,607. (No model.)

Claim.—1. A device of the kind described, comprising a central draft-beam, beams arranged parallel thereto and having their forward ends provided with supporting-wheels, rack-bars adjustably held in the forward ends of the beams and adapted to carry cultivator-points, spring-pawls arranged upon the beams for engagement with the said rack-bars and means connecting the said draft-beam and parallel beams for adjustably holding the said beams parallel to the draft-beam, substantially as shown and described.

2. The combination of a central draft-beam having a slot arranged therein, parallel beams arranged upon either side of the draft-beam and having slots arranged therein, their forward ends being provided with brackets, wheels journaled in the said brackets, semicircular bars adapted to be held in the said parallel beams and having cultivator-points arranged upon the ends thereof, brackets journaled upon the axles of the said wheels and having their ends connected to the said semicircular bars and means carried by the said parallel beams for holding the semicircular bars firmly in position, bars pivotally held at one end to the draft-beam and having their outer ends pivotally connected to the parallel beams and bracing-arms pivotally connected to the parallel bars at one end and having their opposite ends provided with apertures through which passes a bolt that is adapted to operate in the slot of the said draft-beam and means for holding the said arms to the beam, substantially as shown and described.

3. The combination of a central draft-beam having a slot arranged therein, parallel beams arranged upon either side of the said draft-beam, and having slots arranged in the forward ends thereof, bars connecting the said beams, supporting-wheels carried by the parallel beams, semicircular rack-bars held in the slots of the parallel bars, and adapted to carry cultivator-points, spring-pawls arranged for engagement with the rack-bars, a breastplate arranged upon the rear end of the draft-beam and grip-handle sections arranged upon the parallel beams, substantially as shown and described.

704,182. MOP HOLDER AND WRINGER. ARTHUR W. SMITH, New York, N. Y. Filed Apr. 30, 1902. Serial No. 105,176. (No model.)



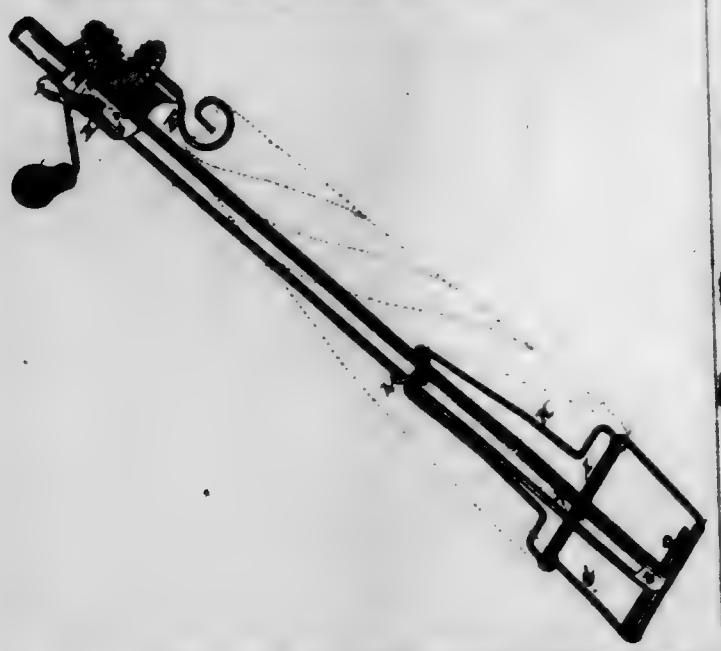
Claim.—1. A mop-holder comprising two clamping-jaws hinged together at their lower ends, one of said jaws being pivotally connected with the handle and the opposite jaw adapted to slide on said handle, whereby the two jaws with the mop may be elevated, substantially as and for the purpose set forth.

2. A mop-holder consisting of a suitable handle having laterally-extending tubular arms, a clamping-jaw having inwardly-extending ends to engage with the tubular arms and bearing-eyes at its lower end, a second clamping-jaw having a loop at its upper end through which the handle

extends, and at its lower end having inwardly-extending ends to engage the bearing-eyes, and a tubular bearing-roller located between the eyes, substantially as and for the purpose specified.

3. In a mop-holder, the combination with a suitable slidable wringing device provided with means for holding it in operative position, of two clamping-jaws hinged together at their lower ends and one of the jaws being pivotally connected with the handle and the opposite jaw having a loop at its upper end through which the handle extends and adapted to slide upon the handle, substantially as and for the purpose described.

704,138. MOP HOLDER AND WRINGER. ARTHUR W. SMITH, New York, N. Y. Filed Apr. 29, 1902. Serial No. 105,177. (No model.)



Claim.—1. The combination with a mop-holder having two pivoted and hinged jaws, of a wringer provided with a hook device for engaging the mop, said wringer provided with a sleeve slidable upon the handle of the mop-holder, and a spring-actuated latch for holding the sleeve against rotation and holding it in a lowered or raised position, substantially as and for the purpose set forth.

2. A mop-holder comprising two hinged and pivoted clamping-jaws, one of said jaws having a loop at its upper end and a handle extending through the loop, a longitudinal groove in the handle and sockets in the groove, and a suitable wringer slidable upon the handle, and a spring-actuated latch to engage the groove and sockets to hold the wringer from turning upon the handle and also hold it stationary in either a lowered or elevated position, substantially as and for the purpose specified.

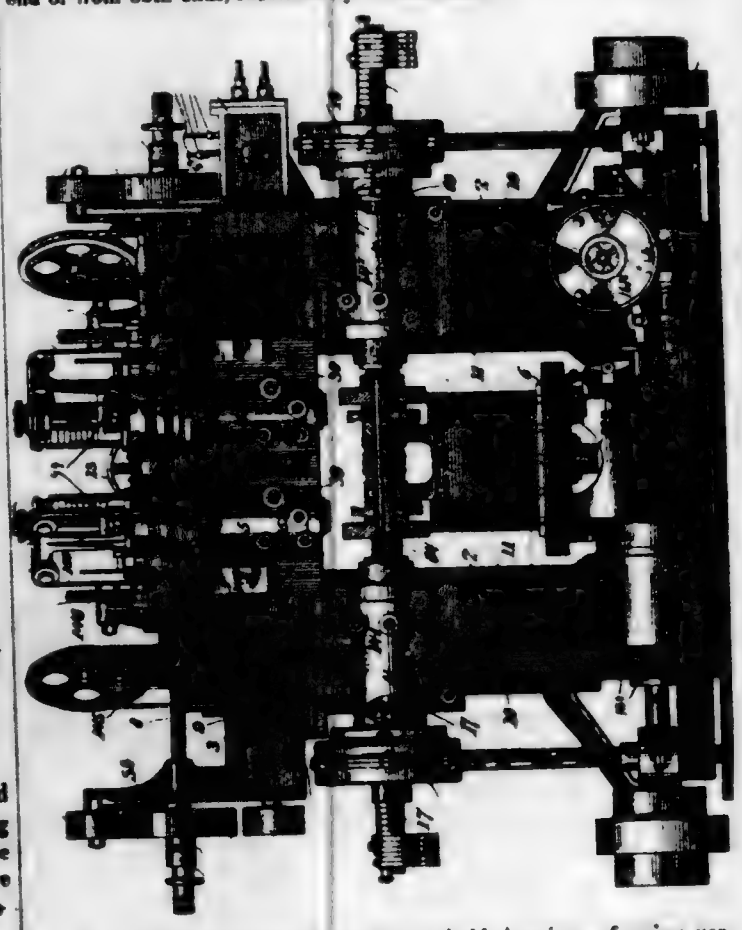
704,184. MILLING-MACHINE. GEORGE W. SMITH, Rockford, Ill., and ROBERT J. LEES, Franklin, Pa., assignors to the Ingersoll Milling Machine Company, a Corporation of Illinois. Filed Sept. 21, 1901. Serial No. 76,107. (No model.)

Claim.—1. In a milling-machine, the combination with a suitable frame, of adjustable vertical milling-heads mounted thereon, and adjustable horizontal milling-heads also on said frame, cutters carried by all of said heads, means for communicating a rotary motion to the said cutters no matter what the adjusted position of the milling-heads, means for adjusting the vertical heads simultaneously or separately toward or away from each other, and means for operating all of the said cutters simultaneously or any one or more of them without the others, substantially as described.

2. In a milling-machine, the combination with a frame, a plurality of horizontal milling-heads, and a plurality of vertical milling-heads, and means for adjusting the said milling-heads vertically and horizontally irrespective of each other, of means for operating any one of the milling-heads separately or in conjunction with any other milling-head, the operation of any of the milling-heads either separately or conjointly not interfering with the operation of others, substantially as described.

3. A milling-machine, comprising a suitable frame, and housings, a plurality of vertical milling-heads adjustably mounted in said frame, means for adjusting them simultaneously or separately in either direction, a shaft common to said milling-heads, and means connecting the shaft with each milling-head for driving rotary cutters at different rates of speed, and changing from one speed to another, substantially as described.

4. A milling-machine comprising a suitable frame, a vertically-adjustable cross-rail movable upon the said framing, vertical milling-heads adjustably mounted on the said cross-rail, spindles carried by said heads, a shaft carried by the said cross-rail for actuating the vertical milling-spindles, means for driving the said shaft from either or both ends thereof comprising loose pulleys mounted thereon, clutch members on the said shaft for engaging the said pulleys, and belts engaging each of the said loose pulleys and receiving their power from any suitable source, together with idler-pulleys also carried by the said cross-rail for maintaining the belt taut no matter what the position of the cross-rail, the said clutches making it possible to connect the belt-wheels with the said shaft at one or both ends thereof as found desirable for actuating the shaft from either end or from both ends, substantially as described.



5. A milling-machine comprising a suitable housing or framing, vertical milling-heads mounted thereon, spindles carried by said heads, a shaft for operating them, means for driving the said shaft from either or both ends, comprising belt-engaging pulleys loosely mounted on said shaft, the hubs of said pulleys being formed with clutch-engaging teeth, spring-pressed clutch members splined upon the said shaft and having teeth for engaging the teeth upon the said pulleys, and spring-controlled plungers or detents carried by the said clutch members for engaging recesses formed in the shaft, so that the clutch members may be held out of engagement when desired, and when the shaft is being driven by belts on both sides of the machine any unevenness in the length of the belts will be compensated by the slipping of one or the other of the clutch members, substantially as described.

6. A milling-machine comprising a frame, milling-heads mounted thereon, cutter-actuating spindles carried by the said milling-heads, depth-gages applied to the said spindles comprising a series of gage-blocks adapted to be swung against the spindles separately or together, clamp-collars secured to the spindles and adjusting-collars engaging the clamp-collars, the depth to which the cutters will be operated being quickly and accurately gaged, substantially as described.

7. In a milling-machine the combination with suitable cutter-operating spindles, depth-gages for the said spindles comprising a series of gage-blocks, a standard near each spindle for pivotally supporting the said gage-blocks, the said gage-blocks being formed with concaved recesses so that they may fit closely around the spindles, a clamp-collar secured to each spindle, an adjustable collar engaging threads upon each of the clamp-collars, the gage-blocks being made of predetermined thickness and the adjustable collars being movable so as to secure fractional parts of said thickness, the depth to which the spindles will be permitted to operate being regulated to the thousandth part of an inch, substantially as described.

8. In a milling-machine the combination with vertical and horizontal cutter-spindles of depth-gages, arranged at their outer ends for regulating the depth of the cuts, comprising standards or bases secured to the frame of the machine and surrounding the said spindles, standards or rods projecting therefrom, a series of gage-blocks pivoted to the said standard so that they may be swung against or away from the said spindles, the said gage-blocks being made of a predetermined thickness and formed with concaved recesses so that they may fit around the spindles, clamp-

collars fastened to the spindles, and adjustable collars engaging screw-threads upon the said clamp-collars adjustments to the fraction of an inch being thus obtained, the said adjusting gage-blocks affording means for obtaining quickly approximate adjustments to the proper depth, substantially as described.

9. A milling-machine comprising adjustable milling-heads, cutters carried thereby, and a frame for supporting the same, spindles for carrying the milling-cutters arranged horizontally in the said milling-heads, means for adjusting said spindles toward or away from each other, means for rotating the said spindles, an intermediate spindle for connecting the said horizontal spindles, so that when horizontal cutters are being employed they may be actuated simultaneously from both sides of the machine by the said horizontal spindles thus connected, substantially as described.

10. A milling-machine comprising a suitable housing upon the frame of the machine, horizontal milling-heads movable thereon, spindles mounted in the said milling-heads, gearing for rotating the said spindles, clutches for connecting the spindles with the said gearing, the said clutches being splined upon the said spindles so as to rotate therewith and yet capable of longitudinal movement thereon, levers for moving the said clutches to bring them into engagement with the said gearing, an intermediate connecting-spindle for joining the said horizontal spindles, the said intermediate spindle having tapered ends adapted to be keyed in the ends of the horizontal spindles so as to make practically one shaft of them, the arrangement of the clutches being such that the said spindles and shaft may be driven from either one or both sides of the machine, the levers affording means for bringing the clutches again into engagement with the gearing when they have been thus thrown out of such engagement, substantially as described.

11. A milling-machine comprising a suitable frame, a cross-rail adjustable thereon carrying vertical milling-heads, horizontal milling-heads movable on said frame, means for adjusting the cross-rail vertically on the frame and separate means for adjusting the horizontal milling-heads vertically on the frame and means for connecting the horizontal milling-heads with the cross-rail so that they may be adjusted simultaneously by one of said adjusting means, substantially as described.

12. A milling-machine comprising a suitable frame, a cross-rail carrying milling-heads mounted thereon, means for adjusting the said cross-rail vertically in the frame of the machine, horizontal milling-heads also vertically adjustable upon said frame by independent means, means for securing the horizontal heads to the cross-rail comprising bolts pivoted at their lower ends to the said horizontal heads, nuts engaging threads upon the said bolts, the said cross-rail having slotted recesses formed in its lower edge for receiving the said bolts and nuts, so that by connecting the said horizontal milling-heads with the cross-rail they may be moved simultaneously therewith and will be held exactly opposite to each other during the said movement, substantially as described.

13. A milling-machine, comprising a suitable framing, vertical milling-heads mounted thereon, spindles for carrying milling-cutters mounted therein, a plurality of trains of gearing adapted to be connected with said cutters for rotating them, and mechanism for connecting the cutters directly with one of said trains of gearing or indirectly therewith through the other train of gearing, so that the cutters may be revolved at different speeds by changing the gearing, substantially as described.

14. In a milling-machine the combination with a suitable frame of an adjustable cross-rail, vertical milling-heads adjustably mounted thereon so that they may be moved to different positions in the machine, one or more trains of gearing connected with a source of power and adapted to be connected with the spindles of the said milling-heads for imparting a rotary motion thereto, a plurality of shafts carrying said gearing, the adjustment of the cross-rail and of the milling-heads to different positions on the machine not interfering in the least with the operation of the said gears, and means for bringing the gears into engagement with one shaft directly or indirectly through the agency of the other shaft, or throwing them out of engagement therewith when they are not being used, substantially as described.

15. In a milling-machine, the combination with a suitable frame of an adjustable cross-rail, movable milling-heads mounted thereon, a shaft common to a plurality of the said milling-heads, counter-shafts adjacent to said common shaft, gearing connecting the counter-shafts with the common shaft, the common shaft being adapted to operate the milling-heads directly through some of the gearing or indirectly through other gearing of the said counter-shafts, cutter-actuating spindles in the milling-heads having gears adapted to engage the gearing upon the said shafts, and clutches for throwing the said gears into or out of engagement with the said spindles, substantially as described.

16. In a milling-machine, the combination with a frame of vertical milling-heads adjustably mounted thereon, an actuating-shaft arranged across the machine so that it may be caused to actuate the milling-heads, cutter-carrying spindles in each of the milling-heads, upper and lower gears loosely mounted on the said spindles, clutches for connecting the gears with the said spindles, gearing upon the said cross-shaft for engaging one set of gears on the spindles, a counter-shaft mounted in suitable proximity to the cross-shaft, gearing for transmitting motion from the cross-shaft to the counter-shafts, and gears upon the counter-shaft for engaging the other set of gears upon the spindles, and clutches for controlling the said gears, either set of gears being used to drive the spindles, so that different speeds may be imparted to the same according to the train of gears which is selected, substantially as described.

17. In a milling-machine the combination with a suitable frame of laterally-adjustable vertical milling-heads mounted thereon, a cross-shaft supported in the machine so as to actuate each of the said milling-heads, counter-shafts adjacent to said cross-shaft and geared thereto, two trains of gearing connecting the spindles of the milling-heads with the cross-shaft and counter-shafts, and means for throwing either train of gearing into engagement for driving the spindles directly by the cross-shaft or indirectly through the counter-shafts, substantially as described.

18. In a milling-machine the combination with a suitable frame of laterally-adjustable vertical milling-heads mounted thereon, cutter-carrying spindles mounted in each milling-head, a cross-shaft for actuating the said milling-heads, two trains of gearing for connecting the said cross-shaft with the said spindles, one comprising worm-gears directly connecting the said spindles with the said shaft, and the other comprising counter-shafts, gearing for connecting the counter-shafts with the cross-shaft, and spiral gearing connecting the counter-shaft with the said vertical spindles, clutches for throwing either the worm-gearing or the spiral gearing into engagement with the spindles, and clutches for connecting the counter-shafts with the gearing interposed between them and the said cross-shaft, substantially as described.

19. In a milling-machine the combination with a suitable frame of vertical milling-heads adjustably mounted thereon, spindles mounted in the said milling-heads, upper and lower gears loosely mounted thereon, splined clutches for connecting each gear to the spindle, levers for operating the said clutches, gears upon the cross-shaft for engaging the lower gears on the spindles, counter-shafts arranged above the cross-shaft, gearing connecting the counter-shafts and cross-shaft, clutches for throwing the gearing into and out of engagement with the said counter-shafts, and gearing connecting the counter-shafts with the upper gears upon the spindles, either the upper or the lower train of gearing being employed for actuating the spindles according to the speed with which it is desired to operate the same, substantially as described.

20. In a milling-machine the combination with a suitable frame of vertical milling-heads mounted thereon, means for raising and lowering the milling-heads, cutter-actuating spindles mounted in each of the milling-heads, means for raising or lowering either of the spindles independently of each other in the milling-heads, and independently of the milling-head adjustments, comprising sleeves supporting the said spindles, and vertically movable in the milling-heads, racks upon the said sleeves, and pinions for engaging the said racks, gearing splined to the upper portion of the said spindles, and means for throwing the said gearing into and out of engagement with the spindles, the spindles being adjusted vertically without interfering with their connection with the driving-gearing, substantially as described.

21. In a milling-machine the combination with a suitable frame of a cross-rail mounted thereon, means for raising or lowering the said rail on the said frame, vertical milling-heads adjustably mounted upon the said cross-rail, whereby they may be moved laterally to different points in the machine, vertical spindles mounted in the milling-heads, a cross-shaft carried by the cross-rail and arranged so as to be common to both the milling-heads, gearing interposed between the said cross-shaft and the said vertical spindles, the said gearing being some of it splined to the cross-shaft and some of it splined to the vertical spindles, suitable casings for holding the gearing in place with respect to the milling-heads, the milling-heads being adjusted up or down in the machine or laterally without interfering with the actuating-gearing, substantially as described.

22. In a milling-machine the combination with a suitable frame of vertical milling-heads mounted thereon, vertical spindles mounted in each milling-head, a cross-shaft mounted upon the machine so that it may be employed or actuated in said milling-heads, casings mounted upon the said milling-heads so as to surround a portion of the said shaft as well as a portion of each of the said spindles, counter-shafts carried in each of the said casings, spur-gears connecting the counter-shafts with the said cross-shaft, an actuating-gear upon the cross-shaft opposite each spindle, an actuating-gear upon each counter-shaft opposite each spindle, gears upon the spindles meshing with the gears upon the cross-shaft and counter-shafts, and clutches for controlling all of the said gears, the counter-shaft transmitting either motion directly to the spindles or indirectly through the counter-shafts for varying the speed with which the spindles are driven, substantially as described.

23. In a milling-machine the combination with a suitable frame of

horizontal milling-heads mounted thereon, horizontal spindles carried thereby, vertical actuating-shafts arranged in suitable proximity to the said spindles, and gearing connecting the vertical shafts with the spindles, some of the said gearing being splined to the vertical shafts and some of the said gearing being splined to the said spindles, clutch mechanisms for connecting or disconnecting the parts, and means for raising or lowering the milling-heads on the frame, and means for adjusting the horizontal spindles in and out in the milling-heads, the splined engagement of the gears with the said shafts and with the said spindles permitting of such adjustment, substantially as described.

24. In a milling-machine the combination with the main frame of horizontal milling-heads mounted thereon, and adapted to be vertically adjusted, horizontal spindles carried by the said milling-heads, vertical shafts for driving the spindles, casings carried by the milling-heads and inclosing portions of the vertical shafts and portions of the said spindles, counter-shafts mounted in the said casings and connected by gearing with the said vertical shafts, a train of gearing connecting each vertical shaft with each spindle, and gearing connecting each counter-shaft with each spindle, and clutches controlling the said gearing, the horizontal spindles being driven directly from the vertical shafts at one speed and indirectly through the counter-shafts at another speed, substantially as described.

25. In a milling-machine the combination with a supporting-frame of vertical and horizontal milling-heads mounted thereon, spindles carried by each of the milling-heads, means for adjusting the vertical milling-heads vertically in the machine and means for adjusting them longitudinally, means for adjusting the spindles in said vertical heads independently of each other in a vertical manner, comprising racks, sleeves carrying the said racks and holding the said spindles, and pinions for actuating the said racks, means for adjusting the horizontal milling-heads vertically in the machine, means for adjusting the horizontal spindles back and forth in their respective heads independently of each other, comprising racks formed upon sleeves and attached to the spindles, and pinions for engaging the same, substantially as described.

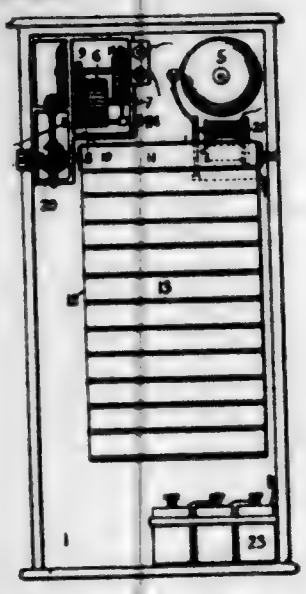
26. In a milling-machine the combination with a supporting-frame of laterally-adjustable vertical milling-heads mounted thereon, feed screw-rods for moving the said milling-heads back and forth, adjustable gearing interposed between the said rods, means for controlling the said gearing whereby the feed-rods may be connected thereby or disconnected, a pulley for actuating the gearing, a shaft carrying the same, speed-controlling friction feed-disks connected with the said shaft, reversible gears for receiving motion from the said feed-disks, and a train of gears for connecting the said reversible gears with the gears of the feed-rods, both rods being driven simultaneously by power in either direction or by hand separately and independently of each other, substantially as described.

27. In a milling-machine the combination with a supporting-frame of laterally-adjustable vertical milling-heads mounted thereon, feed-rods for moving the milling-heads back and forth on the machine, gearing connecting the feed-rods, an idler-pulley mounted in the frame in suitable proximity to said gearing and adapted to engage one of the driving-belts of the machine, speed-controlling feed-disks for receiving motion from the shaft of the said pulley, a lever for operating the said disks, reversible gears receiving motion from the said feed-disks, a lever for operating the said reversible gears, a train of gearing connecting the reversible gears with the gearing upon the feed-rods, and a casing formed with bearings for supporting the arbors and shafts of all the said gears, substantially as described.

28. In a milling-machine the combination with a supporting-frame of laterally-adjustable vertical milling-heads mounted thereon, a cross-rail for supporting them, means for raising or lowering the cross-rail, and depth-gages for limiting their downward movement comprising adjustable members secured to the vertical housings of the machine on both sides thereof, and a fixed member secured to the cross-rail opposite each of the adjustable members, an adjusting-screw carried by the said adjustable members and adapted to be engaged by the fixed members, the said stops being very accurately adjusted by means of said screws for permitting the cross-rail to descend the same depth a number of times, substantially as described.

29. In a milling-machine the combination with a supporting-frame of a cross-rail mounted thereon, and carrying milling-heads, a depth-gage for controlling the depth to which the cross-rail may be lowered in the machine comprising a movable member secured to each side of the machine, bolts engaging vertically-arranged grooves in the housings of the machine for holding the movable members in their different adjusted positions, an adjusting-screw carried by each movable member, a clamp-screw for clamping the said adjustable screw when they have been arranged at the desired height, a fixed member secured to the cross-rail opposite each adjustable member, a bolt arranged in each fixed member so that its head forms a contact or bearing surface for engaging the end of the adjusting-screw held by its corresponding movable member, and means for adjusting the said adjusting-screws, substantially as described.

704,185. STATION-INDICATOR. HARRY T. SMITH and ARTHUR J. TARRANT, Christchurch, New Zealand. Filed Jan. 14, 1902. Serial No. 89,660. (No model.)



Claim.—1. A station-indicator comprising a case provided with a door, an opening and grating in said door, a wound coiled spring attached to and turning a spindle, a ratchet-wheel secured thereto, a spring-compressed pawl secured to a toothed wheel running loose on said spindle and engaging said ratchet-wheel; intermediate gearing operating a removable four-sided roller carrying an endless belt having lathe attached thereto for the inscription of station-names, a slotted escapement-lever with two steps spanning an escapement-disk provided with studs, said escapement-lever carrying an armature attracted by a magnet, and a spiral spring to withdraw same, beveled gearing to reverse the movement of said roller, and magnets to operate said escapement-lever connected electrically with any convenient source of current all substantially as described.

2. A station-indicator comprising a case provided with a door, an opening and grating in said door, a wound coiled spring attached to and turning a spindle, a ratchet-wheel secured thereto, a spring-compressed pawl secured to a toothed wheel running loose on said spindle and engaging said ratchet-wheel, intermediate gearing operating a removable four-sided roller carrying an endless belt having lathe attached thereto for the inscription of station-names, a slotted escapement-lever with two steps spanning an escapement-disk provided with studs, said escapement-lever carrying an armature attracted by a magnet, and a spiral spring to withdraw same, beveled gearing to reverse the movement of said roller, in combination with an electric bell, and magnets to operate said escapement-lever and bell connected electrically in parallel with any convenient source of current all substantially as described.

704,186. EXPANDING REAMER FOR OIL OR ARTESIAN WELLS. JONAS P. SMITH, Peru, Ind., assignor of one-half to James A. Beverly, Omaha, Nebr. Filed Feb. 20, 1902. Serial No. 94,980. (No model.)

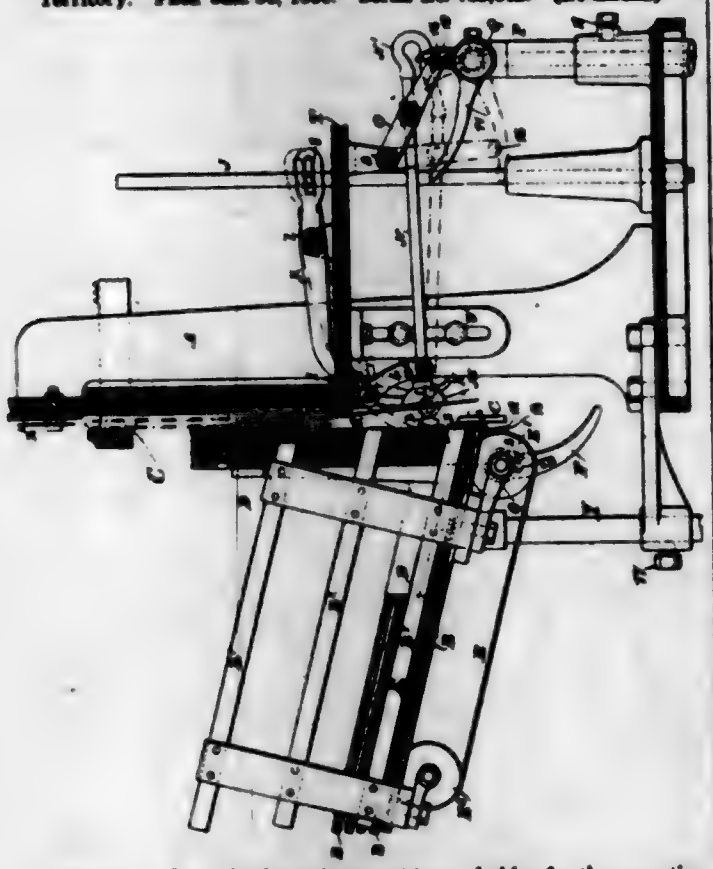
Claim.—1. The combination in an expanding reamer for boring oil-wells or other Artesian wells, of a reamer-body having a slot or opening therein, a pair of cutter-jaws pivoted together at their upper ends and so mounted in said slot or opening as to move up and down therein, a block connecting the central part of the sides of the body together in the lower portion of said slot or opening, bearings on the jaws adapted to contact with said block when the jaws are raised in said slot, and means for retaining the jaws in a normally upraised position, substantially as and for the purpose set forth.

2. The combination in an expanding reamer for boring out oil or other Artesian wells, of a reamer-body having a vertical slot or opening therein, a tapering block connecting the central portion of the sides of the body together at the lower end of the slot, a pair of cutter-jaws pivoted together at their upper ends and arranged to slide vertically in said slot or opening, so that their lower portions extend down past each side of said central block, grooves in the body at each side of said block, ribs or guides on the jaws operating in said grooves, and spring-actuated mechanism operating to raise the jaws in the body, substantially as and for the purpose set forth.

3. The combination in an expanding reamer for boring oil or other Artesian wells, of a reamer-body A provided with a screw-threaded pin *a*, and having a slot or opening B therein with its upper end *b* circular,

and depressions or grooves *b'* and D D in the inside faces of said slot or opening, a tapering block C connecting the sides A' A' of the body A between the depressions or grooves D D, a pair of jaws E E pivoted together at their upper ends by means of a pin *a*, and having their joint circular so as to fit against the surface *b*, bearing-surfaces E' E' on the lower portions of the jaws adapted to fit against the sides of the block C, and ribs *c' c'* thereon adapted to fit into the grooves D D, and a spring-actuated rod F adapted to raise the jaws in the slot or opening B in the reamer-body, substantially as and for the purpose set forth.

704,187. FEEDING MECHANISM FOR SEWING-MACHINES. DAVID M. SMYTH, Pasadena, Cal., assignor, by mesne assignments, to Smyth Machine Company, Hartford, Conn., a Corporation of Arizona Territory. Filed Jan. 30, 1900. Serial No. 703,812. (No model.)



Claim.—1. In a book-sewing machine, a holder for the reception of signatures composed of a bottom and connected end portion at right angles to each other, the bottom being inclined downwardly toward its delivery edge and also longitudinally tipped so that the side to which the end portion is connected is lowest, the bottom having a portion along the delivery edge that in section is horizontal and level, substantially as specified.

2. The combination with the signature-holder, of the rock-shaft G, an arm L connected to said rock-shaft, the sucker M hinged to said arm, the tubular rod N connected at one end to said sucker, a pivoted lever O to which the other end of said rod N is connected, a pipe and cock connected to said tubular rod N and the arm 19 and lever 11 upon the cock against which the lever O acts to open and close said cock, substantially as specified.

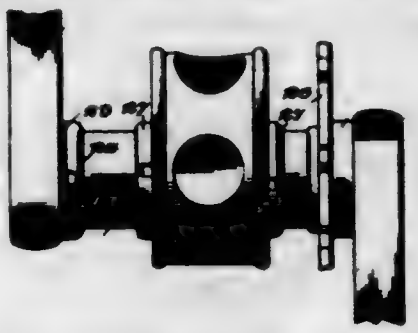
3. The combination with the holder for a pile of signatures, a sucker for opening the lower signature in the pile of signatures by moving half of the signature away from the other half, an endless belt and pulleys for moving the pile of signatures toward the place of delivery, an adjustable stop R acting near the junction of the folded back and top edges of the signatures for preventing the signatures moving too far as they slide down the holder, a spring-claw acting at the lower edges of the signatures and means for giving motion to said endless belt, substantially as specified.

4. In a book-sewing machine the combination with the sheet-holding arm, of a signature-holder composed of a bottom and connected end portions at right angles to each other, said bottom being inclined downwardly toward its delivery edge and also longitudinally tipped so that the side to which the end portion is connected is lowest, an endless belt in the bottom and near the lower corner and end portion of the holder and inclined longitudinally to agree with the inclination of the signature-holder and parallel therewith and upon which belt the edges of all the signatures rest, pulleys around which the belt passes and a ratchet, pawl and lever-arm actuated by the sheet-holding arm for moving the belt progressively to carry the signatures toward said arm, substantially as specified.

5. In a book-sewing machine, the combination with the sheet-holding arm, of a signature-holder composed of a bottom and connected end portions at right angles to each other, said bottom being inclined downwardly toward its delivery edge and also longitudinally tipped so that the side to which the end portion is connected is lowest, an endless belt in the bottom and near the lower corner and end portion of the holder and inclined longitudinally to agree with the inclination of the signature-holder and parallel therewith and upon which belt the edges of all the signatures rest, pulleys around which the belt passes, and means for moving the belt progressively to carry the signatures toward said arm, substantially as specified.

6. The combination with the holder for a pile of signatures, of means for opening the lower signature in the pile of signatures by moving half of the signature away from the other half, an endless belt and pulleys for moving the pile of signatures toward the place of delivery, a pivoted spring-claw acting at the lower edges of the signatures, and means for giving motion to the endless belt intermittently, substantially as set forth.

704,188. CRANK-HANGER. WILLIAM R. SPENCER, Chicago, Ill. Filed Sept. 19, 1900. Serial No. 30,495. (No model.)



Claim.—1. The combination with a hanger-band and separate heads, of a hanger-sleeve piercing the heads eccentrically and capable of endwise adjustment, and locking-rings screwed upon the sleeve and clamping against the outer faces of the heads to retain the sleeve in its adjusted positions and to retain the heads in place.

2. The combination with a hanger-band and heads provided with openings and with annular concavities receiving the opposite edges of the band and openings, of internally-threaded locking-rings extended into the openings of the heads and having shoulders opposed thereto, and a hanger-sleeve piercing the heads and externally-threaded for engagement with the locking-rings, and a bolt extending from one head and loosely engaging the other to maintain their proper relative positions.

3. The combination with a hanger-band frame-tubes connected thereto and heads adjustable with respect to the band, of a hanger-sleeve connected to the heads for endwise adjustment, independent of the heads and located at a point eccentric to said heads.

4. The combination with a hanger-band and movable heads, of a hanger-sleeve piercing the heads eccentrically and capable of endwise adjustment independent thereof, and means for retaining the heads in its endwise adjusted position and for retaining the sleeve in fixed relation to the heads.

5. The combination with a hanger-band and heads, of a hanger-sleeve piercing the heads eccentrically and capable of endwise adjustment, and locking means screwed upon the sleeve and clamping the heads to retain said heads in fixed relation to the band and to retain the sleeve in fixed relation to the heads.

6. The combination with a crank-hanger comprising a band, heads disposed against the opposite edges of the band and capable of rotary movement, means for compelling the heads to move in unison, an endwise-adjustable hanger-sleeve piercing the heads eccentrically, and locking-rings clamping said heads.

7. The combination with a hanger-band and heads provided with eccentric openings and with annular cavities receiving the opposite edges of the band, of internally-threaded locking-rings extended into the openings of the heads and having shoulders opposed thereto, a hanger-sleeve piercing the heads and externally threaded for engagement with the locking-rings, and a bolt extending from one head and loosely engaging the other to maintain their proper relative positions.

8. The combination with a hanger-band, frame-tubes connected thereto, and adjustable heads opposed to the opposite edges of the band and provided with eccentric openings, of a hanger-sleeve extended through the eccentric opening in the head, and locking-rings screwed upon the sleeve beyond the heads and bearing against the same, whereby said rings perform the dual function of means for adjustably retaining the sleeve in the heads and for adjustably retaining the heads in contact with the hanger-band.

704,189. FOOD-GUARD. ALITA M. STARKMAN, New Rochelle, N. Y. Filed Aug. 27, 1901. Serial No. 73,433. (No model.)

Claim.—1. A food-guard comprising a strip constructed to be disposed edgewise upon and at right angles to the bottom of the plate, and an arm projecting from said strip and disposed at right angles thereto for securing it in place on a plate.

2. A food-guard comprising a strip to be disposed on a plate, and a clamp projecting from said strip, said clamp comprising a member to be disposed under the plate and a member to press upon the upper face of the flange of the plate.

3. A food-guard comprising a strip to be disposed on a plate and means to engage the top and bottom of the plate for positively locking said strip in place on the plate.

4. A food-guard comprising a strip to be disposed on a plate, and an arm to embrace the flange of the plate and having a notch to receive the bead on the bottom of the plate for locking the device in place.

5. A food guard or stop comprising a segmental shield or abutment, an integral clamping-arm thereon adapted to project beneath a plate to secure the shield in place, and a spring-tongue integral with said arm and adapted to press against the upper edge of the plate.

704,140. MEANS OR APPARATUS FOR COOKING EGGS. LUCY H. STOCKS, Leeds, England. Filed July 1, 1901. Serial No. 66,735. (No model.)

Claim.—1. In an egg-poacher the combination of a semispherical and perforated body divided into two portions jointed together at a point above the upper edge, a horizontally-projecting handle attached to the upper edge of each portion of the semispherical body for opening purposes, and a handle attached to the portions of the semispherical body above the upper edge for carrying purposes substantially as set forth.

2. In an egg-poacher, the combination of a perforated semispherical body formed in two portions out of a blank stamped to a concavo-convex shape provided with an irregular division-line at the points where the two portions meet and fit into each other, projections on the said semispherical body portion by which the said two portions are jointed together above their upper edge, a pivot-pin on which the said two parts turn, and horizontally-projecting loop-handles on the semispherical body portion for opening purposes, as set forth.

3. In an egg-poacher, the combination of a perforated body formed in two portions, each portion having projections by which the body portions are jointed together above their upper edge, said projections being of different lengths, a pivot-pin for jointing the two body portions together, handles attached as described to upper edge of said body portions for opening purposes, and a handle for carrying purposes attached to the longer projections, substantially as set forth.

704,141. STREET-CAR FENDER. CHARLES T. STOELTING, St. Louis, Mo. Filed Dec. 9, 1901. Serial No. 85,281. (No model.)

Claim.—1. A car-fender comprising a bar supporting the fender-rods, means for allowing lateral and vertical movement of the bar, rods carried by said bar and free to move thereon, a shaft carried by the frame and allowed to move in slots formed in lower ends of the rods, auxiliary wheels mounted on the shaft, a plurality of peculiarly-bent springs carried by the frame and means whereby the fender will follow the rails while turning a curve, substantially as specified.

2. A car-fender of the class described, comprising a horizontal bar, a slot formed in the bar, recesses formed in the ends of the bar, fender-rods movably secured in said recesses, a brace connecting the fender-rods a shaft pivotally connected to the brace, its ends moving freely in slots formed in the lower ends of the fender-rods, and a plurality of spring-straps carried by the fender-frame, substantially as specified.

3. A car-fender, comprising a suitable frame, movable joints securing together the frame, a plurality of spring-straps connected to said frame, and means whereby lateral and vertical movement of the fender is permitted, and means whereby the fender is folded against the car.

4. A car-fender, comprising a pair of rods, wheels mounted in the lower ends thereof, a fender-frame carried by said rods, a bar pivotally connected to a car-platform, to allow the bar to have a lateral movement, and swinging joints to connect the rods and the bar together to allow a vertical movement to the fender.

5. In combination with a car having mounted thereon a pivot and springs, of a car-fender comprising a bar mounted upon said pin, a pair of rods swingingly connected to the bar, and a fender-frame carried by the rods.

6. In combination with a car having mounted thereon a pivot and a spring surrounding the pivot, of a car-fender comprising a bar mounted upon said pivot above the spring, a pair of rods having wheels to engage the rails mounted in their lower ends pivotally connected to said bar, and a fender-frame supported by the rods.

704,142. LOADING APPARATUS. JACOB STRAUB, Campbellsport, Wis. Filed Apr. 10, 1902. Serial No. 102,267. (No model.)

Claim.—1. In a loading apparatus, the combination with a sectional and portable structure embodying an overhead rail, a carrier mounted to travel on said rail and an operating-cable for the carrier, of a scoop detachably connected with the carrier, a suspending-ring, a sectional bail consisting of two arms having a loose pivotal connection with the suspending-ring and a hooked detachable connection with the scoop, and a combined hook-arm and trip-lever mounted on the suspending-ring, the hook-arm being adapted to support the scoop in a substantially horizontal position when filled, substantially as described.

2. In a loading apparatus, a scoop provided with oppositely-located holes in its sides and in rear of its center, in combination a detachably jointed bail comprising a pair of downwardly-diverging arms having hooked lower ends for insertion in the holes in the sides of the scoop and having their upper ends pivotally connected with a suspending-ring, and a combined hook-arm and trip-lever pivotally connected with the suspending-ring, the hook-arm being adapted to engage the front of the scoop, substantially as and for the purpose specified.

3. In a loading apparatus, a scoop in combination with a detachably-jointed bail comprising a suspending-ring, and a pair of downwardly-diverging arms provided at their upper ends with eyes to receive the suspending-ring and having hooks at their lower ends to engage the scoop, and a combined hook-arm and trip-lever journaled on the suspending-ring between the arms of the jointed bail, the hook-arm being adapted to engage the scoop and hold the same in a substantially horizontal position when filled, substantially as described.

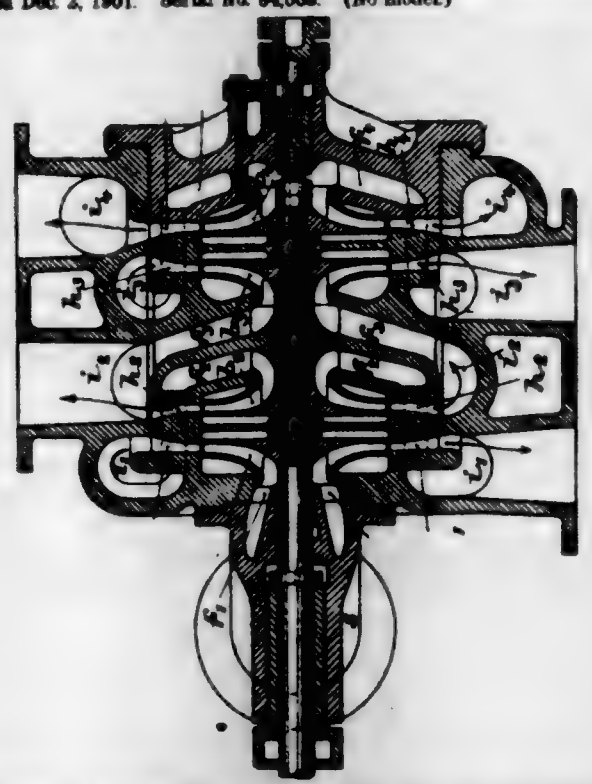
704,148. HAND-STRAP FOR STREET-RAILWAY CARS. MAX STRAUS, Denver, Colo. Filed Oct 28, 1901. Serial No. 80,297. (No model.)

Claim.—1. A hand-strap, the lower end of which is formed into a loop; a plurality of steps or loops, arranged one above the other, between the two members of the main loop, and securely attached at each end to one of the members of the said loop, substantially as shown.

2. A hand-strap, the lower portion of which is formed into a loop, a

plurality of short straps which extend longitudinally from one member of the loop to the other, the said straps being arranged one above the other, and secured to the members of the aforesaid loop, substantially as shown.

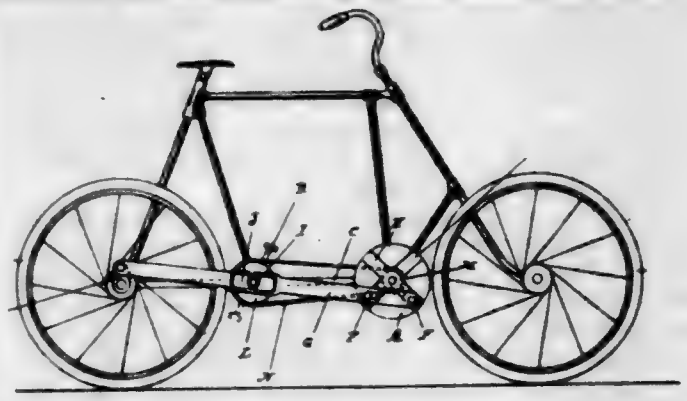
704,144. CENTRIFUGAL PUMP. HEINRICH SULZER, Winterthur, Switzerland, assignor to Gebrüder Sulzer, Winterthur, Switzerland. Filed Dec. 2, 1901. Serial No. 84,308. (No model.)



Claim.—A centrifugal pump adapted to be driven at a constant speed and comprising a plurality of pump-sections arranged in series relation with respect to each other, each pump-section communicating independently with the outlet, whereby by opening one or the other of such communications the lifting power of the pump may be varied without varying its speed, as and for the purpose set forth.

704,145. ATTACHMENT FOR BICYCLES. FELIX W. TALLEY, New York, N. Y. Filed Jan. 11, 1902. Serial No. 89,353. (No model.)

Claim.—In combination with a bicycle an attachment consisting of a rotary disk having intersecting grooves and blocks fitted so as to slide back and forth therein, a connecting-rod pivoted at one end to the sliding blocks its opposite end being connected to a crank secured to the shaft of the driving-wheel, the connecting-rod slotted centrally so as to admit of longitudinal and vibrating movements over a fulcrum secured to the frame of the vehicle substantially as herein set forth and shown.

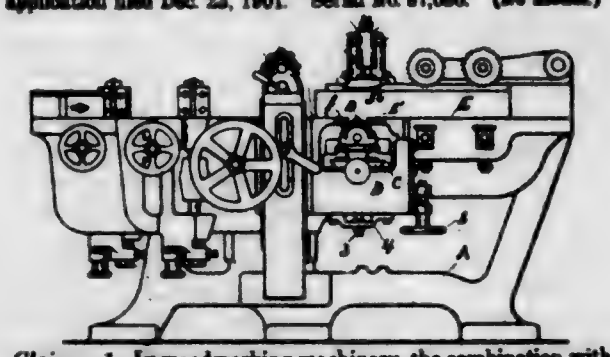


704,146. BUSTLE. HENRY H. TAYLOR, Bridgeport, Conn. Filed Mar. 10, 1902. Serial No. 97,560. (No model.)

Claim.—1. A bustle comprising a woven-wire bulging form having its edges bound with tape, and a closed backing sewed to the inside of said form at a distance from said tape, substantially as set forth.

2. A bustle comprising a woven-wire bulging form having its edges bound with tape, and a comparatively small closed backing stretched tightly and sewed to the inside of said form, the perimeter of said backing throughout its extent being separated from said tape whereby the edges of the bulging form are rendered flexible, substantially as set forth.

704,147. PRESSURE DEVICE FOR WOODWORKING-MACHINES. JOHN R. THOMAS, Cincinnati, Ohio, assignor to J. A. Fay & Egan Company, Cincinnati, Ohio, a Corporation of West Virginia. Original application filed May 29, 1901, Serial No. 62,413. Divided and this application filed Dec. 23, 1901. Serial No. 87,080. (No model.)



Claim.—1. In woodworking machinery, the combination with a machine-frame, and a cutter-head therefor, of a pressure device comprising in combination a swinging frame projecting sidewardly over the cutter-head, a plurality of separately-yielding pressure-feet side by side in the swinging frame, and means for securing the swinging frame rigidly in place, substantially as described.

2. In woodworking machinery, the combination with a machine-frame, a work-supporting table therefor, and a cutter-head, of a pressure device comprising in combination a swinging frame pivoted with relation to the machine-frame to one side of the table and freely overhanging the cutter-head, with a plurality of separately-yielding pressure-feet side by side in the swinging frame, and a fastening device for securing the swinging frame against upward movement to the same side of the table as the pivot, substantially as described.

3. In woodworking machinery, the combination of a pressure device above the cutter-head comprising a swinging frame, a plurality of sockets in the frame, pressure-feet taking into the sockets, springs taking against the pressure-feet for resisting their upward movement, with the swinging frame constructed and arranged for being raised upwardly away from the cutter-head, substantially as described.

4. In a pressure device for woodworking machinery, the combination of a machine-frame, a cutter-head therefor, a swinging frame extend-

ing above the cutter-head and pivoted to the main frame, sockets for the swinging frame above the cutter-head, pressure-foot having shanks taking into and sliding in the sockets from their lower ends, bolts screwing into the sockets from their upper ends, springs interposed between the shanks and bolts for forcing the pressure-foot downwardly, and additional bolts taking slidably through the first-named bolts and screwing into the shanks of the pressure-foot for adjustably limiting the downward movement of the pressure-foot, with means for rigidly holding the swinging frame above the cutter-head and arranged for releasing the swinging frame and permitting the same to be swung upwardly away from the cutter-head, substantially as described.

5. In a woodworking-machine, the combination of a main frame, a cutter-head, a plate for the frame, ears extending therefrom, a swinging frame pivoted to the plate and arranged to take snugly between the ears, a link for rigidly holding down the swinging frame between the ears, sockets for the swinging frame extending above the cutter-head, pressure-foot having shanks taking into the sockets, bolts for the shanks, and springs taking between the shanks and bolts, and arranged for permitting the swinging frame to be raised away from the cutter-head, substantially as described.

704,148. BED-RAIL. WILLIAM TUCKER, Indianapolis, Ind., assignor to the T. B. Laycock Manufacturing Company, Indianapolis, Ind., a Corporation of Indiana. Filed Dec. 23, 1901. Serial No. 87,022. (No model.)

Claim.—1. In a corner-fastener for bedsteads a post, a shank on the post having a rounded end and a reverse curve forming a hook near its base and a shoulder between the hook and shank and oblique to the upper and lower edges of the shank and a rail having a head with a shank, the end of said shank fitting into the hook of the post-shank and having a hook to engage the end of the post-shank and a shoulder to contact with the shoulder of the post-shank to draw the parts of the fastener together when the bed-rail is depressed.

2. In a corner-fastener for bedsteads a post, a shank on the post having a rounded end, and a reverse curve forming a hook near its base and a shoulder separating the two curves, said shoulder being oblique to the upper and lower edges of the shank and being a straight surface inclined downwardly toward the post, and a bed-rail having a head with a shank, said shank having a rounded end to fit into the hook of the post-shank and having a reverse curve forming a hook to receive the rounded end of the post-shank and having a shoulder between the hook and end to contact with the oblique shoulder of the post-shank.

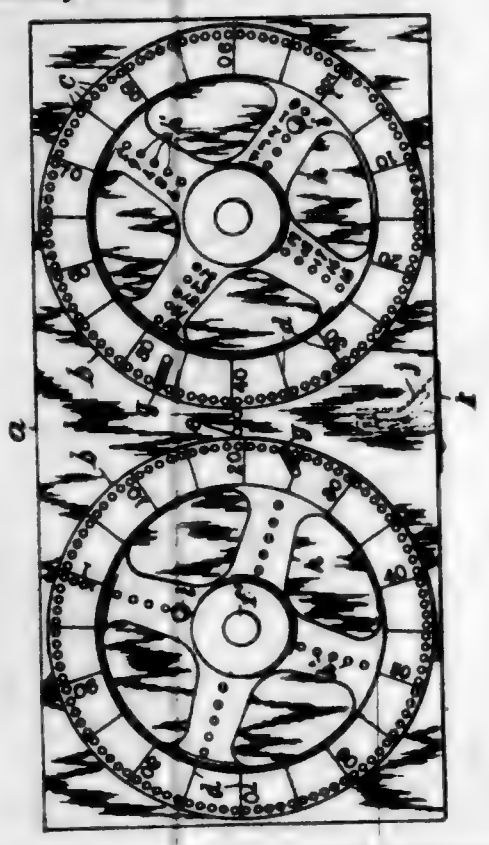
3. In a corner-fastener for bedsteads a post, a shank on the post having a rounded end and a reverse curve forming a hook near its base and an oblique shoulder between said hook and the end of the shank, a side rail having a shank with a rounded end to fit into the hook of the post-shank and a reverse curve forming a hook near its base and a shoulder between said hook and the end of the shank, the ends of the two shanks engaging the opposite hooks of the shanks and the shoulders contacting with each other.

4. In a corner-fastener for bedsteads a post, a shank on the post having a rounded end and a reverse curve forming a hook near its base and an oblique shoulder between said hook and the end of the shank said shoulder sloping downwardly toward the post, a side rail having a shank with a rounded end and a reverse curve forming a hook near its base with a shoulder between said hook and the end of the shank said shoulder sloping from its middle portion toward each end and toward the outer end of the shank, the ends of the two shanks engaging the opposite hooks of the shanks and the shoulders contacting with each other.

5. In a corner-fastener for bedsteads, a post, a shank on the post having an abrupt decrease in thickness on one side to form a shoulder and having a stop farther out toward its end, a rail or frame fixture having a head with an end to fit the shoulder on the shank and having a projection to engage said stop, the said stop and its engaging projection having in their construction a wedge formation to compel a close fit between said head end and shank-shoulder.

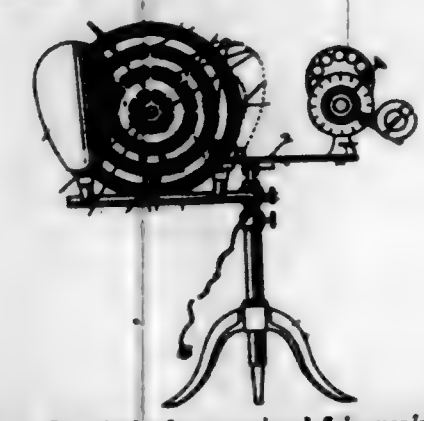
704,149. GAME-COUNTER. EUGENE T. VAN GIESON, Newark, N. J. Filed Mar. 1, 1902. Serial No. 96,195. (No model.)

Claim.—1. In a single-dial game-counter, the combination, with a flat base and a visible circular dial pivoted thereon and formed with arms to turn the same, and having a spring-pawl to hold the dial in place, and a series of holes adjacent to its edge with divisions between the holes at intervals and numbers applied to the divisions, of two score-pins operated in connection with such holes for indicating respectively the score prior to the last play, and the score made during such play, a series of game-counting holes in the arms of the dial, numbered serially, an additional hole without number, and a pin fitted to such game-counting and additional holes to register the number of games, the whole arranged and operated substantially as herein set forth.



2. The combination, with the base *a*, of two single-dial game-counters comprising each the circular dial *b* having the series of holes *c* adjacent to its edge with divisions *d* between the holes at intervals and numbers applied to the divisions, of two score-pins operated in connection with such holes to indicate simultaneously, when the score is registered, the score prior to the last play and the score made during the last play, the dials being held each rotatably upon the base by the central clamp-screw *f*, which permits them to be turned separately into convenient positions for the use of two players.

704,150. REFRACTO-OPHTHALMOMETER. HERBERT VAN PATTEN, Meadville, Pa. Filed Oct. 26, 1901. Serial No. 80,545. (No model.)



Claim.—1. In a device for correcting deficiencies in eyesight, a disk having a central aperture, concentric black and white bands thereon and lines indicating degrees of a circle, a telescopic eye-tube at the rear thereof opposite said central aperture, a disk around the end of said tube, lines on said disk indicating the degrees of a circle, and disks revolubly mounted on said disk each having a multiplicity of lenses arranged in a series near its periphery, substantially as shown and described.

2. In a device for correcting deficiencies in eyesight, a suitable standard, a bracket mounted thereon, a disk attached thereto having a central aperture, concentric circular bands of black and white on the front of said disk and radial lines crossing said bands indicating degrees of a circle, the rear of said bracket extended upward to support a barrel portion, a

telescopic eye-tube mounted in said barrel portion, and disks, having a multiplicity of lenses arranged near their periphery, mounted to rotate said lenses into the line of vision of said eye-tube, substantially as shown and described.

3. In a device for correcting deficiencies in eyesight, a suitable standard, a bracket mounted thereon, a disk mounted on said standard, concentric circular bands of black and white on the front of said disk and radial lines crossing said bands indicating degrees of a circle, the rear of said bracket extended upward and supporting a barrel portion, an eye-tube mounted in said barrel portion, a disk around the end of said tube, radial lines on said disk indicating degrees of a circle, disks revolubly mounted on said disk each having set therein a series of lenses near its periphery, a bar arranged for vertical adjustment on said standard and a chin-rest on said bar, substantially as shown and described.

4. In a device for correcting deficiencies in eyesight, an eye-tube arranged for rotation, a disk mounted around the end thereof, a multiplicity of disks revolubly mounted on said disk and having set therein a series of lenses near their periphery, and means for rotating said eye-tube and disks, substantially as shown and described.

5. In a device for correcting deficiencies in eyesight, an eye-tube arranged for rotation, a disk mounted around the end of said eye-tube, the front of said disk being divided by radial lines into degrees of a circle, means for rotating said eye-tube and disk, studs on rear of said disk, disks revolubly mounted on said studs and a series of lenses set in each said disk near its periphery, substantially as shown and described.

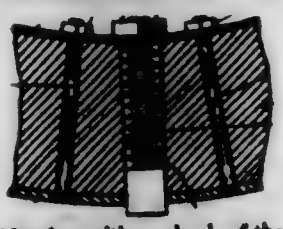
6. In a device for correcting deficiencies in eyesight, a frame suitably mounted, an eye-tube revolubly mounted thereon, a disk mounted around the end of said eye-tube having its face divided by radial lines in degrees of a circle, pointers on said frame indicating points on said disk ninety degrees removed from each other, a circular rack fixed on said disk, a shaft journaled in said frame, and a pinion-gear keyed to the shaft meshing with said circular rack, substantially as shown and described.

7. In a device for correcting deficiencies in eyesight, a frame suitably mounted, an eye-tube journaled therein, a disk mounted around the end of said eye-tube having its face divided by radial lines in degrees of a circle, pointers on said frame indicating points on said disk ninety degrees removed from each other, a circular rack fixed on said disk, a shaft journaled in said frame, a pinion-gear keyed to the shaft meshing with said circular rack, disks mounted for rotation on the rear of the first-mentioned disk, each of said disks having a series of lenses set near its periphery, substantially as shown and described.

8. In a device for determining muscular insufficiency in eyes, a frame suitably mounted, an eye-tube journaled therein, means attached to said eye-tube and to said frame for determining focal deficiencies in eyesight, an arm revolubly mounted on said eye-tube having a slot near its free end, a disk adjustably mounted in said slot to regulate the distance between said eye-tube and said disk to the distance between the pupils of the eyes of the patient, and a cylindrical glass rod revolubly mounted in said disk, substantially as shown and described.

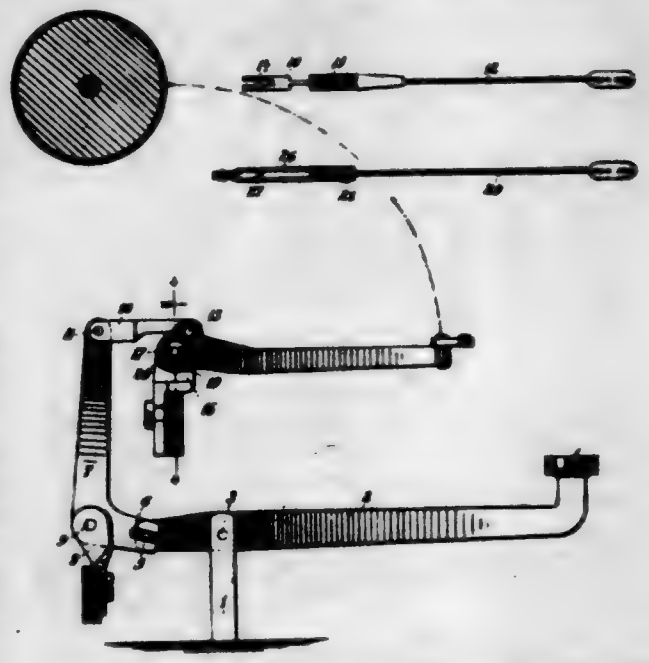
9. In a device for determining muscular insufficiency in eyes, a frame suitably mounted, an eye-tube journaled therein, means attached to said eye-tube and to said frame for determining focal deficiencies in eyesight, an arm revolubly mounted on said eye-tube having a slot near its free end, a circular plate mounted in said slot and adapted to be adjusted longitudinally of said arm, a cylindrical glass rod set in a disk journaled in said circular plate, a rack on the edge of said disk, and a gear-wheel meshing with said rack and adapted to rotate said disk, substantially as shown and described.

704,151. WHEEL FOR MOTOR-VEHICLES. GEORGE O. VESSEL, Lawrence, Mass. Filed May 1, 1902. Serial No. 105,422. (No model.)



Claim.—In combination with a wheel, of the rim, a metal tire surrounding the same, said rim having a series of chambers extending radially therethrough, a tooth located in each chamber, each tooth having an enlarged head which projects beyond the bearing-surface of the rim and having a shank which projects through the inner side thereof, a stop-plate through which said shank passes, bolts for securing said plate to the inner side of the rim which pass through said tire, rim and plate successively, the heads of said bolts engaging the outer side of the tire, nuts on said bolts which engage the opposite side of said plate from the rim, a spring which is interposed between said plate and said enlarged head, and a stop for limiting the outward movement of said tooth, substantially as described.

704,152. TYPE-CARRIER ACTION AND MEANS FOR MOUNTING SAME. FRANK X. WAGNER, New York, N. Y., assignor to the Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed June 4, 1900. Serial No. 18,969. (No model.)



Claim.—1. In an action for type-writing machines, the combination of an oscillating type-carrier, a hanger to which said type-carrier is pivoted, one of said parts being bifurcated, a two-part pivot for uniting said type-carrier and hanger, said two-part pivot comprising a headed internally-screw-threaded member which is adapted to extend substantially through said type-carrier and hanger and a headed externally-screw-threaded member adapted to be received in said first-mentioned member, means for locking the internally-screw-threaded member of said pivot to the bifurcated part and means for seating the head of the externally-threaded member in one of the arms of the bifurcated part as specified.

2. In an action for type-writing machines, the combination of an oscillating type-carrier, a hanger disconnectedly pivoted thereto, means for adjusting said hanger in a direction perpendicular to the axis of the type-carrier, a bifurcated compressed link pivoted to said type-carrier adapted to be sprung apart, a key-lever and means for operatively connecting said key-lever to said link.

3. The combination of a segmental support, overlapping type-carrier hangers having their shanks S6 wider than their projecting portions and mounted upon opposite sides of said support and staggered with relation to one another, the pivotal openings in said hangers being in alinement with one another and oscillating type-carriers pivoted to said hangers all arranged to permit said type-carriers to be brought close together as specified.

4. The combination of a hanger-support, a positioning-lug 37 for each hanger on said support, a hanger having a bifurcated securing-arm adapted to straddle the lug 37 and a screw passing through the bifurcated portion of the securing-arm and secured to the hanger-support, the stem of said screw being smaller in diameter than the distance between the arms of the bifurcated portion to permit of a longitudinal and limited lateral adjustment of the hanger.

5. In a visible type-writer, the combination of a segmental support with hangers carrying type-levers, said hangers being applied alternately to opposite faces of the segmental support and so arranged as to be staggering and overlapping, substantially as and for the purposes specified.

6. In a visible type-writer, the segmental support for the type-levers combined with hangers to which the type-levers are pivoted, said hangers forming shoulders that rest on the upper edge of the segmental support and having pivot-holes for receiving the type-levers which pivot-holes are in line with the center of the segmental support as specified, all arranged so that the hangers can be arranged in staggering and overlapping order alternately on opposite faces of the segmental support as set forth.

704,158. COMBINED LETTER-SHEET AND ENVELOP. HENRY V. WARNER, Bonnieburst, N. Y. Filed Sept. 13, 1901. Serial No. 75,152. (No model.)

Claim.—1. A combined letter and envelop comprising a plurality of pages, a sealing-flap provided with a gummed coating arranged along an edge of one of the pages, a covering-flap also arranged along an edge of one of the pages, and a safety-flap having a gummed coating arranged at and extending along an edge of the covering-flap and adjacent to the sealing-flap.

2. A combined letter and envelop comprising a plurality of pages,

a sealing-flap provided with a gummed coating arranged along an edge of one of the pages, a covering-flap also arranged along an edge of one of the pages, and a safety-flap having a gummed coating and arranged relatively to the pages so as to fold over a page and under the sealing-flap.

3. A combined letter and envelop comprising a plurality of pages, a covering-flap attached to one page and adapted to be folded over and protect a loose edge of one or more pages, a sealing-flap attached to one page and adapted to be folded over and protect a loose edge of one or more pages, means for rigidly retaining both said sealing-flap and said covering-flap in their said folded and protecting positions—the said letter and envelop being adapted to be opened by a single cut along one edge of the same as folded.

4. A combined letter and envelop comprising a plurality of pages, a sealing-flap attached to one page and adapted to be folded over and protect a loose edge of one or more pages, a covering-flap attached to a page and adapted to be folded over and protect a loose edge of one or more pages, and a safety-flap attached to said covering-flap and adapted to be rigidly secured and to hold said covering-flap in its folded-over and protecting position—the said letter and envelop being adapted to be opened by a single cut along one edge of the same as folded.

704,154. BRACKET-SHELF. REUBEN R. WALKER, Indianapolis, Ind. Filed Jan. 21, 1902. Serial No. 90,712. (No model.)

Claim.—1. The combination, in a bracket-shelf, of wire brackets adapted to be secured to a wall and provided with notches extending transversely thereof, and a shelf adapted to be placed on said brackets and provided with clips adapted to engage with said notches whereby the shelf is removably but securely held in place thereon, substantially as set forth.

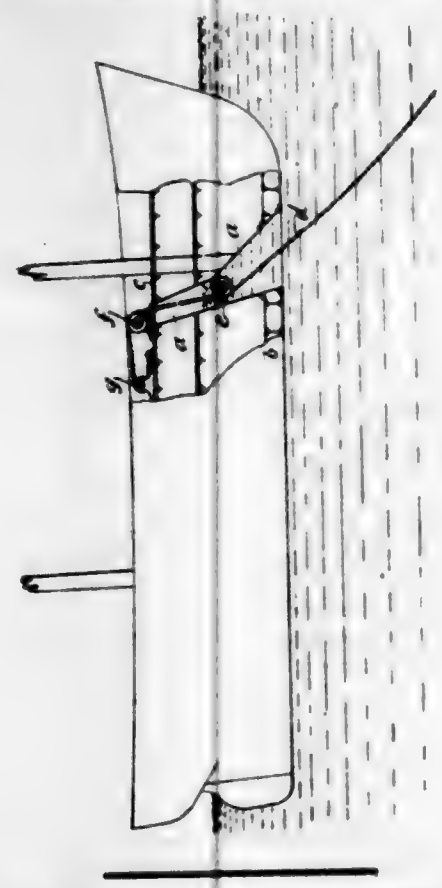
2. The combination, in a bracket-shelf, of brackets composed of wire each having a horizontal and an inclined member, the upper or horizontal member being screw-pointed at its rear end, and provided with a flange or collar in front of the screw-pointed portion, and having a notch in front of the flange or collar, and a shelf provided with clips having slits therein adapted to embrace those portions of the brackets where the notches are and to enter and engage with said notches, substantially as set forth.

704,155. MOORING SHIPS. WILLIAM M. WALTERS, Liverpool, England. Filed Sept. 10, 1901. Serial No. 74,932. (No model.)

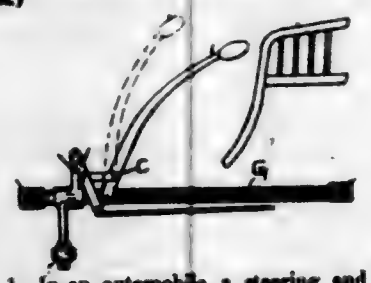
Claim.—1. In combination with a ship an upwardly and backwardly sloping tube extending from the bottom of the ship near the keel, at about one-quarter of the length of the ship from the bow, to the deck, a wheel located within the tube at about the center of resistance to wind and waves such wheel being arranged to guide the cable, and means for hauling and securing the cable, substantially as described.

2. In combination with a ship an upwardly and backwardly sloping tube extending from the bottom of the ship near the keel, at about one-quarter of the length of the ship from the bow, to the deck, said tube being narrower at the top than at the bottom, a wheel located within the tube at about the center of resistance to wind and waves, such wheel being arranged to guide the cable passing up the tube, and means for hauling and securing the cable, substantially as described.

3. A vessel having a substantially vertical opening leading upward from the bottom of the vessel at about one-quarter the length of the vessel from the bow, said opening having a front wall inclining forwardly and downwardly, and a guide for a cable located approximately centrally of the height of said opening, substantially as described.



704,156. STEERING AND BRAKING DEVICE. CHRISTIAN F. WEBER, Jr., Albany, N. Y. Filed Dec. 13, 1901. Serial No. 85,756. (No model.)



Claim.—1. In an automobile, a steering and braking device consisting of a rocking shaft, adapted to turn in bearings attached to the automobile; a downwardly-projecting arm and an upwardly-projecting arm attached to said rocking shaft; a connecting-rod connecting the said downwardly-projecting arm with the steering-knuckles of the automobile, whereby the rocking of said shaft in its bearings will operate said steering-knuckles; a handle attached to said rocking shaft; a brake-lever attached at one end to said upwardly-projecting arm of said rocking shaft, and at the other end to the brake, by suitable intermediate connections and means for connecting said brake-lever to said handle, whereby said handle will be adapted to both operate said brake and turn said rocking shaft in its bearings, substantially as described and for the purposes set forth.

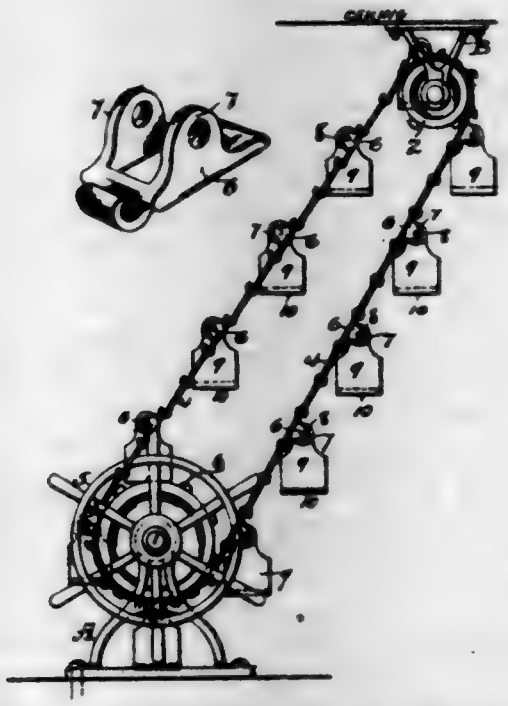
2. A braking device to an automobile consisting of a handle adapted to be operated by the driver of the automobile attached to a rocking shaft at or under the floor of the automobile; said rocking shaft adapted to turn in bearings attached to the automobile at or under the floor of the automobile; a projecting arm attached to said rocking shaft; a brake-lever attached to said projecting arm as a fulcrum and by suitable intermediate connections to the brake of the automobile and means for connecting said brake-lever to said handle, whereby said handle will be adapted to operate said brake while turning said rocking shaft in its bearings, substantially as described.

3. In a steering and braking device to an automobile, a rocking shaft adapted to turn in its bearing, two or more bearings attached to said automobile adapted to receive and retain said rocking shaft; an upwardly-projecting arm and a downwardly-projecting hanging arm attached to said rocking shaft; a connecting-rod connecting said hanging arm with the steering-knuckles of the automobile; a handle attached to said rocking shaft adapted to be operated by the driver of the automobile; a brake-rod parallel to and immediately under said rocking-shaft; a brake-lever in two parts, each part connecting said brake-rod to said upwardly-projecting arm, one on each side of said rocking shaft; a connecting-arm con-

necting said handle to said brake-lever whereby said handle is adapted to both operate the brake-rod and turn said rocking shaft in its bearings at the same time, while maintaining the brake-rod in the same relative position to the rocking shaft, all substantially as described and for the purpose set forth.

4. In a steering and braking device to an automobile; a rocking shaft having a downwardly-projecting arm and an upwardly-projecting arm; means for connecting the downwardly-projecting arm to the steering-knuckles of the automobile; a brake-lever attached to said upwardly-projecting arm; means for connecting said brake-lever to the brake of the automobile; a handle attached to said rocking shaft and suitably connected to said brake-lever, whereby said handle is adapted to both turn said rocking shaft in its bearings and operate said brake, substantially as described and for the purpose set forth.

704,157. DISPLAY-RACK. WILLIAM WHITE, Lawrenceburg, Tenn. Filed July 23, 1900. Renewed Dec. 9, 1901. Serial No. 85,273. (No model.)



Claim.—1. In a display-rack, the combination with upper and lower revolubie supports, the upper support disposed in a plane rearwardly of the lower support, of a set of sprocket-chains passing over said supports, shelves pivotally suspended from said chains so as to be disposed in different vertical planes and constantly in horizontal positions, said supports, chains and shelves constituting the entire display-rack whereby articles can be supported on each shelf without interference with the shelf next above and free access be had to shelves from the front of the rack and means connected with the lower revolubie support for operating the rack.

2. In a display-rack, the combination with a support, and means for raising, and lowering said support, of a broad shelf, vertical end pieces on said shelf having curved slots in their upper ends, arms pivotally connected to the lower ends of said end pieces, trunnions on said arms disposed in the slots, means for securing the trunnions in any portion of the slots and bearings in the movable support for said trunnions.

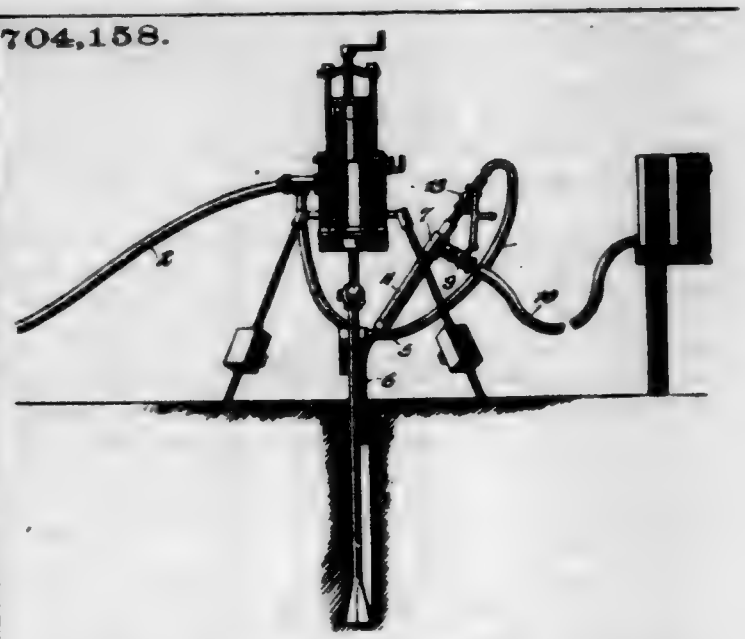
3. In a display-rack, the combination with a support, means for moving said support up and down, of a broad shelf, vertical end pieces on said shelf having curved slots in their upper ends, arms pivotally connected to the lower ends of said end pieces, trunnions on said arms disposed in the slots and screw-threaded throughout a portion of their length, nuts on the threaded portions of said trunnions to secure them in any portion of the slots and bearings in the movable support for said trunnions.

704,158. WATER ATTACHMENT FOR POWER-DRILLS. FREDERICK L. WHITEHEAD, Butte, Mont. Filed July 16, 1901. Serial No. 68,498. (No model.)

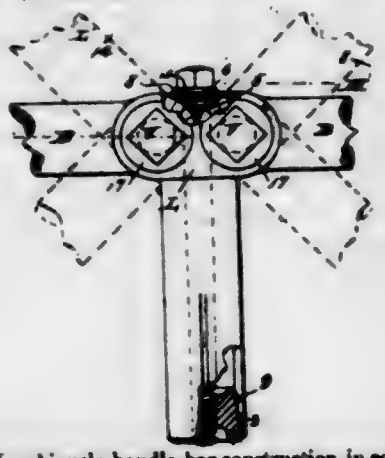
Claim.—1. In combination with a power-drill, a power-fluid-supply pipe, of a cylinder, a pipe connecting the fluid-supply pipe to the top of said cylinder, a water-supply to the cylinder and a pipe for conducting the water to the drill-hole.

2. An attachment for power-drills comprising a cylinder, a coupling on the end terminating in a tube, a cock on the opposite end, a connection from the cock to the fluid-pressure-supply pipe, a second cock extending from the side of the cylinder and a water-reservoir in communication with the cylinder through the last-named cock.

704,158.



704,159. BICYCLE HANDLE-BAR. WILLIAM H. WHITELY and WILLIAM H. WHITELY, Jr., Springfield, Ohio. Filed Jan. 23, 1900. Serial No. 2,499. (No model.)



Claim.—1. In a bicycle-handle-bar construction, in combination with the handle-bar post, of vertically-adjustable handle-bars, separately and pivotally mounted upon said post, a link, corrugated upon its face around its eyes, engaging the handle-bars by similar corrugations upon their faces, two separate and independent screw-threaded pivotal clamping-bolts passing through the eyes of said link and bearing-apertures of said bars and having screw-threaded connection with said post; said link and bolts forming the supporting and adjusting means of the bars upon said post.

2. In a bicycle-handle-bar construction, in combination with the handle-bar post, of vertically-adjustable handle-bars, separately and pivotally mounted upon said post and geared together, one bar controlling its fellow bar to move in unison, a link corrugated upon its face around its eyes, engaging the bars upon their faces by similar corrugations, and interlocking with each bar opposite the post, said link connecting each bar directly to the pivot of the other bar by two separate and independent screw-threaded pivotal clamping-bolts passing through the eyes of said link and the bearing-apertures of said bars and having screw-thread connection with said post; said link and bolts forming the supporting and adjusting means of said bars upon said post that the adjustable handle-bar members shall be as one continuous piece when adjusted and clamped together by said bolts and said corrugated link.

3. In a bicycle-handle-bar construction, in combination with the vertically-adjustable handle-bar post, having binding contact with the hollow steering-fork stem, of vertically-adjustable handle-bars having intermeshing gear-segments on their inner ends, said bars being individually and pivotally mounted on said post on separate centers, a clamp within the post, a rod for operating said clamp passing longitudinally and centrally throughout said post clearly to one side of the geared ends of said bars, a connecting-link corrugated around its eyes engaging corresponding corrugated faces on said bars, two clamping-bolts for clamping said link and bars to said post to permit of vertical adjustment of the handle-bars and vertical adjustment of the handle-bar post independently of each other.

4. In a bicycle-handle-bar construction, in combination, a handle-bar post, and integral therewith a head having ear projections 11 suitably formed to support two vertically-adjustable handle-bars upon said ear projections 11, the handle-bar post being longitudinally perforated, said handle-bars intermeshing with each other at their meeting ends by means of gear-segments, a clamp-actuating rod passing through said han-

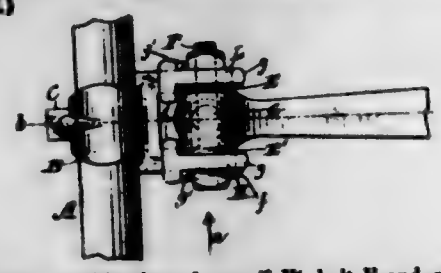
gitudinal perforation between said ears 11 and centrally of said post independent of said bars and entirely to one side thereof, an expander-clamp within the post operated by the clamp-actuating rod; said bars secured to said ears 11 by pivotal clamping-bolts and held against rotation by means of a corrugated link engaging similar corrugations upon the faces of the bars, the eyes of said corrugated link inclosing each of said clamping-bolts.

5. In a bicycle-handle-bar construction, the combination of a handle-bar post longitudinally perforated, and integral therewith the head having suitably-formed lateral ear projections, vertically-adjustable handle-bars externally secured to one side thereof, said bars intermeshing with each other at their meeting ends by means of gear-segments, a handle-bar-post clamp-actuating rod passing through said longitudinal perforation between said ears and centrally of said post, independent of said bars and entirely to one side thereof; said bars secured to said ears by clamping-bolts and held from rotation by means of a corrugated connecting-link and by similar corrugations upon their faces, the eyes of said link inclosing each of the two clamping-bolts, and the bars and post secured in any desired adjustment, substantially as described.

6. In a bicycle-handle-bar construction, in combination, a handle-bar post having a head suitably formed with ear projections, two handle-bars individually and separately mounted upon said ears, and geared together to move in unison during adjustment, said ears and said bars having smooth-faced concave and convex surfaces, respectively, engaging each other at the rotative centers of the bars, a connecting corrugated faced link extending from one of said centers to the other, surrounding screw-threaded clamping-bolts at each center of said bars, said bolts passing through said link and bars and having screw-thread connection with said ears to hold said bars rigidly together when adjusted.

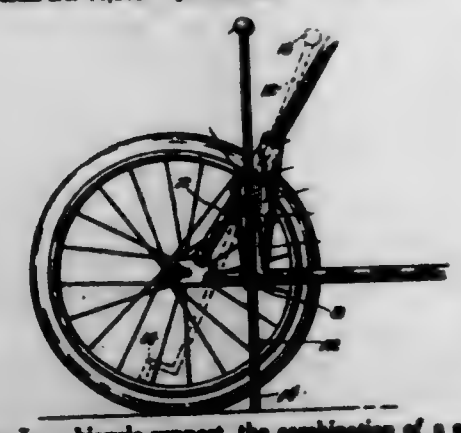
7. The combination with a handle-bar post of two vertically-adjustable handle-bars pivoted thereon on trunnions integral with said post, and means for clamping the handle-bars in fixed position relative to said post consisting of a link having corrugations engaging corresponding corrugations on the ends of the handle-bars and screw-threaded bolts for clamping said link in engagement with the handle-bars, of an actuating-rod passing longitudinally through said post from top to bottom, and a clamp at the lower end of said rod within the post for the adjustment thereof, as and for the purposes shown and described.

704,160. ANTIRATTLER FOR THILL-COUPLINGS. JAMES R. WHITNEY, Leominster, Mass. Filed Jan. 23, 1902. Serial No. 91,563. (No model.)



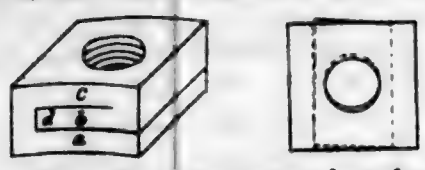
Claim.—The combination of ears E E', bolt F and shaft-iron eye G, with hollow hub H, elastic cushion J fitted therein, block K, means for regulating the pressure of said block against said shaft-iron eye, clamp L attached at its lower end to hub H and adapted to fit and hook over the ear E, clamp M pivoted at its lower end to a cam-lever *f*, and adapted to fit and hook over the other ear E', and said cam-lever *f*, pivoted at its inner end to hub H, substantially as and for the purpose set forth.

704,161. BICYCLE-SUPPORT. ERNEST O. WILCOX, Wichita, Kans., assignor to John H. Hedrell, Wichita, Kans. Filed Oct. 7, 1901. Serial No. 77,879. (No model.)



Claim.—In a bicycle-support, the combination of a support-frame provided with means of attachment to a bicycle-frame, a hand swiveled to the support to swing in a plane parallel to the bicycle-frame and having laterally-projecting ears formed with alined apertures, a prop inserted through said apertures and provided with a stop-pin adapted to limit its downward movement, and fastenings carried by said support, one located below and in the vertical line of the head, and the other above and to one side of the vertical line of the head, for securing the prop against movement when adjusted in contact with the ground, or elevated, substantially as set forth.

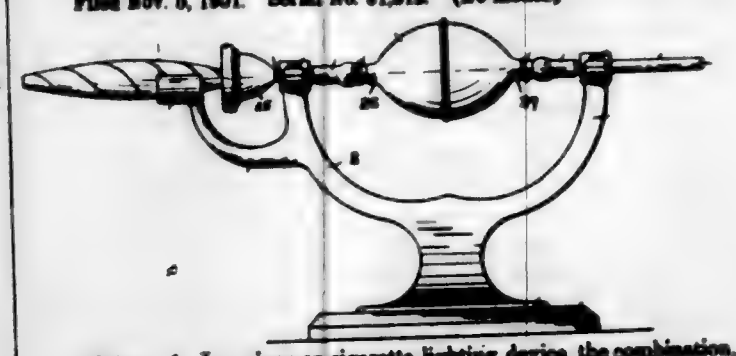
704,162. LOCK-NUT. PETER J. WILSON, Sheffield, England. Filed Feb. 21, 1901. Serial No. 48,327. (No model.)



Claim.—1. The herein-described improved nut formed of a blank of a spring metal, and consisting of inner, middle and outer layers formed integral, the outer layer being sufficiently long to fold over the top, beyond the end and under the middle layer, thus forming the outer convex and inner concave layers, the length of the middle layer being shorter by the thickness of the metal than the inner and outer layers, the displacing of the middle layer or fold about half the depth of the thread of the nut, so that one edge stands within, and the other without the inner and outer folds, or layers, substantially as specified.

2. The herein-described improved nut formed of a blank of a spring metal and consisting of inner, middle and outer layers formed integral, the outer layer being sufficiently long to fold, under, beyond the end, and over the top of the middle layer, thus forming the inner concave and outer convex layers, the middle layer being shorter by the thickness of the metal than the inner and outer layers, the displacing of the middle layer or fold about half the depth of the thread of the nut, so that one edge stands within, and the other without the inner and outer folds or layers, substantially as specified.

704,168. CIGAR OR CIGARETTE LIGHTING DEVICE. ROBERT WILSON, Newark, N. J., assignor to William Walker, Newark, N. J. Filed Nov. 5, 1901. Serial No. 81,812. (No model.)



Claim.—1. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a compressible air-bulb, an induction-valve at one end of said bulb, and an eduction-valve at the other end of said bulb, an eduction-tube connected with said eduction-valve, an induction-tube connected with the casing of said induction-valve, a funnel-shaped member on said induction-tube, and a perforated disk in said funnel-shaped member, all arranged for receiving the end of a cigar or cigarette and causing a motion of air through the same, substantially as and for the purposes set forth.

2. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a compressible air-bulb, an induction-valve at one end of said bulb, and an eduction-valve at the other end of said bulb, an eduction-tube connected with said eduction-valve, an induction-tube connected with the casing of said induction-valve, a funnel-shaped member on said induction-tube, provided with a screw-thread, a screw-ring thereon, and a pair of perforated disks in said funnel-shaped member, the perforation in the one disk being larger than the perforation in the other disk, all arranged for receiving the end of a cigar or cigarette and causing a motion of air through the same, substantially as and for the purposes set forth.

3. In a cigar or cigarette lighting device, the combination, with a standard having a pair of upwardly-extending arms, and a bearing on each arm, of a support on one of said arms provided with a shelf for the arrangement thereon of a cigar or cigarette, a compressible air-bulb supported by the said bearings, and means connected therewith for causing a motion of air through the cigar or cigarette, substantially as and for the purposes set forth.

4. In a cigar or cigarette lighting device, the combination, with a standard having a pair of upwardly-extending arms, and a bearing on each arm, of a support on one of said arms provided with a shelf for the

arrangement thereon of a cigar or cigarette, a compressible air-bulb supported by the said bearings, an induction-valve at one end of said bulb, and an eduction-valve at the other end of said bulb, and a means of communication with the casing of said induction-valve for causing a suction of air through the cigar or cigarette, substantially as and for the purposes set forth.

5. In a cigar or cigarette lighting device, the combination, with a standard having a pair of upwardly-extending arms, and a bearing on each arm, of a support on one of said arms provided with a shelf for the arrangement thereon of a cigar or cigarette, a compressible air-bulb supported by the said bearings, an induction-valve at one end of said bulb, and an eduction-valve at the other end of said bulb, an eduction-tube connected with said eduction-valve, an induction-tube connected with the casing of said induction-valve, a funnel-shaped member on said induction-tube, and a perforated disk in said funnel-shaped member, all arranged for receiving the end of a cigar or cigarette and causing a suction of air through the same, substantially as and for the purposes set forth.

6. In a cigar or cigarette lighting device, the combination, with a standard having a pair of upwardly-extending arms, and a bearing on each arm, of a support on one of said arms provided with a shelf for the arrangement thereon of a cigar or cigarette, a compressible air-bulb supported by the said bearings, an induction-valve at one end of said bulb, and an eduction-valve at the other end of said bulb, an eduction-tube connected with said eduction-valve, an induction-tube connected with the casing of said induction-valve, a funnel-shaped member on said induction-tube, provided with a screw-thread, a screw-ring thereon, and a pair of perforated disks in said funnel-shaped member, the perforation in the one disk being larger than the perforation in the other disk, all arranged for receiving the end of a cigar or cigarette and causing a suction of air through the same, substantially as and for the purposes set forth.

7. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a means for creating a suction and an induction-tube connected therewith, a funnel-shaped member on one end of said tube, a perforated flexible disk in said funnel-shaped member adapted to receive the end of a cigar or cigarette in its perforation, and means for securing said disk in position, substantially as and for the purposes set forth.

8. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a means for creating a suction and an induction-tube connected therewith, a funnel-shaped member on one end of said tube, a perforated flexible disk in said funnel-shaped member adapted to receive the end of a cigar or cigarette in its perforation, means for securing said disk in position, and a screen in said funnel-shaped member, substantially as and for the purposes set forth.

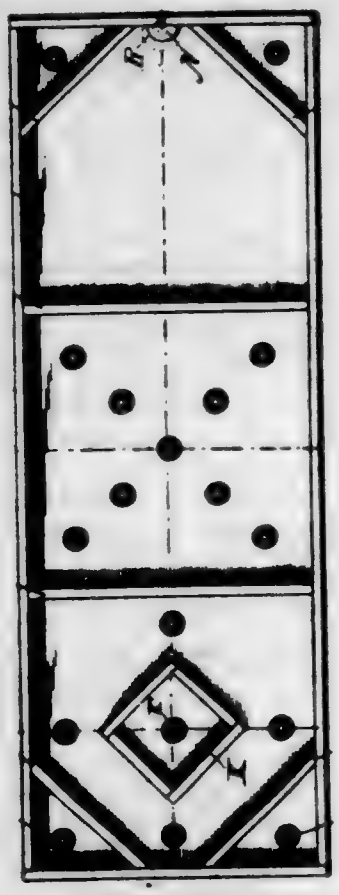
9. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a means for creating a suction and an induction-tube connected therewith, a funnel-shaped member on one end of said tube, a pair of perforated flexible disks in said funnel-shaped member, the perforation in one of said disks being larger than the perforation in the other disk, and means for securing said disks in position, substantially as and for the purposes set forth.

10. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a means for creating a suction and an induction-tube connected therewith, a funnel-shaped member on one end of said tube, a pair of perforated flexible disks in said funnel-shaped member, the perforation in one of said disks being larger than the perforation in the other disk, means for securing said disks in position, and a screen in said funnel-shaped member, substantially as and for the purposes set forth.

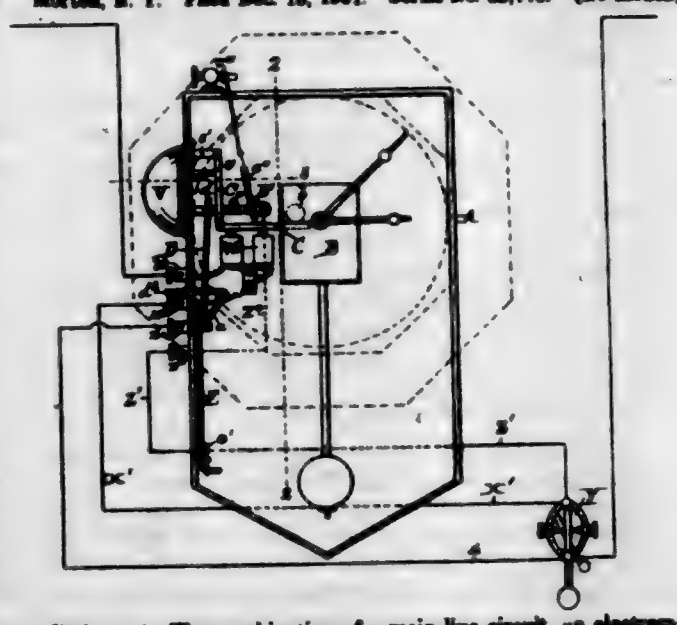
11. In a cigar or cigarette lighting device, the combination, with a means of support for the cigar or cigarette, of a means for creating a suction and an induction-tube connected therewith, a funnel-shaped member on one end of said tube, a pair of perforated flexible disks in said funnel-shaped member, the perforation in one of said disks being larger than the perforation in the other disk, and the disk which is provided with the smaller perforation being formed with radially-extending slits, and means for securing said disks in position, substantially as and for the purposes set forth.

704,164. GAME APPARATUS. MARIE R. WRIGHT, New York, N. Y. Filed Mar. 12, 1902. Serial No. 97,913. (No model.)

Claim.—A game apparatus comprising a board with peripheral wall, divided into communicating compartments by partition-walls, corner-partitions to said board, a block-house in one of the compartments disposed diagonally with relation to the transverse partition-walls and its opposite faces parallel to the adjacent diagonal partition-walls respectively, a horizontally-disposed block mounted on the upper surface of the board and against the end wall thereof, and intermediate the adjacent ends of the partitions screen the corners of one end of the board, said end wall having a transverse slot and a central vertical slot, the latter cut in from the upper edge of the end wall, with its lower marginal edge flush with the upper horizontal surface of said block, as set forth.



704,165. TELEGRAPHIC SAFETY DEVICE. SELDEN B. WRIGHT, Morton, N. Y. Filed Dec. 13, 1901. Serial No. 85,775. (No model.)



Claim.—1. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism, and a circuit-closer mechanism for said shunt-circuit comprising a movable part adapted when the main-line circuit is broken to connect with and be moved by said time mechanism, and a contact-piece in said shunt-circuit having an insulated portion and an uninsulated portion, and a movable arm adapted to be moved from said insulated portion to said uninsulated portion when said movable part is operated by said time mechanism, substantially as described.

2. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism, and a circuit-closer mechanism for said shunt-circuit comprising an armature for said electromagnet having a movement to and from said electromagnet and another movement, means for making connection between said armature and said time mechanism for moving the former when the main-line circuit is broken, and a circuit-closer in said shunt-circuit adapted to close the shunt-circuit by the second-mentioned movement of said armature, substantially as described.

3. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism, and a circuit-closer mechanism for said shunt-circuit comprising an armature for said electromagnet having a movement to and from the same and another movement, means for making connection between

said armature and said time device for moving the former, and a circuit-closer in said shunt-circuit consisting of an insulated section and an uninsulated section, and a movable arm normally making contact with said insulated section but when moved by the second movement of the armature to close the shunt-circuit by contact with said uninsulated section, substantially as described.

4. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism having a toothed wheel, and a circuit-closer mechanism for said shunt-circuit comprising a toothed armature for said electromagnet, a spring adapted to lift the teeth of the armature into contact with the teeth of the wheel when the circuit through the electromagnet is broken, a support for said armature permitting the movement of the same to and from the electromagnet and also another movement, a part in said shunt-circuit having an insulated section and an uninsulated section, and a movable arm in said shunt-circuit normally in contact with said insulated section and adapted to be moved to make contact with the uninsulated section to close the shunt-circuit by said second-mentioned movement of said armature, substantially as described.

5. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism, and a circuit-closer mechanism for said shunt-circuit comprising a movable part adapted when the main-line circuit is broken to connect with and be moved by said time mechanism, and a contact-piece in said shunt-circuit having an insulated portion and an uninsulated portion, a movable arm adapted to be moved from said insulated portion to said uninsulated portion when said movable part is operated by said time mechanism, and an alarm device adapted to be operated upon the same movement of said movable part, substantially as described.

6. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism and a circuit-closer mechanism for said shunt-circuit comprising an armature for said electromagnet having a movement to and from said electromagnet and another movement, means for making connection between said armature and said time mechanism for moving the former, a circuit-closure in said shunt-circuit adapted to close the shunt-circuit by the second-mentioned movement of said armature, and an alarm device adapted to be operated upon the same movement of said movable part, substantially as described.

7. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt circuit around said key, a time mechanism, and a circuit-closer mechanism for said shunt-circuit comprising an armature for said electromagnet having a movement to and from the same and another movement, means for making connection between said armature and said time device for moving the former, a circuit-closer in said shunt-circuit consisting of an insulated section and an uninsulated section, a movable arm normally making contact with said insulated section but when moved by the second movement of the armature to close the shunt-circuit by contact with said uninsulated section, and an alarm device adapted to be operated upon said second-mentioned movement of said armature, substantially as described.

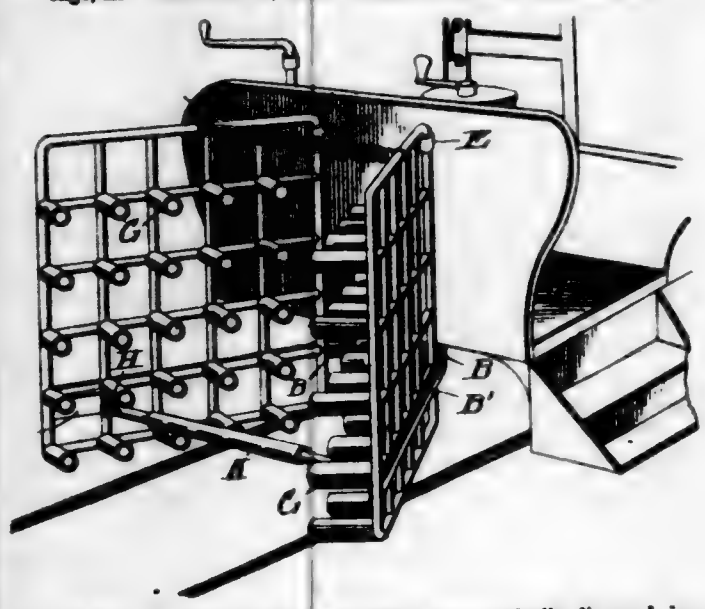
8. The combination of a main-line circuit, an electromagnet and a key in said circuit, a normally open shunt-circuit around said key, a time mechanism having a toothed wheel, and a circuit-closer mechanism for said shunt-circuit comprising a toothed armature for said electromagnet, a spring adapted to lift the teeth of the armature into contact with the teeth of the wheel when the circuit through the electromagnet is broken, a support for said armature permitting the movement of the same to and from the electromagnet and also another movement, a part in said shunt-circuit having an insulated section and an uninsulated section, a movable arm in said shunt-circuit normally in contact with said insulated section and adapted to be moved to make contact with said uninsulated section to close the shunt-circuit by said second-mentioned movement of said armature, and an alarm device adapted to be operated upon said second-mentioned movement of said armature, substantially as described.

9. The combination of a main-line circuit, an electromagnet and a key in said circuit, a time mechanism, an alarm device, and means for causing the operation of said alarm device comprising a movable part adapted when the main-line circuit is broken to connect with and to be moved by said time mechanism, substantially as described.

10. The combination of a main-line circuit, an electromagnet and a key in said circuit, time mechanism, an alarm device and a mechanism for causing operation of said alarm device comprising an armature for said electromagnet having a movement to and from said electromagnet and another movement, means for making connection between said armature and said time mechanism for moving the former when the main-line circuit is broken and thereby putting said alarm device in operation by the last-mentioned movement of said armature, substantially as described.

11. The combination of a main-line circuit, an electromagnet and a key in said circuit, a time mechanism having a toothed wheel, an alarm device and means for putting said alarm device in operation comprising a toothed armature for said electromagnet, a spring adapted to lift the teeth of the armature into contact with the teeth of the wheel when the circuit through the electromagnet is broken, a support for said armature permitting the movement of the same to and from the electromagnet and also another movement and connections between said armature and said alarm device for putting the same in operation by the last-mentioned movement of said armature, substantially as described.

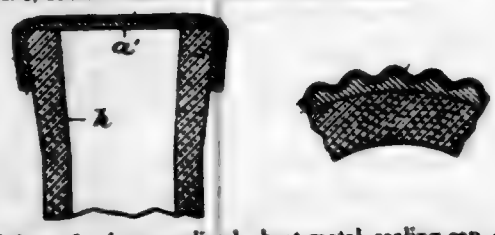
704,166. STREET-CAR FENDER. CASPER ZIMMERMAN, Chicago, Ill. Filed Feb. 19, 1902. Serial No. 94,806. (No model.)



Claim.—1. A car-fender, comprising two vertically-disposed jaws pivotally mounted at the end of a car, buffers on the adjacent faces of the jaws, springs for normally holding the jaws closed, a bar having antifriction-wheels, pivoted one at each end of said bar, notched lugs, one mounted on each inner face of a jaw and adjacent to the lower edges thereof, a guard-plate adjacent to each notched lug, said antifriction-wheels designed to be held in said notched lugs and to contact with said guard-plates under pressure of the spring-actuated jaws, as set forth.

2. In combination with the platform and dashboard of a car, springs secured to the under face of the platform, vertically-mounted jaws having pivotal connection with the dashboard, the lower portions of said jaws fastened to said springs, a horizontally-disposed spring connecting the upper edges of the two jaws, flexible buffers on the adjacent faces of the jaws, a bar having antifriction-wheels pivotally mounted at the ends of said bar, notched lugs on the inner faces of the jaws, and designed to receive the antifriction-wheels, as set forth.

704,167. SHEET-METAL SEALING-CAP FOR BOTTLES. NATHANIEL B. ABBOTT, Baltimore, Md., assignor to Imperial Bottle Cap & Machine Company, Baltimore, Md., a Corporation of Delaware. Filed Feb. 6, 1902. Serial No. 92,885. (No model.)



Claim.—1. A paper-lined sheet-metal sealing-cap composed of a metallic crown circular in outline with integral pendent annular flange, an adherent paper lining therefor coextensive with and conforming to the interior thereof, and longitudinal crimps or corrugations in the metal flange the inner ribs of which are embedded in the coinciding surface of the paper flange without penetrating through the same, said paper flange thereby retaining a smooth interior surface.

2. A paper-lined sheet-metal sealing-cap, composed of a sheet-metal portion having a circular crown with integral pendent annular flange, an adherent like-shaped paper lining therefor, a series of longitudinal crimps or corrugations in the sheet-metal flange, the inner ribs of which are embedded in the coinciding surface of the paper-lining flange without penetrating through the same, said concrete flange having a crimped exterior metallic surface and a smooth interior paper surface, and diametric ribs in the crown of the concrete cap of less length than the diameter thereof.

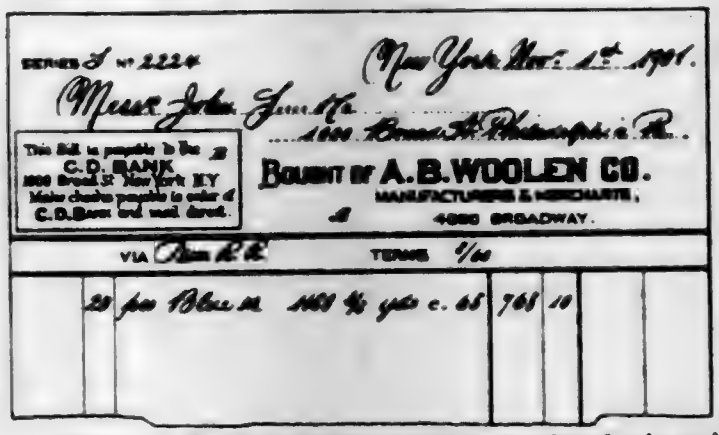
3. A paper-lined sheet-metal sealing-cap, composed of a sheet-metal circular crown with an integral pendent annular flange, a like-shaped paper lining therefor fitting closely within the interior of the metal cap and

its flange, said sheet-metal crown being provided with diametric depressions embedded in the surface of the interior paper crown, of less length than the full diameter of the crown.

4. In combination with a bottle, a paper-lined sheet-metal sealing-cap therefor consisting of an exterior metallic portion and an interior like-shaped coextensive paper-lining portion, each having a circular crown with integral pendent annular flange, the flange of the paper lining having a smooth interior surface, and the metallic portion of the concrete paper-lined flange having longitudinal corrugations entering without penetrating through or interrupting the smooth interior surface of the paper flange, and circumferentially compressed around the bottle-neck and against the interposed interiorly-smooth paper-lining flange.

5. In combination with a bottle, a paper-lined sheet-metal sealing-cap therefor, consisting of an exterior metallic portion and an interior like-shaped coextensive paper-lining portion, each composed of a circular crown with central diametric ribs and each having an integral pendent annular flange, the flange of the paper lining having a smooth interior surface, and the metallic portion of the concrete paper-lined flange having longitudinal corrugations entering without penetrating through or interrupting the smooth interior surface of the paper flange, and circumferentially compressed around the bottle-neck and against the interposed interiorly-smooth paper-lining flange, and a central section of both metal and paper of the crown of the concrete cap being forced into the bottle-mouth.

704,168. **MEANS FOR CASHING SALES ACCOUNTS.** FRANK E. ANDERSON, New York, N. Y. Filed Nov. 29, 1901. Serial No. 83,974. (No specimens.)



Claim.—1. The hereinbefore-described means adapted to be used in cashing sales accounts consisting of the combination of a bill for goods sold and delivered, a duplicate bill and an obligation of the seller of the goods on said duplicate bill consisting of an assignment of the debt, a guaranty of the *bona fides* of the sale, of the correctness of the account and that the seller will make good any claims or allowances or failure of payment and a statement on the original bill of sale that said bill is payable to a determined assignee.

2. The combination of a series of documents which together form a chain of bankable collateral, consisting of an original bill for goods sold and delivered made out to the buyer, which said original bill bears upon its face the statement that it is payable by check to the order of a certain bank; a duplicate of said bill, which duplicate contains an assignment of said account, together with a guaranty by the seller of the *bona fides* of the sale, of the correctness of the account, of the delivery and acceptance of the goods, and a further guaranty that the seller will make good any claims or deductions, or allowances made by the buyer from the amount of said bill, or his failure to pay the same when due; a certificate upon said duplicate sales account that the sale is insured under the terms of a specific policy of credit insurance referring thereto; a second assignment by the first assignee of said account to the bank to which the original bill is on its face made payable, which said second assignment contains a further guaranty by the first assignee that said sales account will be paid when due, said series of documents constituting a chain of guaranteed collateral upon which a loan is made by said bank.

3. The herein-described collateral security consisting of the combination of a bill of sale displaying a notice that the same is payable to a lender of money; a duplicate bill of sale containing an assignment of the account to an intermediary; a reassignment of the account and a guaranty of payment in full to the aforesaid lender of money.

4. The herein-described collateral security consisting of the combination of a bill of sale displaying a notice that the same is payable to a lender of money; a duplicate bill of sale containing an assignment of the account to an intermediary; a reassignment of the account with a certificate that the account is covered by insurance and a guaranty of payment in full to the aforesaid lender of money.

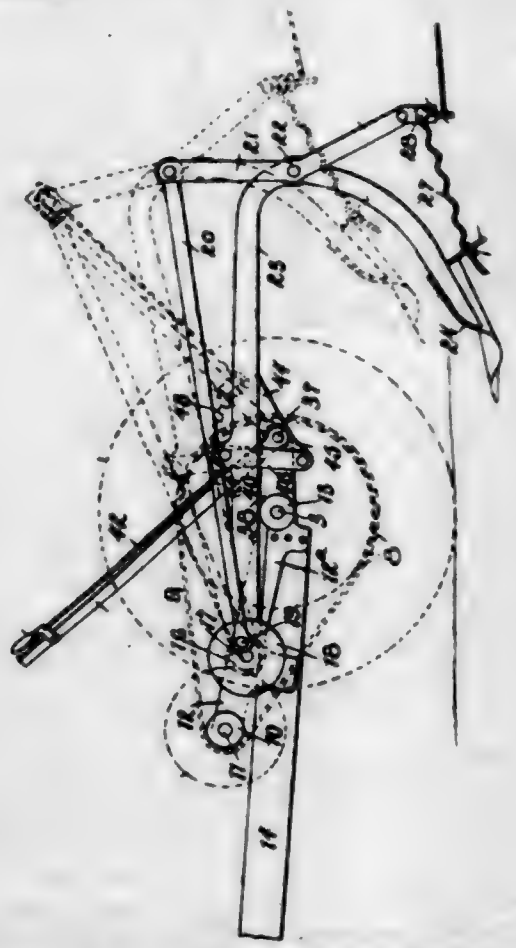
5. The hereinbefore-described means adapted to be used in cashing sales accounts consisting of the combination of an original and a duplicate bill of sale, the original displaying a notice that the account is payable to the concern which shall advance money thereon, the duplicate containing an assignment of the claim and a guaranty of its *bona fide* character and that the seller will settle allowances and claims made by the purchaser of the goods.

6. The hereinbefore-described means adapted to be used in cashing sales accounts consisting of the combination of an original and a duplicate bill of sale, the original displaying a notice that the account is payable to the concern which shall advance money thereon, the duplicate containing an assignment of the claim.

7. The hereinbefore-described means adapted to be used in cashing sales accounts consisting of the combination of an original and a duplicate bill of sale, the original displaying a notice that the account is payable to the concern which shall advance money thereon, the duplicate containing an assignment of the claim, a guaranty of its *bona fide* character and that the seller will settle allowances and claims made by the purchaser of the goods, and a certificate that the sales account is insured.

8. The hereinbefore-described means adapted to be used in cashing sales accounts consisting of the combination of an original and a duplicate bill of sale the original displaying a notice that the account is payable to the concern which shall advance money thereon, the duplicate containing an assignment of the claim and a certificate that the sales account is insured.

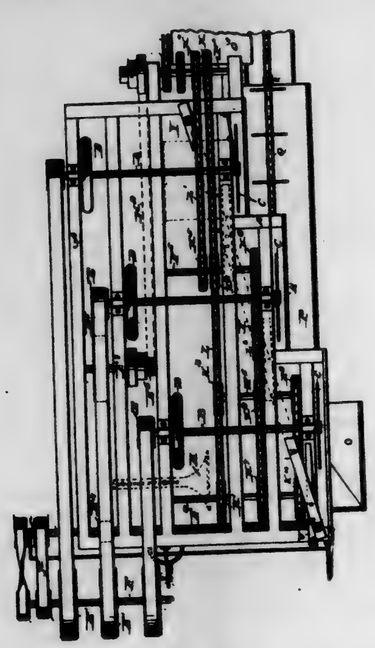
704,169. **POTATO-DIGGING MACHINE.** FRANK O. ANDREWS, Christchurch, New Zealand. Filed Oct. 25, 1901. Serial No. 80,007. (No model.)



Claim.—1. In a machine for the purpose indicated the combination of a share-scoop arranged between and fixed to a pair of beams one upon each side of the implement said beams being pivotally supported at their forward ends upon a spindle journaled in a bracket carried upon the axle of a pair of traveling wheels, a grid consisting of a plurality of bars, each bar having a plain portion at one end, which works in a hole formed for its reception in the share-scoop, and an eye at the other end which is threaded upon a bar, said bar being connected to and extending between a pair of levers which are pivoted one upon each beam a rod connecting each lever with a crank-pin carried by a crank-disk the spindle of said crank-disks being journaled in bearings upon which the beams are pivoted, and means for imparting motion to said crank by the forward movement of the implement whereby jigging motion is communicated to said grid as specified.

2. In a machine for the purpose indicated the combination with a share-scoop having a downwardly-projecting flange along its rear end, of a grid formed of bars the upper rear ends of which are threaded upon a bar which is carried between pivoted levers, the lower end of each grid-bar passing through a hole in said flange and means for vibrating said levers whereby jigging motion is communicated to said grid as specified.

704,170. SAWING-MACHINE. PETER P. BATTE, Petersburg, Va. Filed Mar. 4, 1902. Serial No. 96,667. (No model.)



Claim.—1. The combination with devices adapted to convey sticks laterally of a series of parallel saws in position to act in succession cutting successive segments from the end of a stick conveyed by said devices, a table for supporting the saws, and means for driving the devices and saws; said conveying devices, table and driving means being arranged to permit each of the successive segments as it is cut from the stick to drop instantly below the saw which severed it.

2. The combination of a series of saws arranged to cut segments in succession from the end of a stick fed sidewise to them and mounted in a frame permitting each segment as it is severed to fall below the plane of the saw severing it, and means for so feeding sticks in succession to the saws.

3. The combination with a suitable open frame, of means for carrying a series of sticks transversely across the frame, saws arranged in succession in the path of said sticks to cut from each successive segments, and a carrier arranged below the plane of the saws in position to receive the segments or blocks as they fall in succession from the saws.

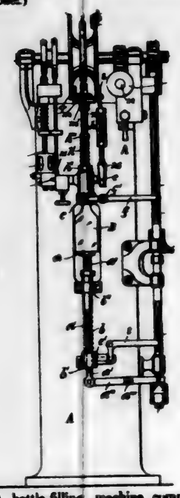
4. The combination with a series of saws arranged in position to cut segments or blocks in succession from the end of a stick, fed sidewise to the saws, carrying devices arranged to thus feed the sticks to the saws, and means for at will reversing the movement of said devices.

5. A series of saws arranged out of line and one in advance of another and mounted in a frame adapted to permit blocks at one side of any saw to fall below the latter, carriers arranged to feed long wood sidewise to the saws without obstructing such fall of blocks, and means for pressing the sticks firmly against said carriers while any saw acts upon it.

6. The combination with a series of saws arranged in position to cut blocks in succession from one end of sticks advancing sidewise to the saws and mounted in a frame adapted to permit each block to fall when severed, carriers driven independently of the saws and arranged for thus advancing a succession of sticks to the saws, and means operable from either side of the frame to reverse the movement of the carriers.

7. The combination with a table of devices arranged to convey sticks sidewise along the same, of parallel saws arranged at successively greater distances from that side from which the sticks are conveyed and in the path of such sticks; said table being narrowed by successive offsets, whereby each saw lies near the table's margin, to the end that each of the successive segments cut from the end of any stick by the several saws may drop instantly below the saw which severed it.

704,171. BOTTLE FILLING AND STOPPERING MACHINE. PICKLES BURNS, Shipley, England. Filed Mar. 22, 1901. Serial No. 52,416. (No model.)



Claim.—1. A bottle-filling machine comprising adjustable supports for the bottle, a clamp for grasping the neck of the bottle, a vertically-moving shaft having a clutch for removing and replacing a stopper, said clutch comprising a horizontal pin at the end of the shaft, two clutching jaws pivoted on the pin and a spring coiled about said pin and having its ends bearing outwardly upon the portions of the jaws above the pin, substantially as herein specified.

2. A bottle-filling machine comprising a vertically-movable and yieldingly-supported spindle on which the bottle is adapted to rest, a lever connected with said spindle, means for intermittently and positively holding the lever to prevent upward movement of the spindle, a shaft above and in alinement with the spindle, means for alternately rotating said shaft in opposite directions, a clutch at the lower end of the shaft said clutch comprising a horizontal pin at the end of the shaft, two clutching-jaws pivoted on the pin and a spring coiled about said pin and having its ends bearing outwardly upon the portions of the jaws above the pin, substantially as herein specified.

3. A bottle-filling machine comprising a support for the bottle, a vertically-movable shaft having a stopper-clutch at its lower end, means for vertically moving said shaft, a pinion splined on said shaft, and a horizontal power-shaft above the stopper-shaft, said power-shaft having two disks provided with segmental gears adapted to alternately engage and rotate the pinion and the stopper-shaft, said pinion having a polygonal plate or flange, and the disks having surfaces at the ends of the segmental gears to bear on the straight sides of the polygonal flange to hold the pinion from turning when not engaged by the segmental gears.

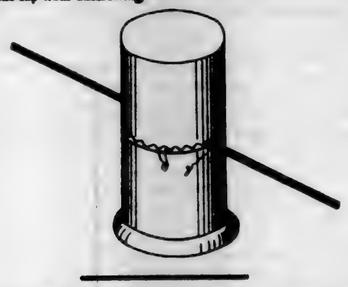
4. A bottle-filling machine comprising a support for the bottle, a vertically-movable shaft having a stopper-clutch at its lower end, a spring for normally pressing said shaft upward, a pinion splined on said shaft, and a horizontal power-shaft above the stopper-shaft and having two disks provided with segmental gears adapted to alternately engage and rotate the pinion and the stopper-shaft, and a cam between the disks and adapted to bear on and depress the stopper-shaft against the action of its elevating-spring, said pinion having a polygonal plate or flange, and the disks having surfaces at the ends of the segmental gears to bear on the straight sides of the polygonal flange to hold the pinion from turning when not engaged by the segmental gears.

704,172. INSULATOR. JAMES E. CALVIN, Camptonville, Cal., assignor of one-half to Enos C. Cochran, Camptonville, Cal. Filed May 1, 1902. Serial No. 105,461. (No model.)

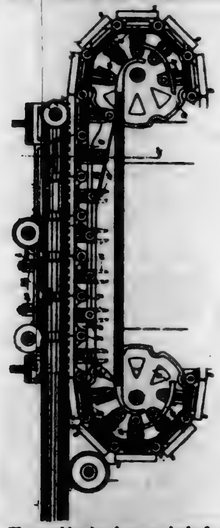
Claim.—1. An insulator consisting of a base having a longitudinally-slotted screw-threaded stem or post and cap screwing on over said stem and having its under face radially recessed.

2. An insulator consisting of a base having a slotted screw-threaded stem, a screw-cap fitting said stem, said cap having radial corrugations on its edge in which the wire to be held is engaged.

3. An insulator consisting of a base, a cylindrical screw-threaded stem thereon, an annular shoulder on said base, said stem having a slot adapted to receive a conductor, said shoulder having grooves coincident with said slot so that the conductor is maintained and supported in an essentially straight line, and a screw-cap fitting over said stem and having corrugations on its edge in which the conductor is adapted to rest and prevent the cap from unscrewing.



704,178. CAN-BODY-FORMING MACHINE. WILBER S. CASE, Haywards, Cal., assignor of one-half to Joseph H. Hunt, Oakland, Cal. Filed Dec. 12, 1901. Serial No. 85,562. (No model.)



Claim.—1. The combination in a can-body-forming machine of a horn about which the can is formed, a channel made longitudinally in the horn, clamps, or jaws and devices for opening and closing them about the horn, means for holding the metal sheet within the jaws and bending it about the horn with the edges overlapping and crossing the channel, and a folding edge depending into the channel, beneath which the overlapping edges of the blank are carried and folded into the channel.

2. In a can-body-forming machine an endless traveling carrier, said carrier consisting of a series of flexibly-connected tables, with surfaces adapted to receive the blanks, folding-clamps centrally pivoted beneath the upper surfaces of the tables, open channels formed in the tables in line above the clamps, mechanism by which the clamps are closed about their pivots, and a stationary horn about which the blanks are folded by the clamps.

3. The combination in a can-body-forming machine of an endless traveling carrier composed of a series of flexibly-connected channeled tables having surfaces adapted to receive the blanks and upturned ledges at the sides with inclined surfaces between said ledges and the flat central portion of the table, rollers with the peripheries beveled to travel upon said inclines, a horn located above the line of travel of the tables, clamps centrally hinged beneath the upper surface of each table and mechanism by which the clamps are closed to fold the blank about the horn.

4. The combination in a can-body-forming machine of a series of flexibly-connected channeled tables with inclined edges and upturned guides to receive the blanks, rollers having the peripheries beveled to bend the edges of the blanks between said rollers and the inclines, a horn located above and in the line of travel of the tables, clamps hinged beneath the upper surfaces of the tables, and mechanism by which they are actuated to fold the blanks about the horn, a longitudinal groove in the top of the horn over which the edges of the blank are lapped, and a folding device beneath which said overlapping edges are passed and by which they are bent into the groove.

5. The combination in a can-body-forming machine of an endless traveling carrier composed of a series of flexibly-connected open-centered tables adapted to receive the blanks, a horn located above the line of travel of the carrier, folding jaws or clamps centrally hinged below the upper surface of each table, vertically-guided slidable blocks, links connecting said blocks with the jaws, and stationary inclines over which the blocks pass during the forward movement of the carriers and by which the jaws are closed.

6. The combination in a can-body-forming machine of an endless traveling carrier composed of a series of flexibly-connected open-centered tables adapted to receive and carry the blanks, folding jaws or clamps centrally hinged below the upper surface of the tables, a horn located above the line of travel of the carrier, vertically-guided independently-slidable blocks, links connecting each of said blocks with one of the jaws, and inclined surfaces of different pitch, over which the jaw-actuating blocks move whereby the jaws are closed successively.

7. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables, adapted to receive and advance the blanks, centrally-hinged jaws or clamps on each table, a horn located above the line of travel of the carrier with a longitudinal groove upon the upper side, having a shallow depression upon one side of said groove, vertically-guided slides connected with the folding-jaws, and cams or inclines of different pitch over which the slides pass, whereby one jaw moves in advance of the other to fold one edge of the blank across the groove and into the depression of the horn, with the succeeding edge overlapping said first edge.

8. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive and advance the blanks, a horn located above the line of travel of the carrier having a groove made in its upper surface, and a shallow depression made upon one side of said groove, folding-jaws centrally hinged beneath the upper surface of each table, mechanism whereby said jaws are actuated, one in advance of the other whereby one edge of the blank is folded across the groove into the depression of the horn, and the other edge is folded above the first one, and just above the groove, and a wheel or folder located above the groove and acting to bend the overlapping edges of the blanks into the groove as they pass beneath the folder.

9. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive and advance the blanks, curved jaws centrally hinged beneath the upper surface of the tables, mechanism by which said jaws are closed, one in advance of the other, a horn located above the line of travel of the carrier about which here the blank is closed by the jaws, said horn having a groove longitudinal upon its upper side with a depression at one side of the groove whereby one edge of the blank is carried across the groove to lie in the depression, and the other edge is laid upon the first-named portion and above the groove, and a roller journaled above the groove with its edge adapted to bend the overlapping edges into the groove and form a double bend of the inner fold, and a single bend of the outer one embraced by the two sides of the inner fold.

10. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive and advance the blanks, a horn located above the line of travel of the carrier having a groove formed in its upper side, the first portion of said groove being essentially radial to the axis of the horn and the subsequent portion being gradually turned in a spiral manner until it is brought to the surface as above, jaws hinged to each of the tables, mechanism by which said jaws are moved to fold the blank about the horn with one of its edges in advance of the other, and overlapping the groove on the upper side of the horn and the other edge laid above said groove, a wheel journaled above and adapted to fold the overlapping edges into the groove of the horn so that the double bend of one edge inclosed the single bend of the other, projections upon the table and upon the folding-jaws, channels formed in the sides of the horn into which the projections enter whereby the advance of the carrier and jaws impels the folded blank along the horn and causes the interlocked edges to follow the changing direction of the groove into which they are folded.

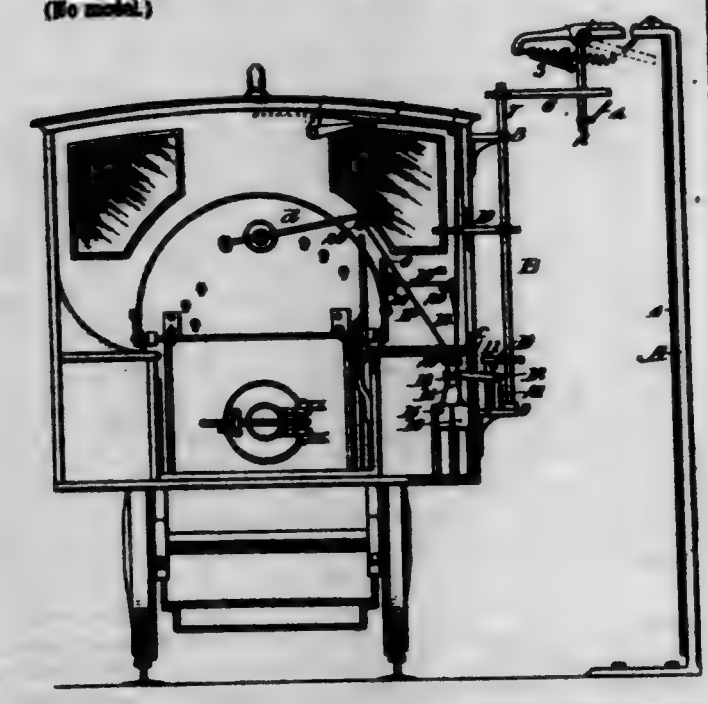
11. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive the blanks from which the body is to be formed, a horn located above the line of travel of the carrier having a groove formed in its upper side, the first portion of said groove being essentially radial to the axis of the horn, and the subsequent portions being gradually turned in a spiral manner so that the bottom of the groove finally arrives at the surface of the horn,

clamps or jaws hinged centrally to each table, mechanism by which the jaws are closed as the tables advance and the blank is folded about the horn with one edge crossing the groove and the other overlapping it and terminating in line above the groove, a wheel journaled above the groove adapted to press the overlapping edges of the blank into the groove so that the inner edge has a double bend inclosing the single bend of the outer edge, lugs projecting from the table and from the folding-arms so as to contact with the rear edge of the blank when folded, channels made in the horn in the line of travel of the lugs whereby the folded blank is evenly advanced from one end to the other of the horn.

12. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive and advance the blanks, jaws hinged beneath the upper surface of said tables, mechanism by which said jaws are closed and a blank folded during the forward movement of the carrier, a horn located above the carrier having a groove in its top about which horn the jaws fold the blank with one edge in advance of the other and overlapping the groove, a wheel journaled above the horn so that its periphery acts to bend the overlapping edges of the blank into the groove, and a pressure plate or bar beneath which the partially-united edges pass after leaving the roller.

13. The combination in a can-body-forming machine of an endless traveling carrier composed of flexibly-connected tables adapted to receive and advance the blanks, jaws hinged beneath the upper surface of said tables, mechanism by which said jaws are closed and a blank folded during the forward movement of the carrier, a horn located above the carrier, having a groove in its top about which horn the jaws fold the blank, with one edge in advance of the other and overlapping the groove, a wheel journaled above the horn so that its periphery acts to bend the overlapping edges of the blank into the groove, a pressure plate or bar beneath which the partially-united edges pass after leaving the roller, and a roller journaled above the terminal end of the groove whereby the interlocked seam is compressed and finished.

704,174. AUTOMATIC STOP-SIGNAL FOR RAILWAYS. THOS. P. CHALONER, New York, N.Y. Filed May 14, 1902. Serial No. 107,203. (No model.)



Claim.—1. The combination with the throttle-lever, in a locomotive, of a tappet-actuated arm, a vertical rock-shaft from which said arm projects horizontally outward, and provided with a latch-engaging arm, a latch projecting normally in the path of the arm last named, a horizontal lever normally engaged with said latch, a ring normally engaged with said horizontal lever, a weight normally suspended from said ring, and a connection between said weight and said throttle-lever, arranged to actuate the throttle-lever for shutting off the steam when said weight is liberated by the automatic retraction of said latch.

2. The combination with an air-brake lever, in a locomotive, of a tappet-actuated arm, a vertical rock-shaft from which said arm projects horizontally outward, and provided with a latch-engaging arm, a latch projecting normally in the path of the arm last named, a horizontal lever normally engaged with said latch, a ring normally engaged with said horizontal lever, a weight normally suspended from said ring, and a connection between said weight and said air-brake lever arranged to actuate said lever so as to apply the brake by means of said weight when said latch is automatically retracted.

3. The combination with a whistle-lever, in a locomotive, of a tappet-actuated arm, a vertical rock-shaft from which said arm projects horizontally outward, and provided with a latch-engaging arm, a latch projecting normally in the path of the arm last named, a horizontal lever normally engaged with said latch, a ring normally engaged with said horizontal lever, a weight normally suspended from said ring, and a connection between said weight and said whistle-lever arranged to actuate said lever and start the whistle by means of said weight when said latch is automatically retracted.

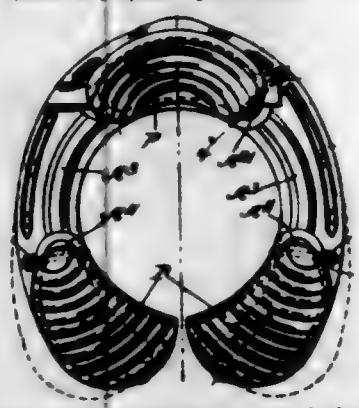
4. The combination, substantially as hereinbefore specified, of a tappet-actuated arm, a vertical rock-shaft turned by said arm, a latch-retracting arm carried by said rock-shaft, a horizontal lever normally engaged by said latch, a pair of rings normally engaged with said horizontal lever, a pair of weights connected with said rings respectively, and cords, leading from said weights, adapted respectively to operate the throttle-lever and the air-brake lever within the cab of a locomotive.

5. The combination, substantially as hereinbefore specified, of a tappet-actuated arm, a vertical rock-shaft turned by said arm, a latch-retracting arm carried by said rock-shaft, a horizontal lever normally engaged by said latch, a pair of rings normally engaged with said horizontal lever, a cord extending from one of said rings and adapted to be connected with the throttle-lever of the locomotive, and a bifurcated cord attached to the other ring and arranged for connection with the air-brake lever and whistle-lever of the locomotive.

6. The combination with the cab of a locomotive of a tappet-actuated arm projecting therefrom, a rock-shaft actuated by said arm, a latch-retracting arm carried by said rock-shaft, a spring-retracted latch projecting normally in the path of said latch-retracting arm, a horizontal lever normally engaged by said latch, a ring normally engaged with said horizontal lever, a weight suspended from said ring, and a cord extending from said weight to a safety device carried by the locomotive.

7. The combination with the cab of a locomotive of a tappet-actuated arm projecting therefrom, a rock-shaft actuated by said arm, a latch-retracting arm carried by said rock-shaft, a spring-retracted latch projecting normally in the path of said latch-retracting arm, a horizontal lever normally engaged by said latch, a pair of rings normally engaged with said horizontal lever, a pair of weights suspended from said rings, and cords extending from said weights respectively and adapted to operate safety devices carried by the locomotive, substantially as hereinbefore specified.

704,175. HORSESHOE. FRED W. CLINE, Chicago, Ill., assignor of one-half to A. G. Thompson, Chicago, Ill. Filed Aug. 19, 1901. Renewed June 11, 1902. Serial No. 111,139. (No model.)



Claim.—1. A horseshoe comprising a metal body or base, having cavities for heel and toe calks, and undercut recesses or apertures at a point in the periphery of each of said cavities; removable calks adapted to be lodged in the cavities and having projections adapted to enter said undercut recesses, the shoe-base having the bounding walls or flanges of said cavities at points opposite said undercut recesses respectively, pierced in position to admit a retaining device to prevent withdrawal of the projections from the recesses respectively.

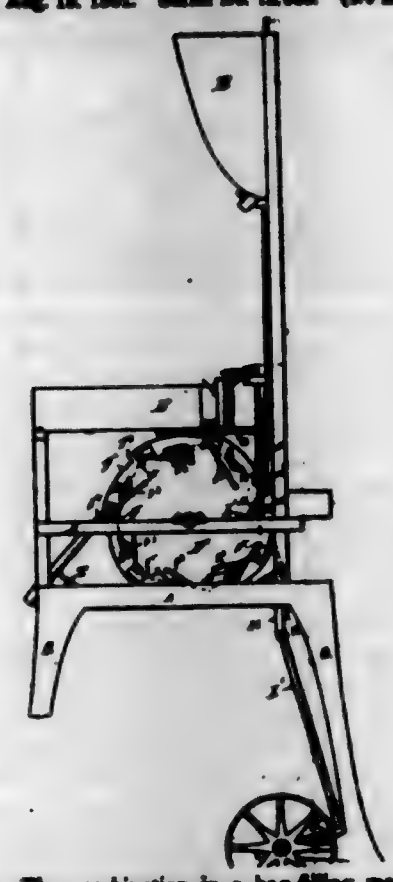
2. In a horseshoe, in combination with the base A, having the cavities for the calks provided with undercut recesses at one end, calks adapted to be lodged in said cavities, having lugs to enter the recesses; the flanges or bounding walls of the cavities at the opposite ends being pierced to receive a retaining-pin, and the web of the shoe outside the wall having a depression to lodge the head of such pin; in combination with a headed pin inserted through said flanges in position to retain the calks, and having its head lodged in said depression.

3. A horseshoe, having its body or base provided with a cavity for a toe-calk, such cavity having its forward wall recessed or undercut, in combination with a calk having a rigid base adapted to enter the cavity, provided with a flange or head adapted to enter the undercut recess; the body of the shoe being apertured transversely back of the calk, and a key inserted endwise through the edge of the shoe, behind the calk, to hold the same engaged in the undercut recess.

4. A horseshoe, having at the forward side a cavity for a toe-calk, whose forward wall is forwardly convex and undercut, in combination with a calk adapted to enter the cavity and having its forward edge curved to conform with the outline of the cavity, and provided with a head or flange entering the undercut recess of the forward wall of the cavity, and a key inserted transversely through the shoe, holding the calk, preventing its direct withdrawal from the recess.

5. A horseshoe, having the heel-calks corrugated in concentric arcs convex rearward about centers at the opposite sides of the shoe.

704,176. BAG-FILLING MACHINE. JAMES L. DUGGINS, Dunkirk, N. Y. Filed Aug. 19, 1901. Serial No. 72,698. (No model.)



Claim.—1. The combination in a bag-filling machine, of a bag-holder, a rotary carrier, a cementing apparatus, and a reciprocating plunger adapted to deliver bags from the bag-holder upon the rotary carrier, and cooperating with and actuating the rotary carrier, substantially as set forth.

2. The combination in a bag-filling machine, of a bag-holder, a rotating bag-carrier, flattened peripheral faces on said carrier adapted to receive bags from the bag-holder, a cement-carrier adapted to deposit cement on bags on the rotary carrier, bag-flap-folding mechanism on said rotating carrier, and a hollow reciprocating plunger mechanism, cooperating with and actuating said mechanism, substantially as set forth.

3. The combination in a bag-filling machine, of a bag-holder, a follower automatically moving bags along therein, a rotary carrier under said bag-holder adapted to receive bags removed from the bag-holder, a cementing mechanism in front of said carrier adapted to deposit cement on bags on the carrier, bag-flap folders on the carrier adapted to fold down bag-flaps after the bags are cemented, a hopper above the bag-holder, a reciprocating frame carrying a hollow plunger, adapted to remove bags from the bag-holder, deliver them upon the carrier and deposit a predetermined amount of the contents of the hopper therein, and means on the reciprocating frame and plunger for operating the carrier and the cementing apparatus, substantially as set forth.

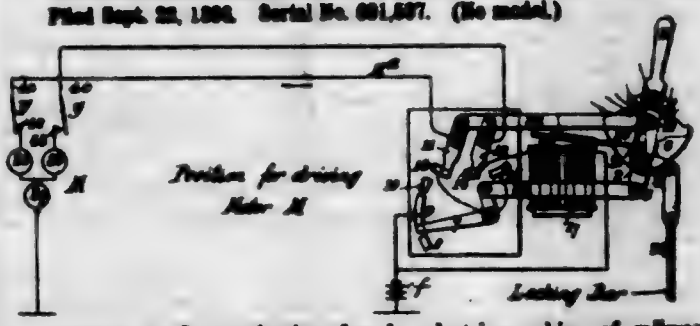
4. The combination in a bag-filling machine of a bag-holder, means for moving bags forward therein, a carrier, means thereon for receiving bags and folding down the flaps thereof, a cement-receptacle, means for delivering cement therefrom to a bag on the carrier, a hopper, a reciprocating frame carrying a hollow plunger operating in said hopper, and also provided with means for removing a bag from the bag-holder and depositing it upon the carrier, means on said reciprocating mechanism for rotating the carrier and operating the flap-folding mechanism thereon, and means on said reciprocating parts for operating the cementing apparatus, substantially as set forth.

5. The combination in a bag-filling machine, of a frame having an upright extension thereon, a bag-holder, a follower therein for moving the bags forward, means for actuating said follower, a carrier, faces thereon for receiving bags, spring-actuated flap-holders on said carrier, stops on said carrier, spring-actuated latches on the frame engaging the flaps on the carrier, a cement-receptacle in front of the carrier, a cement-conveying apparatus therein, a reciprocating frame operating vertically in said machine-frame and the upright extension thereon, mechanism for actuating said reciprocating frame, a hopper on the upright extension of the frame, a hollow plunger carried by said reciprocating frame, and communicating with said hopper, cut-off valves in said hollow plunger, a lip on the lower end of the plunger adapted to enter the mouth of a bag in the end of the bag-holder, arms on said reciprocating mechanism adapted to engage and rotate the carrier, and operate the bag-flap folders thereon, mechanism on the reciprocating frame adapted to disengage the latches from the stops on the carrier, and also for operating the cement-carrier, substantially as set forth.

6. In a bag-filling machine, a rotary carrier, peripheral faces thereon adapted to receive a bag, spring-actuated bag-flap-folding mechanism on said rotary carrier, means for engaging and opening the bag-flap folders, and means for actuating said rotary carrier, substantially as set forth.

7. In a bag-filling machine, a rotary carrier, having faces thereon adapted to receive and retain a bag when filled spring-actuated bag-flap-closing mechanism thereon, curved arms on said bag-flap closers, a chute at the rear of the carrier resting thereon having slots therein adapted to engage the curved arms on the bag-flap closers and release the bags from the carrier, substantially as set forth.

704,177. ELECTRICAL APPARATUS FOR OPERATING RAILWAY SWITCHES AND SIGNALS. THÉOPHILE DUCRETET, Paris, France. Filed Sept. 22, 1900. Serial No. 691,597. (No model.)



Claim.—1. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, pawls on said lever acting in opposite directions, a current-controlled bolt, and means for projecting said bolt into the path of said pawls in case of accidental throwing of the switch.

2. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, pawls on said lever acting in opposite directions, in combination with a frame having notches adapted to receive said pawls, and means for closing said notches to permit the passage of said pawls in the normal operation of the mechanism.

3. In mechanism for the electric working of railway switches and signals, a transmitting-commutator, a lever for working it, pawls on said lever acting in opposite directions, notches or steps on the frame adapted to receive said pawls, in combination with means for preventing engagement of the notches and pawls when moved in the forward direction and permitting engagement thereof in the opposite direction.

4. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, pawls on said lever acting in opposite directions, a frame having notches or steps adapted to receive said pawls, and a cam on said frame with two notches differing in position from those on the frame, the said cam adapted to disengage the pawl from the notch or step for the movement of the lever forward, and to permit the pawl to engage the notch or step for the back movement.

5. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, pawls on said lever acting in opposite directions, a frame having notches or steps thereon, a cam with two notches adapted to be brought into coincidence with the notches on the frame, and two shoulders on said cam in the path of said pawls whereby the cam is moved by the lever to the ends of its stroke.

6. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever, connections between said commutator and said lever whereby the movement of the latter controls the former, an electric bolt controlling the lever, two pawls on the lever, and a notched and shouldered cam adapted to be operated by said lever.

7. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, an electric bolt controlling the lever, two pawls on the lever, a notched and shouldered cam adapted to be operated by said lever, a reversing-switch adapted to be operated by said cam, and a motor attached to said railway-switches, in combination with a transmitting-circuit from said switch to said motor.

8. In mechanism for the electric working of railway-switches, a transmitting-commutator, a lever for working it, an electric bolt controlling the lever, two pawls on the lever, a notched and shouldered cam adapted to be operated by said lever, and a reversing-switch adapted to be operated by said cam, in combination with a transmitting-circuit and a circuit adapted to operate the electric bolt.

9. In mechanism for the electric working of railway-switches, a wheel, a crank-roller thereon, a slotted lever for locking and moving the switch, the wheel operating in said slot, a worm and electric motor for operating said wheel, and a commutator having two springs, in combination with a rod attached to the moving part of the switch, and means connected to said rod whereby one or the other of the springs is strained by the movement of the switch.

10. In mechanism for the electric working of railway-switches, a wheel, a crank-roller thereon, a slotted lever, the roller operating in said slot, a worm and electric motor for operating said wheel, a commutator having two springs, and means for straining said springs by the movement of the switch, in combination with a releasing-lever and two studs on the wheel whereby the commutator is released when the switch is fully moved and locked.

11. In mechanism for the electric working of railway-switches, a wheel, a crank-roller thereon, a worm and electric motor for operating said wheel, a slotted lever operated by said roller and connected to said switch, a commutator having two springs, means for straining said springs by the movement of the switch, a releasing-lever for said springs, two studs on the wheel adapted to operate said lever, and a controlling apparatus and transmitting-circuit leading therefrom, the commutator being adapted to connect the motor and the transmitting-circuit.

12. In mechanism for the electric working of railway-switches, a wheel, a crank-roller thereon, a worm and an electric motor for operating said wheel, a slotted lever operated by said roller and connected to said switch, a commutator having two springs, means for straining said springs by the movement of the switch, a releasing-lever for said springs, two studs on the wheel adapted to operate said lever, a controlling apparatus, a transmitting-circuit leading therefrom, the commutator being adapted to connect the motor with said transmitting-circuit, a safety device, and means whereby the motor is connected to the transmitting-circuit during its action, and after its action is automatically put in circuit with said safety device.

13. In mechanism for the electric working of a group of simultaneously-acting switches, controlling apparatus, motors connected directly to said switches, transmitting-circuits connecting said controlling apparatus and said motors and comprising two wires, and a relay in each of said wires controlling the circuit of the other wire.

14. In mechanism for the electric working of a group of simultaneously-acting switches, central apparatus, local motors, line-wires connecting said apparatus, and a relay in each of the line-wires, in combination with a contact-breaker in each motor of the group, and an electromagnet in series with said contact-breakers, the electromagnet being so arranged as to lock the relay in one of its positions so that the relay is only released when all the contact-breakers in series close the circuit.

15. In mechanism for the electric working of railway-switches, a safety device and a transmitting-circuit comprising two line-wires, in combination with two differential circuits, an electromagnet in one of said differential circuits and a relay in the other, means for connecting said differential circuits to said line-wires and means connected with said electromagnet and said relay for controlling said safety device.

16. In mechanism for the electric working of railway-switches, a safety device, a transmitting-circuit comprising two line-wires and two differential circuits, an electromagnet in one of said differential circuits and a relay in the other, means for connecting said differential circuits to said line-wires, means connected with said electromagnet for controlling said safety device, and means connected with said relay for controlling the current through said electromagnet, so that any break or equilibrium in the current of the differential circuits works the safety device.

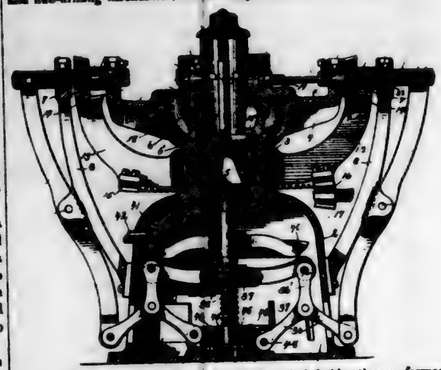
704,178. METALLIC-HUB-DRILLING MACHINE. GEORGE H. EVERSON, Pittsburg, Pa. Filed May 20, 1901. Serial No. 61,168. (No model.)

Claim.—1. The combination of radially-disposed drill-spindles arranged in different planes, levers operatively connected to the spindles and fulcrumed in correspondingly-different planes, lever-actuating mechanism, and connections arranged in different planes between said actuating mechanism and the levers, the difference in plane of said connections corresponding to the difference in plane of the lever-fulcrums and of the drill-spindles, substantially as shown and described.

2. The combination of a circular series of horizontal spindles, a circular series of vertical levers operatively connected to the spindles for moving them longitudinally, a vertically-movable spider, a toggle-lever connection between each lever and spider, and means for adjusting the spider vertically, substantially as shown and described.

3. In a hub-drilling machine, the combination of drilling mechanism, and a hollow hub-holder adapted to embrace and rigidly confine the hub while being drilled, substantially as shown and described.

4. The combination of a frame formed with a central depression, a hollow hub-embracing hub-holder removably centered in the depression, and hub-drilling mechanism, substantially as shown and described.



5. The combination of a frame, a hollow hub-holder thereon formed with an internal hub-supporting flange, tool-apertures in the holder, and hub-drilling mechanism, substantially as shown and described.

6. The combination of a frame, a hollow hub-holder having a radial series of tool-guiding passages, and a radially-arranged series of tools operative through said passages, substantially as shown and described.

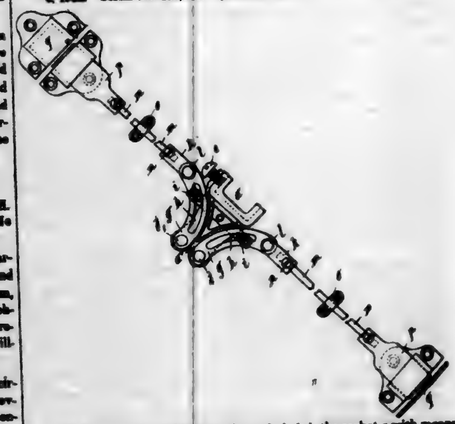
7. The combination of a frame, a hollow hub-holder having a radial series of tool-guiding passages, means for sustaining a hub within the holder with the points to be drilled in line with said tool-passages, and tools operative through said passages, substantially as shown and described.

8. In a hub-drilling machine, the combination of drilling mechanism, and a removable hollow hub-holder adapted to embrace and rigidly secure the hub while being drilled, substantially as shown and described.

9. In a hub-drilling machine, the combination of drilling mechanism, a hub-holder, and a hub-holder receiver adapted to confine holders for hubs of different sizes, substantially as shown and described.

10. In a drilling-machine, the combination of a horizontal series of radially-arranged drill-spindles, a corresponding series of vertical levers operatively connected at their upper ends to the spindles and fulcrumed between their ends, a vertically-movable device arranged centrally between the lower ends of said levers, and toggle mechanism connecting said device and lever ends, substantially as shown and described.

704,179. DOOR-BOLT. EMILE FAGES, Paris, France. Filed Apr. 8, 1901. Serial No. 101,919. (No model.)



Claim.—1. In combination, the main bolt *b*, the socket *a* with means for clamping it to said main bolt, the sliding segments having their inner ends pivoted to said bolt, guiding means for said segments, supplemental bolts at the top and bottom of the door, and connections from said supplemental bolts to the outer ends of said segments, substantially as described.

2. In combination, the main bolt *b*, the socket *a* with means for clamping it to said bolt, the sliding segments having their inner ends pivoted to said bolt, stationary pins engaging curved slots in the segments, supplemental bolts at the top and bottom of the door, and connections from said supplemental bolts to the outer ends of the segments, substantially as described.

704,180. LOCK. ALAN B. PEDDINGHAUS, New York, N. Y. Filed Apr. 22, 1901. Serial No. 56,557. (No model.)

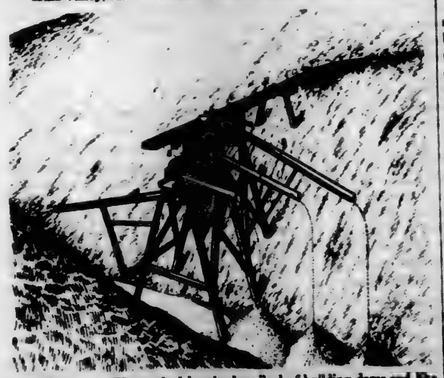
Claim.—1. In a lock, the combination of a pair of bolts or latches, one behind the other, one a main latch and the other an auxiliary member or bolt; a shiftable tumbler for engaging the bolt; and means carried by the auxiliary bolt and movable between the tumbler and main latch for positively moving and holding the tumbler out of engagement with the main latch when said auxiliary bolt is in its protracted position.

2. In a lock mechanism, the combination with a latch or bolt, of a locking-tumbler for locking said latch and comprising a pivoted lever having a flanged end; and an auxiliary bolt having a laterally-extending part movable between the flanged end of said tumbler and the latch and effective when in its protracted position to interfere with the locking of said latch by said tumbler, and when shifted into a retracted position to permit the locking of said latch.

3. In a lock, the combination with a casing, of a knob-spindle carried thereby having a tumbler-engaging surface; a pair of spring-controlled latches or bolts, one behind the other, one a main latch connected with said spindle for movement thereby and the other an auxiliary bolt; a spring-controlled tumbler having a part adapted to engage said main latch and lock the latch in a protracted position, said auxiliary bolt having a part movable between the tumbler and main latch for positively moving and holding the tumbler out of engagement with the main latch when said auxiliary bolt is in its protracted position, the organization being such that on the rotation of the knob-spindle or the protraction of the auxiliary bolt the tumbler will be disengaged from the main latch.

4. In a lock mechanism, the combination with a tubular casing, of a knob-spindle projecting transversely thereof and carrying a cam; a main bolt or latch carrying a spiral spring and connected with said spindle by a chain and having a stop-face; a tumbler pivotally connected to said casing at one side of the spindle and having a flanged end at the other side of said spindle effective to engage the stop-face of said latch; a spring for throwing said tumbler into locking position, the cam on the operation of the knob being effective to lift said tumbler from the latch; an auxiliary bolt mounted in said casing and carrying a spiral spring, said bolt having a laterally-projecting part provided with a beveled end working intermediate the flanged end of said tumbler and the latch and effective in one position to permit the locking of said latch by the tumbler, and in another position to lift said tumbler free of the latch.

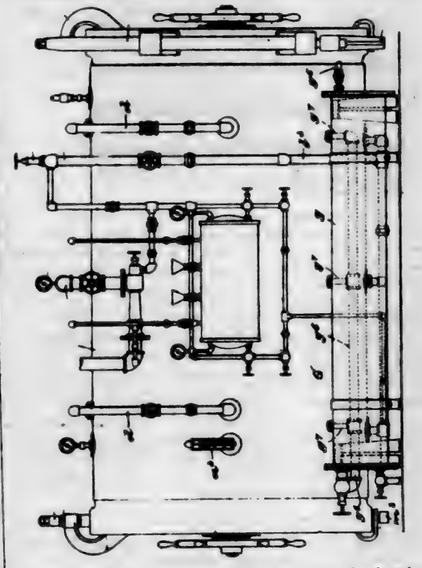
704,181. METHOD OF BUILDING DAMS. ARTHUR D. FOOTE, Grass Valley, Cal. Filed Mar. 17, 1902. Serial No. 98,501. (No model.)



Claim.—1. The method herein described of building dams and like structures consisting in first separating and grading the material from the coarser to the finer while said material is in motion, and then depositing the separated materials successively from the front to the back of the structure.

2. The method herein described of building dams and like structures, consisting in first separating associated material into its coarser and successively finer elements, then delivering these separated materials by chutes or the like to form successive embankments, commencing with the coarser and terminating with the finer material.

704,182. DISINFECTING APPARATUS. WILLIAM H. FRAHER, Philadelphia, Pa. Filed May 7, 1901. Serial No. 60,121. (No model.)



Claim.—1. In a disinfecting or sterilizing apparatus, a chamber wherein the articles to be treated are adapted to be introduced, a jacket surrounding said chamber, a valve-controlled steam-pipe leading from a source of steam-supply directly to the base of the jacket, a valve-controlled pipe leading from the jacket above the base of said jacket to the upper portion of the chamber and constituting the sole means for introducing steam into said chamber, a box open at one end to the external atmosphere, a steam-coil supplied from the source of steam-supply and inclosed in said box, a pipe leading from the closed end of said box and entering said chamber, said pipe and box constituting the sole means for introducing hot air into said chamber, and an exhaust apparatus connected directly with the chamber and operated by steam from the source of steam-supply.

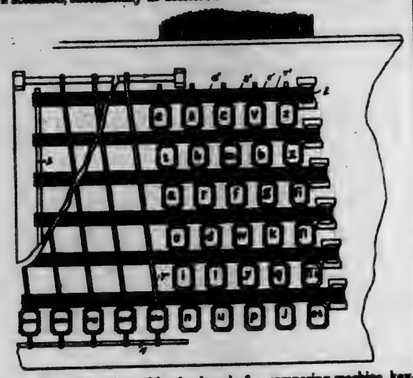
2. In a disinfecting or sterilizing apparatus, a chamber, wherein the articles to be treated are adapted to be introduced, a curved hood following closely the interior of the chamber and arranged within and some distance from the top or roof of said chamber, said hood, consisting of a central curved upper section and two end curved sections concentric with and overlapped by said central section, and means for introducing steam to the chamber directly above the upper curved section.

704,188. ATTACHMENT TO KEYBOARDS OF COMPOSING MACHINES. DAVID W. FRATHER, Detroit, Mich., assignor of one-third to Harry B. Caldwell, Detroit, Mich. Filed June 11, 1900. Renewed May 17, 1902. Serial No. 107,826. (No model.)

Claim.—1. In a machine of the kind described, the combination of the key-levers lying parallel to each other, intermediate levers pivoted at one side of and extending across said key-levers, and word-levers pivoted at one side of the key-levers and of the intermediate levers, and extending across the free end of said intermediate levers beyond the key-levers, each of the word-levers being adapted to actuate a certain number of the intermediate levers, and each of the intermediate levers being adapted to actuate a certain number of the key-levers, substantially as described.

2. The combination with the keyboard of a composing-machine, the key-levers thereof, a word-lever, and intermediate levers interposed between the key-levers and the word-lever, the said word-lever being ar-

ranged to actuate the intermediate levers successively, and the intermediate levers being arranged to actuate the key-levers in the order of their own actuation, substantially as described.

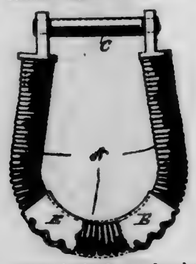


3. In combination with a keyboard of a composing-machine, key-levers, word-levers arranged at the side of the keyboard, and intermediate levers interposed between the key-levers and the word-levers, each intermediate lever being adapted to actuate a single key-lever, and each word-lever being adapted to actuate a plurality of intermediate levers, substantially as described.

4. In combination with the key-levers of a composing-machine, a plurality of word-levers, and a plurality of intermediate levers, each intermediate lever being arranged to engage with and actuate a single key-lever, and each word-lever being adapted to engage with and actuate a plurality of intermediate levers, substantially as described.

5. In combination with the keyboard of a composing-machine, a plurality of word-levers arranged in approximate parallelism with the key-levers, a plurality of intermediate levers arranged at approximate right angles to the key-levers and above the same and engaging under the word-levers, substantially as described.

704,184. STIRRUP. CHARLES W. GILLESPIE, Tascosa, Tex. Filed Nov. 14, 1901. Serial No. 82,262. (No model.)



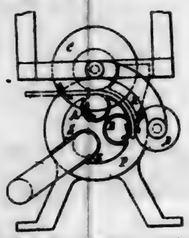
Claim.—1. A stirrup having its tread and each side formed of a continuous coiled spring said spring being bent in the form of a stirrup with its ends sprung toward each other and held in such position by a suitable bolt connecting said ends.

2. A stirrup having its tread and sides formed of a coiled spring bent in U shape, heads adapted to be secured to the ends of said springs, and a tie connecting said heads forming a connection adapted to retain the coiled spring in its bent position.

3. A stirrup consisting of a continuous coiled spring bent in U shape, heads having eyes adapted to enter the ends of said spring provided with threads adapted to engage with the coils of said spring, standards formed integral with said heads projecting above the same, and a tie connecting said standards.

704,185. APPARATUS FOR MAKING CHAINS. JOSEPH GELOT, Jolie St. Pierre, Belgium, assignor to Société Générale du Lamissage Automatique pour la Fabrication de Chaînes sans Soudure, Brussels, Belgium, a Corporation of Belgium. Filed Apr. 28, 1902. Serial No. 105,044. (No model.)

Claim.—1. Apparatus for making chains of successive superposed windings of a metal strip, comprising a stationary core provided with a recess for a previously-formed link, rotating cylinders in the core and compressing-rollers, substantially as described.



2. Apparatus for making chains of successive superposed windings of a metal strip, comprising a stationary core provided with a recess for a previously-formed link, rotating cylinders in the core, compressing-rollers and a guide between the compressing-rollers, substantially as described.

3. Apparatus for making chains of successive superposed windings of a metal strip, comprising a stationary core provided with a recess for a previously-formed link, rotating cylinders in the core, compressing-rollers, one compressing-roller having a rim, and a guide K, substantially as described.

4. Apparatus for making chains of successive superposed windings of a metal strip, comprising a stationary core, a portion of said core being of less diameter than the main body, the core being provided with a recess for the previously-formed link, rotating cylinders in the core and compressing-rollers, substantially as described.

5. Apparatus for making chains of successive superposed windings of a metal strip, comprising a stationary core, a portion of said core being of less diameter than the main body, the core being provided with a recess for the previously-formed link, rotating cylinders in the core, compressing-rollers and a guide between said rollers, one of which has a rim, substantially as described.

704,186. BOAT PROPELLING DEVICE. FRANK J. GLEASON, Vanwert, Ohio. Filed Apr. 23, 1902. Serial No. 105,668. (No model.)

Claim.—1. A rowing mechanism for boats comprising an angle-lever pivoted to the gunwale of a boat, a feathering-blade pivoted to one end of said lever, a pivoted operating-handle, and link connection between the same and said lever, as set forth.

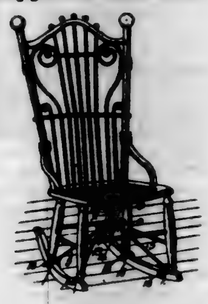
2. A reverse-action rowing mechanism comprising in combination with an angle-lever adapted for attachment to the side of a boat, a feathering-blade having integral arms which are pivoted on opposite sides of the free end of said lever, the lower end of the latter adapted to form a stop against which the face of the blade is adapted to contact during the stroke of the oar, the pivotal handle, and link connections between the same and said lever, as set forth.

704,187. CHAIR-BRACE. ARNOLD GRUENWALD, Columbia, S. D. Filed July 16, 1901. Serial No. 68,587. (No model.)

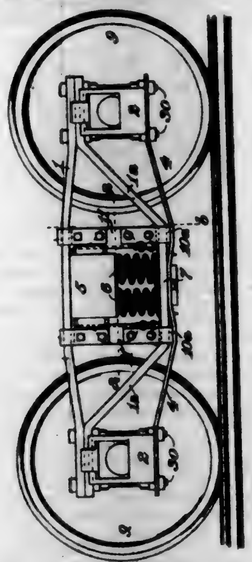
Claim.—1. A furniture-brace comprising a cross-head, tensile bracing elements for connecting the cross-head with an article of furniture, a hanger having a threaded stem adjustably connected with the cross-head, said hanger being composed of two sections arranged to slide longitudinally on each other and provided with means for securing them at the desired adjustment, and means for swiveling the hanger to an article of furniture, whereby the hanger is adapted to be rotated bodily for adjusting the cross-head, substantially as described.

2. A furniture-brace composed of two sections arranged to slide longitudinally on each other, one of the sections being provided with a shank and the other being provided with parallel sides spaced apart to receive the section having the said shank, an adjustable cross-head mounted on the shank, means for swiveling the hanger to an article of furniture, whereby the hanger is adapted to be rotated bodily for adjusting the cross-head, and tensile bracing elements connecting the cross-head with the article of furniture, substantially as described.

3. A furniture-brace comprising a hanger having a stationary member provided with parallel sides or cheeks, an adjustable member fitted between said sides or cheeks for vertical adjustment, and means for securing the adjustable member at the desired adjustment on the stationary member, a cross-head swiveled upon the adjustable member, and looped tensile bracing means engaged with the cross-head and provided with terminal clamps for engagement with chair elements.



704,188. CAR-TRUCK. ROCHESTER HASKELL, Saginaw, Mich. Filed May 13, 1902. Serial No. 107,080. (No model.)



Claim.—1. In a car-truck, the combination of an arch-bar having a pair of U-shaped straps fixed to and depending from its middle portion, an inverted arch-bar having a pair of similar straps fixed to and extending upwardly from its middle portion, bolster-guides fitting, at one end, between the arms of a strap of the arch-bar, and, at the other, between the arms of a strap of the inverted arch-bar, and connections securing the bolster-guides to the straps.

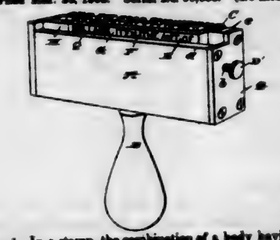
2. In a car-truck, the combination of an arch-bar having a pair of U-shaped straps fixed to and depending from its middle portion, an inverted arch-bar having a pair of similar straps fixed to and extending upwardly from its middle portion, bolster-guides fitting, at one end, between the arms of a strap of the arch-bar, and, at the other, between the arms of a strap of the inverted arch-bar, flanges projecting laterally from the lower ends of the bolster-guides for the attachment of a spring-plank, and connections securing the bolster-guides to the straps.

3. In a car-truck, the combination of an arch-bar having a pair of U-shaped straps fixed to and depending from its middle portion, an inverted arch-bar having a pair of similar straps fixed to and extending upwardly from its middle portion, bolster-guides, of channel-section, fitting, at one end, between the arms of a strap of the arch-bar, and, at the other, between the arms of a strap of the inverted arch-bar, and bolts or rivets passing through transverse lugs on the bolster-guides and securing said guides to the straps.

4. In a car-truck, a side frame comprising an arch-bar and an inverted arch-bar, each having inwardly-projecting U-shaped straps, fixed to its middle portion without the employment of bolts or other independent connections, and bolster-guides fitting between, and connected to, the arms of said straps.

5. A bolster-guide for car-trucks, consisting of a casting of box or channel form, having transverse lugs for the reception of bolts to connect the guide to the arch-bars of a truck, and lower lateral flanges for connection to a spring-plank.

704,189. HAND-STAMP. LEROY J. HEIDENREICH, Spokane, Wash. Filed Mar. 20, 1902. Serial No. 99,063. (No model.)



Claim.—1. In a stamp, the combination of a body having a socket, and also having one side wall *c* of the socket extended downwardly below the other side wall *d* thereof, a type projecting beyond the face of the wall *c*, a type removably arranged in the socket with its face flush with that on wall *c*, and having an inscription corresponding to the matter it is adapted to print on its side adjacent to the wall *d*, and means for securing the removable type in the socket.

2. In a stamp, the combination of a body having a socket, and also having one side wall *c* of the socket extended downwardly below the other side wall *d* thereof, a line of type permanently secured on the face of the wall *c*, one or more removable types arranged in the socket with their faces flush with that of the line of type, and having inscriptions corresponding to the matters they are adapted to print on their sides adjacent to the wall *d*, and a screw bearing in one end wall of the socket and arranged to engage the adjacent type.

704,190. RAIL-JOINT. THOMAS HEMBERGER, Larimore, N. D. Filed Apr. 18, 1902. Serial No. 103,005. (No model.)

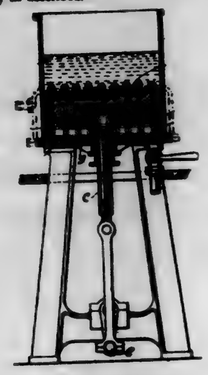
Claim.—In a rail-joint, rails having the lower corners of the head of the adjacent ends cut away, a rail-chair, and fish-plates arranged on opposite sides of the rails and having their lower edges interlock with the said chair and their upper edges interlock with the head of the rails, one of the fish-plates having an extension to enter the space formed by the cut-away portions at the lower corners of the rail-heads, substantially as specified.

704,191. APPARATUS FOR DYEING. ROCHESTER ILLINGWORTH, JOHN T. HARDY, and GEORGE HAYLOR, Coventry, England. Filed Jan. 18, 1902. Serial No. 90,203. (No model.)

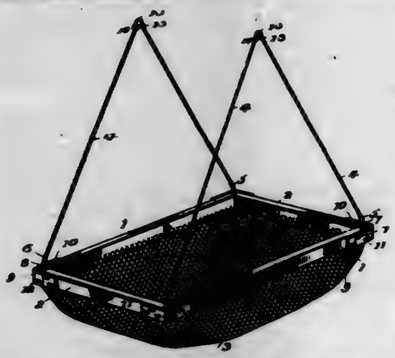
Claim.—1. An apparatus for dyeing comprising a vessel for containing the dyeing liquor, a piston reciprocating therein, hollow pillars carried by said piston having lateral apertures and perforated tubes upon which the material to be treated is wound removably carried by said pillars, substantially as described.

2. An apparatus for dyeing comprising a vessel for containing the dyeing liquor, a piston reciprocating therein, hollow pillars carried by said piston having spool-shaped upper ends, perforated tubes removably seated upon the spool-shaped portions of said pillars, said pillars having lateral apertures, and caps removably secured upon the upper ends of the pillars and abutting against the upper edges of the tubes, substantially as described.

3. An apparatus for dyeing comprising a vessel for containing the liquor, a piston representing therein, hollow pillars carried by the said piston and having cross-ports immediately above the upper sides of the said piston, the said hollow pillar and cross-ports communicating with the vessel on the opposite side of the piston from that upon which they are located, substantially as described.



704,192. SWING. ALBERT C. JACOBS, Birmingham, Ala. Filed Dec. 20, 1901. Serial No. 87,712. (No model.)



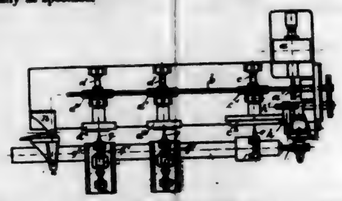
Claim.—1. The herein-described swing comprising a suitable frame-section; a flexible member 8 connected to the frame-section and depending therefrom; suitable supporting-ropes and means to secure the upper ends thereof, in combination with compensating corner-plates 10 having elongated apertures 11 operatively connected to each corner of said frame; a compensating wedge 9 within an opening between the meeting ends of the frame-sections, and suitable means to connect the lower ends of the supporting-ropes to said wedge, all substantially as specified and for the purpose set forth.

2. In a swing of the character specified, a suitable supporting-frame having expansible corner-sections; a wedge-section 9 for each corner of said frame, each wedge having an apertured ear upon its tapered edge, in combination with an expansible tubular clamp fitting around each of said ropes near each corner of the swing; a collar fitting around said tubular clamp and adapted to secure the same in an adjusted position upon the rope and means to connect the tubular clamp and said ear, all combined substantially as specified and for the purpose set forth.

3. In a swing of the character specified, a frame-section and supporting-ropes, said frame-section having reinforcing corner-plates 10 provided with elongated apertures whereby when screws are entered through said apertures into the frame, the frame-sections are left free to move away from each other, thereby expanding the frame, in combination with a wedge fitting in the opening between the meeting ends of the frame-sections and suitable means to connect said wedge with the supporting-rope, all combined substantially as specified and for the purpose set forth.

704,193. ENGRAVING-MACHINE. RUDOLF JAY, Leipsic, Germany. Filed Oct. 9, 1901. Serial No. 78,003. (No model.)

Claim.—1. In an engraving-machine, the combination of a rotatable screw with a slide engaged thereby, a lever pivoted to the slide, a tracing-tool and an engraving-tool mounted upon the lever, an electric motor for driving the screw, a resistance in the circuit of the motor, and a contact mounted upon the slide and gliding upon said resistance, substantially as specified.



2. In an engraving-machine, the combination of an electric motor with a shaft driven thereby, pattern-plate and work-plate rotated by said shaft, a screw, means intermediate the shaft and screw for rotating the latter, a slide engaged by the screw, a lever pivoted to the slide, a tracing-tool and an engraving-tool carried by the lever, means for rotating the engraving-tool, an electric resistance in the circuit of the electric motor, and a contact on the slide that engages said resistance, substantially as specified.

704,194. WORKMAN'S TIME-RECORDER. ALFONSO L. JAYNES, Buffalo, N. Y., assignor, by mesne assignments, to International Time Recording Company. Filed Sept. 20, 1900. Serial No. 31,145. (No model.)

Claim.—1. In a time-recorder, the combination of a time-stamp, time mechanism connected thereto, and means whereby a record is printed by said stamp upon a card, said means being constructed and arranged to be operated by the card to be printed as the latter is presented to the time-stamp.

2. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression device coöperating with said type, of time mechanism for adjusting said type, and means for operating the impression mechanism to print the time upon a card, said means being constructed and arranged to be operated by the card as the latter is presented to the time-stamp.

3. In a time-recorder, the combination with a time-stamp comprising time-printing wheels, and an impression device coöperating with said wheels, of time mechanism for adjusting said wheels, and means for operating the impression mechanism to print the time upon a card, said means being constructed and arranged to be operated by the card as the latter is presented to the time-stamp.

4. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression device coöperating with said type, of time mechanism for adjusting said type, a movable abutment constructed and arranged to limit the inward movement of a card presented to said time-stamp, and a connection between said abutment and said impression device whereby the movement of the abutment by the card causes the impression device to imprint the time upon said card.

5. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression device coöperating with said type, of time mechanism for adjusting said type, and means for operating the impression mechanism to print the time upon a card, said means being constructed and arranged to be operated by the card as the latter is presented to the time-stamp, and said operating means and time-stamp being relatively adjustable whereby the latter is adapted to print upon different portions of the card.

6. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression device coöperating with said type, of time mechanism for adjusting said type, and means for operating the impression mechanism to print the time upon a card, said time-stamp being adjustable to different positions to correspond to different days or dates, and said means for operating the impression mechanism being constructed and arranged to be operated by the card as the latter is presented to the time-stamp.

7. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression mechanism coöperating with said type, of time mechanism for adjusting said type, a card-receiver into which the card is inserted to be printed by the time-stamp, means for moving said stamp relatively to said receiver to cause the stamp to print upon different parts of the card, and operating means for the impression mechanism constructed and arranged to be actuated by the card as the latter is presented to the time-stamp.

8. In a time-recorder, the combination with a time-stamp comprising adjustable type, and an impression device coöperating with said type, of time mechanism for adjusting said type, a movable abutment arranged to limit the movement of a card presented to said time-stamp, and a connection between said abutment and said impression device, said abutment and time-stamp being relatively movable and said connection being adapted to operate the time-stamp in any of its relative positions.

9. In a time-recorder, the combination with a card-receiver adjustable in one direction, and a time-stamp adjustable in a direction at right angles to the path of the said receiver, and comprising adjustable type and an impression device coöperating with said type, of means for operating the impression mechanism to print the time upon a card, said means being constructed and arranged to be operated by the card as the latter is presented to the time-stamp.

10. In a time-recorder, the combination of a laterally-movable card-receiver, a time-stamp movable longitudinally of said receiver, and an abutment providing a fixed limit to the longitudinal movements of cards thrust into said receiver, whereby different sections of a card may be printed, the card being always thrust into the receiver to the same extent.

11. In a time-recorder, the combination of a bodily-movable time-controlled stamp, and actuating mechanism movable within fixed limits and adapted to be operated by the time-card to actuate said time-controlled stamp in any of its adjustments to print upon said card, for the purpose set forth.

12. In a time-recorder, the combination with the time-stamp and time mechanism for operating the same, of a card guide or receiver, a pivoted abutment adapted to be operated by a time-card, and a part connected to said abutment adapted to actuate an impression mechanism to print upon said card, substantially as set forth.

13. In a time-recorder, the combination with the time mechanism, of a time-stamp embodying marking-wheels operated thereby, a movable hammer having a tooth or trip formed thereon and adapted to coact with said marking-wheels, a card guide or receiver in proximity to said stamp, an abutment pivoted at its upper end and arranged to be operated by said time-card, a bar pivoted between its ends to said abutment and having a series of teeth formed thereon which are adapted to engage the tooth or trip formed on said movable hammer so as to elevate the same, and means for controlling the movement of said bar whereby it is disengaged from the hammer and allows the same to drop, thus causing the time-card to be marked, substantially as set forth.

14. In a time-recorder, the combination with the time mechanism, of a time-stamp embodying marking-wheels operated thereby, a movable hammer having a tooth or trip formed thereon and adapted to coact with said marking-wheels, a card guide or receiver in proximity to said stamp, an abutment pivoted at its upper end and arranged to be operated by the time-card, an actuating-bar pivoted between its ends to said abutment and having a series of teeth formed thereon which are adapted to engage the tooth or trip formed on said movable hammer so as to elevate the same, and means for controlling the movement of said actuating-bar whereby it is disengaged from the hammer and allows the same to drop, thus causing the time-card to be marked, substantially as set forth.

15. In a time-recorder, the combination with a time-controlled stamp manually adjustable in one direction, of a card-guide manually adjusted in another direction, a time-card adapted to be stamped, and actuating mechanism operated by said time-card whereby it is caused to be marked by said time-controlled stamp, substantially as set forth.

16. In a time-recorder, the combination with a time-stamp and time mechanism for adjusting the same, of an impression device, a time-card having a reinforcing device permanently connected thereto, and the actuating mechanism for said impression device constructed to be operated by the insertion of said reinforced time-card, whereby the time-card is automatically marked by the time-stamp when inserted in the machine.

17. In a time-recorder, the combination with a time-controlled stamp, a shaft having an indicator thereon, operating connections between the two whereby said time-controlled stamp is adjusted by said shaft, an impression device, a card guide or receiver in proximity to said stamp, a time-card adapted to enter said card guide or receiver, and actuating mechanism for the impression device constructed to be operated by said time-card, whereby the time-controlled stamp is actuated, substantially as set forth.

18. In a time-recorder, the combination with the casing having a sight-opening therein, of a time-controlled stamp, a shaft carrying an indicator bearing the days of the week and being located in rear of said sight-opening, a pinion secured to said shaft, a bell-crank lever having a gear-segment at one end adapted to mesh with said pinion, a link connecting the other end of said bell-crank lever with the time-controlled stamp, a card guide or receiver in proximity to said stamp, and actuating mechanism whereby the card when placed in said guide or receiver is caused to be stamped or marked, substantially as set forth.

19. In a time-recorder, the combination with a card guide or receiver, and a time card adapted to enter said guide or receiver, of means for trapping or retaining a card partially inserted in the card-guide to prevent its withdrawal before it has been properly inserted for printing and to prevent its withdrawal after printing.

20. In a time-recorder, the combination with a card guide or receiver and a time-card adapted to enter said card guide or receiver, of means for trapping or retaining a card partially inserted in the card-guide to prevent its withdrawal before it has been properly inserted for printing, and means for releasing the card when fully inserted, said latter means being operated by the card.

21. In a time-recorder, the combination with a time-controlled stamp, of actuating mechanism therefor, a card guide or receiver in proximity to said stamp, a pawl pivotally held on said card guide or receiver, a time-card having a slot therein and being adapted to tilt said pawl and slide under said pawl until said slot is directly under the same, when the card may be withdrawn from said card guide or receiver.

22. In a time-recorder, the combination with an adjustable time-controlled stamp having an actuating-hammer pivoted thereto and a tooth or trip formed on said hammer, of a card guide or receiver, a time-card adapted to be marked, an abutment pivoted at its upper end and adapted to be operated by said time-card, an actuating-bar pivoted between its ends to said abutment and having a series of teeth formed thereon and rollers secured thereto at its rear end on opposite sides thereof, one of the teeth of said actuating-bar being engaged with the tooth or trip on the actuating-hammer by the movement of the abutment, and a casing secured to the casing having grooves in which said rollers travel and whereby the front end of the actuating-bar is raised and disengaged from the tooth or trip of said actuating-hammer, thereby allowing the hammer to drop and cause the time-card to be marked, substantially as set forth.

23. The combination with a stamp, of a card guide or receiver, a card adapted to be stamped, a movable abutment adapted to be operated by said card, and an actuating-bar connected to said abutment and adapted to actuate the stamp, substantially as set forth.

24. The combination with the stamp, of a movable hammer having a tooth or trip formed thereon and adapted to coact with said stamp, a card adapted to be stamped, an abutment pivoted at its upper end and operated by said card, an actuating-bar pivoted between its ends to said abutment and having a series of teeth formed thereon, one of which is adapted to engage the tooth or trip formed on said movable hammer so as to elevate the same, and means for controlling the movement of said actuating-bar whereby it is disengaged from the hammer and allows the same to drop, thus causing the card to be marked, substantially as set forth.

25. In a time-recorder, the combination with a time-stamp, time mechanism for adjusting said stamp, a time-card, and an impression device adapted to be set in motion by the time-card when the latter is inserted to be printed, whereby the printing of the card is effected by the presentation of the card to the time-stamp.

26. In a workman's time-recorder, the combination of a casing, a time-stamp having suitable mechanism for setting the same, a card-guide and mechanism for producing such a relative movement between the time-stamp and card-guide element that various portions of the surface of the card in the card-guide can be printed upon, and means for effecting the printing by the presence of the card in the guide.

27. In a time-recorder, the combination of a card-guide and time-stamp mechanism including means for setting the time-stamp, one of the time-stamp and card-guide elements being adjustable with respect to the other so as to effect the printing on various portions of the card, and means for causing an impression to be made, controlled by a movement of the card while in the card-guide.

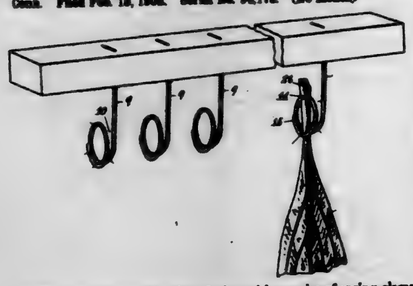
28. In a time-recorder, the combination of a card-guide and time-stamp, one bodily adjustable with respect to the other, means for adjusting the types of the time-stamp, and means for effecting the printing directly by mechanism whose movement is initiated by a movement of the card in the time-stamp.

29. In a time-recorder, the combination of a card-receiver for receiving the time-card to be printed, an abutment fixed relatively to the mouth of said receiver providing a limit to the movement of cards thrust into said receiver and a time-stamp, said receiver being bodily movable relatively to said time-stamp in order to print upon different parts of a card held therein.

704,195. GRINDING-MILL. HANS G. JOHNSON, Waukon, Iowa, assignor of one-half to Theodore Schulte, Waukon, Iowa. Filed Nov. 1, 1901. Serial No. 80,725. (No model.)

Claim.—In a mill of the character specified, a suitable grinding disk or wheel having a milled surface upon both sides and a toothed periphery; suitable means to rotatably mount said wheel; a pair of levers 6 and 7 carrying a detent designed to engage the periphery of said grinding-wheel; connecting-rods operatively connected to the lower end of said levers and a walking-beam pivotally connected to the upper end thereof; a hopper and grain-agitating devices carried by the hopper and connected to one of said rods whereby the contents of the hopper will be agitated and prevented from clogging, and means intermediate the hopper and the grinding-wheel to deliver the grain to the latter, all substantially as specified and for the purpose set forth.

704,196. TOBACCO-HANGER. WILLIAM M. KEYSER, Terryville, Conn. Filed Feb. 15, 1902. Serial No. 94,173. (No model.)



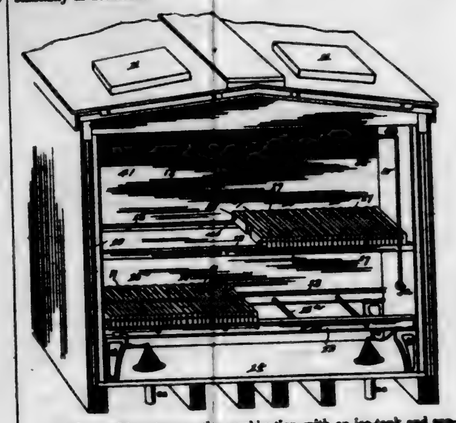
Claim.—1. The combination of a bar with a series of spring-clamps each forming an open throat, converging to a substantially closed portion for receiving and clamping a stem.

2. In a tobacco-hanger, the combination of a bar with a series of spring-clamps, each having an integral shank fixed in the bar, and forming an open converging throat for receiving and clamping a stem, the series of throat-openings being substantially parallel with each other.

3. In a tobacco-hanger, the combination of a bar, and a series of coiled spring-clamps, each forming an open converging throat between its coils for receiving and clamping a leaf, each clamp being provided with an integral shank clenched in the bar, for maintaining the clamps in substantially parallel relation.

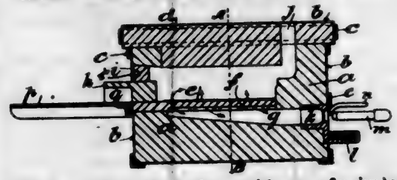
704,197. ICE-TANK FOR REFRIGERATOR-CARS. THOMAS B. KENT, Chicago, Ill., assignor to Armour & Company, copartnership of Philip D. Armour, Jonathan G. Armour, and Philip D. Armour, Jr., Chicago, Ill. Filed Oct. 23, 1897. Serial No. 656,057. (No model.)

Claim.—1. In a refrigerator-car, the combination, with an ice-tank, of a lower support consisting of I-beams extending transversely of the car and suitably connected, and brackets supporting said beams, and other supports located above the lower supports and consisting of angle-bars secured to the sides of the tank, and a movable floor adapted to rest on either of said supports and to be tilted to pass between the same, substantially as described.



2. In a refrigerator-car, the combination, with an ice-tank and supports therein, of a movable floor composed of separate sections adapted to rest on said supports, locking-rods hinged to the tank-walls adjacent to said supports and having apertured ends adapted to pass downward through said floor, a locking-pin adapted to be inserted through said apertures, and a fixed locking-bar above said locking-pin, substantially as described.

704,198. CUPELLATION-FURNACE. DAVID LAIRD, Forfar Scotland. Filed Sept. 24, 1901. Serial No. 76,208. (No model.)



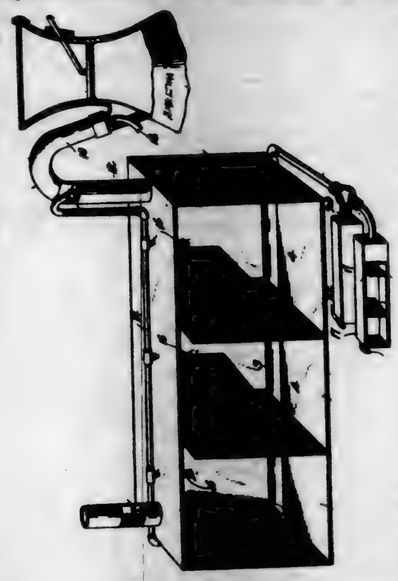
Claim.—1. In combination in a cupel-furnace, a fire-clay body *a*, enveloped in sheet metal and provided with a lid *g*, the fire-clay body *a* being provided with a hearth of refractory material having ribs on its under side, an inclined flame-bed below the hearth having side passages, said transverse ribs serving to divert the heated gases to the side passages, a burner of oil and air or gas and air under pressure to supply heat to the flame-bed, a tray for the cupels arranged on the hearth and dampers A and *i* adapted to close the entrance to the hearth, substantially as described.

2. In a cupel-furnace, a removable tray to carry the cupels, a hearth of refractory material having ribs on its under side, a flame-bed below the hearth, having side passages, and said transverse ribs serving to divert the heated gases to the side passages, the space above the hearth being adapted to receive the tray of cupels, substantially as described.

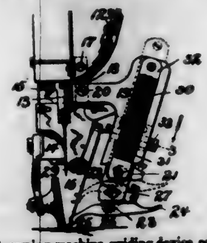
704,199. APPARATUS FOR RECOVERING MINERALS CARRIED OFF IN THE FUMES FROM SMELTING-FURNACES. WILLIAM B. LEE, Marion, Ill. Filed Aug. 28, 1901. Serial No. 73,513. (No model.)

Claim.—1. The combination with a smelting-furnace, of a precipitating-chamber having baffle-plates arranged therein and separating the chamber into communicating compartments, an induction-flue connecting one end of the chamber with the furnace and including means for accelerating the projection of fumes to the chamber and for moistening the same, water-spraying mechanism arranged in the compartments, an induction-flue including suction mechanism connecting with the other end of the chamber, a conduit for conveying the precipitated materials from the chamber, and settling-troughs including valve mechanism connecting with the conduit.

2. The combination with a smelting-furnace, of a precipitating-chamber, an inverted-U-shaped flue connecting one end of the chamber with the dome of the furnace, an upwardly-discharging steam-pipe entering the leg of the flue connecting with the furnace, a downwardly-discharging water-pipe connecting with the leg of the flue entering the chamber, water-spraying means communicating with the chamber, and a flue including suction mechanism disposed at the discharge end of the chamber.



704,200. SEWING-MACHINE GUIDE. ALEXANDER LESSOX, Harrison, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Apr. 2, 1901. Serial No. 54,098. (No model.)



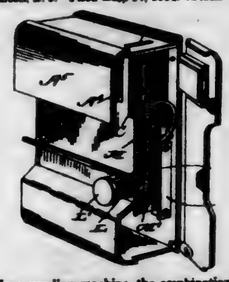
Claim.—1. A sewing-machine guiding device comprising the combination with a frame or bracket adapted for attachment to the head of the machine, so as to be supported above the work-plate thereof, of a sliding bar mounted in said frame or bracket and movable up and down, a spring for lifting said bar, a latch or catch for holding said bar in working position when depressed, a horizontally-disposed arm or bar pivotally attached to the lower end of said sliding bar and provided with a guide, and a spring acting on said arm or bar and serving to yieldingly hold the said guide downward in working position, while permitting it to yield upwardly to accommodate material of varying thickness passing beneath it.

2. In a sewing-machine, the combination, of a guide supported above the work-plate of the machine and having a recessed part to receive the edge of the material being guided, and having also a small lip extending beneath the ply of material to be guided, a sliding bar, movable up and down, with which said guide is connected, a latch or catch for holding said bar down when the guide is in working position, and a spring for lifting said bar, and thereby removing the said guide out of the way, when the said catch or latch is released.

3. In a sewing-machine, the combination, of a guide supported above the work-plate of the machine and having a recessed part to receive the edge of the material being guided, and having also a small lip extending beneath the ply of material to be guided, a sliding bar, movable up and down, with which said guide is connected, a latch or catch for holding said bar down when the guide is in working position, and a spring for yieldingly holding said guide downward while permitting it to move upwardly to accommodate material of varying thickness passing beneath it.

4. In a sewing-machine guiding device, the combination with the frame or bracket 19 adapted for attachment to the head of the machine, of the sliding bar 21 movable up and down in said frame or bracket, the spring 30 for lifting said bar, the spring-pressed sliding catch or latch 33 for retaining said bar in a lowered position, the bar 24 pivotally attached to the lower end of the said sliding bar and provided with a recessed guiding part or guide 25 supported above the work-plate of the machine, and the spring 26 for yieldingly pressing the said guiding part or guide 25 downward.

704,201. COIN-OPERATED VENDING-MACHINE. PHINEAS G. MACLEAN, Boonton, N. J. Filed Aug. 17, 1901. Serial No. 72,337. (No model.)



Claim.—1. In a vending-machine the combination with a case, of a casting-plate arranged therein, said casting-plate having side flanges, a plunger working between the flanges and across the top of the casting-plate, said plunger having integral webs or flanges, one of which is provided with a lateral extension, and another slotted vertically, a rock-shaft to which the plunger is connected, an operating-lever having a laterally-projecting pin adapted to engage the slotted flange of the plunger, the coin-chute, operating-rod and spring for returning the several parts to their normal positions, substantially as shown and described.

2. In a vending-machine the combination with a case, of a casting-plate arranged therein dividing the case into front and rear compartments, the spring-actuated follower arranged in the forward compartment and adapted to support a plurality of packages, a plunger consisting of a plate provided with a number of rearwardly-extending flanges, one of which is formed with a lateral extension, the other slotted vertically and another connected by means of an arm to a rock-shaft, the operating-lever having a laterally-projecting lower end attached to the said casting-plate, said casting-plate having flanges at each side, one of the flanges being cut away at its rear side to receive the laterally-projecting lower end of the lever, the push-rod and plate, the spring for bearing upon said plate, and the guide-plate for guiding the inner end of the push-rod plate, all arranged and adapted to operate substantially as shown and described.

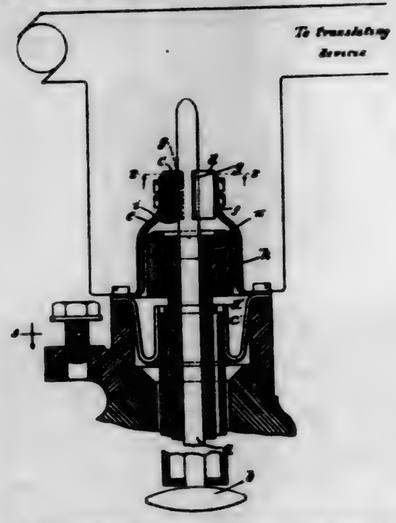
3. In a vending-machine the combination with a case, of a casting-plate arranged therein dividing the case into front and rear compartments, the spring-actuated follower arranged in the forward compartment and adapted to support a plurality of packages, a plunger consisting of a plate having a perforation therein and provided with a number of rearwardly-extending flanges, one of which is formed with a lateral extension, the other slotted vertically and another connected by means of an arm to a rock-shaft, the operating-lever having a laterally-projecting lower end, said lever being connected to the aforesaid casting-plate, said casting-plate having flanges at each side, one of the flanges being cut away at its rear side to receive the laterally-projecting lower end of the lever, the push-rod and plate, the spring for bearing upon said push-rod and plate, and the guide-plate for guiding the inner end of the push-rod plate, and a guide-pin carried by the follower, the upper end projecting above the follower and adapted to engage the perforation in the plunger when the supply of confections becomes exhausted, substantially as described.

704,202. SWITCHING APPARATUS. CARL MICHALKE, Charlottenburg, Germany, assignor to Siemens & Halske Electric Company of America, Chicago, Ill., a Corporation of Illinois. Filed Nov. 13, 1900. Serial No. 737,467. (No model.)

Claim.—1. In a switch, the combination with a member *a*, of contact means acting therewith for controlling the continuity of a circuit, the said member being movable longitudinally with relation to the contact means, a sleeve surrounding the contact member *a*, said member being also movable longitudinally with relation to the said sleeve to enable the contact member to be drawn within the sleeve to extinguish arcs formed in the operation of the switch, and supplemental means associated with the said sleeve for radiating the heat due to the arcs to prevent the heat from injuriously affecting the sleeve, substantially as described.

2. In a switch, the combination with a metallic member *a*, of me-

bolts contact means acting therewith for controlling the continuity of a circuit, the said member being movable longitudinally with relation to the contact means, a sleeve of insulating material surrounding the contact member a, the said member being also movable longitudinally with relation to said sleeve to enable the contact member to be drawn within the sleeve to extinguish arcs formed in the operation of the switch, and a body of metal surrounding the said member and interposed between the same and the sleeve for radiating and dissipating the heat to prevent the same from injuring the sleeve, substantially as described.



3. In a switch, the combination with a longitudinally-movable metallic rod a, of metallic contact means, a sleeve of insulating material inclosing the rod, and a metallic ring also inclosing the rod, interposed between the same and the said sleeve and located near the end of the said sleeve contiguous to the said contact means, substantially as described.

4. In a switch, the combination with a longitudinally-movable metallic rod a, of contact means, the said rod by its longitudinal movement being adapted to be engaged and removed from engagement with the said contact means, a sleeve surrounding the said rod and having an end opposed to the said contact means, and a heat-radiating device interposed between the said contact means and the said sleeve to prevent heat from injuring the sleeve, substantially as described.

5. In a switch, the combination with a longitudinally-movable metallic rod a, of contact means, the rod by its longitudinal movement being adapted to be engaged and removed from engagement with the said contact means, a sleeve of insulating material surrounding the said rod and having an end opposed to the said contact means, and a body of metal interposed between the said contact means and the said sleeve to prevent heat from injuring the sleeve, substantially as described.

6. In a switch, the combination with a longitudinally-movable metallic rod a, of contact means, the rod by its longitudinal movement being adapted to be engaged and removed from engagement with the said contact means, a sleeve of insulating material surrounding the said rod and having an end opposed to the said contact means, a recess being provided in the said end, and a metallic body contained within the said recess placed adjacent to the said rod, adapted to prevent heat due to arcing from injuring the sleeve, substantially as described.

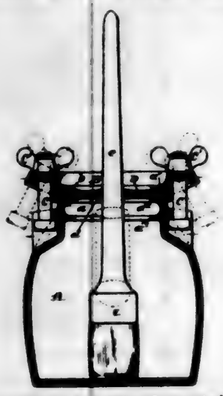
7. In a switch, the combination with main switch portions, of a rod movable with one of the aforesaid main switch portions, supplemental metallic contact means, the said rod and supplemental metallic contact means serving to open the circuit after the main switch portions have been separated, a sleeve of insulating material inclosing the rod, and means interposed between the rod and said sleeve for preventing the heat due to arcing from injuring the sleeve, substantially as described.

8. In a switch, the combination with main switch portions, of a longitudinally-movable metallic rod, metallic contact means, the said rod and metallic contact means serving to open the circuit after the main switch portions have been separated, a sleeve of insulating material inclosing the rod, and means interposed between the rod and the said sleeve for preventing the heat due to arcing from injuring the sleeve, substantially as described.

704,203. PULLEY-AND-BAND POWER-TRANSMITTING APPLIANCE. JAMES MOSSBROOK, Ashton-under-Lyne, England. Filed Mar. 1, 1901. Serial No. 49,962. (No model.)

Claim.—The combination of two pulleys, one at least of which is conical, a driving-belt passing around said pulleys, a loose pushing-strap intermediate the belt and conical pulley, and means embracing said belt and strap to hold them in operative position, as and for the purpose set forth.

704,204. POT FOR CONTAINING SHELLAC, &c. WILLIAM L. HOZEN, Cleveland, Ohio. Filed Jan. 18, 1900. Serial No. 1,881. (No model.)



Claim.—1. A shellac-pot consisting of a receptacle and cover therefor and provided with a disk of flexible material formed with an aperture for receiving a brush-handle, and two screw-bolts for securing said disk between said cover and the rim of the receptacle, substantially as set forth.

2. A shellac-pot consisting of a receptacle and cover therefor and provided with a disk of flexible material formed with an aperture for receiving a brush-handle, and two screw-bolts removably engaging said receptacle for securing said disk between said cover and the rim of the receptacle, substantially as set forth.

3. A shellac-pot consisting of a receptacle and cover therefor, the latter having two eyes and a shoulder, and provided with a disk of flexible material formed with an aperture for receiving a brush-handle, and two screw-bolts passing through said eyes and removably engaging said receptacle for securing said disk between said shoulder and the receptacle-rim, each of said bolts having pivotal movement in its respective eye, substantially as set forth.

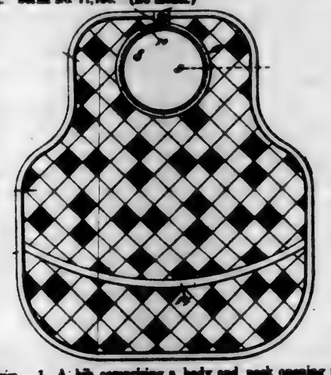
4. A shellac-pot consisting of a receptacle and cover therefor, the latter provided with an annular shoulder and with two laterally-disposed eyes, a disk of flexible material formed with an aperture for receiving a brush-handle, and two screw-bolts passing through and having pivotal movement in said eyes, said receptacle formed with lateral slotted lugs for receiving the bolt-heads, each bolt provided with a thumb-nut engaging the upper surface of the cover, whereby the latter may be secured to the receptacle-rim, said disk located between said rim and said shoulder, substantially as set forth.

704,205. CURTAIN-FIXTURE. SEMPHIS T. HAKAMIIAN, Worcester, Mass. Filed Apr. 12, 1901. Serial No. 55,504. (No model.)

Claim.—A curtain-fixture, comprising in combination the shade-roller, the supporting parts B B' at each end thereof and means for fastening said parts in position, the parts B B', each consisting of a single

piece of sheet metal cut, bent and compressed to form the brackets c, d provided respectively with the socket c' and notch d' at their outer ends, and of the horizontal longitudinally-slotted base-plates e e, e e, one at each side of each bracket and projecting at right angles in opposite directions from the inner ends thereof, substantially as and for the purpose set forth.

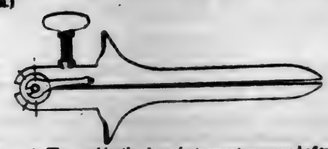
704,206. BIB. HARVEY NEWLIN, Brooklyn, N. Y. Filed Oct. 7, 1901. Serial No. 77,766. (No model.)



Claim.—1. A bib comprising a body and neck opening provided with a circular neck-opening which opens outwardly through the neck portion by means of a radial slit formed therein, and a circular open spring contractile ring placed around said neck-opening and held in place by a loop or tape, said ring being provided at the opening therein with radial extensions which are secured in the opposite sides of said slit substantially as shown and described.

2. A bib provided with a neck portion having a circular neck-opening which opens outwardly through said neck portion by means of a radial slit, and an open spring-ring secured around the periphery of said circular opening and provided at the open side with parallel radial projections which are secured in the side portions of said slit, substantially as shown and described.

704,207. HINGE FOR SURGICAL INSTRUMENTS. CHARLES J. PILLING and GEORGE T. BARNES, Philadelphia, Pa., assignors to George P. Pilling and Charles J. Pilling, copartners trading as George P. Pilling & Son, Philadelphia, Pa. Filed Jan. 9, 1902. Serial No. 88,999. (No model.)

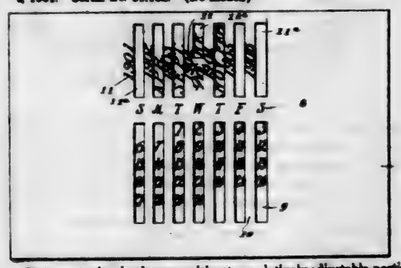


Claim.—1. The combination in an instrument composed of two blade members, of a pivotally-connecting hinge between them, each hinge-section having on one wall a semicircular recess, and on the opposite wall a semicircular projection with a rim or flange to fit within said recess, the two members being so constructed in reverse position relatively, a lateral opening in said projection on each member, and a pivot-pin passing through said opening and operating to maintain the parts in register.

2. The combination in an instrument composed of two blade members, of a pivotally-connecting hinge between them, each section of which has two separate bearing-surfaces lying in parallel planes, said sections being formed with a semicircular groove and within the same a semicircular rim on the exterior of one wall thereof and a semicircular projection with an outer flange edge or rim and an interior concentric rim or edge on the opposite wall, arranged in reverse order on the two hinge-sections, the flanges and grooves on each registering with those in the other hinge-section when said parts are assembled, and a pivoting device adapted to fit a centrally-bored opening passing through said semicircular projection and grooved wall, and adapted to maintain the parts in register.

3. The combination in an instrument having two blade members each having a channeled portion forming opposite walls, a disk with a rim or flange on its inner face, secured on the exterior of one of said walls, and a semicircular groove on the exterior of the opposite wall, said blade members being provided with said recess and projection on reverse walls of each and assembled and combined in such manner that the rim or flange of the projection of each blade member will enter and rotate in the semicircular groove of the other, whereby each section of the hinge will have two independent bearing-surfaces in parallel planes; a central opening in said disk and like semicircular openings in the two opposite walls in line with said disk-opening, and a pivot-pin adapted to enter said openings and maintain the parts in position.

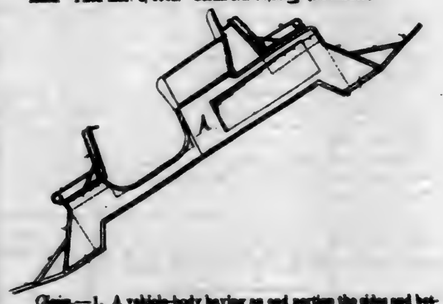
704,208. CALENDAR. CLAUDE I. POST, Chicago, Ill. Filed Nov. 4, 1901. Serial No. 81,102. (No model.)



Claim.—1. A calendar comprising two relatively adjustable portions, one bearing the year or years and the days of the week, and the other bearing the months, and the days of the month consecutively duplicated except 31.

2. A calendar comprising a relatively fixed portion bearing the years and the days of the week and openings corresponding thereto through which the months may be exposed relative to the years and the month-days relative to the week-days, and a relatively movable portion bearing the months and the days of the month, so arranged that thirty days, only, will be exposed with the thirty-day months and thirty-one days with the thirty-one-day months.

704,209. VEHICLE-BODY. CHARLES F. PUTNAM, Fitchburg, Mass. Filed Mar. 4, 1902. Serial No. 97,205. (No model.)



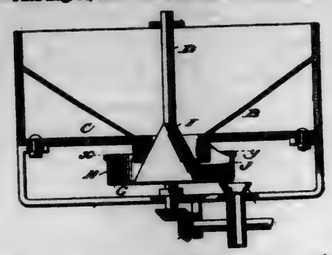
Claim.—1. A vehicle-body having an end portion the sides and bottom of which are dropped vertically below the bottom line of the body, a main seat, and a supplemental seat-frame disposed substantially vertically above the said dropped portion of the body to enable said seat to occupy a lower horizontal plane than the main seat.

2. A vehicle-body having an angular end portion the bottom of which lies in a lower horizontal plane than the bottom of the body, a main seat-frame upon the body, a supplemental seat-frame surmounting the angular dropped end portion, and a hinged closure for the end of the dropped portion.

3. A vehicle-body having a horizontal base-line extending the major portion of its length and a portion at each end of said line and representing the front and rear ends of the vehicle, dropped below the said base-line, a gate or footboard hinged approximately in the plane of the lower edge of each of the dropped portions, a main seat, and a seat surmounting each dropped portion, and with the seat in front of the central seat in a lower horizontal plane than said central seat substantially as and for the purpose described.

4. A vehicle-body, the end of which drops horizontally below the base-line of the body, said dropped portion having a downwardly and outwardly inclined outer end, a seat surmounting the dropped portion, a hinged footboard or gate to operate in the inclined end of the dropped portion, and a main seat longitudinally in line with the first-named seat and occupying a higher horizontal plane than said seat.

704,210. SANDER FOR RAILWAYS. JAMES GEER, Toronto, Canada. Filed Aug. 24, 1901. Serial No. 73,198. (No model.)



Claim.—1. In a sander, a pan capable of continuous rotation in the same direction, a hopper provided with a spout projecting into said pan, means for rotating said pan at will and means for causing the sand to overflow the pan whenever the latter is rotated, substantially as described.

2. In a sander, a rotatable pan, a hopper provided with a spout projecting into said pan, means for rotating said pan at will, and means for causing the sand to overflow the pan, said means comprising a plow projecting into said pan, substantially as described.

3. In a sander, a rotatable pan provided with a central cone, in combination with a hopper provided with a discharge-spout projecting down within the pan, substantially as described.

4. In a sander, a rotatable pan; and a stationary plow so held as to project down within the pan close to its outer edge, in combination with a hopper provided with a spout projecting down within the pan, substantially as described.

5. In a sander, a rotatable pan; the central cone secured within the pan; and a stationary plow so held as to project down within the pan close to its outer edge, in combination with a hopper provided with a spout projecting down within the pan, substantially as described.

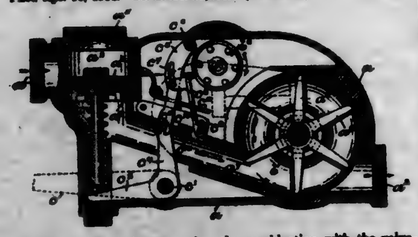
6. In a sander, a rotatable pan; a central cone secured within the pan; and a stationary plow so held as to project down within the pan close to its outer edge in combination with means for supplying sand to the pan, substantially as described.

7. In a sander, a rotatable pan; a central cone secured within the pan; and a stationary plow so held as to project down within the pan close to its outer edge, in combination with a hopper provided with a spout projecting down within the pan; and a spout into which the sand is discharged, substantially as described.

8. In a sander, a rotatable pan; gearing adapted to drive the same; a screw-threaded rotatable crank-spindle adapted to operate the said gearing, a nut engaging the said screw-headed spindle; means for preventing the said nut from rotating or releasing it at will; in combination with a stationary plow projecting down within the pan close to its outer edge; and a hopper provided with a spout projecting down within the pan substantially as described.

9. In a sander a pan, in combination with a hopper provided with a spout projecting down within the pan; a plow held so as to project down within the pan close to its outer edge; and means for revolving the pan and plow relatively to one another, substantially as described.

704,211. FLUSHING-VALVE. JOHN O. RAYMOND, Providence, R. I., assignor of one-half to William A. Hathaway, Edgewood, R. I. Filed Apr. 16, 1901. Serial No. 56,070. (No model.)



Claim.—1. In a flushing-valve, the combination with the valve-body, the inlet and outlet openings, the ducts and cavities in the body, and a spring-controlled valve, of a rock-shaft, levers connected with the rock-shaft for opening the valve, a locking-arm for locking the valve and the actuating-levers in the open position, a pawl on the locking-arm, a motor operated by the flushing-stream, a pawl-lifter and worm and worm-gear mechanism intermediate the motor and the pawl-lifter, whereby at a predetermined interval the valve is released and closed automatically, as described.

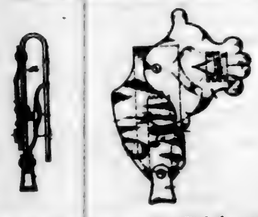
2. A flushing-valve having a motor operated by the stream flowing through the valve-body, means, comprising a bell-crank lever, for opening the valve, a locking-arm for locking the bell-crank lever, and mechanism, comprising a pawl-lifter, a worm and worm-gear, operated by the motor for releasing the valve at a predetermined interval, as described.

3. In an automatic self-closing valve, a self-closing valve, a lever for opening the valve, a locking-arm for locking the valve in the open position, and means comprising a motor operated by the flushing-stream, a pawl connected to the locking-arm, a pawl-lifter, and worm and worm-gear mechanism intermediate the motor and the pawl-lifter; whereby at a predetermined interval the valve is released and closed automatically, as described.

4. In combination in a flushing-valve, a spring-pressed valve, a rock-shaft, an arm on the rock-shaft engaging with the valve, an arm on the rock-shaft engaging with a locking-arm to hold the valve in the open position, mechanism comprising a pawl, a pawl-lifter, a worm, and a worm-gear, operated by a motor actuated by the stream passing through the valve for moving the locking-arm out of engagement with the arm on the rock-shaft, and a case inclosing the parts, as described.

5. In a flushing-valve, the combination with the stem of the valve a^9, the rock-shaft c' and the arms c^2 and c^4, of the notched locking-arm c^{10}, the lever c^5, the pawl c^6 pivotally connected with the arm c^{10} and lever c^5, and the pawl-lifter, of means, actuated by the stream passing through the valve, to operate the pawl-lifter, as described.

704,212. CLASP FOR CHATELAINES. JACOB RITTER, New York, N. Y. Filed May 7, 1901. Serial No. 58,130. (No model.)



Claim.—In a device of the character described, the combination of a suspension-hook, a part consisting of a spring-clip attached at one end to the hook and having its other end free, and adapted by its resilience to retire from one leg of the hook, with a second part consisting of a laterally-movable plate mounted upon the hook, and a cam device carried by one of said parts, which cam device is adapted to coact with the other of said parts to force the free end of the clip toward a leg of the hook, substantially as described.

704,218. VENEER-SLICER. JOHN H. ROBERTS, Indianapolis, Ind., assignor to Lilly & Roberts Veneer Company, Indianapolis, Ind., a Partnership. Filed May 13, 1901. Serial No. 59,994. (No model.)

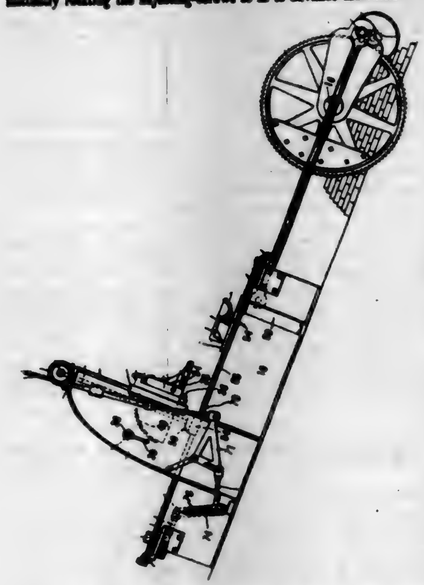
Claim.—1. In a veneer-cutting machine, the combination with the cutter thereof, of a flitch-holding table, consisting of a main body, a plate pivotally mounted thereon, means for holding said plate in various positions, a platen pivotally mounted upon said plate on an axis at an angle to the axis of the plate, and means for holding said platen in various positions of adjustment, said platen being adapted to receive a flitch.

2. In a veneer-cutting machine, the combination with the cutter thereof, of a flitch-holding table, consisting of a main body, a plate pivotally mounted upon said body, means for holding said plate in various positions of adjustment, a platen pivotally mounted upon said plate upon an axis at an angle to the axis of the plate, means for holding said platen in various positions of adjustment, and clamping-dogs carried by said platen in position to engage a flitch.

3. In a veneer-slicer, the combination with the knife, of a table, means for moving said table at an angle to and past the edge of the knife, a plate pivoted upon said table on an axis at right angles to the edge of the knife, means for holding said plate in various positions of adjustment, a flitch-receiving platen pivotally mounted upon said plate upon an axis at right angles to the axis of the plate, and means for holding said platen in various positions of adjustment.

4. In a veneer-slicer, the combination with the knife, of a pressure-bar arm, having a pressure-bar carried thereby and arranged above the edge of the knife, means for adjusting the pressure-bar toward and from the knife, a flitch-carrying table, and means for driving said flitch-carrying table beneath the knife and pressure-bar, whereby the force of the flitch upon the pressure-bar is in opposition to the weight of said bar.

5. In a veneer-slicer, the combination with substantially vertical ways, of a knife-arm supported thereon, one or more substantially vertical adjusting-screws carried by the knife-arm, a wedge carried by each screw, a cooperating wedge mounted adjacent each of said wedges, a flitch-receiving table, means for driving said table beneath the knife, means operated by said table for shifting the cooperating wedges so as to intermittently axially reciprocate the adjusting-screws, and means for intermittently rotating the adjusting-screws so as to advance the knife.



6. In a veneer-slicer, the combination with substantially vertical ways, of a knife-arm mounted thereon, one or more substantially vertical adjusting-screws carried by the knife-arm, a wedge carried by each of said screws, a cooperating wedge mounted adjacent each of said wedges, a flitch-carrying table, means for reciprocating said table on a line at an angle to the movement of the knife-arm, means operated by said table for intermittently reciprocating the cooperating wedges so as to intermittently shift the adjusting-screws axially, and intermediate connecting mechanism between said table and adjusting-screws for rotating said adjusting-screws during the return stroke of the table.

7. In a veneer-slicer, the combination with a pair of adjustable heads, of a knife-arm pivotally mounted between said heads, and a pressure-bar pivotally mounted upon the knife-arm.

8. In a veneer-slicer, the combination with a pair of adjustable heads, of a knife-arm pivoted upon said heads, a pair of blocks adjustably mounted upon said knife-arm, and a pressure-bar pivotally supported upon said blocks.

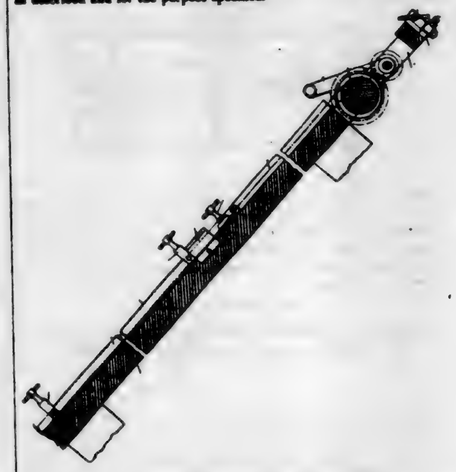
9. In a veneer-slicer, the combination with a knife, of a flitch-carrying table, means for reciprocating said table adjacent said knife, means for retracting said knife from the path of the flitch before the return of the flitch, means for automatically advancing the knife through the distance of the feed during the major portion of the return movement of said flitch, and for afterward advancing the knife through the distance of its retraction.

10. In a veneer-slicer, the combination with a knife, of a flitch-carrying table, means for reciprocating said table adjacent said knife, means operated by the table for retracting said knife from the path of flitch before the return of the flitch, means operated by the table for advancing the knife during the major portion of the return movement of the table, and means operated by the table for afterward advancing the knife through the distance of retraction.

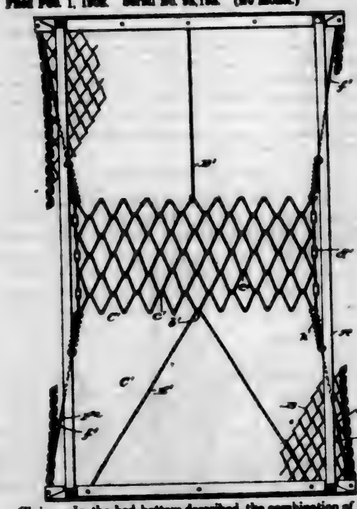
11. In a veneer-slicer, the combination with a support, of a knife-arm pivoted upon said support, and a pressure-bar pivotally mounted on the knife-arm.

704,214. MEANS FOR LONGITUDINALLY COMPRESSING WIRED-ON CUSHION-TIRES BEFORE FITTING THEM INTO THEIR RIMS. GODFREY RENDLE, London, England. Filed Feb. 27, 1902. Serial No. 96,917. (No model.)

Claim.—In apparatus for the purpose set forth, comprising a trough or channel wherein the tire is compressed, the combination of a trough A whereof one of the sides is removed or cut away toward one end, and a vise or clamp revolvable about a vertical axis mounted at each end of the trough, whereby the tire after compression may be drawn along the trough to said vise and its wires having been gripped therein may be drawn sidewise from the trough, the vise turning with it, substantially as described and for the purpose specified.



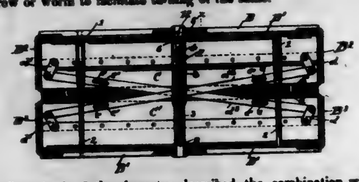
704,215. BED-BOTTOM. PATRICK B. ROONEY, New York, N. Y. Filed Feb. 1, 1902. Serial No. 92,192. (No model.)



Claim.—In the bed-bottom described, the combination of the frame, the fabric B connected thereto, and the support for the fabric B comprising the flexible body made up of wires arranged in pairs, transversely of the bed-bottom, and having the interlocked loops b', and connections d' interposed between the ends of the wires of each pair; the said body resting immediately below and directly against the fabric B at either side of the transverse and longitudinal median lines thereof so as to both reinforce and support a considerable portion of said fabric, and elastic connections between the body and opposite bars of the frame, yieldingly holding the body directly against the under side of the fabric B.

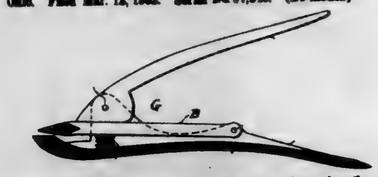
704,216. ACCOUNT-BOOK. CHARLES K. ROSENBERG, San Francisco, Cal. Filed Aug. 22, 1898. Serial No. 689,194. (No model.)

Claim.—1. In a book of the character described, the combination with the adjustable frame-plates, the telescopic connecting-posts carried thereby and which constitute leaf-supports, of the screw-actuated lock mechanism by which the frame-plates are adjusted toward and from each other, said mechanism comprising a thimble having a screw-threaded opening therein, a screw or worm working therein, means for holding the screw or worm against longitudinal movement, and means at each end of said screw or worm to facilitate turning of the same.



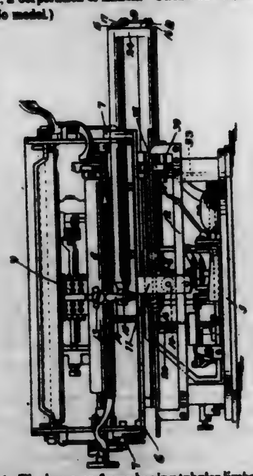
2. In a book of the character described, the combination with a backbone and cover, of an automatic take-up connected with the free ends of the cover whereby said cover may be adjusted to the adjustment of the backbone comprising the lever-rods d^3, d^3 and the relatively short links d, d' pivoted to the respective ends of said rods and to said cover, and means for positively expanding or contracting said backbone, substantially as described.

704,217. JAR-COVER-REPAIRING TOOL. LEON SARR, Ceylon, Ohio. Filed Mar. 12, 1902. Serial No. 97,946. (No model.)



Claim.—In a jar-cover-repairing tool having a lower handle with a beveled curved jaw at one end and handholding piece at the other, an intermediate lever pivoted in the lower lever at one end, and having beveled curved jaws at the other, fitting jaws on the lower lever, a spring for raising the said intermediate lever, and an upper lever pivoted in the lower lever and having a cam on the under side which engages the intermediate lever to force it down on the lower bevel-curved jaw of the lower handle, thus forming a means of pressing the edges of a jar-cover substantially as shown and described.

704,218. TYPE-WRITER HAMMER MECHANISM. SAMUEL J. SNEIDER, Chicago, Ill., assignor to Chicago Writing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed June 15, 1901. Serial No. 64,846. (No model.)



Claim.—1. The hammer-frame having tubular limbs, in combination with the hammer rock-shaft in one limb of the frame, the rock-shaft actuated by the keys and supported in the other limb of the frame, and the connections between the shafts, substantially as specified.

2. The hammer-frame made U-shaped and having its limbs made tubular, in combination with the hammer, and mechanism for actuating it, such mechanism embodying rock-shafts supported in the tubular limbs of the frame, substantially as specified.

3. The combination with the paper-carriage and the hammer of a shaft for actuating the hammer located coincidentally with the axis upon which the carriage tips, and means for supporting the shaft in such position without interfering with the carriage, substantially as specified.

4. The combination with the paper-carriage, the hammer, and the hammer-shaft, of a U-shaped frame supporting said shaft in one of its limbs and positioning it in coincidence with the axis on which the carriage tips, substantially as specified.

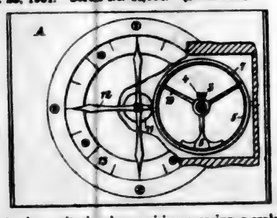
5. The combination with the hammer, of a frame made U-shaped and with tubular limbs, a rock-shaft for vibrating the hammer supported in one limb of the frame, a second rock-shaft for actuating the first-mentioned one and itself rocked by the keys, connections between the shafts at one end thereof, and supports for the frame permitting longitudinal movement thereof, substantially as specified.

6. The combination in a type-writer, of a carriage, the hammer and the U-shaped hammer-frame, the hammer being supported upon a shaft in said frame whose axis is coincident with the axis upon which the carriage tips, substantially as specified.

7. The type-writer wherein are combined a laterally-movable hammer-frame, and means for automatically locking said frame, such means consisting of the arm 33 attached to the frame, and the spring-pressed hooked lever 30, substantially as specified.

8. The type-writer wherein are combined a laterally-movable hammer-frame, an arm 33 attached to the frame, and the slotted stationary guide 38 traversed by the arm, substantially as specified.

704,219. GRAVITY-LEVEL. GUSTAV SCHWARTZ, Brooklyn, N. Y. Filed Jan. 25, 1901. Serial No. 44,761. (No model.)

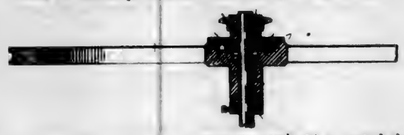


Claim.—1. A gravity-level comprising a casing, a scale on the casing, a shaft mounted in the casing, an indicating device and a serrated wheel secured to the shaft; a second shaft mounted in the casing, and a rim conforming to a circle of a diameter equal to the distance from the center of the second shaft to the circumference of the serrated wheel, and having a yielding covering on its face, secured to the shaft, and a weight secured to the rim.

2. A gravity-level comprising a case, two shafts mounted in bearings set in the case, a circular rim secured to one shaft, a weight and a yielding covering affixed to the rim; a wheel, serrated on its circumference and engaging with the rim, set on the other shaft; a pointer also secured to the other shaft and a scale set on the case in the path of the pointer.

3. The combination of a casing provided with a scale, a shaft revolubly mounted therein, a pointer and a serrated wheel set on the shaft, and of a weighted balancing-wheel revolubly mounted in the casing in position to engage with the serrated wheel and having a yielding covering applied on its face engaging with the serrated wheel.

704,220. DRIVING MECHANISM. ALFRED F. SPAULDING, Northfield, Vt. Filed Apr. 25, 1901. Serial No. 57,502. (No model.)



Claim.—In combination, a wheel provided with a central shaft-opening and ball-recesses communicating therewith in opposite ends of the hub, a shaft located in said opening, balls located in said recesses and bearing upon said shaft, a washer and collar mounted upon said shaft at one end of the hub to retain the balls in the adjacent recess, a sprocket-wheel mounted on said shaft, its hub being extended to form a closure for the other of said ball-recesses, said first-mentioned hub being provided with a corrugated counterbrink surrounding said sprocket-hub, a cam-wheel keyed to the latter hub and located in said counterbrink, clutch-balls located in the space between the cam and the first-mentioned hub, a follower to retain said clutch-balls in place, the other end of the sprocket-hub being provided with a recess, balls in said recess bearing upon the shaft, and a washer and collar cooperating with the other washer and collar to retain the bearing-balls in position and the wheels in proper position on the shaft, as set forth and described.

704,221. RAIL-FASTENER. JAMES M. SPAULDING, Syracuse, N. Y. Filed July 24, 1901. Serial No. 69,570. (No model.)

Claim.—1. A rail-fastener comprising tie-sections having lengthwise ribs or flanges engaged with each other and each provided with transverse slots or openings, keys inserted in the openings for locking the sections together, and a pair of fastening members detachably mounted on the tie and having their adjacent ends engaged with the rail and their opposite ends engaged with the keys for the purpose set forth.

2. The herein-described tie composed of lengthwise sections having openings arranged at opposite sides of the rail-seat, in combination with keys inserted in the openings for securing the sections together, and rail-holding members engaged with the keys.

3. The combination with a tie composed of lengthwise sections having transverse openings, of rail-holding members having transverse openings, and keys inserted into the openings of the tie-sections and said members for locking the same together.

4. In a rail-fastener, the combination with a tie composed of lengthwise sections, one having a groove and the other fitting in the groove and each provided with a pair of transverse openings, rail-holding members removably mounted on the tie and having transverse openings, and keys inserted in the openings for locking the tie-sections and members together.

5. The combination with rail-sections arranged end to end and having transverse apertures therethrough, of a tie receiving the meeting ends of the rail-sections and composed of lengthwise parts fitting one upon the other and each provided with an opening, means inserted in said opening for securing the tie parts together, and a rail-holding member mounted on the tie and engaged with said means, said member having studs or pins entering the apertures of the rail-sections.

6. The combination with rail-sections arranged end to end and having transverse apertures therethrough, of a tie receiving the meeting ends of the rail-sections and composed of lengthwise parts fitting one upon the other, each of the sections having a pair of openings, keys inserted in said openings for securing the tie parts together, and rail-holding members mounted on the tie at opposite sides of the rail and engaging said keys, one of said members having studs or pins entering the apertures of the rail-sections and the other having apertures receiving the studs or pins.

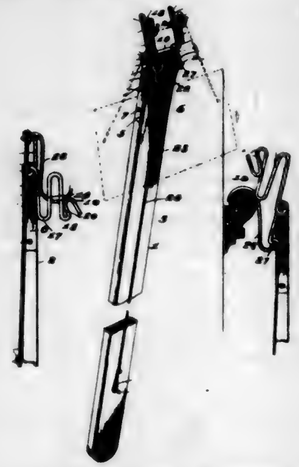
7. The combination with rail-sections arranged end to end and provided with transverse apertures, of lengthwise tie-sections mounted one upon the other and provided with alined openings arranged in pairs, rail-holding members mounted on the tie and formed with transverse openings, one of the members of each pair having studs or pins inserted through the apertures of the rail-sections, and the other member having apertures receiving the projecting ends of said studs or pins, and keys inserted into the openings of the tie-sections and said members for locking the same together.

704,222. HOISTING DEVICE. ELLERY STOWELL, Denver, Colo. Filed Nov. 13, 1901. Serial No. 82,146. (No model.)

Claim.—1. A hoisting device, comprising a supporting-bar, a yoke having its arms pivoted intermediate their length to said bar, at the upper end thereof, and means near the lower end of said bar for rotating said yoke upon its pivots, substantially as described.

2. A hoisting device, comprising a supporting-bar, a yoke having its arms pivoted intermediate their length to said bar, a normally downwardly opening hook formed upon each of the said yoke-arms, and means for rotating said yoke upon its pivots for inverting the position of said hooks, substantially as described.

3. A hoisting device, comprising a supporting-bar, formed with a transverse groove in its upper end, a shaft supported therein, a yoke pivotally supported by said shaft, hooks formed upon the arms of said yoke and normally opening downwardly, and means for rotating said yoke upon its pivot for inverting the position of said hooks, substantially as described



4. A hoisting device, comprising a supporting-bar, a yoke pivoted to the upper end thereof, means for limiting the backward movement of the arms of said yoke, a hook formed upon each of said yoke-arms normally opening downwardly, a cable secured to the upper end of said yoke and passed downwardly longitudinally of said supporting-bar and designed to be operated for rotating said yoke and thereby altering the position of said hooks, and means for retaining said cable in a taut condition when said upper portion of the yoke is at the lowest point of its movement, substantially as described.

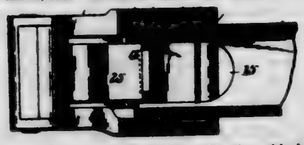
5. A hoisting device, comprising a supporting-bar, a shaft extending transversely of the upper end thereof, a yoke formed of a cross-bar, an eye at either end thereof, an arm extending at a right angle to said cross-bar at each end thereof, each of said arms being formed with an eye adapted to inclose one end of said transverse shaft and thereby pivotally engaging the same and projecting beyond said shaft and formed into a number of plications, a cable connecting and passed through said eyes and extending downwardly longitudinally of said supporting-bar, and means for retaining that portion of said cable between the said eyes in a slack condition, substantially as described.

6. A hoisting device, comprising a supporting-bar, a yoke pivoted thereto intermediate the length of its arms, a plurality of plications formed in the length of said arms to one side of their pivot, transversely-arranged bars connecting portions of the plications of the opposite arms and forming a grated basket or cradle designed for the reception of a picture-book, and means for rotating said yoke for inverting the said hook, substantially as described.

7. A hoisting device, comprising a yoke formed of parallel arms, each of said arms being formed with a plurality of plications, means securing said arms together, means pivotally supporting said yoke, and means for rotating the same upon its pivot, substantially as described.

8. A hoisting device, comprising parallel arms, plications formed upon one end of each of said arms, an eye intermediate the length of each of said arms, designed to receive pivotal supporting means, a bar connecting said arms, and eyes carried by said arms for receiving operating means, substantially as described.

704,223. CAR-COUPLING. JAMES B. THOMAS, St. Louis, Mo. Filed Mar. 8, 1901. Serial No. 50,334. (No model.)



Claim.—1. In a car-coupling, the combination with the draw-bar, of a draw-head having a pivot ball-bearing arranged to bear the weight of the head.

2. In a car-coupling, the combination with the draw-bar, the draw-head, and a separate pivotal ball-bearing connection coupling the head with the bar and arranged to bear the weight of the head.

3. In a car-coupling, the draw-bar, the draw-head, and a pivotal connection between the draw-bar and draw-head, the said pivotal connection comprising means for permitting the draw-head to have an independent lateral oscillation, and also for causing it to automatically return to a centered position when released from lateral strain.

4. In a car-coupling, the draw-bar, the draw-head, and means for permitting the draw-head to have an independent lateral oscillation, and also to gravitate automatically to a centered position when released from lateral strain.

5. In a car-coupling, the draw-bar, the draw-head, and a pivotal connection between the draw-head and the draw-bar, said connection comprising means for causing the draw-head to automatically gravitate to a centered position when released from lateral strain.

6. In a car-coupling, the draw-bar, the draw-head, and a pivotal ball-bearing connection between the draw-head and the draw-bar, said pivotal ball-bearing connection comprising means for causing the draw-head to automatically gravitate to a centered position when released from lateral strain.

7. In a car-coupling, the draw-bar, the draw-head, and a pivotal connection between the draw-head and the draw-bar, said pivotal connection being detachable from the draw-head and comprising means for causing the latter to automatically gravitate to a centered position when released from lateral strain.

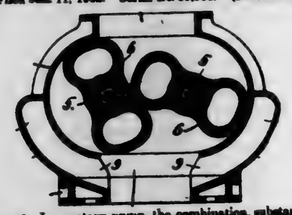
8. In a car-coupling, the draw-bar, the draw-head, and a pivotal connection between the draw-head and the draw-bar, said pivotal connection comprising oppositely-arranged bearing members, and a ball-bearing associated with one of said members, and arranged to permit the automatic gravitation of the head to a centered position.

9. In a car-coupling, the draw-bar, the draw-head, and a pivotal connection between the draw-head and the draw-bar, said pivotal connection comprising upper and lower bearing-steps pivotally fitting the draw-bar, and a ball-bearing interposed between the upper bearing-step and the draw-bar, and arranged to permit of the automatic gravitation of the head to a centered position.

10. In a car-coupling, the draw-bar, the draw-head, a pivotal connection between the draw-head and the draw-bar comprising upper and lower bearing-steps, the upper step and the adjacent side of the draw-bar having a ball-seat, and a bearing-ball arranged therein.

11. In a car-coupling, the draw-bar, the draw-head, a pivotal connection between the draw-head and the draw-bar comprising upper and lower bearing-steps arranged respectively at the upper and lower sides of the draw-bar, said draw-bar being provided beneath the upper bearing-step with a ball-seat having inclined walls, a bearing-ball arranged in said bearing-seat, and means for holding said ball in place.

704,224. ROTARY PUMP. WILLIAM W. WAINWRIGHT, Connersville, Ind., assignor to the P. H. & F. M. Roots Company, Connersville, Ind. Filed Jan. 11, 1902. Serial No. 89,366. (No model.)



Claim.—1. In a rotary pump, the combination, substantially as set forth, of a casing having an inlet and an outlet, a pair of lobed impellers mounted in the casing, and a pair of separate air-chambers connected with opposite sides of the single pump-inlet at the point where the latter enters the casing and disposed substantially in the plane of rotation of the impellers.

2. In a rotary pump, the combination, substantially as set forth, of a casing having an inlet and an outlet, a pair of lobed impellers mounted in the casing, and outer walls joining the casing and in conjunction therewith forming separate air-chambers having connection with the single pump-inlet at the point where the latter enters the casing, said separate air-chambers being oppositely disposed in substantially the plane of rotation of the impellers.

3. In a rotary pump, the combination, substantially as set forth, of a casing having an inlet and an outlet, a pair of lobed impellers mounted in the casing, a base separably secured to the casing at the inlet thereto, and outer walls connected with the casing and the base and in conjunction therewith forming separate air-chambers at the opposite sides of the inlet in substantially the plane of rotation of the impellers and having connection therewith at the point where the single inlet enters the casing.

704,225. SASH-BALANCE CONNECTION. ALBERT WEIDMANNER, St. Louis, Mo. Filed Sept. 9, 1901. Serial No. 74,785. (No model.)

Claim.—1. An article of the class described comprising a body having a corrugated surface, and tongues located upon two opposite sides of the body and adapted to clamp a flexible connection thereon.

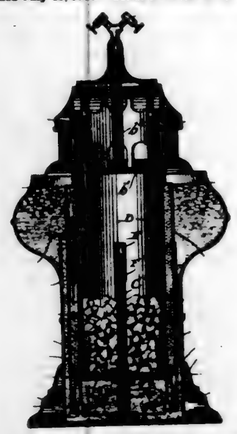
2. An article of the class described comprising a body having a corrugated surface and tongues located upon two opposite sides of the body at each depression in the surface and adapted to clamp a flexible connection thereon.

3. An article of the class described comprising a body, and tongues upon two opposite sides of the body; each of said tongues being grooved.

4. An article of the class described comprising a body having grooves, and tongues located upon opposite sides of the body and provided with grooves; the grooves in the tongues being continuations of the grooves in the body.

5. An article of the class described comprising a body having corrugations, tongues located upon two opposite sides of the body at each depression in the same, a finger secured to the body and extending transversely thereover, an arm located adjacent to the free end of the finger, and a hook.

704,226. ACETYLENE-GAS GENERATOR. ALLEN WILCE, Chicago, Ill. Filed July 15, 1901. Serial No. 68,384. (No model.)



Claim.—1. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up from the bottom of the generating-chamber, a valve at the lower end of said tube, a laterally-perforated closed cap on the upper end of said tube, and a downwardly-converging funnel extending from the perforations in said cap down into the tube and terminating in a restricted opening, substantially as described.

2. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, and a downwardly-converging funnel extending down into the tube and terminating in a restricted opening through which the water in the tube passes to enter the generating-chamber, substantially as described.

3. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, a laterally-perforated cap on the upper end of said tube, and a downwardly-converging funnel extending from the perforations in said cap down into the tube and terminating in a restricted opening, substantially as described.

4. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, a downwardly-converging funnel extending down into the tube and terminating in a restricted opening, an inlet-valve at the lower end of the tube provided with a restricted opening, substantially as described.

5. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, a laterally-perforated cap on the upper end of said tube, a downwardly-converging funnel extending from the perforations in said cap down into the tube and terminating in a restricted opening, substantially as described.

6. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, a laterally-perforated cap on the upper end of said tube, the upper end of said cap being closed and terminating not far above its lateral perforations, and a downwardly-converging funnel extending from the perforations in said cap down into the tube and terminating in a restricted opening, substantially as described.

7. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending into the generating-chamber, and a removable carbid-receptacle in said generating-chamber consisting of a cylindric cup provided with a detachable bottom perforated to set over the inlet-tube, substantially as described.

8. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending into the generating-chamber, and a removable carbid-receptacle in said generating-chamber consisting of a cylindric cup provided with a loose bottom perforated to set over the inlet-tube, slots in said bottom, and bent wires secured to the receptacle and entering said slots to hold the bottom in place, substantially as described.

9. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, and a closed cap on the upper end of said tube, provided with perforations at different levels, substantially as described.

10. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber, a closed cap on the upper end of said tube provided with perforations at different levels, and a downwardly-converging funnel extending from the lower perforations in the cap down into the tube, substantially as described.

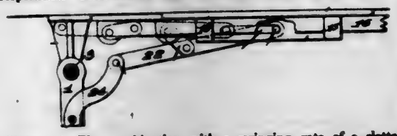
11. A gas-lamp comprising a font, a generating-chamber in said font, an inlet-tube extending up into the generating-chamber and provided with a valveless port affording open communication between the upper end and body portion of the tube, and a laterally-perforated closed cap on the upper end of said tube, substantially as described.

704,227. RATCHET-BRAKE FOR CARS. HERBERT WHITE, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed July 3, 1901. Serial No. 66,966. (No model.)

Claim.—1. The combination with a brake-staff, and a ratchet-head, of a bracket having a projection, a handle, a pawl secured to the handle, and a dog pivoted to the handle at one side of the pawl, connected to the pawl and extending over the same to engage with the projection on the bracket.

2. The combination with a brake-staff and a ratchet-head, of a bracket having a projection, a handle, a spring-pressed pawl sliding longitudinally within the handle and having a pin, and a dog provided with a slot in which the pin on the pawl works, pivoted to the handle at one side of the pawl, and extending over the same to engage with the projection on the bracket.

704,228. GUARD-GATE FOR RAILWAY-CARS. HERBERT WHITE, St. Louis, Mo., assignor to St. Louis Car Company, St. Louis, Mo., a Corporation. Filed Oct. 21, 1901. Serial No. 79,304. (No model.)

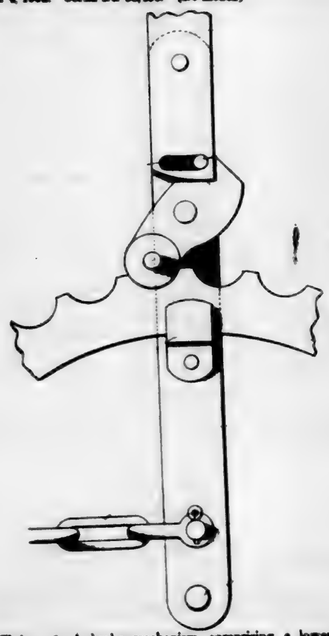


Claim.—1. The combination with a swinging gate of a slotted bracket supported beside said gate, a throw-rod pivoted to said gate and arranged to operate in said bracket, a push-rod, a connecting-link by which said push-rod and throw-rod are connected, and a hand-lever having connection with said push-rod, substantially as described.

2. The combination with a swinging gate, of a bracket mounted beside said gate having a pair of slotted arms, a throw-rod pivotally connected to said gate and arranged to operate in said bracket-arms and be guided thereby, a push-rod, a connecting-link by which said throw-rod and push-rod are connected, and a hand-lever connected to said push-rod, substantially as described.

3. The combination with a swinging gate, of a bracket mounted beside said gate having a pair of slotted arms, a throw-rod connected to said gate, a push-rod, a connecting-link by which said throw-rod and push-rod are united, and studs carried by said throw-rod adapted to operate in the slots in said bracket-arms to guide and limit the movement of said throw-rod, substantially as described.

704,229. BRAKE. JAMES S. ALEXANDER, Fairfield, Iowa. Filed Jan. 4, 1902. Serial No. 88,400. (No model.)



Claim.—1. A brake mechanism, comprising, a lower fulcrumed member, an upper handle member pivoted intermediately thereon and extending thereabove, a pawl intermediately pivoted on the said fulcrumed member and below the handle member and adapted to be vibrated thereby, a loose roller at the lower free end of the pawl, and a locking-bar below the pawl and provided with recesses substantially agreeing with the said loose roller of the pawl and adapted to receive the same.

2. A brake mechanism, comprising, a lower fulcrumed member, an upper handle member pivoted thereon and extending thereabove, a pawl pivoted on the said fulcrumed member and adapted to be vibrated by the said handle member, a loose roller carried by the free end of the pawl, and a locking-bar below the pawl and provided with recesses for engaging the said loose roller.

3. A brake mechanism, comprising, a lower fulcrumed member, an upper handle member overlapping the upper end of and intermediately pivoted to the lower fulcrumed member, and terminating at its lower end in a shoulder and provided above the same with a segmental slot, a pin projecting from the lower member and engaging the slot, a loosely-pivoted gravity-pawl mounted on the lower member and provided at its upper end with a shoulder located in the path of that of the upper handle member and adapted to be struck thereby, a loose roller mounted on the lower free end of the pawl, and a curved locking-bar provided with a series of substantially semicircular recesses of substantially the same diameter as the roller and adapted to engage the same.

704,230. TANK-VALVE. SYLVESTER J. ARDELL, Paterson, N. J. Filed Feb. 7, 1902. Serial No. 93,067. (No model.)

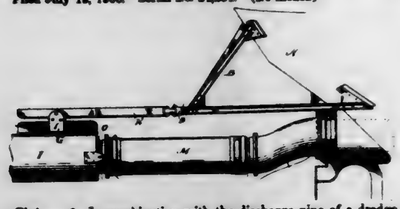
Claim.—1. The combination, with a valve-casing, of a cap for said casing forming therewith a valve-chamber and screwed onto the same,

the contiguous portions of said cap and casing being provided with internal annular flanges, a tubular valve-seat having a surrounding flange clamped between said casing and cap flanges, said valve-seat having its tubular or body portion thus spaced from the surrounding casing and cap walls, and a tubular part disposed in said casing below said valve-seat, having its upper end formed as a valve, and also having ducts opening laterally into said casing, substantially as described.

2. The combination, with a valve-casing and a cap surmounting the same and forming therewith a valve-chamber, of a valve-seat arranged in said chamber, a vertically-movable valve also arranged in said chamber and adapted to take against said valve-seat, and a tubular portion extending substantially horizontally from said chamber and communicating therewith, the tops of said chamber and the tubular portion being flush with each other, substantially as described.

3. The combination, with a valve-casing open at the top, of a hollow cap closed at the top and surmounting said casing to form therewith a valve-chamber, a tubular portion extending laterally from, and communicating with, said hollow cap and having the top portion of its bore-surface in a plane coincident with that of the inside top surface of said cap, a tubular valve-seat disposed substantially centrally in said valve-chamber and having its tubular portion appreciably spaced from the surrounding casing and cap walls, and a tubular part disposed in said casing below said valve-seat, having its upper end formed as a valve, and also having ducts opening laterally into said casing, substantially as described.

704,281. HYDRAULIC DREDGE. LINDON W. BATES, Chicago, Ill.
Filed July 19, 1900. Serial No. 24,251. (No model.)



Claim.—1. In combination with the discharge-pipe of a dredge, a pontoon; a discharge-pipe carried by said pontoon; a flexible connection intermediate said pipes; and an adjustable universal connection intermediate the dredge and the pontoon independent of the flexible connection between the pipes.

2. In combination with the discharge-pipe of a dredge, a pontoon; a discharge-pipe carried thereby; a flexible connection intermediate the discharge-pipe and the pipe carried by the pontoon; a brace or strut connected to the rear of the dredge; a frame universally connected to said brace; and pivotal connections intermediate the frame and the pontoon.

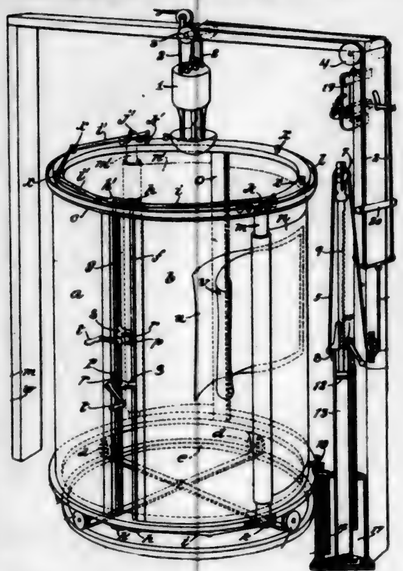
3. In combination with the discharge-pipe of a dredge; a pontoon; a discharge-pipe carried thereby; a flexible pipe intermediate the discharge-pipe and the pipe on the pontoon; a strut or brace rigidly attached to the rear of the dredge; a frame universally jointed to the rear end of said strut or brace; and adjustable pivotal connections between said frame and the pontoon.

4. In combination with the discharge-pipe of a dredge, a pontoon; a pipe carried thereby; a flexible pipe connecting said discharge-pipe and the pipe on the pontoon; a strut or brace extending out from the rear of the dredge; a frame universally connected to the rear end of said strut or brace; rails secured to the pontoon; brackets adjustably mounted upon said rails; and pivotal connections intermediate said bracket and the frame.

5. In combination with the discharge-pipe of a dredge; a pontoon; a pipe carried thereby; wedge-shaped sections connected to the end of the discharge-pipe and the pipe carried by the pontoon; and a flexible pipe connecting said wedge-shaped sections.

6. In combination with the discharge-pipe of a dredge; a pontoon; a pipe carried thereby; wedge-shaped sections connected to the end of the discharge-pipe and the pipe carried by the pontoon; a flexible pipe connecting said wedge-shaped sections; and means for holding the pontoon in its proper position relative to the dredge.

704,282. MACHINE FOR MAKING BLUE-PRINTS. ROBERT A. BELL, Philadelphia, Pa., assignor to Charles A. Rutter, Philadelphia, Pa.
Filed Nov. 18, 1901. Serial No. 82,462. (No model.)



Claim.—1. The combination in a machine for making prints, of a glass platen, a curtain one end of which is secured to a line along said platen, a spring-actuated roller to which the other end of said curtain is secured, and means for drawing said roller across said platen.

2. In a machine for making prints, in combination, a glass cylinder, rings secured to the top and bottom of said cylinder, a curtain one end of which is fixed to said cylinder, a spring-actuated roller to which the other end of said curtain is secured, means carried by said rings for carrying said roller, and means for drawing said roller and connected parts circumferentially around said glass cylinder.

3. In a machine for making prints, in combination, a sectional glass cylinder, metallic rings carried by and securing the ends of said sections, a curtain secured to said cylinder upon a line parallel with its axis, spring-actuated rollers upon which the ends of said curtain are rolled, means carried by said rings for carrying said rollers, and means for drawing said rollers circumferentially around said glass cylinder toward one another and away from the point at which said curtain is secured to said cylinder.

4. In a machine for making prints, in combination, a glass cylinder, metallic rings carried by the ends of said cylinder furnished with grooves concentric with said cylinder, a curtain one end of which is secured to said cylinder, a spring-actuated roller to which the other end of said curtain is secured, carriages carried by said rings carrying the ends of said roller and being guided in their movements by said grooves in said rings, a shaft, pulleys upon said shaft, belts secured at one end to said carriages and at the other to said pulleys, a gear-wheel upon said shaft, a gear-wheel meshing with said first gear, and means for revolving said latter gear.

5. The combination with the glass cylinder and the curtains as described, of a lamp, a cord one end of which is secured to said lamp and the other to a fixed point, a stationary pulley under which said cord passes, a movable pulley over which said cord passes, a rod carrying said latter pulley, a piston to which said rod is secured, a cylinder in which said piston works, a reservoir, a connection between said reservoir and said cylinder, and a valve by means of which the flow of liquid from said cylinder to said reservoir, or vice versa, may be controlled.

704,283. MUSICAL TOY. HAROLD P. BROWN, Montclair, N. J.
Filed May 22, 1900. Serial No. 17,031. (No model.)

Claim.—1. A wind instrument comprising a cylindrical tube having a series of riffles on its interior wall, the said riffles being transverse to the longitudinal axis of the tube and means for applying the mouth to the tube to force air through it, substantially as set forth.

2. A wind instrument comprising a cylindrical tube provided with a series of riffles projecting from and extending around the interior wall of the tube transverse to the longitudinal axis of the tube and means for applying the mouth to the end of the tube, substantially as set forth.

3. A wind instrument comprising a cylindrical tube provided with riffles extending spirally around the interior of the tube and means for applying the mouth to the end of the tube to force the wind through the tube, substantially as set forth.

4. A wind instrument comprising a cylindrical tube having its wall crimped to form riffles projecting from the interior of the tube transverse to the longitudinal axis of the tube, a mouthpiece attached to one end of the tube and a bell attached to the opposite end of the tube, substantially as set forth.

704,284. WHEEL. WILLIAM T. W. BUSHNELL, Bradley, Ill.
Filed Jan. 14, 1901. Serial No. 43,178. (No model.)

Claim.—1. A wheel composed of a rim, a hub consisting of separable sections fitted together, means for holding said sections together, a series of independent, spoke-sockets carried by each of said sections, said sockets having laterally-bendable clamping devices and spokes secured in said spoke-sockets and to the rim.

2. A wheel, consisting of a rim, a hub composed of separable sections, a series of independent radial spoke-sockets carried by each of said sections, each of said sockets having a clamp, means for holding said sections together, and spokes secured in said sockets and to the rim.

3. A wheel, consisting of a rim, a hub composed of separable interlocking sections, a hub-box upon which said sections are fitted, said box having a stop near one end against which one of said sections bears, means binding said sections together and against said stop, a series of spoke-sockets carried by each of said sections, and spokes secured in said sockets and to the rim, substantially as described.

4. A wheel, consisting of a rim, a hub-box having a peripheral flange, hub-sections fitted on said box, one of said sections bearing against said flange, a cap secured on the end of the box and arranged to bear against the other hub-section, a series of independent spoke-sockets carried by each of said sections, and spokes secured in said sockets and to the rim.

5. The combination of a hub-box, closed at one end and screw-threaded at the other end, an axle having a spindle projecting into said hub-box and carrying a collar, a cap fitted upon said axle and screwed upon the open end of said hub-box, said cap inclosing said collar, a peripheral flange carried by the hub-box and a hub on the hub-box between said flange and collar, the inner edge of said collar being arranged to bear against said hub and bind it against said collar.

6. A wheel, comprising a rim, a hub having on its periphery spoke-sockets, said sockets being enlarged near the hub and being open at the sides to the full depth of the sockets to permit the introduction and removal of the spokes by a lateral movement, spokes having their outer ends secured to the rim, their inner ends having enlarged heads which fit in said sockets and abut against the bottoms thereof, whereby the end thrust of said spokes is directed against the periphery of the hub, and clamps carried by the hub and bendable laterally around the stems of said spokes for securing them in the hub, substantially as described.

704,285. CRAB-MAKER'S BOARD. ALONZO C. CAMPBELL, Charleston, S. C., assignor of one-half to W. B. Crum, Charleston, S. C.
Filed Oct. 26, 1901. Serial No. 80,036. (No model.)

Claim.—1. As an article of manufacture, a cigar-maker's board, consisting of a series of convex wood sections the grain of which is vertically disposed, and means for securing said sections side by side.

2. As an article of manufacture, a cigar-maker's board, consisting of a series of convex wood sections the grain of which is vertically disposed, and a series of tie-rods passed through the sections and provided at their ends with nuts.

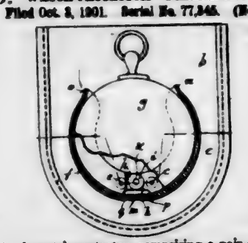
3. As an article of manufacture, a cigar-maker's board having a flat base or bottom and an upper convex working surface.

4. As an article of manufacture, a cigar-maker's board, formed of wood with the grain on end or vertically disposed, said board having a flat base or bottom and an upper convex working surface.

5. As an article of manufacture, a cigar-maker's board, consisting of a series of convex sections arranged side by side and each having its grain vertically disposed, and devices for securing the sections together, the working surface of the board declining from the center toward the edges, the greatest decline being toward the front end.

6. As an article of manufacture, a cigar-maker's board having a flat base or bottom and an upper convex working surface, the greatest slope of said working surface being toward the front.

704,286. WATCH-PROTECTOR. FRANK A. CHERVENKA, Milwaukee, Wis. Filed Oct. 3, 1901. Serial No. 77,845. (No model.)

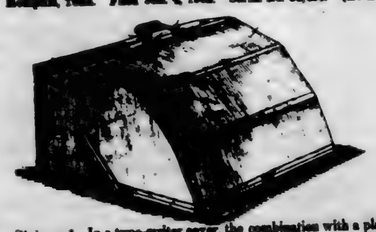


Claim.—1. A watch-protector, comprising a pair of yielding interiorly-grooved curved shells, pivotally connected at their lower ends, in combination with a watch-pocket of flexible yielding material, and screws passing through one wall of said pocket into said shells for directly securing the same to the watch-pocket of the wearer.

2. A watch-protector, comprising a pair of interiorly-grooved curved shells, pivotally connected at their lower end, in combination with a spring for normally forcing the upper ends of said shells toward each other, and a pair of screws, engaging horns in said shells adjacent to their pivotal connection, for securing said protector to a watch-pocket.

3. A watch-protector, comprising a pair of interiorly-grooved curved shells, formed with inwardly-projecting upper extensions at their lower ends; pivots centrally uniting said projections; opposing pins projecting inwardly from said lower ends of the shells, below the plane of said extensions and above the lowest plane of the shells; a spiral spring having its opposite ends in engagement with said pins; and screws connected to said shells for securing the same to a watch-pocket.

704,287. TYPE-WRITER COVER. HENDERSON P. CHILDERS, Memphis, Tenn. Filed Jan. 4, 1902. Serial No. 88,451. (No model.)



Claim.—1. In a type-writer cover, the combination with a platform arranged to support a type-writer, of a collapsible frame pivoted to the

platform, and a flexible covering secured to the frame, said frame and covering being supported upon the platform when in collapsed position.

2. In a type-writer cover, the combination with a platform arranged to support a type-writer, of a collapsible frame comprising a main bow pivoted to the platform and supplemental bows pivoted to the main bow and to each other, and a flexible covering secured to the bows of the frame.

3. In a type-writer cover, the combination with a platform arranged to support a type-writer, of a collapsible frame movable over and away from the platform, and a covering secured to the frame and the platform.

4. In a type-writer cover, the combination with a platform arranged to support a type-writer, of a collapsible frame mounted upon the platform and movable over and away from the same, and a flexible covering secured to the frame and the platform.

5. In a type-writer cover, the combination with a platform arranged to support a type-writer, of a collapsible frame pivotally connected to the platform, and a flexible covering secured to the frame and collapsible therewith.

6. In a type-writer cover, the combination with a platform adapted to support a type-writer, of a collapsible frame pivoted to the platform and comprising a plurality of pivotally-connected ribs, and a flexible covering secured to said ribs, and having its edges extended below the edges of the platform.

7. In a type-writer cover, the combination with a platform adapted to support a type-writer, of a main bow pivoted at its opposite ends to intermediate portions of the platform, supplemental bows pivoted to the main bow, and a flexible cover attached to said several bows, and having its edges extended below the edges of the platform.

8. In a type-writer cover, the combination with a platform adapted to support a type-writer, of a main bow pivoted at its opposite ends to the platform, supplementary bows pivoted to the main bow, a flexible cover attached to said several bows, and a handle secured to the main bow and projecting above the cover.

9. In a type-writer cover, the combination with a platform adapted to support a type-writer, of a main bow pivoted at its opposite ends to the platform, supplementary bows pivoted to the main bow, a flexible cover attached to said several bows, means for securing the cover about a portion of the platform, one of said bows having a detachable engagement with the platform, whereby a type-writer supported thereon may be completely inclosed.

10. In a type-writer cover, the combination with a base arranged to support a type-writer, of a main bow pivoted at its opposite ends to the base, supplementary bows pivotally connected to the main bow, a flexible cover attached to said several bows, and a holding-bow secured to a portion of the base and having the covering attached thereto, one of said pivoted bows being secured to the edge of the covering and having a detachable engagement with the base whereby a type-writer supported thereon may be completely inclosed.

11. In a type-writer cover, the combination with a base arranged to support a type-writer, of a main bow pivoted at its opposite ends to the base, supplementary bows pivotally connected to the main bow, a flexible cover attached to said several bows, a holding-bow secured to a portion of the base and having the covering attached thereto, one of said pivoted bows being secured to the edge of the covering and having a detachable engagement with the base, whereby a type-writer supported thereon may be completely inclosed, and means for securing said pivoted bow to the base.

12. In a type-writer cover, the combination with a platform having an offset ledge about its edge, of a main bow pivoted at its ends to the opposite portions of the base, supplementary bows pivoted to the main bow, a flexible cover attached to said several bows, a holding-bow secured upon a portion of the peripheral ledge of the base and having the covering attached thereto, one of said pivotal bows being secured to the edge of the covering and detachably fitting upon the remaining portion of the peripheral ledge, and means for securing said pivoted bow to the base.

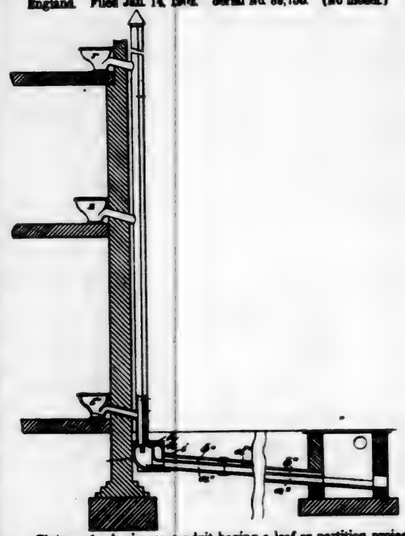
13. In a type-writer cover, the combination with a base adapted to support a type-writer, of a main bow pivoted at its ends to opposite portions of the base, supplementary bows pivoted to the main bow, a flexible covering attached to said several bows, and means for securing the main bow against its pivotal movement.

14. In a type-writer cover, the combination with a base adapted to support a type-writer, of a main bow pivoted at its ends to opposite portions of the base, supplementary bows pivoted to the main bows, a flexible cover attached to said several bows, and a fastening-arm pivoted to the main bow and having a detachable engagement with the base to hold said bow against movement thereon.

15. In a type-writer cover, the combination with a platform having a peripheral ledge, of a collapsible frame secured to and carried by the platform, and a flexible cover carried by the frame and having its edges resting upon the ledge of the platform.

16. In a type-writer cover, the combination with a machine-supporting platform, of a collapsible frame pivoted to the platform at an intermediate point of the length thereof, that portion of the platform in rear of the pivotal attachment of the frame constituting a support for the latter when folded, and a flexible covering secured to the frame and encircling the edge of the platform when unfolded.

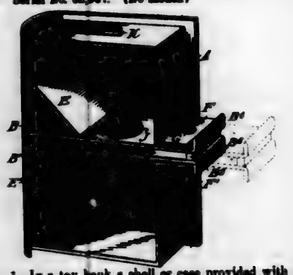
704,238. PIPE OR CONDUIT. ARTHUR W. COOMEY, London, England. Filed Jan. 14, 1902. Serial No. 89,750. (No model.)



Claim.—1. A pipe or conduit having a leaf or partition projecting from one side of its internal surface and extending partly across to the other side thereof, substantially as and for the purposes set forth.

2. A pipe or conduit divided into two compartments connected together by a longitudinal aperture in the dividing leaf or partition, one compartment forming a duct for the passage of liquid or other substance and the other an air-compartment for receiving the air escaping from the said duct through the said aperture, substantially as and for the purpose set forth.

704,239. TOY BANK. ORLO G. CRANDELL, Worcester, Mass., assignor of one-half to Julian F. Bigelow, Worcester, Mass. Filed May 31, 1901. Serial No. 62,567. (No model.)



Claim.—1. In a toy bank a shell or case provided with two compartments, one above the other, a sliding plate between said compartments provided with a perforation adapted to receive a single coin, a partition normally beneath said perforation, and a coin-supporting lug located beyond the end of said partition and in a plane below said partition equal to the thickness of a coin, whereby the coins are individually transferred from the upper to the lower compartment by the sliding movement of said plate, substantially as described.

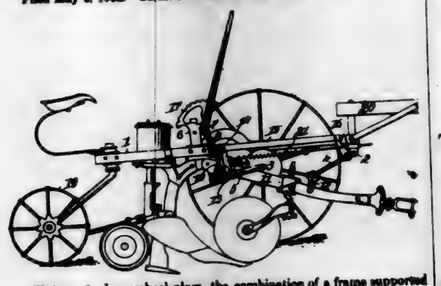
2. The combination in a toy bank comprising two compartments, one above the other, of the plates B, B' provided with perforations D and D', a partition C and coin-supporting lugs at the end of said partition, substantially as described.

3. The combination of compartments A' and A², one above the other, a horizontal sliding plate having a coin-perforation and placed between said compartments, a separating-partition having a thin edge to contact with the coin as the sliding plate is moved, and a supporting-lug for the coin when the sliding plate is drawn out, substantially as described.

4. The combination of a case having two compartments, one above the other, a pair of duplicate sliding plates, each having a coin-perforation, a separating-partition normally separating said perforations, a pair of lugs above and below said sliding plates by which the coin is supported as it is pushed against the edge of said separating-plate, substantially as described.

5. The combination of a case or shell A having the compartments A' and A², partitions C and K, E', sliding plates B, B' having coin-perforations D, D' and lugs F, F' provided with the openings G, whereby a coin held in said perforations is supported normally on said partition C and when the slide is drawn, is allowed to fall on one of said coin-supporting lugs by gravity and be carried to the opposite side of said partition C by the reverse movement of said sliding plates, substantially as described.

704,240. WHEEL-PLOW. BRADFORD CROSS, Canton, Ill., assignor to Parlin & Orendorff Company, Canton, Ill., a Corporation of Illinois. Filed May 8, 1902. Serial No. 106,464. (No model.)



Claim.—1. In a wheel-plow, the combination of a frame supported on wheels, a plow-beam having a plow attached thereto, a pair of bails pivoted in the frame, one in front of the other, and both connected pivotally with the plow-beam and a strut-bar to transmit the motion of one bail to the other.

2. In a wheel-plow, the combination of a frame supported on wheels, a plow-beam having a plow attached thereto, a bail pivoted in the frame and connected pivotally with the plow-beam, a second bail pivoted in the frame in front of the first-named bail, a swinging link connecting the front bail with the plow-beam, and a strut-bar to transmit motion from one bail to the other.

3. In a wheel-plow, the combination of a frame supported on wheels, a plow-beam having a plow attached thereto, a pair of bails pivoted in the frame, one in front of the other, with the rear bail connecting pivotally with the plow-beam, a swinging link connecting the front bail with the plow-beam, arms attached to the beams and extended upward therefrom, and a strut-bar connected pivotally at its ends with the arms of the bails, the connection of the rear end of the bar being farther from the pivot of the bail than the connection of the front end.

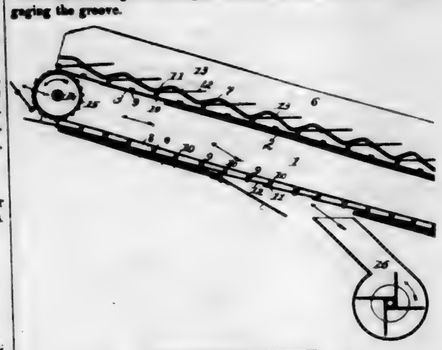
4. In a wheel-plow, the combination of a frame supported on wheels, a plow-beam having a plow attached thereto, a pair of bails pivoted in the frame, one in front of the other, with the rear bail connecting pivotally with the plow-beam, a swinging link connecting the front bail with the plow-beam, arms attached to the bails and extended upward therefrom, and an adjustable strut-bar connected at its ends with the arms of the bails and forming a longitudinally-extensible connection between the arms.

5. In a wheel-plow, the combination of a frame supported on wheels, a plow-beam having a plow attached thereto, a pair of bails pivoted in the frame, one in front of the other, and connected pivotally with the plow-beam, a strut-bar connecting the bails, a lift-lever, and a link connecting the lift-lever with the rear bail.

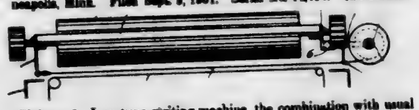
704,241. SEPARATOR. FRED CUTLER, Bradbriton, Ill. Filed Nov. 8, 1901. Serial No. 81,698. (No model.)

Claim.—1. In a separator, the combination of a board, endless chains running over the board, straw-slats attached to the chain in contact with the board, other straw-slats pivotally connected with the chains out of contact with the board, straw-carrying fingers extending rearward from the pivoted slats, a side board having a sinuous groove extending lengthwise thereof and guide-fingers for the pivoted slats engaging the groove.

2. In a separator, the combination of a hollow frame consisting of an upper board, a lower board and side boards, a fan to force air through the hollow frame, a shaft in the open discharge end of the hollow frame, sprocket-wheels on the shaft, endless chains running around the sprocket-wheels with their upper runs above the upper board, cross-slats attached to the chains in position to move in contact with the upper board, other slats pivotally connected with the chains, out of contact with the upper board, straw-carrying fingers extending rearward from the pivoted slats, a side board having a sinuous groove and guide-fingers for the slats engaging the groove.



704,242. TYPE-WRITING MACHINE. NOBLE C. DARROW, Minneapolis, Minn. Filed Sept. 9, 1901. Serial No. 74,757. (No model.)



Claim.—1. In a type-writing machine, the combination with usual inking means, of a secondary inking-ribbon differing in color from said normal inking means, a spool therefor, means for connecting the spool to one end of the paper-carriage, and means for temporarily connecting the unwound portion of the ribbon to the opposite end of the carriage, whereby the ribbon may be periodically presented at the printing-point to produce print differing in color from the normal, substantially as set forth.

2. In a type-writing machine, the combination with usual inking means, of a secondary inking-ribbon differing in color from said normal inking means, a spool therefor, means for connecting the spool to one end of the paper-carriage, a spring for rotating the spool to wind the ribbon, a clamping device for the free end of the ribbon, and means for temporarily connecting such clamp to the opposite end of the carriage, whereby the ribbon may be periodically presented at the printing-point to produce print differing in color from the normal, substantially as set forth.

3. In a type-writing machine, the combination with usual inking means, of a secondary inking-ribbon differing in color from said normal inking means, a spool therefor, means for connecting the spool to one end of the paper-carriage, a spring for rotating the spool to wind the ribbon, a clamping device for the free end of the ribbon, and means for shifting the spool longitudinally on its axis and means for shifting the clamp correspondingly, whereby successive portions of the ribbon may be periodically presented at the printing-point to produce print differing in color from the normal, substantially as set forth.

704,243. BRACELET OR THE LIKE. EDWARD P. DAVIS, Wrentham, Mass., assignor to Whiting & Davis, Wrentham, Mass., a copartnership composed of Charles A. Whiting, Brooklyn, N. Y., and Edward P. Davis, Wrentham, Mass. Filed Jan. 2, 1902. Serial No. 88,053. (No model.)

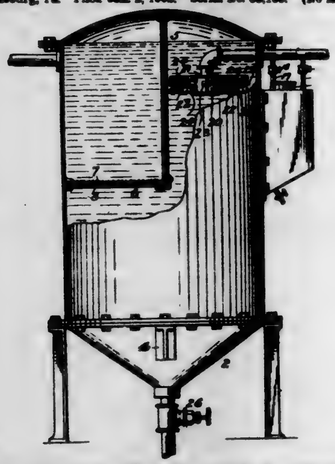
Claim.—1. A bracelet formed of sections pivoted together at their ends, one of said sections having secured therein a spring which extends

into the adjacent section in its extreme open position, a cam in the end of the adjacent section which engages with said spring and holds the two sections in the open and closed positions, and means which limit the extent of opening movement, substantially as described.

2. A bracelet formed of hollow sections pivoted together at their ends, one of said sections having secured therein a spring having a free end which extends into the hollow end of the adjacent section both while closed and while in the extreme open position, a cam fixed to said adjacent section which engages with said spring and holds the spring close to the inside walls of the said sections when in their extreme open position, substantially as described.

3. A bracelet formed of curved tubular sections pivoted together, a spring secured inside of one of said tubular sections and having a free end which extends across into the inside of the opposing section when the joint is in its extreme open position, a cam fixed to said opposing section, and having a projection the extreme end of which engages the said spring when the joint is in its extreme open position and holds the said spring close to the inside walls of the sections, and means which limit the extent of opening of said sections, substantially as described.

704,244. APPARATUS FOR PURIFYING WATER. JOHN DAVIS, Pittsburg, Pa. Filed Jan. 2, 1902. Serial No. 88,109. (No model.)



Claim.—1. A water-purifier having a supply-pipe, means for supplying a coagulant or reagent to the water in the supply-pipe, and a mechanical mixer submerged in the purifier, revolubly secured to the discharge end of said supply-pipe and revolved by the water flowing through the mixer.

2. A water-purifier having a supply-pipe, means for supplying a coagulant or reagent to the water in the supply-pipe, and a submerged mixer provided with radial arms through which water is discharged and revolubly secured to the end of said supply-pipe.

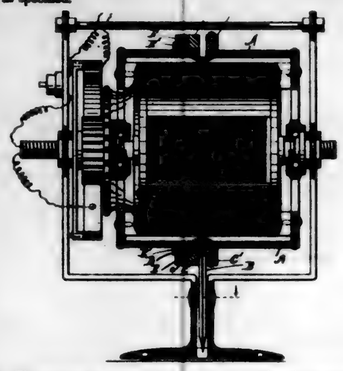
3. A water-purifier having means for supplying a coagulant or reagent thereto, a water-supply pipe, and a mixer revolubly secured to the end of said supply-pipe and provided with radial arms through which the water is discharged, and vanes secured to said arms.

4. A water-purifier having means for supplying a coagulant or reagent thereto, a water-supply pipe, and a submerged mixer revolubly secured to the end of said supply-pipe and provided with radial arms through which the water is discharged, and perforated vanes secured to said arms.

5. A water-purifier having means for supplying a coagulant or reagent thereto, a water-supply pipe, and a mixer revolubly secured to the supply-pipe and through which the water is discharged into the purifier, in combination with a baffle-plate opposite the mixer and an arrester forming the bottom of a chamber from which clear water is discharged.

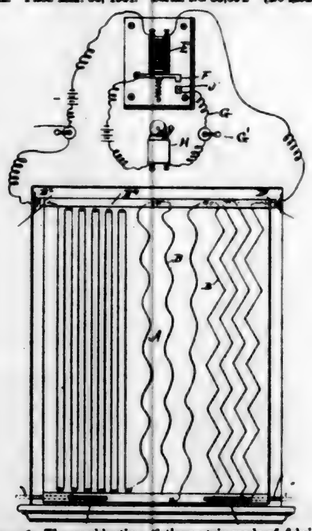
704,245. MEANS FOR TRANSMITTING ROTARY MOTION. PATRICK W. DUNNE, River Forrest, Ill. Filed Jan. 20, 1901. Serial No. 43,891. (No model.)

Claim.—1. The means for communicating rotary motion from one shaft or rotating part to another, which consists in the combination of two shafts or rotating parts, a disk having flat parallel sides in its plane of rotation mounted on one of the shafts, two parallel rings or parts each having a flat parallel side in the plane of their rotation between which the disk is clamped with a frictional contact, and means for adjustably applying the clamping force adjacent to the place of frictional contact, substantially as specified.



2. The means for communicating rotary motion from one shaft or rotating part to another, which consists in the combination of two shafts or rotating parts, a disk having flat parallel sides in its plane of rotation mounted on one of the shafts, two parallel rings or parts each having a flat parallel side in the plane of their rotation between which the disk is clamped with a frictional contact, and means for adjustably applying the clamping force adjacent to the place of frictional contact, said means consisting of a screw-ring bearing against one of the clamping-rings immediately opposite to the frictional surfaces in contact, substantially as specified.

704,246. BURGLAR-ALARM. PATRICK W. DUNNE, River Forrest, Ill. Filed Mar. 30, 1901. Serial No. 53,894. (No model.)



Claim.—1. The combination of the curtain made of fabric whereof a portion of the warp-threads are made of wire, said wire warp-threads being united together to form a continuous electric conductor; the shade-roller with metallic axes and fixtures, connected to said continuous curtain-wire; the electric circuit including an electromagnet which controls a secondary circuit including an alarm-bell, substantially as specified.

2. The combination of the curtain made of fabric whereof a portion of the warp-threads are made of wire, said wire warp-threads being united together to form a continuous electric conductor; the shade-roller with metallic axes and fixtures, connected to said continuous curtain-wire; the electric circuit including an electromagnet which controls a secondary circuit including an alarm-bell, and means at the bottom of the curtain for fastening it down to the window or frame, substantially as specified.

3. The combination of the curtain made of fabric whereof a portion of the warp-threads are made of wire, said wire warp-threads being united together to form a continuous electric conductor; the shade-roller with metallic axes and fixtures, connected to said continuous curtain-wire; the electric circuit including an electromagnet which controls a secondary circuit including an alarm-bell, and means at the bottom of the curtain for fastening it down to the window or frame which consists of a hollow tube provided with sliding bolts one at each end setting into sockets in the window-framing, substantially as specified.

704,247. BURGLAR-ALARM. CHARLES PERSHAW, Chicago, Ill. Filed Dec. 26, 1901. Serial No. 87,233. (No model.)

Claim.—1. In an electric burglar-alarm for doors and the like, the combination of battery-terminals, a pivoted support, contacts on the support movable to engage the terminals, a spring-pressed rod movable to engage the block and elevate the contacts into engagement with the terminals, an electric circuit including an alarm-signal connected with the contacts, and means on the door for engaging and restraining the rod.

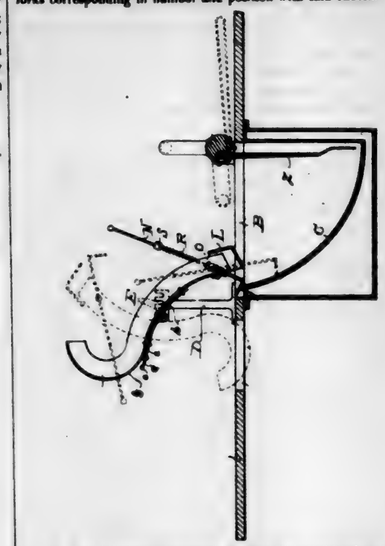
2. In a burglar-alarm for doors and the like the combination of a normally open electric circuit including contacts and an alarm-signal, a separate normally open distant alarm electric circuit, including a circuit-closer, a swinging lever adapted in its movement in one direction to elevate the contacts into engagement with the terminals, an arm on the lever arranged to engage the closer of the other circuit, a rod for moving the lever and means on the door or the like for restraining the rod.

3. The combination of a casing, an electric battery in the casing having hooked terminals *k*, swinging lever D in the casing carrying hooked contacts *i* in circuit with alarm-sounding mechanism, rod E connected with the lever and extending through a wall of the casing, spring upon the rod tending normally to move the lever to cause the contacts *i* to engage the terminals *k* and means for engaging and releasing the rod, substantially as and for the purpose set forth.

704,248. CANDY-DIPPING MACHINE. FERDINAND GOLDSCHMIDT, Chicago, Ill. Filed Oct. 18, 1901. Serial No. 79,066. (No model.)

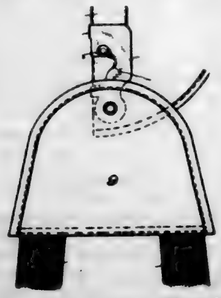
Claim.—1. In a machine of the kind specified, the combination with a receptacle adapted to receive the coating, and devices movable in said receptacle for removing the dipped candy, of a receiver movable over said receptacle and provided with chutes to receive the candy to be dipped and deliver same to said receptacle at predetermined points, and devices carried by said receiver for forcibly immersing the candy.

2. In a machine of the kind specified, the combination with a receptacle, a receiver movable over same and provided with a series of chutes each adapted to receive a piece of candy to be dipped and deliver same into said receptacle at predetermined points, and devices carried by said receiver for forcibly immersing said candy in the coating contained in said receptacle, of a crank-shaft above said receptacle carrying forks adapted to move into and out of said receptacle to remove the dipped candy, said forks corresponding in number and position with said chutes.



3. In a machine of the kind specified, the combination with a receptacle adapted to contain coating, a receiver provided with chutes at regular intervals pivotally mounted adjacent to said receptacle and projecting over same at one end, said chutes being adapted each to receive a piece of candy to be dipped, and deliver same to said receptacle at predetermined points, and devices for forcibly immersing said candy, of a shaft mounted adjacent said receptacle, guides on said shaft, a member movable in said guides, and forks each secured at one end to said shaft and at its other to the member movable in said guides, said forks being adapted to be turned by the movements of said member as said shaft is turned, said forks corresponding in number and location with said chutes.

704,249. HOSE-SUPPORTER HOOK. MYRON E. HAMMOND, Bridgeport, Conn. Filed Apr. 17, 1902. Serial No. 103,572. (No model.)

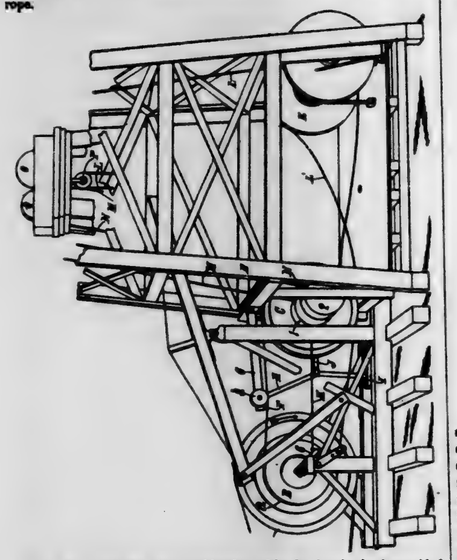


Claim.—A hose-supporter hook, comprising a sheet-metal body cut away at its front edge and having a notch in the upper wall of said cut-away portion and a recess in the rear wall of said portion immediately below said notch, and provided with rearwardly-extending resilient flanges at the upper and lower ends of said cut-away portion, said fastener adapted to be forced on the corset-busk with the flanges extending in the rear of said busk, while the notch is capable of embracing the stud of the corset-clasp, substantially as set forth.

704,250. WELL-RIG. EDWIN A. HARDISON, Santa Paula, Cal., assignor of one-half to Joseph L. Olive, Santa Paula, Cal. Filed Sept. 6, 1899. Serial No. 729,598. (No model.)

Claim.—1. A well-rig, comprising a band-wheel provided on one

side with a beveled friction-cost; a loose tug-pulley mounted to slide on the axle of the band-wheel and beveled to fit the friction-cost of the band-wheel; means for sliding the loose tug-pulley into and out of the seat in the band-wheel; an extra bull-wheel and shaft mounted on the side of the derrick opposite the main bull-wheel, said shaft being provided with two spools, one of which is fixed to the shaft and the other of which is journaled to rotate on the shaft; a latch or clutch for fixing the loose spool to the shaft; an extra bull-rope around the loose tug-pulley and the extra bull-wheel; and means for tightening and loosening the extra bull-rope.



2. In a well-rig, the combination with the band-wheel provided with a friction-cost; of a tug-pulley loosely mounted on the shaft of the band-wheel and provided with a flanged neck; a stationary cam; a cam-lever upon the flanged neck and upon the stationary cam to slide the loose tug-pulley on the shaft of the band-wheel to bring it into and out of engagement with the friction-cost; an extra bull-wheel; an extra bull-rope connecting said loose tug-pulley with the extra bull-wheel, and means for tightening and loosening said extra bull-rope.

3. The combination with the band-wheel, of the loose tug-pulley to rotate with the band-wheel; the extra bull-rope around the loose tug-pulley and the extra bull-wheel; a pivoted lever extending along the extra bull-rope and provided with a grooved wheel to run on top of the extra bull-rope, a knuckle-joint pivoted at one end to the lever and at the other end to a stationary support; and a handle pivoted to the joint of the knuckle for operating the knuckle-joint.

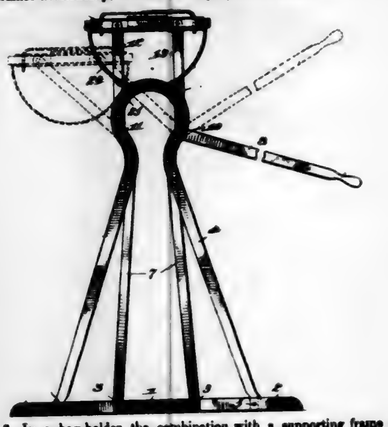
4. In a well-rig the combination with the band-wheel; of an extra bull-wheel provided with a fixed spool and a spool which is loose on the shaft and constructed to be coupled with and uncoupled from said shaft; and means for connecting and disconnecting the extra bull-wheel and band-wheel independently of the main bull-wheel.

5. A well-rig comprising a main bull-wheel; a band-wheel; a loose tug-pulley to rotate with the band-wheel; the extra bull-wheel; the extra bull-rope around the loose tug-pulley and the extra bull-wheel; a pivoted lever extending along the extra bull-rope and provided with a grooved wheel above the extra bull-rope to run thereon; a knuckle-joint pivoted at one end to the lever and extending downward therefrom and pivoted at the other end to a stationary support; and a handle pivoted to the joint of the knuckle for operating the knuckle-joint to raise the grooved wheel when the joint is straightened, and vice versa.

704,251. BAG-HOLDER. WALTER HAYWARD, Palmerston, Canada. Filed Mar. 11, 1902. Serial No. 97,727. (No model.)

Claim.—1. In a bag-holder, the combination with a supporting frame or stand, of an elbow-lever fulcrumed thereto, a link-bar pivoted to said frame or stand, a head connected to the upper ends of said lever and link, and an inner and an outer clamping-frame pintled to said head, said head having bearings to maintain both frames horizontally, substantially as and for the purpose set forth.

2. In a bag-holder, the combination with a supporting frame or stand, of an elbow-lever fulcrumed thereto, a link-bar pivoted to said frame or stand, a horizontal head connecting the upper ends of said lever and link and pivoted thereto to oscillate by the operation of the lever, said horizontal head having a projecting stop or lip, and inner and outer clamping-frames pintled to said horizontal head, the inner frame being provided with a push-bar to disengage a bag from said lip when the frame is lifted inclinedly, said horizontal head having bearings to support said frames horizontally, as and for the purpose set forth.



3. In a bag-holder, the combination with a supporting frame or stand, of an elbow-lever fulcrumed thereto, a link-bar pivoted to said stand, a horizontal head pivoted to the upper ends of said lever and link, said horizontal head having rectangularly-bent ends and at the middle a rearwardly-projecting stop or lip, and an inner and an outer clamping-frame pintled to said horizontal head and supported horizontally by said bent ends and lip, said inner frame having a push-rod to disengage a bag when lapped on said lip when the inner frame is raised to an inclined position, and the inner frame having a bail to lift both frames simultaneously to an inclined position, substantially as and for the purpose set forth.

4. In a bag-holder, the combination with a suitable bag-retaining device, of a frame or stand comprising a base, uprights secured at their lower ends to said base, and joined together at their upper ends to form a head, braces secured at their lower ends to said base and at their upper ends to said uprights, a link-bar pivoted to said head, and an elbow-lever fulcrumed to said head, said bar and lever pivotally supporting said retaining device.

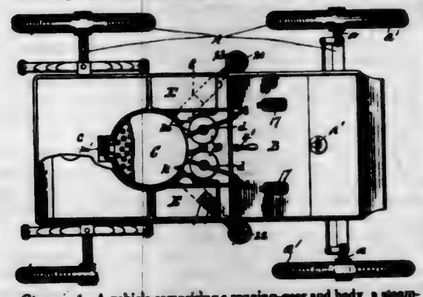
704,252. PROCESS OF MAKING PLATES FOR STORAGE BATTERIES AND PRODUCT THEREOF. HENRY K. HESS, Philadelphia, Pa. Filed July 30, 1901. Serial No. 70,373. (No specimens.)

Claim.—1. The process for forming an electric-battery plate consisting, first, in mechanically applying an active material or material to become active to the back piece of a suitable mold; second, arranging portions of a series of separate metal strips against the material in separated relation and other portions in sliding contact; third, applying mechanically extra active material or material to become active to the exposed surfaces of said separated portions of the strips so that the separated portions of the strips are concealed, and then compressing the active material so as to form a self-supporting mass to hold the strips in position.

2. A product of the herein-described process consisting of an electrode composed of outer layers of active material or material to become active and metal strips having portions separated and concealed in the material, portions exposed and protruding from said material and arranged in sliding contact for the purpose described.

3. The art or method of making plates for storage batteries consisting, first, in spreading active material or material to become active on a suitable support to form a layer of substantially uniform thickness, then arranging portions of independent strips of metal on said layer in separated relation and other portions in sliding contact, then mechanically applying an additional layer of the same material to the exposed surfaces of said separated portions of the strips so as to conceal the separated portions of the metal strips.

704,253. STEAM-PROPELLED VEHICLE. HENRY K. HESS, Philadelphia, Pa. Filed Nov. 15, 1901. Serial No. 82,576. (No model.)



Claim.—1. A vehicle comprising a running-gear and body, a steam-generator and engine mounted on the body, means actuated by the engine and connected to the generator to force air into the combustion-chamber, and additional means controlled by the operator for connecting and disconnecting the engine and running-gear independently of the former means.

2. The combination with a running-gear and body of a vehicle, of a steam-generator and engine mounted on the body, the generator having a coal-burner, a fan connected to the engine and discharging into the burner, and movable means controlled by the operator to connect or disconnect the engine and running-gear and to drive the fan independently of the running-gear by the engine.

3. A steam-propelled vehicle comprising a running-gear and body, a steam-boiler and engine mounted on the body, a coal-burner for the boiler, a fan driven by the engine and discharging air to the burner, and driving mechanism connecting the engine and running-gear and having a clutch whereby the fan may be operated by the engine without propelling the vehicle.

4. A steam-propelled vehicle comprising a running-gear and body, a steam-boiler and engine mounted on the body, a coal-burner for the boiler, a fan driven by the engine and discharging air to the burner, driving mechanism connecting the engine and running-gear and having a clutch whereby the fan may be operated by the engine without propelling the vehicle, and and means in proximity to the seat of the vehicle for controlling the clutch.

5. In a steam-propelled vehicle, a steam-generator and an engine mounted on the vehicle, a clutch-section connected to the engine, an additional clutch-section connected to the running-gear of the vehicle, manually-operated means for moving one section into and out of engagement with the other, and a blower actuated by the engine independently of the running-gear of the vehicle and discharging air into the burner of the generator.

6. In a steam-propelled vehicle, a steam-generator and an engine mounted on the vehicle, the generator having a coal-burner, clutch-sections connected to the engine and running-gear, means for moving one of the sections into and out of engagement with the other, and a blower actuated by the engine independently of the running-gear and discharging into the burner.

7. In a steam-propelled vehicle, the combination with a steam-generator and an engine, a fuel-bunker discharging into the combustion-chamber, means on the vehicle actuated by the engine to feed the fuel to the combustion-chamber, and an air-feed device actuated by the engine to force air into said chamber.

8. In a steam-propelled vehicle, the combination with a steam-generator and an engine, a fuel-bunker discharging into the combustion-chamber, means on the vehicle actuated by the engine to feed the fuel to the combustion-chamber, and an air-feed device actuated by the engine to force air into said chamber, manually-operated means on the vehicle to disconnect the fuel-feed from the engine, a blower operated by the engine, and vehicle-propelling mechanism operated by the engine independently of the fuel-feed mechanism.

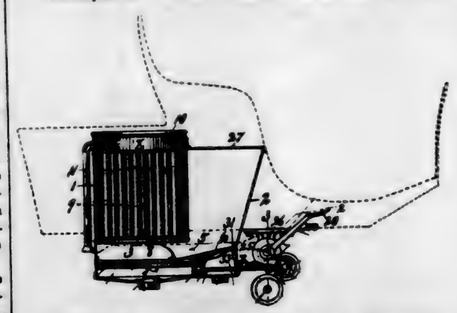
9. In a steam-propelled vehicle, the combination with a steam-generator, and an engine mounted on the vehicle, of a fuel-bunker and a channel leading from the bunker to the combustion-chamber of the generator, a fuel-feed in said channel and of less cross-sectional area than the channel for the purpose described, means to actuate the feed, said feed being of such construction and arrangement relative to the channel that lumps of fuel, as coal, or charcoal, may be fed to the combustion-chamber and retained in the channel when fuel is fed to the combustion-chamber beyond its capacity.

10. A steam-propelled vehicle comprising a running-gear and body, an engine and boiler mounted on the body, a fuel-bunker and a channel connecting the fuel-bunker with the combustion-chamber of the boiler, a feed-screw rotatable in the channel and of less cross-sectional area than said channel, means to rotate the screw having a device in proximity to the seat for controlling its rotation.

11. In combination with a running-gear and body of a vehicle, an engine and boiler mounted on the vehicle, mechanism adapted to be thrown into and out of connection with the engine for propelling the vehicle, a fan actuated by the engine independently of the running-gear, a fuel-bunker, a feed-channel connecting the bunker to the combustion-chamber of the boiler, a rotary screw-feed in the channel of less cross-sectional area than the channel, and mechanism adapted to be thrown into and out of connection with the engine for operating the screw-feed independently of or simultaneously with the operation of the running-gear.

12. The combination with the running-gear and body of a vehicle, a steam-generator and an engine mounted upon and connected to propel the vehicle, a smoke-conduit leading from the smoke-chamber of the generator, a steam-conduit discharging into the smoke-conduit for the purpose described and provided with means in proximity to the seat for controlling the passage of steam to the smoke-conduit, a fuel-bunker mounted on the vehicle-body, a conduit connecting the fuel-bunker to the combustion-chamber of the generator, a rotary screw-feed in said conduit for feeding the fuel from the bunker to the combustion-chamber, and mechanism adapted to be thrown into and out of connection with the engine for controlling the operation of the screw.

704,254. STEAM-PROPELLED VEHICLE. HENRY K. HESS, Philadelphia, Pa. Filed Jan. 14, 1902. Serial No. 89,713. (No model.)



Claim.—1. The combination of a vehicle-body, a steam-generator mounted on the body, a coal-bunker located by the side of the generator, a rotary grate beneath the steam-generator, an additional grate beneath the bunker arranged to discharge the fuel upon the former grate, an air-chamber beneath one of the grates and means for supplying air to said chamber.

2. The combination of a vehicle-body, a steam-generator mounted on the body, a coal-bunker located by the side of the generator, a rotary grate beneath the steam-generator, an additional grate beneath the coal-bunker arranged to discharge fuel onto the rotary grate, an air-chamber beneath the said additional grate, and means for supplying air to said air-chamber.

3. The combination of a vehicle-body, a steam-generator mounted on the body, a coal-bunker located by the side of the generator, a rotary grate beneath the steam-generator, a grate beneath the bunker inclining downwardly toward the rotary grate to discharge the fuel thereon, an air-chamber beneath the inclined grate, and means for supplying air to the air-chamber.

4. The combination of a vehicle-body, a steam-generator mounted on the body, a coal-bunker located by the side of the generator, a rotary grate beneath the steam-generator, an inclined grate beneath the coal-

bunker arranged to discharge onto the rotary grate, air-chambers beneath said grates and means for supplying air to said chambers.

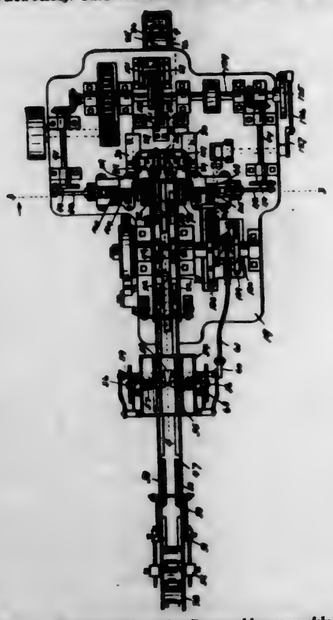
5. The combination of a vehicle-body, a steam-generator and engine mounted on the body, a coal-bunker situated at one side of the steam-generator, a rotary grate beneath the generator, a second grate beneath the coal-bunker arranged to discharge fuel onto the rotary grate, connections between the engine and grate to rotate the grate, and means in proximity to the seat of the vehicle for making and breaking said connections.

6. The combination of a vehicle-body, a steam-generator and engine mounted on the body, a coal-bunker situated at one side of the steam-generator, a grate beneath the generator, a second grate beneath the bunker arranged to discharge onto the former grate, an air-chamber beneath the second grate, means actuated by the engine to supply air to the air-chamber, and additional means in proximity to the seat of the vehicle to control the action of the former means.

7. In a steam-propelled vehicle, the combination with a vehicle-body and having a combustion-chamber in its base, of a steam-generator mounted on the body, and a closed coal-bunker located at the side of the generator and opening at its base into the combustion-chamber for feeding and burning the fuel at the junction of the bunker and combustion-chamber and preventing the combustion of the fuel in the bunker and means on the vehicle controlled by the operator for feeding air to the combustion-chamber.

8. In a steam-propelled vehicle, the combination with a vehicle-body, of a steam-generator mounted on the body, an air-tight coal-bunker located at the side of the generator and provided with an inlet-opening for the fuel and a discharge-opening leading to the combustion-chamber of the generator, a closure for the inlet preventing the entrance and exit of air or gases to or from the bunker, a grate and subchamber in the base of the burner, and an air-feeding mechanism connected to the subchamber and controlled by the operator for feeding air to said subchamber.

704,255. CAN HEADING OR BEADING MACHINE. JOHN S. ROBBINS and EDGARTO H. ROBBINS, Haywood, Ill., assignors, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 33,903. (No model.)



Claim.—1. The automatic can-heading machine, comprising in co-operative combination a rotary carrier 20, having arms or heads 21, a series of pairs of endwise-sliding heading-jaws 22, a spacer-cam 35, can-body feed-chute 47, having automatic can-body discharge-gate 50, and movable sliding or fluting disks 55, a reciprocating slide 29 having head 31, and a pair of endwise-sliding header-jaws 22, furnished each with a pin 33, a stationary cam or fork 34, heading-plungers 37, operating-slides 40 therefor, furnished with roller or projection 105, can-header-operating levers 104, a bottom-head feed-chute 72, top-head feed-chute 73, can-head feeders 79 and 82 in said chutes, connecting-lever 102, lever 108, engaged by can-body on said carrier 20 to move said connection 102 into position to be operated by said levers 104, a device in said bottom-head feed-chute for arresting top heads or reversed bottom heads, said feeder 82 in said top-head feed-chute 73 having a device for arresting bottom heads, substantially as specified.

2. In a can-heading machine, the combination with heading-plungers, of two pairs of endwise-sliding heading-jaws, a pair of can-head chutes and a pair of stationary can-head-centering guides or rings in which said heading-plungers reciprocate, substantially as specified.

3. In a can-heading machine, the combination with a rotary wheel or carrier having a series of pairs of endwise-sliding heading-jaws mounted thereon, a reciprocating slide having a pair of endwise-sliding heading-jaws mounted thereon, a pair of can-head chutes and a pair of stationary can-head-centering guides or rings in which said heading-plungers reciprocate, substantially as specified.

4. In a can-heading machine, the combination with a rotary wheel or carrier having a series of pairs of endwise-sliding heading-jaws mounted thereon, a reciprocating slide having a pair of endwise-sliding jaws mounted thereon and heading-plungers, a pair of can-head chutes and a pair of stationary can-head-centering guides or rings in which said heading-plungers reciprocate, substantially as specified.

5. In a can-heading machine, the combination with a rotary wheel or carrier having a series of pairs of endwise-sliding heading-jaws mounted thereon, a reciprocating slide having a pair of endwise heading-jaws mounted thereon, and heading-plungers, and a stationary cam engaged by the heading-jaws on said rotary wheel or carrier to restore the same to position, substantially as specified.

6. In a can-heading machine, the combination with a rotary wheel or carrier having a series of pairs of endwise-sliding heading-jaws mounted thereon, a reciprocating slide having a pair of endwise-sliding jaws mounted thereon, heading-plungers, and a stationary cam or fork engaged by the heading-jaws on said slide to restore them to position, substantially as specified.

7. In a can-heading machine, the combination with a rotary wheel or carrier having a series of pairs of endwise-sliding heading-jaws mounted thereon, a reciprocating slide having a pair of endwise-sliding jaws mounted thereon, heading-plungers, a stationary cam or fork engaged by the heading-jaws on said slide to restore them to position, and a stationary cam engaged by the heading-jaws on said rotary wheel or carrier to restore the same to position, substantially as specified.

8. In a can-heading machine, a rotary wheel or carrier 20, having a series of heads 21, a series of heading-jaws 22 fitting and sliding on said heads, and cams 35 and 36 for centering said heading-jaws on the carrier, substantially as specified.

9. In a can-heading machine, the combination with a reciprocating slide 29, having head 31, and endwise-sliding heading-jaws mounted thereon and having slots 23 fitting and sliding on said head 31, substantially as specified.

10. In a can-heading machine, the combination with a reciprocating slide 29, having head 31, endwise-sliding heading-jaws mounted thereon provided with jaws or projections 33, and cams 34 engaged by said pins to move the heading-jaws endwise into position, substantially as specified.

11. The combination with rotary carrier 20 having arms or heads 21 and endwise-sliding heading-jaws 22 thereon, of slide 29 having head 31, and endwise-sliding heading-jaws 22ª thereon, heading-plungers 37 and can-head-centering guides or rings 26 on the frame of the machine and means for registering said heading-jaws with said can-head-centering guides, substantially as specified.

12. The combination with rotary carrier 20 having arms or heads 21 and endwise-sliding heading-jaws 22 thereon, of slide 29 having head 31, endwise-sliding heading-jaws 22ª thereon, heading-plungers 37, stationary can-head-centering guides or rings 26 and can-head feed-chutes, substantially as specified.

13. The combination with rotary carrier 20 having arms or heads 21 and endwise-sliding heading-jaws 22 thereon, of slide 29 having head 31, endwise-sliding heading-jaws 22ª thereon, heading-plungers, said heading-plungers 37 having curved recesses 46 in their upper portions, substantially as specified.

14. The combination with rotary carrier 20 having arms or heads 21 and endwise-sliding heading-jaws 22 thereon, of slide 29 having head 31, endwise-sliding heading-jaws 22ª thereon, heading-plungers 37, stationary can-head-centering guides or rings 26, can-head feed-chutes, said can-head feed-chutes being provided with vibrating can-head feeders, substantially as specified.

15. The combination with rotary carrier 20 having arms or heads 21 and endwise-sliding heading-jaws 22 thereon, of slide 29 having head 31, endwise-sliding heading-jaws 22ª thereon, heading-plungers 37, stationary can-head-centering guides or rings 26, can-head feed-chutes, said can-head feed-chutes being provided with vibrating can-head feeders, and a lever engaged by the can-body on the carrier controlling the operation of said can-head feeders, substantially as specified.

16. The combination with a can-head feed-chute provided with a can-head feeder, of a heading-plunger and a can-head-feeder-operating lever operated by the forward movement of the heading-plunger, a trip-lever or connection 102, a can-body carrier and a lever operated by the can-body on the carrier to move the trip-lever or connection into position, substantially as specified.

17. The combination with the can-body carrier 20, of a heading-plunger, a lever 104 operated by the forward movement of the heading-plunger, a can-head feed-chute, a movable feeder therein, a lever 108 operated by the can-body on the carrier, and a movable lever, link or connection 102 operated by said lever 108 to cause said lever 104 to operate the can-head feeder, substantially as specified.

18. In a can-heading machine, the combination with heading-jaws of a can-body feed-chute having a movable automatically-opening gate 50 to automatically discharge surplus cans from the feed-chute and prevent crowding, substantially as specified.

19. The combination with a can-body carrier 20, a feed-chute 47 therefor, furnished with a hinged weighted automatically-opening gate 50 adapted to receive thereon and be depressed by a plurality of cans, substantially as specified.

20. In a can-heading machine the combination with the carrier 20 having heading-jaws 22 thereon to receive the can-bodies, of a can-body feed-chute 47, having rotary sliding or fluting disks 55 at its sides to engage the ends of the can-bodies as they pass along the feed-chute, and springs for pressing said disks together against the can-bodies, substantially as specified.

21. In a can-heading machine, the combination with the carrier 20 having heading-jaws 22 thereon to receive the can-bodies, of a can-body feed-chute 47, having rotary sliding or fluting disks 55 at its sides to engage the ends of the can-bodies as they pass along the feed-chute, springs for pressing said disks together against the can-bodies, and a vibrating wedge or cam for separating said disks, substantially as specified.

22. In a can-heading machine, the combination with the heading-jaws and heading-plungers, of can-head chutes, furnished with pivoted pawls or retarders 74 movable by the weight of the can-head itself and adapted to engage and prevent the can-heads from dancing or rebounding upward in the can-head chutes, substantially as specified.

23. In a can-heading machine, the combination with heading-jaws and heading-plungers, of can-head chutes provided with devices for arresting reversed can-heads in the chutes, substantially as specified.

24. In a can-heading machine, the combination with a can-head feed-chute for feeding bottom heads, of a device for stopping a reversed bottom head, substantially as specified.

25. In a can-heading machine, the combination with heading-jaws and heading-plunger of a can-head feed-chute, for feeding top heads, of a device therein for stopping a reversed top head, substantially as specified.

26. In a can-heading machine, the combination with heading-jaws and heading-plunger of a can-head feed-chute for feeding bottom heads, of a device therein for arresting a top head, substantially as specified.

27. In a can-heading machine, the combination with heading-jaws and heading-plunger of a can-head feed-chute for feeding top heads, of a device therein for arresting a bottom head, substantially as specified.

28. The combination with top-head feed-chute 73, of can-head feeder 82, provided with a spring-stop 87, and a pivoted catch 91, adapted to be released by said spring stop-pin engaging a bottom head, substantially as specified.

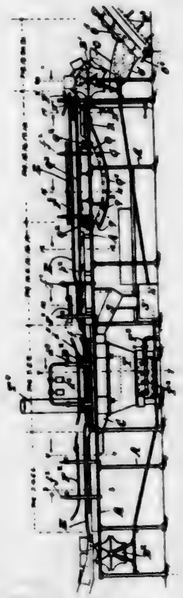
29. The combination with can-heading jaws and plunger and bottom-head feed-chute 72, of a spring-hook 114 adapted to stop a top head or a reversed bottom head, substantially as specified.

30. The combination with can-heading jaws and plunger and a can-head feed-chute, of a series of movable retarders 74 therein, substantially as specified.

31. The combination with carrier 20, having heads 21 and endwise-sliding header-jaws 22, of slide 29 having head 31, and endwise-sliding header-jaws 22 thereon, header-plungers 37, reciprocating slides 40 therefor, can-head feeder-levers 104 operated by said slides 40, can-head feed-chutes 72, 73 having each vibrating feeders 79, 82, connecting-bars 100, lever 102, and can-body-operated lever 108, substantially as specified.

704,256. AUTOMATIC SIDE-SEAM-SOLDERING MACHINE FOR SHEET-METAL CANS. JOHN S. ROBBINS, Haywood, Ill., and JOHN C. TALIAFERRO, Baltimore, Md., assignors, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Nov. 24, 1900. Serial No. 37,000. (No model.)

Claim.—1. In a side-seam-soldering machine for can-bodies, the combination with a solder bath or vessel, of a furnace for keeping the solder therein molten, a float in the solder bath or vessel, upper and lower guides on the float for the can-bodies, guides or tracks for the can-bodies leading to and from the float and connecting with the can-body guide on the float, a can-body carrier or conveyer chain having side bars and cross-bars with open spaces between to receive the can-bodies, sprocket-wheels for said carrier-chain, a track or guide for said carrier-chain, the rear sprocket-wheel having central spokes furnished with flanges at their outer ends forming a slot or channel between the same, an inside supporting trunk or rod H around which the can-bodies pass, furnished with a curved end H' fitting between the flanges on said central spokes of the rear sprocket-wheel, and engaging on its outer curved face the cross-bars of the carrier-chain, a can-body-turning device G connected at its rear end to said trunk or rod H and open at its front end to receive the can-bodies around it, and provided with a longitudinal channel or slot having diverging walls or shoulders to engage the side seam of the can-body, an inside wiper-bar connected to said trunk or rod, and provided with wiper-holder blocks and wipers, an inside wiper or dusting-brush connected to said trunk or rod, outside wipers, wiper-holders and weight-arm rock-shafts therefor, a series of outside wipers or duster-brushes, a traveling belt or chain upon which they are mounted, a plate or shoe for pressing said brushes against the can-bodies, brush-cleaner devices in the path of the brushes, can-body-receiving chutes or devices O and O', a can-body-turning finger or device O², and a can-body conveyer O³, substantially as specified.



2. In a side-seam-soldering machine, the combination with a solder-bath, of a float-guide for the can-bodies extending over the solder-bath, a fixed can-body track or guide connecting with said float-guide, and means for moving the can-bodies horizontally along said can-body guide and float-guide, substantially as specified.

3. The combination with a molten solder-bath, of a guide for the cans floating in the molten solder and thus automatically maintaining a fixed relation to the surface of the molten solder and a horizontally-moving can-body conveyer, substantially as specified.

4. The combination with a solder-bath of guide or track for the can-bodies, and a float in the solder-bath supporting said guide or track and a horizontally-moving can-body conveyer, substantially as specified.

5. The combination with a solder-bath, of upper and lower guides for the can-bodies and a float upon which both said guides are mounted or supported and means for moving the can-bodies along between said upper and lower guides, substantially as specified.

6. The combination with a solder-bath, of a float-guide, a fixed can-body track connecting therewith and a can-body conveyer for moving the can-bodies horizontally along, substantially as specified.

7. The combination with a solder-bath, of a float-guide, a horizontally-moving can-body conveyer, and means for supporting the conveyer independently of the float-guide, substantially as specified.

8. The combination with a furnace, of a solder bath or vessel form-

ing the top of the furnace, a fleet having a central slot or channel for the solder to enter, a guide or track for the can-bodies on the fleet, a can-body conveyor or carrier, and a track or guide for the same, substantially as specified.

9. The combination with a furnace, of a solder bath or vessel forming the top of the furnace, a fleet having a central slot or channel for the solder to enter, a guide or track for the can-bodies on the fleet, a can-body conveyor or carrier, a track or guide for the same, and means for adjusting the height of the fleet in respect to the surface of the solder, substantially as specified.

10. The combination with a furnace, of a solder bath or vessel, a fleet therein, a can-body guide or track on the fleet, a can-body carrier, a track or guide therefor, sprocket-wheels for the carrier, and a can-body track or guide connecting with said track on the fleet, substantially as specified.

11. The combination with a furnace, of a solder bath or vessel, a fleet therein, a can-body guide or track on the fleet, a can-body carrier, a track or guide therefor, sprocket-wheels for the carrier, a can-body track or guide connecting with said track on the fleet, and a can-body-turning device in the path of the can-bodies and around which the can-bodies pass, substantially as specified.

12. The combination with a furnace, of a solder bath or vessel, a fleet therein, a can-body guide or track on the fleet, a can-body carrier, a track or guide therefor, sprocket-wheels for the carrier, a can-body track or guide connecting with said track on the fleet, a can-body turning device in the path of the can-bodies and around which the can-bodies pass, and an inside trunk or supporting-rod extending from said can-body-turning device to the rear sprocket-wheel of the carrier, and provided with a curved end extending partially around said rear sprocket-wheel for holding the can-body-turning device in position, substantially as specified.

13. The combination with a furnace, of a solder bath or vessel, a fleet therein, a can-body guide or track on the fleet, a can-body carrier, a track or guide therefor, sprocket-wheels for the carrier, a can-body track or guide connecting with said track on the fleet, a can-body-turning device in the path of the can-bodies and around which the can-bodies pass, and an inside trunk or supporting-rod extending from said can-body-turning device to the rear sprocket-wheel of the carrier, and provided with a curved end extending partially around said rear sprocket-wheel for holding the can-body-turning device in position, said trunk or rod extending over and around the path of the cross-bars of the can-body carrier, substantially as specified.

14. The combination in a side-seam-soldering machine, with a can-body carrier or conveyor and its sprocket-wheels, of a can-body-turning device in the path of the can-bodies and around which they pass, of a trunk or rod for holding the same in position having a curved end extending partially around the rear sprocket-wheel, substantially as specified.

15. The combination in a side-seam-soldering machine, with a can-body carrier or conveyor and its sprocket-wheels, of a can-body-turning device in the path of the can-bodies and around which they pass, of a trunk or rod for holding the same in position having a curved end extending partially around the rear sprocket-wheel, and a track for the can-bodies, substantially as specified.

16. The combination in a side-seam-soldering machine, with a can-body carrier or conveyor and its sprocket-wheels, of a can-body-turning device in the path of the can-bodies and around which they pass, of a trunk or rod for holding the same in position having a curved end extending partially around the rear sprocket-wheel, and a track for the can-bodies having a curved end extending partially around said rear sprocket-wheel, substantially as specified.

17. The combination in a side-seam-soldering machine, with a can-body carrier or conveyor and its sprocket-wheels, of a can-body-turning device in the path of the can-bodies and around which they pass, of a trunk or rod for holding the same in position having a curved end extending partially around the rear sprocket-wheel, said can-body-turning device having a longitudinal slot or recess furnished with curved or inclined diverging shoulders to engage the side seam of the can-body, substantially as specified.

18. In a side-seam-soldering machine, a can-body-turning device connected at its rear end with a rod for holding it in position, and open at its front end for the can-bodies to pass onto and around it, substantially as specified.

19. In a side-seam-soldering machine, a can-body-turning device connected at its rear end with a rod for holding it in position, and open at its front end for the can-bodies to pass onto and around it and furnished with a longitudinal slot or recess having diverging curved or inclined shoulders, substantially as specified.

20. In a side-seam-soldering machine, a can-body-turning device connected at its rear end with a rod for holding it in position, and open at its front end for the can-bodies to pass onto and around it, and a track for the can-bodies, substantially as specified.

21. In a side-seam-soldering machine, a can-body-turning device connected at its rear end with a rod for holding it in position, and open at its front end for the can-bodies to pass onto and around it furnished with a longitudinal slot or recess having diverging curved or inclined shoulders, and a curved or shoe-shaped track for the can-bodies, substantially as specified.

22. In a side-seam-soldering machine, a can-body-turning device connected at its rear end with a rod for holding it in position, and open at its front end for the can-bodies to pass onto and around it and furnished with a longitudinal slot or recess having diverging curved or inclined shoulders, and a can-body carrier or conveyor engaging the can-bodies at their ends and leaving them free to turn, substantially as specified.

23. In a side-seam-soldering machine having an endless flexible can-body carrier mounted on sprocket-wheels, an inside supporting trunk or rod around which the can-bodies pass, furnished with a curved end extending partially around the rear sprocket-wheel, substantially as specified.

24. In a side-seam-soldering machine having an endless flexible can-body carrier mounted on sprocket-wheels, an inside supporting trunk or rod around which the can-bodies pass, furnished with a curved end extending partly around the rear sprocket-wheel, the cross-bars of the carrier engaging said curved end on its outside and holding the rod from forward longitudinal movement, substantially as specified.

25. In a side-seam-soldering machine having an endless flexible can-body carrier mounted on sprocket-wheels, an inside supporting trunk or rod around which the can-bodies pass, furnished with a curved end extending partly around the rear sprocket-wheel, the cross-bars of the carrier engaging said curved end on its outside and holding the rod from forward longitudinal movement, said rear sprocket-wheel having guides or flanges engaging said curved end and holding said rod laterally in position and from axial turning, substantially as specified.

26. In a side-seam-soldering machine having an endless flexible can-body carrier mounted on sprocket-wheels, an inside supporting trunk or rod around which the can-bodies pass, furnished with a curved end extending partly around the rear sprocket-wheel, the cross-bars of the carrier engaging said curved end on its outside and holding the rod from forward longitudinal movement, said rear sprocket-wheel having guides or flanges engaging said curved end and holding said rod laterally in position and from axial turning, and said sprocket-wheel being further provided with rollers or projections engaging the inner face of said curved end, substantially as specified.

27. In a side-seam-soldering machine, the combination with an inside wiper-bar free at its front end to admit the can-bodies around the same and furnished with an inside wiper, and connected at its rear end with a rod for holding it longitudinally in position and adapted to permit the can-bodies to pass off the same, substantially as specified.

28. In a side-seam-soldering machine, the combination with an inside wiper-bar furnished with an inside wiper, and connected at its rear end with a rod for holding it longitudinally in position, a can-body carrier, sprocket-wheels therefor, and said rod having a curved end extending partly around said sprocket-wheel, substantially as specified.

29. In a side-seam-soldering machine, the combination with an inside wiper-bar furnished with an inside wiper, and connected at its rear end with a rod for holding it longitudinally in position, a can-body carrier, sprocket-wheels therefor, said rod having a curved end extending partly around said sprocket-wheel, and an inside wiper or duster brush also connected to said rod, substantially as specified.

30. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, an endless flexible can-body carrier, sprocket-wheels therefor, an inside supporting trunk or rod extending from the rear sprocket-wheel over the solder-bath in the path of the can-bodies, a can-body turner open at its front end for entrance of the can-bodies around it, and connected at its rear end to said trunk or rod, substantially as specified.

31. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, an endless flexible can-body carrier, sprocket-wheels therefor, an inside supporting trunk or rod extending from the rear sprocket-wheel over the solder-bath in the path of the can-bodies, a can-body turner open at its front end for entrance of the can-bodies around it, and connected at its rear end to said trunk or rod, and an inside wiper supported from said trunk or rod, substantially as specified.

32. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, an endless flexible can-body carrier, sprocket-wheels therefor, an inside supporting trunk or rod extending from the rear sprocket-wheel over the solder-bath in the path of the can-bodies, a can-body turner open at its front end for entrance of the can-bodies around it, and connected at its rear end to said trunk or rod, and an inside wiper or duster brush also connected with said trunk or rod, substantially as specified.

33. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, an endless flexible can-body carrier,

sprocket-wheels therefor, an inside supporting trunk or rod extending from the rear sprocket-wheel over the solder-bath in the path of the can-bodies, a can-body turner open at its front end for entrance of the can-bodies around it, and connected at its rear end to said trunk or rod, and an inside wiper-bar connected with said trunk or rod and furnished with a longitudinal slot or channel, and a series of wiper-holder blocks mounted in said slot or channel, substantially as specified.

34. The combination in a side-seam-soldering machine, with an inside wiper-bar, of a series of independently-removable wiper-holder blocks, substantially as specified.

35. The inside wiper-holder bar M, in combination with the removable wiper-holder block M' having hook m^2, substantially as specified.

36. The combination of wiper-holder bar M having a slot or recess m' and transverse pins m^3, of wiper-holder block M' having hook M^3, substantially as specified.

37. The combination of wiper-holder bar M having a slot or recess m' and transverse pins m^3, of wiper-holder block M' having hook m^2, wiper M^2 and wiper clamp or screw m', substantially as specified.

38. The combination with a solder-bath, track for the can-bodies and can-body carrier, of a series of outside traveling wiper or duster brushes mounted on an endless flexible belt or chain below the track for the can-bodies, and a guide shoe or plate over which said belt or chain passes and against which it bears for pressing the brushes against the can-bodies, substantially as specified.

39. The combination with a solder-bath, track for the can-bodies and can-carrier, of a series of outside traveling wiper or duster brushes mounted on an endless flexible belt or chain below the track for the can-bodies, a guide shoe or plate over which said belt or chain passes and against which it bears for pressing the brushes against the can-bodies, and means for adjusting said shoe or plate, substantially as specified.

40. The combination with a solder-bath, track for the can-bodies and can-body carrier, of a series of outside traveling wiper or duster brushes on an endless flexible belt or chain, and a guide shoe or plate over which said belt or chain passes for pressing the brushes against the can-bodies, and a cleaner for said brushes, substantially as specified.

41. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, a can-body carrier, sprocket-wheels therefor, said track for the can-bodies having a curved extension extending partly around the rear sprocket-wheel of the carrier, an inside rod H having a curved end H' around which the can-bodies pass, a can-body-receiving chute O, a can-body passage-way O', and a can-body-turning finger O^2, substantially as specified.

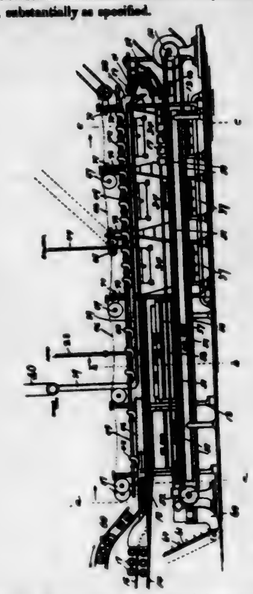
42. In a side-seam-soldering machine, the combination with a solder-bath, a track for the can-bodies, a can-body carrier, sprocket-wheels therefor, said track for the can-bodies having a curved extension extending partly around the rear sprocket-wheel of the carrier, an inside rod H having a curved end H' around which the can-bodies pass, a can-body-receiving chute O, a can-body passage-way O', a can-body-turning finger O^2, and a can-body conveyor O^3, substantially as specified.

43. The combination with the inside supporting trunk or rod H, of the inside wiper or duster brush N, its metal holder or block N', and pivoted links N^2 connecting it with said trunk or rod, substantially as specified.

704,257. CAN-SOLDERING MACHINE. JOHN G. HODGSON, Maywood, Ill., and JOHN C. TALIAFERRO, Baltimore, Md., assignors, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Nov. 24, 1900. Serial No. 37,500. (No model.)

Claim.—1. In a can-end-soldering machine, the combination with a solder bath or vessel, of a fluxing device, a furnace for heating and keeping molten the solder, a pair of oppositely and transversely inclined can-body track-plates having upper and lower guides for the cans, can-carriers for rolling the cans along said plates, a pair of cooling-belts for conveying the cans in an upright position, a curved and twisted guideway for turning the cans into an upright position, and delivering them in such position to the cooling-belt, air trunks or boxes above, below and at the side of the cans as they are carried on the cooling-belts, an inclined loop-shaped track furnished with an elevator for conveying the cans from the first cooling-belt, turning them end for end and delivering them with their unsoldered ends downmost to the second can fluxing and soldering track or plate, and flues leading from the furnace horizontally over the solder-bath and fluxing device for heating the ends of the cans preparatory to soldering, said solder-bath having a solder-overflow passage or spout at a point where the cans roll out of the same, substantially as specified.

2. In a can-end-soldering machine, the combination with a solder bath or vessel, of means for automatically feeding solder thereto, and a track or guide extending over said solder vessel along which the cans may be rolled in an inclined position to present the end seam of the can to the molten solder, said solder bath or vessel having a solder overflow or channel in the path of the corners of the cans and along and through which the cans roll to prevent the solder from walling up, whereby the level or surface of the solder is maintained constant in respect to the guide or track for the cans, substantially as specified.



3. The combination with a solder-bath having a solder overflow or channel in the path of the corners or seams of the cans, and a track or guide for the cans to cause the corners or seams of the cans to pass through and along said solder overflow or channel to prevent the solder from walling up thereon, and means for automatically and continuously feeding the solder into said solder vessel, substantially as specified.

4. The combination with a solder-bath having a solder overflow or channel in the path of the corners or seams of the cans, and a track or guide for the cans to cause the corners or seams of the cans to pass through and along said solder overflow or channel to prevent the solder from walling up thereon, and solder-feed rollers for continuously feeding or delivering solder to said bath or vessel, substantially as specified.

5. In a soldering-machine, the combination with a can-cooling belt or conveyor, of air trunks or boxes furnished with openings for directing blasts of air against the top, bottom and sides of the cans as they are conveyed along the cooling-belt, substantially as specified.

6. In a can-soldering machine, the combination with a can-cooling belt or conveyor, of a can-spacer for automatically spacing the cans on the belt, substantially as specified.

7. In a can-soldering machine, the combination with a can-cooling belt or conveyor, of a can-spacer for automatically spacing the cans on the belt, and retarder-springs, substantially as specified.

8. In a can-soldering machine, the combination with a cooling-belt, of a star-wheel-shaped can-spacer 65 and retarder-springs 66 and 67, substantially as specified.

9. In a can-end-soldering machine, the combination with a solder bath or vessel, of a fluxing device, a furnace for heating and keeping molten the solder, a pair of oppositely and transversely inclined can-body track-plates having upper and lower guides for the cans, can-carriers for rolling the cans along said plates, a pair of cooling-belts for conveying the cans in an upright position, a curved and twisted guideway for turning the cans into an upright position and delivering them in such position to the cooling-belt, air trunks or boxes above, below and at the side of the cans as they are carried on the cooling-belts, an inclined loop-shaped track furnished with an elevator for conveying the cans from the first cooling-belt, turning them end for end and delivering them with their unsoldered ends downmost to the second can fluxing and soldering track or plate, substantially as specified.

10. In a can-end-soldering machine, the combination with a solder bath or vessel, a pair of oppositely and transversely inclined can-body track-plates having upper and lower guides for the cans, can-carriers for rolling the cans along said plates, a pair of cooling-belts, and an inclined

loop-shaped track furnished with an elevator for conveying the cans from the first cooling-belt turning them end for end and delivering them with their unsoldered ends downmost to the second inclined track-plate, substantially as specified.

11. In a can-end-soldering machine, the combination with a solder bath or vessel, of an inclined track-plate along which the cans roll, a can-carrier for rolling the cans along said plate, rail 49 and pivoted weights 48 furnished with guide-fingers 50 overhanging said rail 49, substantially as specified.

12. The combination with a can-rolling chain 46, of a rail 49, metal weights 48 pivoted to said rail 49 and provided with guide-fingers 50, substantially as specified.

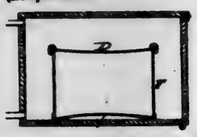
13. In a can-soldering machine, the combination with the flux or acid pan 25, of an inclined plate or guide 18 along which the cans are rolled, provided with small angular flux troughs or channels 26 at each side of and below the flux-pan 25, so that as the cans roll along said track-plate their end seams will come in contact with a shallow channel of acid or flux flowing in said trough, substantially as specified.

14. In a can-soldering machine, the combination with the flux or acid pan 25, of an inclined plate or guide 18 along which the cans are rolled, provided with small angular flux troughs or channels 26, at each side of and below the flux-pan 25 so that as the cans roll along said track-plate their end seams will come in contact with a shallow channel of acid or flux flowing in said trough, and a surplus-flux pan 29 beneath the angle-trough 26, substantially as specified.

15. In a can-end-soldering machine the combination with a plurality of coal-burning furnaces, each having an open top, a grate, a fire-box above the grate, and a box beneath the grate, of a single molten-solder vessel, extending over all of the furnaces and resting on and closing the tops thereof, tracks, or guides, extending to, from and over the solder-bath, and along which the cans may be rolled, and means for rolling the cans along said track, substantially as specified.

16. In a can-end-soldering machine the combination with a plurality of coal-burning furnaces arranged in line with each other and having each an open top, a grate, a fire-box above the grate and a closed box beneath the grate, and provided each with an air feed or blast pipe entering said closed box, of a single molten-solder vessel extending over all of the furnaces and resting on and closing the tops thereof, said solder vessel being directly above the plurality of grates and receiving the radiant heat of the furnace fire-boxes of which it forms the top, tracks or guides extending to, from and over the solder-bath along which the cans may be rolled, and a means for rolling the cans along said track substantially as specified.

704,258. PROCESS OF CANNING FOOD PRODUCTS. JOHN G. HODGSON, Maywood, Ill., assignor to Automatic Vacuum Canning Company, Chicago, Ill., a Corporation of Illinois. Filed June 28, 1901. Serial No. 66,251. (No specimens.)



Claim.—The process or method of producing hermetically-sealed and sterilized can goods having inwardly-curved or collapsed heads, consisting in first putting the goods to be preserved in a can having an inwardly-curved head then applying and double-seaming an inwardly-curved final head to the can-body, and then cooking and sterilizing, substantially as specified.

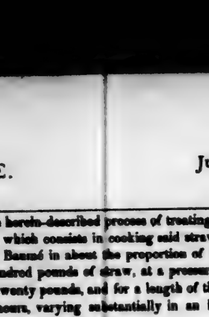
704,259. PROCESS OF TREATING FIBROUS SUBSTANCES. ENOCH T. HOLMES, Chicago, Ill., assignor of one-third to John C. Brockhausen, Chicago, Ill. Filed Mar. 1, 1900. Serial No. 6,960. (No specimens.)

Claim.—The herein-described process of treating fibrous substances, such as flax-straw, which consists in cooking said straw in an alkaline solution of 6° to 7° Baumé in about the proportion of fifty gallons of said solution to one hundred pounds of straw, at a pressure of from eighty to one hundred and twenty pounds, and for a length of time, within the limits of six to four hours, varying substantially in an inverse ratio to the pressure and temperature employed.

704,260. STACKING OF BOARDS. GREENLEAF JOHNSON, Jr., Baltimore, Md. Filed Dec. 27, 1901. Serial No. 87,461. (No model.)

Claim.—A stack of boards consisting of the combination of boards laid flatwise in horizontal layers with means to separate the said layers, devices to separate the adjoining boards of each layer, and mechanism to clamp the said adjoining boards edgewise, substantially as, and for the purpose specified.

704,261. SHEET-METAL BAILED CAN OR VESSEL. BERNARD H. LARKIN, River Forrest, Ill., assignor, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 33,234. (No model.)



Claim.—1. The combination with a body A, of a head or breast D, provided with exterior flange d', soldered to the can-body and having integral bail-ears d^2, projecting downwardly from the lower edge thereof and fitting and secured to the can-body, substantially as specified.

2. The head or breast D, for cans or vessels, provided with integral flange D', having integral dish-shaped bail-ears d^2 projecting downwardly from the lower edge thereof, in combination with a body A, to the exterior wall of which said integral bail-ears and said flange are soldered, substantially as specified.

3. The combination with a can-body A of seamless ring or breast D having inner flange d and exterior flange d' provided with integral bail-ears d^2 projecting downwardly from the lower edge of said exterior flange d', substantially as specified.

704,262. FOUNTAIN-PEN. WILLIAM E. LINDSAY, Baltimore, Md. Filed Jan. 3, 1902. Serial No. 88,297. (No model.)

Claim.—1. In a fountain-pen, the combination of a hollow handle; a pen-point projecting from one end of the hollow handle; a cap adapted to fit over either end of said handle and having an elongated slot in the side thereof; and a removable piece of absorbent material impinging against the inner side of the said cap.

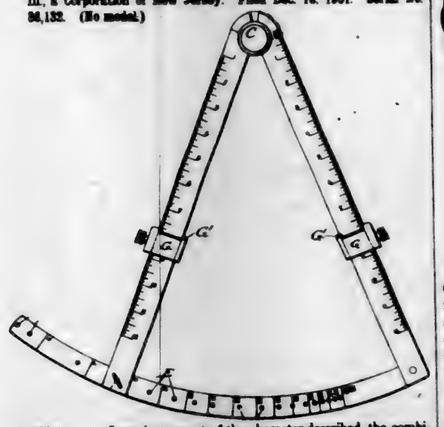
2. In a fountain-pen, the combination of a hollow handle; a pen-point projecting from one end of said handle; a cap adapted to fit over either end of said handle; a piece of resilient metal having a piece of absorbent material secured thereto and adapted to be inserted in the said cap, for the purpose described.

3. The combination with a fountain-pen, of a cap adapted to fit over either end of the said pen, and a removable lining of absorbent material for the side wall of the said cap and adapted to surround the conical end of the hollow handle when the cap is fitted thereon, as and for the purpose described.

4. In a fountain-pen, the combination of a hollow handle; a pen-point projecting from one end of the hollow handle; and a cap adapted to fit over either end of said handle and having a removable lining of absorbent material for the side wall.

5. In a fountain-pen, the combination of a hollow handle; a pen-point projecting from one end of said handle; a cap adapted to fit over either end of said handle; and a removable lining of absorbent material for the inner side wall of said cap and adapted to surround the conical end of the hollow handle when the said cap is fitted thereon, as and for the purpose described.

704,263. MEASURING INSTRUMENT. GUSTAVE J. LOCK, Milwaukee, Wis., assignor of one-half to Allis-Chalmers Company, Chicago, Ill., a Corporation of New Jersey. Filed Dec. 16, 1901. Serial No. 86,132. (No model.)



Claim.—1. In an instrument of the character described, the combination of a pair of arms pivotally connected together at one end; a scale-plate carried by the outer end of one of said arms; means for securing the other arm to said plate in its desired adjusted position; and blocks slidably mounted upon the arms, said blocks being provided with scale or center punch-marks which come into alinement with the graduations on the scale-plate when the parts are adjusted, substantially as described.

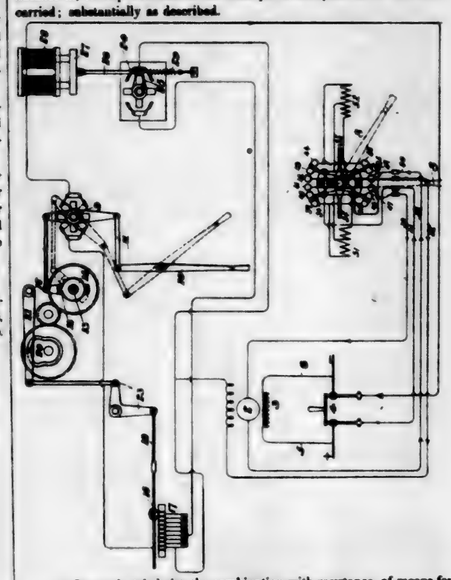
2. In an instrument of the character described, the combination of a pair of arms pivotally connected together at one end, said arms being graduated; a block slidably mounted upon each of said arms, said blocks being provided with a scale or center punch-mark; means for securing the blocks in their adjusted position; a scale-plate carried by one of said arms; and means for securing the other arm to said plate in any desired adjustment.

704,264. CONTROLLING SYSTEM FOR ELECTRIC HOISTS OR ELEVATORS. ANDREW B. MACOMBER, Braddock, Pa., assignor to the Otis Elevator Company, New York, N. Y., a Corporation of New Jersey. Filed Apr. 29, 1898. Serial No. 679,204. (No model.)

Claim.—1. In an electric hoist, a reversing-controller and a hand-controlled cut-out switch included in the circuit, and a mechanism connected with the cut-out switch operated by the movement of the hoist and arranged to automatically break the main circuit when the car has reached the limit of its travel; substantially as described.

2. In an electric hoist, a hand-operated reversing-controller and a rotary cut-out switch included in the main circuit, and actuating connections between the hoisting-drum and the cut-out switch arranged to throw such switch so as to break the main circuit independently of the position of the controller, when the car has reached the limit of its travel; substantially as described.

3. In an electric hoist, an electromagnet arranged in series with the current flowing through the motor and adapted to cut in and cut out resistance automatically, a switch actuated thereby, and an adjusting device for the electromagnet, said adjusting device being arranged to vary the air-gaps of the electromagnet so that it will lift for heavy loads and cut out resistance, and remain in normal position for light loads, leaving resistance in, to stop the hoist at the same point, independent of the load carried; substantially as described.



4. In an electric hoist, the combination with resistance, of means for cutting in said resistance near the end of the travel of the car, and an electromagnet in series with the current flowing through the motor and arranged to close the switch so as to cut out a part of the slow-down resistance when the motor is started and arranged so that it will open the switch on a light load when the car nears the end of its travel and thus slow down the motor, but may be held by the current when a heavy load is carried; substantially as described.

5. In an electric hoist, a reversing-controller and a hand-operated cut-out switch included in the circuit, connections between the cut-out switch and the hoisting-drum arranged to operate the switch to break the main current when the car reaches the end of its travel, mechanism arranged to cut in a slow-down resistance as the car nears the end of its travel, and another switch arranged in connection with the slow-down resistance and actuated by a solenoid in series with the current through the main motor; substantially as described.

6. A car, a hoisting-motor therefor, means for accelerating the speed of the motor as it starts up, and means operated by the motor for automatically arresting the car at any predetermined point; substantially as described.

7. A car, a hoisting-motor therefor, and means actuated by the motor for reducing the speed thereof as the car approaches any predetermined stopping-point; substantially as described.

704,265. TRAINING APPARATUS. JOHN MCMASTER, Cambridge, Mass., assignor to A. G. Spalding & Bros., Jersey City, N. J., and New York, N. Y., a Corporation of New Jersey. Filed Apr. 29, 1902. Serial No. 105,154. (No model.)

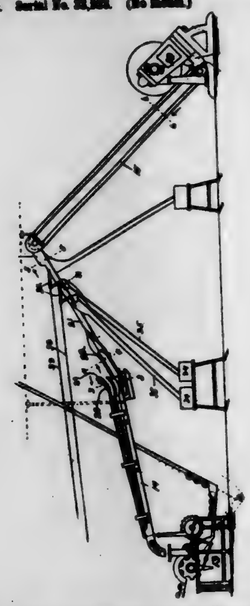
Claim.—1. A training apparatus for foot-ball players, comprising a dummy figure, a support therefor, and a releasing device interposed between the dummy figure and its support, whereby the dummy figure is

released from its support when properly tackled, substantially as described.

2. A training apparatus for foot-ball players, comprising a dummy figure, a support therefor, and a releasing device interposed between the dummy figure and its support, said releasing device comprising a spring and a latch engaged by the dummy figure and held normally in its closed position by said spring, substantially as described.

3. A training apparatus for foot-ball players, comprising a dummy figure, a support therefor, and a releasing device interposed between the dummy figure and its support, said releasing device comprising a rod secured to the support and having a cross-head, a second rod also having a cross-head, a spring interposed between said cross-head, and a latch engaged by the dummy figure and normally held by said spring in engagement with one of said cross-heads, substantially as described.

704,266. CAN-HEAD-DELIVERING APPARATUS. HORATIO H. HORTON, Maywood, Ill., assignor, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 33,988. (No model.)



Claim.—1. The combination with a can-beading mechanism and a can-head-forming mechanism or press, of a can-head feed-chute along which the can-heads pass in an upright position, of a continuously-operating can-head elevator upon which the can-heads rest in a flat position, and an intermediate curved or twisted connecting-chute operating to turn the can-heads onto their edge and deliver them into the can-head chute in this position, substantially as specified.

2. The combination with a continuously-operating can-head elevator, of a can-head chute having a curved or twisted portion to turn the can-heads onto their edges and a can-heading mechanism, substantially as specified.

3. The combination with a can-head-forming mechanism a can-head elevator, of a can-head chute having a curved or twisted portion to turn the can-heads onto their edges, and provided with means for separation and escape of flat disks or punchings of sheet metal, substantially as specified.

4. The combination with a continuously-operating can-head elevator, of a can-head chute having a curved or twisted portion to turn the can-heads onto their edges, and provided with a movable gate for the discharge of surplus can-heads and a can-heading mechanism, substantially as specified.

5. The combination with a continuously-operating can-head elevator, of a can-head chute having a curved or twisted portion to turn the can-heads onto their edges, and provided with a movable gate and a discharge-chute for the discharge of surplus can-heads and a can-heading mechanism, substantially as specified.

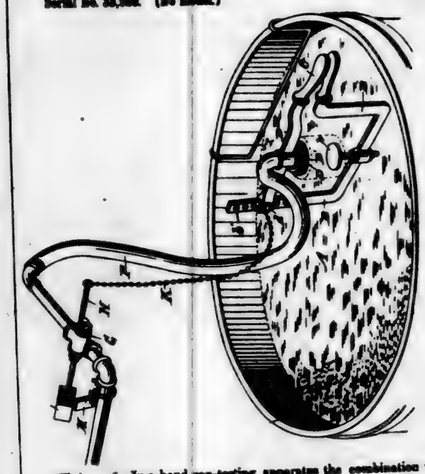
6. The can-head feed-chutes for conveying can-heads in an upright position, provided with a narrow blade or rail at its bottom to permit escape of flat disks or punchings from the can-heads, substantially as specified.

7. The combination with the can-head feed-chute 14, of intermediate chute 21, having a curved or twisted portion 22, said chute 14 having a curved brake-acting upper guide 26, substantially as specified.

8. The combination with a can-head-forming mechanism or press, of a can-heading mechanism and means for automatically delivering the can-heads from the can-head-forming mechanism to the can-heading mechanism, said means having a device for separating flat disks or punchings from the can-heads, substantially as specified.

9. The combination with a can-head-forming mechanism or press, of a can-heading mechanism, means for automatically and continuously delivering can-heads from the can-head-forming mechanism, and a movable gate or device for discharging surplus can-heads interposed between said continuously-operating can-head-delivery means and the can-heading mechanism, substantially as specified.

704,267. CAN-TESTING MACHINE. HORATIO H. HORTON, Maywood, Ill., assignor, by mesne assignments, to American Can Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 22, 1900. Serial No. 33,989. (No model.)



Claim.—1. In a hand can-testing apparatus the combination with a water-bath, of a movable can-holder having a handle, a clamp having a handle and an air-pipe, of a valve connected with the can-holder and automatically operated to open and close as the can-holder is immersed in and taken out of the water, the handles of said holder and clamp being adapted to be grasped by the hand for moving the can in the holder and clamp into and out of the bath, substantially as specified.

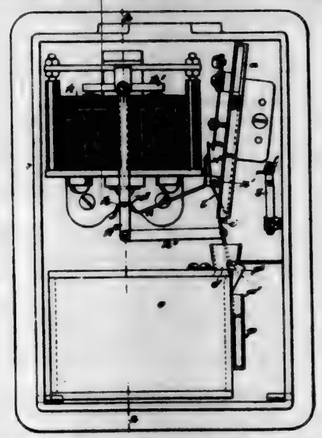
2. The combination with a bath, of a can-holder having a handle, a clamp having a handle, an air-pipe and valve connected with the holder and automatically operated by its movement, the handles of said holder and clamp being adapted to be grasped by the hand for moving the can in the holder and clamp into and out of the bath, substantially as specified.

3. The combination with a bath, of a can-holder having a handle, a clamp having a handle and air-pipe, of a valve, a lever for operating the same, a connection between the lever and the can-holder and a weight connected with the valve, the handles of said holder and clamp being adapted to be grasped by the hand for moving the can in the holder and clamp into and out of the bath, substantially as specified.

4. The combination with a bath, of a movable can-holder having a handle, a clamp having a handle, an air-pipe and an automatically-operated valve in the air-pipe, the handles of said holder and clamp being adapted to be grasped by the hand for moving the can in the holder and clamp into and out of the bath and means for automatically operating said valve, substantially as specified.

704,268. COIN-COLLECTOR FOR TELEPHONE TOLL-LINES. JOSEPH J. O'CONNELL, Chicago, Ill., assignor to the Western Electric Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 17, 1900. Serial No. 33,234. (No model.)

Claim.—1. In a toll-collecting appliance for telephone-lines, the combination with a chute for receiving a coin, of a coin-distributing electromagnet and mechanism connected therewith for directing the course of the coin, an electric circuit, a pair of contact-terminals controlling the continuity of said circuit, said contact-terminals being adapted to be closed together to complete said circuit by a coin deposited in said chute, and mechanism operated by the armature of said electromagnet, for closing said contacts together independently of the coin, substantially as described.



2. In a toll-collecting appliance for telephone-lines, the combination with a chute for receiving a coin, of a polarized coin-distributing electromagnet and an armature therefor adapted to tilt to one side or the other, according to the character of the current flowing through the coils of said magnet, mechanism operated by said armature for directing the coin to one side or the other as it leaves the chute, means for yieldingly maintaining said armature in a central position, an electric circuit, a pair of contacts controlling the same, said contacts being adapted to be closed together by a coin deposited in said chute, and means, operated by the armature of said electromagnet, for closing said contacts together independently of a coin when the armature is moved out of its central position, substantially as described.

3. The combination with the coin-chute *a*, of a valve *i* for directing the course of a coin, a coin-distributing electromagnet *h* and an armature therefor adapted to operate said valve, a contact-lever *l* adapted to be actuated by a coin within the chute, an electric circuit including the winding of said electromagnet, said circuit being controlled by said contact-lever, and a lever *n* operated by the armature of said electromagnet, adapted to actuate said contact-lever *l* independently of a coin, substantially as set forth.

4. The combination with the coin-chute *a*, of an electromagnet and mechanism operated thereby for directing the course of the coin, a contact-lever *l* adapted to be actuated by a coin within the chute, a contact-anvil *m* adapted to be engaged by said contact-lever, an electric circuit including the winding of said electromagnet, said circuit being controlled by the contact-pieces *l m*, and an actuating-lever *n* adapted to be moved by said electromagnet, simultaneously with the coin-distributing mechanism, said lever *n* engaging with the contact-lever *l* and serving to maintain the same in engagement with its contact-anvil *m* after the coin has passed from the chute, substantially as set forth.

5. The combination with the coin-chute *a*, of a polarized electromagnet, an armature therefor adapted to tilt to one side or the other under the influence of current flowing in the coils of said magnet, according to the direction of such current, a valve *i* for directing the course of a coin as it leaves the chute, a mechanical connection between the valve and said armature, whereby the valve is caused to tilt to one side or the other by the movement of said armature, a centralizing-spring *k* adapted yieldingly to maintain the armature and valve in central positions, an electric circuit including the winding of said electromagnet, contact-pieces *l m* controlling said circuit, said contact-pieces being adapted to be closed together by a coin within said chute, and an actuating-lever *n* moved through the agency of the electromagnet when the same is energized, for maintaining said contact-pieces in engagement, substantially as set forth.

704,269. PADLOCK. FREDERICK W. PIRRIE, Willenhall, England. Filed Jan. 9, 1902. Serial No. 38,868. (No model.)

Claim.—1. In a padlock, a tubular body divided lengthwise, separately-formed end pieces fixed to the body, means for securing said parts together, a shackle pivoted near the rear end of the body, and lock mechanism for engagement with the free end of the shackle, substantially as set forth.

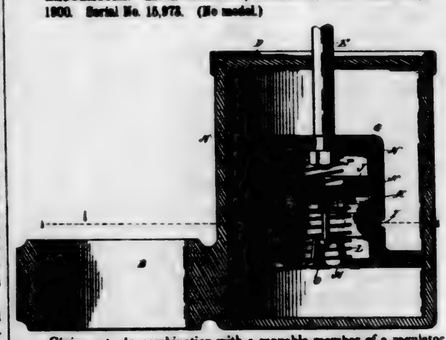
2. In a padlock, a tubular body divided lengthwise, a sheath surrounding the body and holding the divisions together, end pieces fixed to the body, means for securing said parts together, a shackle pivoted near the rear end of the body, and lock mechanism for engagement with the free end of the shackle, substantially as set forth.

3. A padlock having a shackle and locking mechanism, a tubular body divided lengthwise, separately-formed end pieces for the body having rims which embrace and house the respective ends of the sectional body, and means for securing the said parts together, substantially as set forth.

4. A padlock having a tubular body divided lengthwise, separately-formed ends having rims which house the respective ends of the sectional body, means for securing said parts together, said means consisting of an integral, headed pin which extends through the axis of the body and the said end pieces and rigidly distances the latter, a shackle, and locking mechanism for the shackle, substantially as set forth.

5. In a padlock, a tubular body divided lengthwise, and a diaphragm forming the inner end of the lock-mechanism chamber, secured to the body by lugs within slots of the divisions of the body, substantially as set forth.

704,270. CONTROLLING MECHANISM FOR STEAM-ENGINE REGULATORS. EDWIN REYNOLDS, Milwaukee, Wis. Filed May 8, 1900. Serial No. 15,973. (No model.)



Claim.—1. In combination with a movable member of a regulator for steam-engines, means for holding said member against a force of any magnitude exerted for a short period, and permitting the movement thereof when said force is exerted for a greater period, and finally holding the regulator in its new adjusted position.

2. In combination with a movable member of a regulator for steam-engines, a fluid-controlling device directly connected thereto and adapted and arranged to hold said member against any sudden movement, but permitting the same to move after a stated period of time, and finally to hold it in its adjusted position.

3. In combination with a movable member of a regulator for steam-engines, a fluid-containing pot or chamber; controlling devices mounted and working therein, comprising a piston and valve carried thereby, said valve normally closing the passages through the piston; and direct connections intermediate the movable member of the regulator and the controlling devices mounted in the pot.

4. In combination with a movable member of a regulator for steam-engines, a pot or chamber; a piston mounted therein; connections intermediate said piston and the movable member of the regulator; a valve working in conjunction with said piston; and means for holding the valve in such position relatively to the piston that the piston and rod will be prevented from being moved to any extent through the exertion of a force of any magnitude for a short period, but which will permit the parts to move when said force has been exerted for a period of any length, and will lock the parts in their adjusted position when they come to rest.

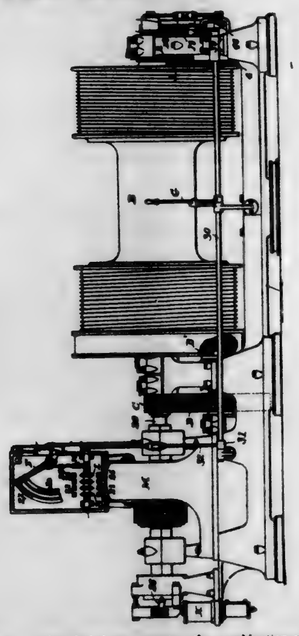
5. In combination with a movable member of a regulator for steam-

engines, a pot or chamber; a piston mounted therein having openings formed near its upper end and ports I below the same; connections intermediate said piston and the movable member; a valve working within said piston and adapted normally to close the ports; and means for holding said valve in such position.

6. In combination with a movable member of a regulator for steam-engines, a pot or chamber; a valve G mounted therein and provided with openings H near its upper end and ports I near its lower end; connections intermediate said piston and the movable member; a valve mounted in said piston and provided with ports K; a spring adapted to hold said valve in its elevated position with the ports out of alinement; and means for limiting the upward movement of said spring.

7. In combination with a movable member of a regulator for steam-engines, a pot or chamber; a piston G mounted therein and provided with openings H near its upper end and with ports I near its lower end; a valve mounted therein and provided with ports K; a spider M secured to the piston below the valve; a spring mounted upon said spider; a plate N interposed between the upper end of the spring and the valve; and a screw or stem O extending through the spider and connected to the plate, and adapted and arranged to limit the upward movement of the spring.

704,271. CONTROL DEVICE FOR HOISTING-MACHINES. GEO. H. REYNOLDS, Chicago, Ill., assignor to the Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Dec. 29, 1898. Serial No. 700,637. (No model.)



Claim.—1. In a hoisting apparatus, the combination with control devices for starting and stopping the engine, of automatic regulating devices connected to some moving part of the apparatus for reducing the speed of the engine before the hoist reaches the limits of its movement, substantially as described.

2. In a hoisting apparatus, the combination with the control devices for starting and stopping the engine, of an automatic stop device for stopping the engine as the hoist reaches the limits of its movement, and automatic regulating devices connected to some moving part of the apparatus for reducing the speed of the engine before the hoist reaches the limits of its movement, substantially as described.

3. A hoisting-engine provided with a control device for cutting off and turning on the motor fluid, and connections operated by the engine for shifting said devices at the limits of travel of the cable, and with an auxiliary or speed-regulating device for gradually decreasing or increasing the flow of said fluid, and means for shifting the regulating device to retard said flow prior to the operation of the control device, substantially as set forth.

4. A hoisting-engine provided with a motor and its control and regulating devices, a winding-drum, two shifting devices, and means for operating the same, one connected with the control device and the other with the regulating device of the motor, substantially as set forth.

5. The combination of a hoisting-engine, motor, motor control and regulating devices, and two shifting devices connected to be moved by operating parts of the apparatus and respectively connected to operate the control and regulating devices, substantially as set forth.

6. The combination with a hoisting drum and motor, of two shifting devices connected to independently control the operation of the motor, and means for operating the shifting devices in succession, substantially as set forth.

7. The combination with a hoisting drum and motor, of two shifting devices connected to independently control the operation of the motor, and means for operating the shifting devices in succession as the drum terminates its travel in either direction, substantially as set forth.

8. The combination of a hoisting-drum, two shifting devices, and a train of gears between each shifting device and the drum, substantially as set forth.

9. The combination of a hoisting-drum, drum-shaft, a shifting-cam N and shifting-lever 37, and a train of gears between each shifting device and the drum-shaft arranged to successively operate the same as the drum completes a predetermined travel in either direction, substantially as set forth.

10. The combination of a motor provided with control and regulating devices and a winding-drum provided with a shifting-cam and connections between the latter and the regulating device, and a shifting-lever and connections between the same and the control device, substantially as set forth.

11. In a hoisting mechanism, the combination of a car, mechanism for moving said car, means for stopping said car at the ends of its traverse and automatic means independent of the stopping means for changing the rate of movement of the car as it reaches certain predetermined points in its traverse substantially as set forth.

12. In a hoisting mechanism, the combination of a car, mechanism for moving said car, automatic means for changing the rate of movement of the car from slow to fast and from fast to slow, as it reaches certain predetermined intermediate points in its traverse, and means for automatically stopping the car at the ends of its traverse, substantially as set forth.

13. In a hoisting mechanism, the combination of a car, a motor for moving said car, a connection from the motor to the generator, said connection being automatically controlled to effect a change of speed of the motor as the car reaches certain predetermined points in its traverse, and a normally operative connection from the generator to the motor, substantially as set forth.

14. In a hoisting mechanism, the combination of a car, mechanism for moving said car and automatic means for changing the rate of movement of the car from slow to fast and from fast to slow as it reaches certain predetermined intermediate points in its traverse, substantially as set forth.

15. A car, a hoisting-motor therefor, means for accelerating the speed of the motor as it starts up, and means operated by the motor for automatically arresting the car at any predetermined point.

16. A car, a hoisting-motor therefor, and means actuated by the motor for reducing the speed thereof as the car approaches any predetermined stopping-point.

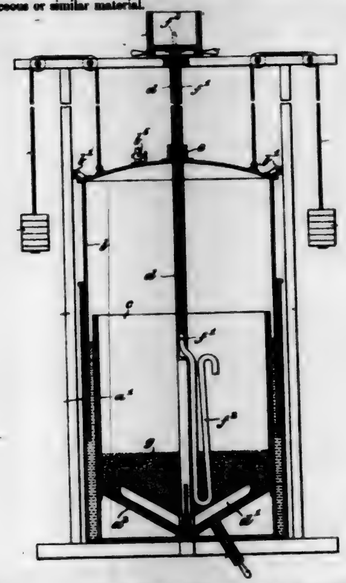
17. In a hoisting mechanism, the combination of a car, mechanism for moving said car, an automatic brake, means for stopping the car at the ends of its traverse, and automatic means independent of the stopping means for changing the rate of movement of the car as it reaches certain predetermined points in its traverse, substantially as described.

18. In a hoisting mechanism, the combination of a car, mechanism for moving said car, an automatic brake which is held out of action by the motor fluid and is put into action by cutting off the motor fluid, means for stopping said car at the ends of its traverse, and automatic means for changing the rate of movement of the car, as it reaches certain predetermined points in its traverse, substantially as set forth.

19. In a hoisting mechanism, the combination of a car, mechanism for moving said car, means for stopping said car at the ends of its traverse, and automatic means independent of the stopping means for changing the rate of movement of the car, said automatic means being constantly connected to mechanism for moving said car, substantially as set forth.

704,272. APPARATUS FOR MAKING CARBONIC-ACID OR OTHER GAS. VAN VECHTEN W. REMSEN, Philadelphia, Pa. Original application filed July 15, 1901, Serial No. 68,726. Divided and this application filed Sept. 26, 1901. Serial No. 76,610. (No model.)

Claim.—1. In an apparatus for the manufacture of gas, a gasometer, comprising a fixed tank adapted to receive the carbonaceous or similar material, and a removable dome adapted to telescope with the tank, a shaft traversing the dome and tank, means for oscillating or turning said shaft, and agitating means carried by said shaft and adapted to enter the carbonaceous or similar material.



2. In an apparatus for the manufacture of gas, a gasometer, comprising a fixed tank adapted to receive the carbonaceous or similar material, a dome adapted to telescope with said tank, a hollow shaft traversing the dome and extending into the tank, means for turning or oscillating said shaft, agitating means carried by said shaft and adapted to enter the carbonaceous or similar material, a box or receptacle for the acid, and a non-corrodible pipe leading from the acid-receptacle and adapted to traverse the hollow shaft and to discharge acid upon the carbonaceous or similar material.

3. In an apparatus of the character described, a collapsible receptacle for the carbonaceous or similar material, a hollow shaft extending into said receptacle, a box or receptacle for the acid located outside the collapsible receptacle, and a non-corrodible pipe leading from the acid-receptacle and adapted to traverse the hollow shaft and to discharge acid upon the carbonaceous or similar material.

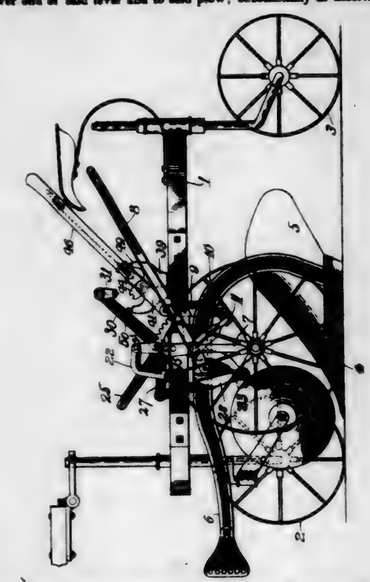
4. In an apparatus of the character described, a collapsible receptacle for the carbonaceous or similar material, a hollow shaft extending into said receptacle, a box or receptacle for the acid located outside the collapsible receptacle, a non-corrodible pipe leading from the acid-receptacle and traversing the shaft, and a siphon located without the shaft and discharging upon the carbonaceous or similar material, said siphon connected with said acid-pipe.

704,273. FINGER-RING. NATHAN ROSEN, New York, N. Y. Filed Apr. 26, 1902. Serial No. 104,563. (No model.)

Claim.—A ring provided at one side with a crown and a bezel which is adapted to fit on said crown, said crown being provided at its opposite sides with notches or recesses and said bezel with a bar which is less in diameter than said bezel and the ends of which are adapted to fit in said notches or recesses, and a locking-pin passed through the opposite sides of the crown and longitudinally through said bar, substantially as shown and described.

704,274. RIDING-PLOW. CHARLES S. RUEF and CLARENCE L. TOOLEMON, Dixon, Ill., assignors to Grand Detour Plow Company, Dixon, Ill., a Corporation of Illinois. Filed July 15, 1901. Serial No. 68,602. (Model.)

Claim.—1. In a plow, the combination of a plow, its frame, and means for raising the plow comprising a lever pivoted intermediate of its length upon the frame and a link pivotally connected respectively to the lower end of said lever and to said plow; substantially as described.



2. In a plow, the combination of a plow, its frame and means for raising the plow, comprising a lever pivoted intermediate of its length upon the frame and a link pivotally connected at its lower end to the plow and intermediate of its length to the lever; substantially as described.

3. In a plow, the combination of a plow, its frame and means for raising the plow comprising a lever pivoted intermediate of its length upon the frame, a link pivotally connected at its lower end to the plow and intermediate of its length to the lever, and an adjustable stop arranged on said lever and adapted to be contacted by the upper or free end of said link; substantially as described.

4. In a plow, the combination of a plow, its frame, a raising-lever pivoted intermediate of its length to said frame, a link pivoted at a point intermediate of its length to the lower end of said raising-lever and at its lower end to the plow, a lowering-lever pivoted to said frame and a link connection pivoted at one end to said lowering-lever and at its other end to the plow; substantially as described.

5. In a plow, the combination of a plow, its frame, a raising-lever pivoted to said frame, a link pivotally connected to the raising-lever and the plow, a lowering-lever also pivoted to said frame and a second link pivotally connected to the lowering-lever and to the plow on the same pivotal axis as the first link; substantially as described.

6. In a plow, the combination of a plow, its frame, a raising-lever and lowering-lever pivoted on said frame on a common axis, a link pivotally connected to the raising-lever and the plow, and a second link pivotally connected to the lowering-lever and to the plow, on the same pivotal axis as the first link; substantially as described.

7. In a plow, the combination of a plow, its frame, a lowering-lever pivoted on said frame and having two forks, one of which has a footpiece, a link connecting the other of said forks to the plow and a stop arranged on said lever to limit the movement of said link in one direction; substantially as described.

8. In a plow, the combination, with the plow and a frame, of means for lowering the plow comprising a foot-actuated lever having a shaft journaled on the frame, a connection between the lever and plow, an arm 21 on the shaft, an arm 23, a connection between said arms and a member carrying arm 23 and arranged to have a slight oscillatory movement in the frame; substantially as described.

9. In a riding-plow, the combination, with the plow and a frame, of means for lowering the plow comprising a foot-actuated lever, having a shaft journaled on the frame, a connection between the lever and plow, an arm on said shaft, a sleeve journaled in said frame, an arm on such sleeve, a connection between said arms and means for roterily adjusting the position of the sleeve; substantially as described.

10. In a riding-plow, the combination with the plow, a frame and the land-wheel having an axle, of means for lowering the plow comprising a foot-actuated lever, having a shaft journaled on the frame, a connection between said lever and plow, an arm on said shaft, a sleeve journaled in said frame and encircling said axle, a second arm on said sleeve, a connection between said arms, and means for rotarily adjusting the position of the sleeve, substantially as described.

11. In a riding-plow, the combination with the plow, a frame and a land-wheel having an axle, of means for lowering the plow comprising a foot-actuated lever having a shaft journaled on the frame, a connection between said lever and plow, an arm on said shaft, a sleeve journaled in said frame and encircling said axle, a second arm on said sleeve, a connection between said arms, and means for rotarily adjusting the position of the sleeve, comprising a sector and adjusting-lever coöperating therewith; substantially as described.

12. In a riding-plow, the combination with the plow, a frame and the land-wheel having an axle, of means for lowering the plow comprising a foot-actuated lever having a shaft journaled on the frame, a connection between said lever and plow, and an arm on said shaft, a sleeve journaled in said frame and encircling said axle, a second arm on said sleeve, a connection between said arms, and means for rotarily adjusting the position of the sleeve, comprising a sector on the sleeve and an adjusting-lever cooperating with said sector; substantially as described.

13. In a riding-plow, the combination with the plow, a frame and the land-wheel having an axle, of means for lowering the plow comprising a foot-actuated lever having a shaft journaled on the frame, a connection between said lever and plow, an arm on said shaft, a sleeve journaled in said frame and encircling said axle, a second arm on said sleeve, a connection between said arms, and means for rotarily adjusting the position of the sleeve comprising a sector on the sleeve and an adjusting-lever loosely mounted on said axle and coöperating with said sector; substantially as described.

14. In a riding-plow, the combination, with the plow, a frame and the land-wheel having an axle, of means for lowering the plow comprising a foot-actuated lever having the shaft journaled on the frame, a connection between said lever and plow, an arm on said shaft, a sleeve journaled in said frame and encircling said axle, a second arm on said sleeve, a connection between said arms, means for rotarily adjusting the position of the sleeve comprising a sector on the sleeve, an adjusting-lever loosely mounted on said axle and coöperating with said sector, and a yielding connection between the lever and axle; substantially as described.

15. In a riding-plow, the combination, with the plow and a frame, of means for raising and lowering the plow, comprising a foot-actuated lever having a shaft journaled in the frame, a connection between the lever and plow, an arm on said shaft, a sleeve journaled in said frame, a second arm on such sleeve and a bent link connecting said arms and permitting a locking of said arms and lever; substantially as described.

16. In a plow, the combination with the plow and frame, of means for lowering the plow comprising a foot-actuated lever pivoted in the frame, a connection between the upper end of such lever and the plow and a stop arranged on the lever and contacted by the link when the lever has substantially completed its upward movement; substantially as described.

17. In a plow, the combination with the plow and frame, of means for lowering the plow comprising a foot-actuated lever pivoted in the frame, a connection pivotally connected at its upper end to the upper end of the lever and at its lower end to the plow, said connection having a relative swinging movement over the face or side of the lever, and a projection arranged on the side of the lever in the path of the connection to limit its swing; substantially as described.

18. In a plow, the combination with the plow and frame, of means for lowering the plow comprising a shaft 20 journaled in the frame, a lever 24 connected at its lower end to the shaft, a bracket 29 on the plow, a link 33 pivotally secured at its lower end to the bracket and at its upper end to the upper or free end of said lever, and a projection on the side of the lever against which the link comes to rest in the upward position of the parts; substantially as described.

19. In a plow, the combination with the plow and frame, of means for lowering the plow comprising a shaft 20 journaled in the frame, a lever 24 pivoted at its lower end and having two upwardly-projecting forks, a footpiece on one fork, a link connected at one end to the other fork and extending downwardly below the shaft and pivotally connected to the plow, and a projection on the side of the lever against which the link comes to rest in the upward position of the parts; substantially as described.

20. In a riding-plow, the combination of a plow, its frame, and means for raising and lowering the plow comprising a lowering-lever pivoted in the frame, a link between said lever and plow, a raising-lever pivoted intermediate of its length in the frame, and a second link between one arm of the raising-lever and plow; substantially as described.

21. In a riding-plow, the combination of a plow, its frame, and means for raising and lowering the plow comprising a shaft mounted in the frame, a lowering-lever on said shaft, a link between said lever and plow, a raising-lever pivoted on said shaft, and a second link between the plow and raising-lever; substantially as described.

22. In a riding-plow, the combination of a plow, its frame and means for raising and lowering the plow, comprising a shaft mounted in the frame, a lowering-lever on said shaft, a link between said lever and plow, a raising-lever pivoted intermediate of its length on said shaft and a second link between one of the arms of the raising-lever and the plow; substantially as described.

23. In a riding-plow, the combination of a plow, its frame, and means for raising and lowering the plow, comprising a lowering-lever pivoted in the frame, a link between said lever and plow, a raising-lever also pivoted in the frame and a link between the raising-lever and the plow, and means for locking the raising-lever and its link; substantially as described.

24. In a riding-plow, the combination, of a plow, its frame, and a foot-actuated raising-lever device comprising a lever pivoted intermediate of its length on the frame, a step on said lever, a link pivoted intermediate of its length to said lever and at its lower end to the plow, the upper or free end of said link being adapted to contact said stop; substantially as described.

25. In a riding-plow, the combination of a plow, its frame, and a foot-actuated raising-lever device comprising a lever pivoted intermediate of its length on the frame, an adjustable stop on said lever, a link pivoted intermediate of its length to said lever and at its lower end to the plow, the upper or free end of said link being adapted to contact said stop; substantially as described.

26. In a riding-plow, the combination of a plow, its frame and a foot-actuated raising-lever device comprising a lever pivoted intermediate of its length on the frame, a stop on said lever comprising a lug and a set-screw therein, a link pivoted intermediate of its length to said lever and at its lower end to the plow, the upper or free end of said link being adapted to contact said stop; substantially as described.

27. In a riding-plow, the combination of a plow, its frame, and means for lowering the plow comprising a lever pivoted at one end to the frame and having its other end forked, one of said forks having a footpiece, and a link connection between the other of said forks and the plow; substantially as described.

28. In a riding-plow, the combination of a plow and its beam, the main frame 1, the auxiliary frame 15, a sleeve 12 journaled in said frames, a shaft 20 journaled in the main frame, a lever 24 mounted on said shaft, and having the forks 25 and 27, a footpiece 26 on the fork 25, a plow-beam bracket 29 and a link 28 between the fork 27 and the bracket; substantially as described.

29. In a riding-plow, the combinative of a plow and its beam, the main frame 1, an auxiliary frame 15, a sleeve 12 journaled in said frames, an arm 23 on the sleeve, a shaft 20 in the main frame, an arm 21 on one end of the shaft, a link 22 between said arms, a lever 24 secured at its lower end to the shaft and having forks 25 and 27, a footpiece 26 on one fork, a bracket 29 secured to the plow-beam, and a link 28 between the fork 27 and the bracket; substantially as described.

30. In a riding-plow, the combination of a plow and its beam, the main frame, a shaft 20 in said frame, a lowering-lever 24 on said shaft, a raising-lever pivoted intermediate of its length on said shaft and independently movable thereon, a bracket 29 on the plow-beam, a link 28 between the lever 24 and the bracket, a link 33 pivoted at one end to the bracket and intermediate of its length to one end of the raising-lever, said link having a free end 35, a lug 36 on said raising-lever and a set-screw 37 adapted to be contacted by the said end of the link 33; substantially as described.

31. In a riding-plow, the combination of a plow, foot-actuated mechanism for raising or lowering the plow comprising an actuating-lever, and operative connections between it and the plow, and a footpiece loosely pivoted on said lever; substantially as described.

32. In a riding-plow, the combination of a plow, foot-actuated mechanism for raising or lowering the plow, comprising an actuating-lever and operative connections between it and the plow, and a stirrup loosely pivoted on said lever; substantially as described.

33. In a riding-plow, the combination of a plow, foot-actuated mechanism for raising or lowering the plow comprising an actuating-lever and operative connections between it and the plow and a stirrup loosely pivoted and arranged to move independently on said lever; substantially as described.

34. In a riding-plow, the combination of a frame, a plow, a hand device for raising and lowering the plow comprising a shaft in said frame, a pivoted lever having a plunger, an arm on the shaft and having a notch adapted to be engaged by said plunger, rests for the forward and rearward positions of the lever and an operative connection between said shaft and the plow; substantially as described.

35. In a riding-plow, the combination of a frame, a plow, a hand device for raising and lowering the plow comprising a shaft in said frame, a pivoted lever having a plunger, an arm on the shaft and having a notch adapted to be engaged by said plunger, a second arm secured to said shaft, a bracket secured to the plow and a link connection between such second arm and the said plow-bracket; substantially as described.

36. In a riding-plow, the combination of a frame, a plow, a hand device for raising and lowering the plow comprising a bracket arranged on the frame, having the two steps or rests 49 and 50, a cross-shaft therein, operative connection between said shaft and plow and a hand lifting-lever adapted to be put into and out of coöperative relation with the shaft and to rest on either one of such rests or steps; substantially as described.

37. In a riding-plow, the combination of a frame, a plow, a hand device for raising and lowering the plow comprising a bracket arranged on the frame, a cross-shaft thereon, operative connection between said shaft and plow, comprising a horizontal arm 41 on said shaft, a bracket 43 on the plow-beam, and a link pivotally connected to the arm 41 and bracket 43 respectively, a notched arm on said shaft and a hand lifting-lever having a spring-pressed plunger adapted to engage and be disengaged from said notched arm; substantially as described.

38. In a riding-plow, the combination of a frame, a plow, a hand device for raising and lowering the plow, comprising a bracket arranged on the frame and having a pair of steps, a shaft in said bracket, operative connection between said shaft and plow, and a hand lifting-lever loosely pivoted on the shaft and adapted to coöperate with the latter, said lever being arranged to rest against one or the other of the steps; substantially as described.

39. In a wheeled plow, the combination of a frame, a plow-beam supported by the frame, a rotatable sleeve in such frame, an operating connection between such sleeve and plow-beam, a land-wheel having an axle, and a hand-lever adapted to engage said sleeve and having a yielding connection with said axle; substantially as described.

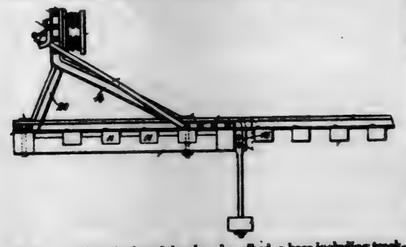
40. In a wheeled plow, the combination of a frame, a plow-beam supported by the frame, a rotatable sleeve in such frame, an operating connection between such sleeve and plow-beam, a land-wheel having an axle, and a hand-lever pivoted on said axle and having a yielding connection therewith; substantially as described.

41. In a wheeled plow, the combination of a frame, a plow-beam supported by the frame, a rotatable sleeve in such frame, an operating connection between such sleeve and plow-beam, a land-wheel having an axle, a hand-lever pivoted on said axle and a spring interposed between the lever and the axle; substantially as described.

42. In a wheeled plow, the combination of a frame, a plow-beam supported by the frame, a rotatable sleeve in such frame, an operating connection between such sleeve and plow-beam, a land-wheel having an axle, a hand-lever pivoted on said axle, an arm projecting from said axle and a spring connected at its ends to the lever and to the arm to form a yielding operative connection between the axle and lever; substantially as described.

43. In a wheeled plow, the combination of a frame, a plow-beam supported thereby, a movable sleeve in such frame and having operative connection with the plow-beam, a toothed segment on such sleeve, a land-wheel having an axle received by such sleeve, a hand-lever pivoted on said axle and adapted to coöperate with said segment and a yielding operating connection between the lever and axle; substantially as described.

704,275. RAILWAY JUMPING-POST. PATRICK SCANLIN, Boone, Iowa. Filed Mar. 15, 1902. Serial No. 98,248. (No model.)



Claim.—1. In a device of the class described, a base including track-rails, two rails having their forward ends on the base and their body portions extending rearwardly and upwardly, two rails having their upper ends connected with the rear ends of the aforesaid rails and their body portions extended downwardly and resting on the base and an anchor connected with the forward ends of the first-mentioned rails.

2. In a device of the class described, a base including track-rails and ties and stringers connecting the ties, two rails having their forward ends fixed to the track-rails and ties and projected downwardly and in engagement with one of the sides of one of the ties and having their body portions extended rearwardly and upwardly, two rails having their upper ends connected with the rear ends of the aforesaid rails and the body portions extending downwardly and having their lower ends resting on the base and an anchor beneath the forward ends of the first-mentioned rails and rods attached to the downwardly-inclined portions of said rails and also to said anchor.

3. In a device of the class described, a base including track-rails, two rails having their forward ends on the base and their body portions extending rearwardly and upwardly, two rails having their upper ends connected with the rear ends of the aforesaid rails and their body portions extended downwardly and resting on the base and an anchor connected with the forward ends of the first-mentioned rails, a plate engaging the rear faces of the upper ends of said rails and rods attached to said plate and projected forwardly and downwardly and attached to the track-rails.

4. An improved railway bumping-post, comprising in combination, a number of railway-ties, stringers connecting said ties, straight track-rails mounted on said ties, two rails having their forward ends inclined vertically and in engagement with the front face of one of said ties and the body portions inclined first horizontally and parallel with the track-rails and secured thereto, then rearwardly, upwardly, and inwardly toward the center of the track and finally straight upwardly, two rails with their forward ends arranged vertically with their upper ends and between the rear ends of the first-mentioned rails and their body portions projected downwardly and rearwardly and their rear ends projected horizontally and resting upon one of the ties, means for connecting the upper ends of both pairs of rails, a plate resting on top of the ties on which the rearwardly-inclined rails rest, and connected with the track-rails, a metal strap on said plate and overlapping the ends of said rails, a bar connected with one of the ties and with its ends engaging horizontal portions of the forward rails to space them apart, an anchor beneath the forward end of the forward rails and rods fixed to the said rails and to the said anchor, for the purposes stated.

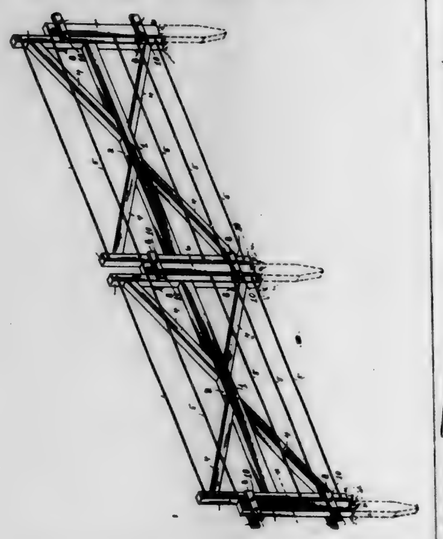
5. An improved railway bumping-post, comprising in combination, a number of railway-ties, stringers connecting said ties, straight track-rails mounted on said ties, two rails having their forward ends inclined vertically and in engagement with the front face of one of said ties and the body portions inclined first horizontally and parallel with the track-rails and secured thereto, then rearwardly, upwardly, and inwardly toward the center of the track and finally straight upwardly, two rails with their forward ends arranged vertically with their upper ends and between the rear ends of the first-mentioned rails and their body portions projecting downwardly and rearwardly and their rear ends projecting horizontally and resting upon one of the ties, means for connecting the upper ends of both pairs of rails, a plate resting on top of the ties on which the rearwardly-inclined rails rest, and connected with the track-rail, a metal strap on said plate and overlapping the ends of said rails, a bar connected with one of the ties and with its ends engaging the horizontal portions of the forward rails to space them apart, an anchor beneath the forward end of the forward rails, and rods fixed to the said rails and to the said anchor, and a plate fixed at the rear face of the upper ends of said rails and rods fixed to said plate and extended forwardly and downwardly and attached to the track-rails, for the purposes stated.

704,276. BUGGY BOOT OR APRON. HERMAN A. SCHIPPER, Hinckley, Ill. Filed Dec. 19, 1901. Serial No. 86,571. (No model.)

Claim.—A lap-robe forming a bag open at its upper end to receive the lower limbs and comprising a lap-section, an under section, a foot-

section, having its opposite edges permanently connected to the lower edges of the lap and under sections, and side sections having their lower edges permanently connected to the ends of the foot-section and their side edges permanently connected respectively to the side edges of the lap and under sections, the latter being narrowed and extended beyond the side sections to form a seat-flap and the lap-section being narrowed and extended at its upper end to form a chest-protecting flap, substantially as described.

704,277. PORTABLE FENCE. JAKOB STEBLER, Toledo, Ohio. Filed Nov. 26, 1901. Serial No. 83,554. (No model.)



Claim.—In a portable fence, the combination of portable panels with wooden posts having their lower end portions pointed for driving into the ground and their top and middle portions each provided with pairs of cleats clamped thereto by bolts engaging inserts in the edges of the posts, the cleats so clamped being adapted to receive and support the ends of panels abutting the posts and to prevent splitting of the posts when driven into the ground.

704,278. CAN-TESTING MACHINE. WILLIAM H. H. STEVENSON, Baltimore, Md. Filed May 15, 1901. Serial No. 60,267. (No model.)

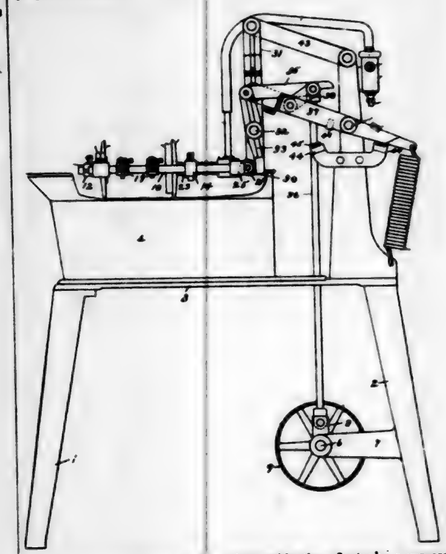
Claim.—1. In a can-testing machine, the combination of a tank; a can-carrier; a movable head to clamp and close the head of the can; and means which on its preliminary stroke will force the movable head against and close the head of the can and then force the carrier downwardly, as and for the purpose described.

2. In a can-testing machine, the combination of a tank; a can-carrier; means to raise and lower said can-carrier; a longitudinally-movable head for clamping and closing the can having a predetermined movement in advance of the movement of the can-carrier; and means to operate said head, as and for the purpose described.

3. In a can-testing machine, the combination of a tank; a can-carrier; means to raise and lower the can-carrier; a movable head to clamp and close the head of the can; and means to automatically operate the movable head to close the head of the can before the can-carrier is moved, as and for the purpose described.

4. In a can-testing machine, the combination of a base having an upright at the rear end thereof; a tank; a frame fulcrumed to said upright; a can-carrier carried by said frame; a movable head to clamp and close the head of the can; means to operate the movable head to close the head of the can before the can-carrier begins its downward movement; and means to admit air to the can after it has been submerged, as and for the purpose described.

5. In a can-testing machine, the combination of a base having an upright at the rear thereof; a tank; a frame fulcrumed to said upright and carrying a vertically-movable frame; a can-carrier secured to the said vertically-movable frame; a movable head to close the head of the can; a rock-arm carried by the vertical frame; means to rock the said arm to cause the movable head to clamp and close the head of the can before the can-carrier begins its downward movement; and means to operate the fulcrumed frame to raise and lower the can-carrier, as and for the purpose described.



6. In a can-testing machine, the combination of a tank; a can-carrier; means to raise and lower the can-carrier; a movable head having a hollow tube connected thereto through which air is supplied to the can; a main shaft journaled to the frame; a rock-arm connected with the main shaft to operate said head, as and for the purpose described.

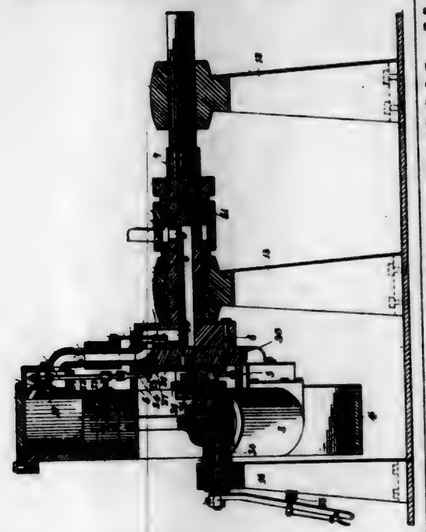
7. In a can-testing machine, the combination of a frame having an upright at the rear thereof; a shaft journaled to said frame; a metal frame movably connected to said upright; a normally closed air-valve; a movable head to clamp and close the head of the can; a tube leading from the air-valve to the movable head; and means connecting with the main shaft to cause the movable head to clamp and close the can and then lower the can-carrier into the tank, as and for the purpose described.

704,279. SASH-LOCK. CHARLES STEPENS, Plainfield, N. J. Filed Feb. 27, 1902. Serial No. 96,803. (No model.)

Claim.—1. In a sash-lock, the combination with a case to be secured to the top surface of the upper rail or member of the lower sash, of a swinging arm pivoted within the said case, a latch-lever pivoted to the said swinging arm and movable within said case, and a mortise-plate secured in the face of the vertical rail of the upper sash and adapted to be engaged by the latch-lever, the swinging of the said arm causing the end of the latch-lever to move out of the case, engage the mortise-plate, lock the sashes and draw the same together, substantially as specified.

2. A sash-lock comprising a case having opposite side apertures, a swinging arm pivoted within the case at a point distant from either end and having one end projecting through one side aperture, a latch-lever within the case pivoted only to the short end of the swinging arm and at its free latch end moving through the opposite side aperture, the pivot of said arm and latch swinging from the retracted position at one side of the pivot of the arm to the position of engagement at the other side of the said pivot, and a mortise-plate engaged by the latch-lever, substantially as specified.

704,280. ROTARY ENGINE. ALFRED T. STIRMAN, Eureka, Cal. Filed Aug. 24, 1901. Serial No. 73,192. (No model.)



Claim.—1. In a rotary engine, the combination with a hollow engine-shaft, means for supplying the motive fluid thereto, and a series of cylinders mounted to revolve in unison with the shaft and having communication therewith, of a stationary eccentric shaft, pistons within the cylinders, oscillatory piston-rods connected to the cylinders and to the stationary shaft, controlling-valves controlling the supply and exhaust of motive fluid to and from the cylinders, and governor mechanism independent of the controlling-valves, for independently regulating the supply of motive fluid to each of the cylinders.

2. In a rotary engine, the combination with a hollow engine-shaft, and means for supplying steam thereto, of a plurality of cylinders mounted to revolve in unison with the engine-shaft, steam-chests mounted upon the cylinders, steam-passages leading from the engine-shaft to the steam-chests and from the steam-chests to the interior of the cylinders, controlling-valves within the steam-chests, means for operating said valves, a governor-valve within each of the steam-passages leading to the steam-chests, means for operating the governor-valves, pistons within the cylinders, a stationary eccentric shaft, and oscillatory piston-rods connected to said shaft and to the several pistons.

3. In a rotary engine, the combination with a hollow engine-shaft, and means for supplying steam thereto, of a plurality of cylinders mounted to revolve in unison with the shaft, pistons within the cylinders, a stationary eccentric shaft, oscillatory piston-rods connected to said shaft and to the several pistons, steam-chests mounted on the cylinders, controlling-valves therein, means for operating said valves, steam-passages leading from the engine-shaft to the steam-chests, independent governor-valves located in said passages and centrifugally-operated governor members arranged to operate the governor-valves.

4. The combination with a hollow engine-shaft, and means for supplying steam thereto, of a plurality of cylinders mounted to revolve in unison with the shaft, pistons within the cylinders, a stationary eccentric shaft, oscillatory piston-rods connected to said shaft and to the several pistons, steam-chests mounted on the cylinders, controlling-valves therein, radial steam-pipes connected to the steam-chests and communicating with the engine-shaft, governor-valves disposed to regulate the supply of steam through said steam-pipes, and centrifugally-operated governor-weights slidably mounted on said steam-pipes and operatively connected to the governor-valves.

5. In a rotary engine, the combination with a plurality of cylinders mounted for rotation in unison around a common center, of steam-chests mounted upon the cylinders, controlling-valves in the steam-chests to control the supply and exhaust of steam to and from the cylinders, sun-and-planet gearing operatively connected with said valves to operate the same, and means for holding the sun or master gear stationary or for effecting its movement, as desired.

6. In a rotary engine, the combination with a plurality of cylinders mounted to rotate in unison around a common center, of steam-chests mounted on said cylinders, controlling-valves in the steam-chests, sun-and-planet gearing operatively related to said valves, and a shiftable controlling device arranged to reverse the operation of the gearing.

7. In a rotary engine, the combination with a plurality of cylinders mounted to revolve around a common center, of steam-chests mounted on the cylinders, controlling-valves therein, sun-and-planet gearing operatively connected to the controlling-valves, the sun or master gear of said gearing being loosely mounted for free rotation and provided with a toothed rim, a locking-pinion arranged to engage the toothed rim of the master-gear, and means for holding the locking-pinion stationary, or for effecting the partial rotation thereof.

8. In a rotary engine, the combination with a plurality of cylinders mounted to revolve around a common center, of steam-chests mounted on the cylinders and controlling-valves within the steam-chests, sun-and-planet gearing operatively connected to the valves, a stationary eccentric shaft, pistons within the cylinders, oscillatory piston-rods connected at their inner ends to the eccentric shaft and at their outer ends to the several pistons, and mechanism associated with said eccentric shaft for controlling the operation of the sun-and-planet gearing.

9. In a rotary engine, the combination with a plurality of cylinders mounted to revolve around a common center, steam-chests thereon and controlling-valves within the steam-chests, of sun-and-planet gearing operatively connected to the valves, pistons within the cylinders, a stationary eccentric shaft, oscillatory piston-rods connected to said shaft and to the several pistons, a controlling-lever located beyond one end of the eccentric shaft, a locking device located at the other end of the eccentric shaft for engagement with the sun or master gear of the sun-and-planet gearing, and means for operatively connecting the lever with the locking device.

10. In a rotary engine, the combination with a plurality of cylinders mounted to revolve around a common center, steam-chests thereon and controlling-valves in the steam-chests, of sun-and-planet gearing arranged to operate the valves, the sun or master gear of said gearing being provided with a toothed rim, a hollow stationary eccentric shaft, pistons within the cylinders, oscillatory piston-rods connected to the said eccentric shaft and to the several pistons, a rod extended through the hollow shaft and provided upon one end with a locking-pinion arranged to engage the toothed rim of the sun or master gear, and a controlling-lever connected to the opposite end of said rod to actuate the same.

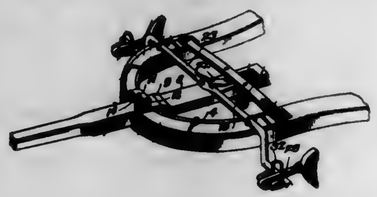
11. In a rotary engine, the combination with inner and outer concentric rims, a series of interposed cylinders, and a hub supporting said rims and located in rear thereof, of sun-and-planet gearing mounted on the face of the hub, steam-chests mounted on the cylinders, controlling-valves located in the steam-chests and operatively connected to the sun-and-planet gearing, a stationary eccentric shaft, pistons within the cylinders, oscillatory piston-rods connected to the stationary eccentric shaft and to the pistons, respectively, and means for controlling the operation of the sun-and-planet gearing.

12. In a rotary engine, the combination with a hollow engine-shaft, and means for supplying motive fluid thereto, of a plurality of cylinders provided with pistons and disposed to rotate in unison, a hub connected to the engine-shaft and cylinders and provided with ports in communication with the interior of the shaft, said hub having a flat face located beyond the shaft, steam-chest mounted upon the cylinders and in communication with said ports, valves within said chests, and valve-operating mechanism connected to the several valves and located upon the flat face of the hub.

13. In a rotary engine, the combination with a hollow engine-shaft, and means for supplying motive fluid thereto, of a plurality of cylinders provided with pistons and disposed to rotate in unison, a hub connected to the engine-shaft and cylinders and provided with ports in communication with the interior of the shaft, steam-chests mounted upon the cylinders and in communication with said ports, valves within said chests, valve-operating mechanism connected to the several valves and located upon the face of the hub, governor-valves located within the ports in the hub, and centrifugally-operated governor-weights operatively related to said governor-valves.

14. In a rotary engine, the combination with an engine-shaft, and means for supplying steam thereto, of a plurality of cylinders mounted to revolve in unison with the shaft, pistons within the cylinders, steam-chests mounted on the cylinders, controlling-valves therein, radial steam-pipes connected to the steam-chests and communicating with the engine-shaft, valve-operating mechanism located in advance of said pipes, governor-valves located in rear of said pipes and disposed to regulate the supply of steam therethrough, and centrifugally-operated governor-weights slidably mounted on the pipes and operatively connected to the governor-valves.

704,281. AUTOMATIC VEHICLE-BRAKE. ENOCH G. STONE, Bloomington, Tenn., assignor of one-half to Dixon A. Robinson, Bloomington, Tenn. Filed Sept. 20, 1901. Serial No. 75,880. (No model.)



Claim.—1. In an automatic vehicle-brake, the combination of the front bounds, a tongue or pole capable of longitudinal movement, a laterally-movable support mounted on the bounds and capable of movement independently thereof, brake-shoes, and operating mechanism mounted on the support and actuated by the tongue or pole and carrying the brake-shoes, substantially as described.

2. In an automatic vehicle-brake, the combination with a running-gear having a pole capable of longitudinal movement, a support mounted on the running-gear and capable of lateral movement independently thereof, whereby when the brake is applied the pole is prevented from whipping against the animals, a shaft carried by the support and provided with brake-shoes, and connections between the shaft and the pole, substantially as described.

3. In an automatic vehicle-brake, the combination with a running-gear having a pole capable of longitudinal movement, of a slide mounted on the running-gear and capable of a limited movement laterally of the running-gear, whereby the pole is prevented from whipping against the animals, a shaft mounted on the slide and provided with arms located at its center and ends, the central arms being connected with the pole, and brake-shoes mounted on the arms at the ends of the shaft, substantially as described.

4. In an automatic vehicle-brake, the combination with a pole capable of longitudinal movement, of front bounds having curved ways and located at opposite sides of the pole, a curved slide mounted in the curved ways, a shaft carried by the slide and connected with the pole, and brake-shoes connected with the shaft, substantially as described.

5. In an automatic vehicle-brake, the combination of the bounds provided with curved ways, a curved slide mounted in the ways, a rock-shaft journaled on the slide and provided at its ends with brake-shoes and having a central arm, and means for actuating the central arm, substantially as described.

6. In an automatic vehicle-brake, the combination of the front bounds provided with curved grooves and spaced apart, a curved slide provided at its front with a loop, a transverse bar connecting the ends of the slide and provided with a guide, a tongue passing through the loop and through the guide and provided with a slot, a rock-shaft having a central arm arranged in the said slot, and brake-shoes carried by the rock-shaft, substantially as described.

7. In an automatic vehicle-brake, the combination with a running-gear having a longitudinally-movable tongue or pole, of a slide, a guide connected with the slide and receiving the tongue or pole, a spring mounted on the guide and engaging the lower face of the tongue or pole, and a shaft mounted on the slide and operated by the tongue or pole and provided with brake-shoes, substantially as described.

8. In an automatic vehicle-brake, the combination of a running-gear having a longitudinally-movable tongue provided with a slot, a slide mounted on the running-gear, a shaft having a central arm arranged in the slot and adapted to be engaged by one of the walls thereof to move the shaft in one direction, a pin mounted on the tongue and extending across the slot and adapted to engage the arm to move the shaft in the opposite direction, and brake-shoes carried by the same, substantially as described.

9. In an automatic vehicle-brake, the combination of a running-gear having a longitudinally-movable tongue, a slide, a guide connected with the slide and receiving the tongue, a spring mounted on the guide and arranged at the bottom of the tongue, and a wedge mounted on the tongue and arranged to engage the spring, substantially as described.

10. In an automatic vehicle-brake, the combination of the front bounds spaced apart, a slide, a tongue extending between the bounds and provided with an enlarged portion to engage the same and having a narrow portion to permit a limited movement of the bounds independently of the pole, brake-shoes, and mechanism mounted on the slide and actuated by the tongue for carrying the brake-shoes into and out of engagement with the wheels, substantially as described.

704,282. ROPE-GRIP FOR SHAFTING. JOHN H. WALLACE, Strathisla, Scotland. Filed July 24, 1900. Serial No. 24,667. (No model.)

Claim.—1. In a rope-grip for the purposes referred to, the combination of the frame A formed at its apex to constitute one jaw of the grip; the grip-plate B hinged at one end to the frame A and formed at its other end to grip the rope against the apex of the frame A and having an aperture D intermediate of its ends for the reception of the knotted end of the rope, substantially as described.

2. In a rope-grip for the purposes referred to, the frame A formed at its apex to constitute one jaw of the grip and the grip-plate B hinged at one end to the frame A, formed at its other end to grip the rope against the apex of the frame A, and having an aperture D intermediate of its ends to receive and retain the knotted part of the rope; in combination with the stop a' adjacent to the hinge to limit the extent to which the free end of the plate B may rise above the gripping end of the frame A, substantially as set forth.

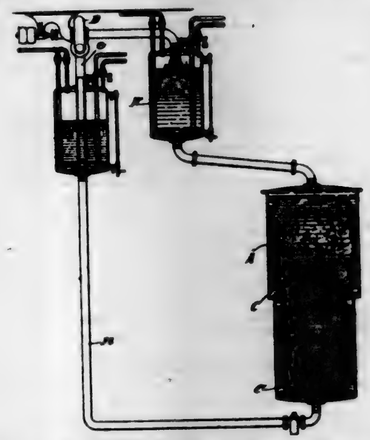
3. In a rope-grip for the purposes referred to, the combination of the frame A: the grip-plate B hinged at one end thereto, formed at its other end to grip the rope against the frame A, and having an apertured projection C at its hinged end, through which the rope is passed and an aperture D intermediate of its ends for the reception of the knotted end of the rope, substantially as described.

4. In a rope-grip, the combination of the frame A, having an aperture E near one end for the reception of the rope; and the plate B hinged to the other end of the frame and having at its free end a gripping-recess *b* adjacent to the aperture E in the frame; a guard or keeper *b'* surrounding the gripping-recess *b* and intermediate of its ends an aperture D in which the other end of the rope is secured, as explained.

704,283. APPARATUS FOR DYEING. ROBERT WEBB, Klingenthein, near Malhouse, Germany. Filed Jan. 13, 1900. Serial No. 1,320. (No model.)

Claim.—1. In an apparatus for the purpose specified, the combination with a closed boiler to contain the material, a closed compensating vessel situated wholly above the boiler, a pipe connecting the top of the boiler with the bottom of said compensating vessel, means for causing the circulating liquid to flow from the bottom of the boiler to the upper part of said compensating vessel, and means for heating the circulating liquid up to the required temperature.

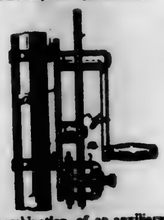
2. In an apparatus for treating textile material with circulating liquids having a temperature above 100° centigrade, the combination with a closed boiler to contain the material, and a pump to maintain a continuous circulation of the liquid through the material in the boiler, of a compensating vessel closed against the atmosphere, coupled at its upper part to the pump and at its lower part to the upper part of said boiler, and means for heating the circulating liquid up to the required temperature, said compensating vessel being situated wholly above the boiler and adapted to contain such a quantity of the liquid that a quantity of the liquid will be always present in the upper part of the boiler sufficient to insure that the textile material in the boiler shall be always covered with liquid, whereby the treatment may be effected at a high temperature and under considerable pressure, substantially as and for the purposes set forth.



3. In an apparatus for treating textile material with circulating fluids, the combination with a boiler in which the textile material is to be treated, of a basket to contain the textile material and to be introduced into the said boiler, the sides of said basket, which are to come into contact with the boiler-wall, being formed of outwardly-curved springs *d*, and the largest diameter of said basket: that is to say, the diameter including the outwardly-curved springs, being greater than that of the part of the boiler to receive the basket, substantially as and for the purposes set forth.

4. In an apparatus for treating textile material with circulating fluids, the combination with a boiler in which the textile material is to be treated, of baskets to contain the material, of different diameters, placed one above another in the boiler and the bottoms of which are adapted to rest upon ledges in said boiler, the sides of said baskets being formed of outwardly-curved springs *d*, the largest diameter of the basket: that is to say, the diameter including said curved springs, being greater than that of the part of the boiler to receive the corresponding basket, substantially as and for the purposes set forth.

704,284. AUXILIARY HAND-OPERATED DRIVING MECHANISM FOR BICYCLES. KARL WEBBER, Regensburg, Germany. Filed June 18, 1901. Serial No. 65,113. (No model.)



Claim.—1. In the combination, of an auxiliary hand driving-gear mechanism, with the driving-gear of a bicycle, comprising a plurality of gear-wheels mounted upon a supporting-plate, means for securing the same to the head of the bicycle-frame, a crank for operating said gear-wheels, a sprocket-wheel loosely supported on the shaft of the lower of said gear-wheels, a spring-actuated dog mounted on said shaft and adapted to connect said sprocket with said gear-wheel, and means for locking said dog in engagement with said sprocket, substantially as set forth.

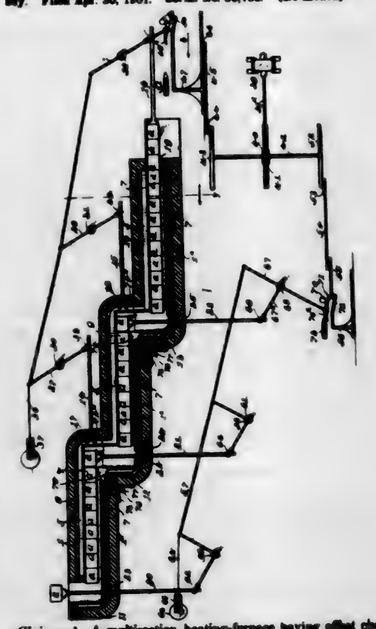
2. In the combination, of an auxiliary hand driving-gear mechanism, with the driving-gear of a bicycle, comprising a plurality of gear-wheels mounted upon a supporting-plate, means for securing the same to the head of the bicycle-frame, a crank for operating said gear-wheels, a sprocket-wheel loosely supported on the shaft of the lower of said gear-wheels, a longitudinal slot in the outer end of said shaft, a spring-actuated dog mounted on said shaft having arms extending inwardly through said gear-wheel and adapted to engage diametrically-arranged openings in said sprocket, and a spring-actuated key secured in slot of said shaft and having a shoulder engaging the dog, substantially as set forth.

704,285. COMPOUND FOR USE IN REDUCING METAL SHEETS IN PACKS. THOMAS V. ALLIS, Bridgeport, Conn., assignor, by mesne assignments, to the International Tin Plate Corporation, a Corporation of New Jersey. Filed Feb. 5, 1901. Serial No. 46,068. (No specimens.)

Claim.—1. A compound for coating the contact-surfaces of metal plates in packs to prevent adhesion or cohesion of the plates in the operation of heating and reducing the same to sheets, consisting of a refractory material combined with water and an adhesive substance.

2. The within-described compound for coating the contact-surfaces of metal plates in packs to prevent adhesion or cohesion of the plates in the operation of heating and reducing the same to sheets, consisting of powdered asbestos combined with water, and an adhesive material.

704,286. FURNACE FOR PROGRESSIVE METAL-HEATING. THOMAS V. ALLIS, Bridgeport, Conn., assignor, by mesne assignments, to the International Tin Plate Corporation, a Corporation of New Jersey. Filed Apr. 20, 1901. Serial No. 56,788. (No model.)



Claim.—1. A multisection heating-furnace having offset chambers located one in advance of another in a substantially horizontal plane, the forward end of each chamber overlapping the rear end of the preceding chamber, passages connecting said overlapping chambers, and means intermediate the ends of the heating-chambers for heating each chamber, as set forth.

2. A multisection heating-furnace having offset chambers located one in advance of another in a substantially horizontal plane, the forward end of each chamber overlapping the rear end of the preceding chamber, passages connecting said overlapping chambers, said furnace being constructed at its opposite ends with charging and delivery openings, and means intermediate the ends of the heating-chambers for heating each chamber, and means for mechanically progressing the metal therethrough, as set forth.

3. A furnace having a plurality of chambers arranged in succession, a cross passage or passages connecting said chambers, a pusher entering one end of each chamber, and means for simultaneously advancing the several pushers, as set forth.

4. A furnace having three or more chambers arranged in succession, cross-passages connecting the chambers, pushers in said cross-passages and means for simultaneously advancing said pushers, as set forth.

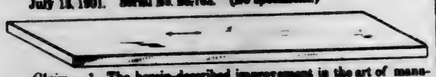
5. The combination, with a furnace of the character described, having a plurality of chambers set one in advance of another, and transfer-passages connecting said chambers, of pusher-rods for said chambers and transfer-passages, linked together in two separate gangs or sets, and means whereby both gangs or sets are operated and each gang or set tripped and returned to its normal position, as set forth.

6. The combination, with a furnace of the character described, of gangs of feeding pusher-rods and gangs of transfer pusher-rods, means for effecting the forward stroke of each of said gangs, and adjustable means for tripping each gang on its forward stroke and returning the same to a normal position, as set forth.

7. The combination, with a furnace of the character described, having a plurality of chambers set one in advance of another, and transfer-passages connecting said chambers, of interposed guides at the junction of said chambers and passages to prevent colliding of the metal transferred from one chamber, with the metal of an adjoining chamber, as set forth.

8. The combination, with a furnace of the character described, having a plurality of chambers set one in advance of another, and transfer-passages connecting said chambers, of adjustable and interchangeable interposed guides at the junction of said chambers and passages to prevent colliding of the metal transferred from one chamber with the metal of an adjoining chamber, as set forth.

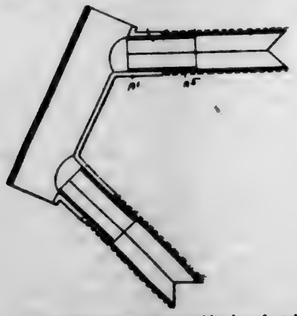
704,287. METHOD OF PRODUCING METAL SHEETS. THOMAS V. ALLEN, Bridgeport, Conn., assignor, by mesne assignments, to the International Tin Plate Corporation, a Corporation of New Jersey. Filed July 13, 1901. Serial No. 68,762. (No specimens.)



Claim.—1. The herein-described improvement in the art of manufacturing metal sheets, which consists in rolling a plurality of initial plates of an established uniform thickness and of predetermined different widths, cutting sections transversely therefrom of a length required in the width of the next succeeding or secondary plates, and cross-rolling said sections into succeeding or secondary plates of uniform thickness, the width and thickness of the initial plates determining the length and thickness of said secondary plates, as set forth.

2. The herein-described improvement in the art of manufacturing metal sheets in packs of predetermined varying sizes, which consists in rolling initial plates of an established uniform thickness and of predetermined different widths, cutting sections transversely from said initial plates of a length required in the width of the secondary or next succeeding plates, and cross-rolling said sections into the next succeeding or secondary plates of a uniform thickness, cutting these secondary plates transversely into sections and to lengths of the required width of packs, prior to reduction, piling said sections into packs, heating the packs, and reducing the same by cross-rolling, as set forth.

704,288. BICYCLE. ANDREW G. ARESKOOG, Worcester, Mass., assignor to Edmund Converse, Worcester, Mass. Filed Nov. 27, 1899. Serial No. 738,266. (No model.)

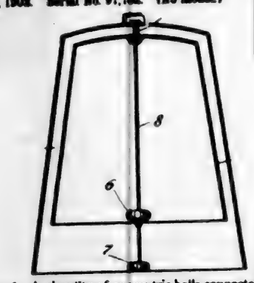


Claim.—1. In a bicycle-frame, the combination of a tubular prong having its end reduced in thickness and forming a shoulder, an interior tube having one end inserted in the end of said tubular prong and having the diameter of its opposite end equal to the diameter of the reduced section of said prong and a tubular strut inclosing the enlarged end of said interior tube and the reduced section of said prong with the overlapping surfaces of said prong, interior tube and inclosing tubular strut brazed together, substantially as described.

2. In a bicycle-frame, the combination of a tubular member divided longitudinally at one side and having a projecting divided prong, the parts of which are located at opposite sides of the division of said longitudinal member and form together a complete prong, the outer portion of which prong is reduced forming an external shoulder, an interior tube secured in said prong and projecting beyond the same and a strut, or frame-tube, fitting over the projecting end of said interior tube and surrounding the reduced portion of said prong to hold the parts thereof together and abutting at its end against said external shoulder of the prong, whereby the external surfaces of the prong and the strut, or frame-tube, form a flush joint, substantially as described.

3. In a bicycle-frame, the combination with a tubular member divided longitudinally at one side and having projecting half-prongs located at opposite sides of the division and forming together a complete prong, the outer portion of said prong being reduced forming a shoulder near the end thereof, of an interior tube secured in said prong and projecting beyond the same, the outer wall of said interior tube being substantially flush with the outer face of the reduced portion of the prong and provided with a shoulder which abuts against the reduced end of the prong and a strut or frame-tube fitting over said interior tube and the reduced portion of said prong and abutting at its end against the shoulder of the prong, substantially as described.

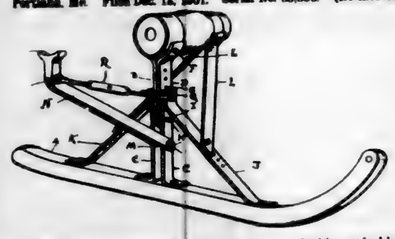
704,289. BELL. WAYLAND B. AUSIN, Deerharbor, Wash. Filed Mar. 11, 1902. Serial No. 97,702. (No model.)



Claim.—1. A plurality of concentric bells connected centrally at the top and having suitable spaces between them, and interior swinging clappers for sounding them, substantially as set forth.

2. The combination of a plurality of bells of different heights and diameters secured together at their tops one within another, and clappers suspended therein for sounding them, substantially as set forth.

704,290. ADJUSTABLE HUB-RUNNER. FREDERICK O. BAILEY, Portland, Me. Filed Dec. 12, 1901. Serial No. 85,558. (No model.)

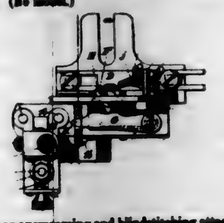


Claim.—1. In a hub-runner, in combination, a double vertical brace, inclined braces running rearwardly and forwardly from said vertical braces to the runner, a vertically-adjustable hub-support moving within said vertical brace and an inwardly-extending vertically-adjustable arm pivotally mounted on said vertical braces.

2. In a hub-runner, in combination, a hub, central vertical braces, a sliding hub-support adapted to have vertical movement therein, an inwardly-extending brace having a rest on the inner end pivotally attached to said vertical brace and capable of being rigidly held in position, inclined braces running from said central brace to the runner and braces running from the outer end of the hub to said inclined braces and capable of vertical adjustment thereon.

3. In a hub-runner, in combination, a hub, a vertically-adjustable hub-support, a central vertical brace, an axle-support pivotally mounted on said central vertical support and means for raising and lowering said support and holding it rigidly in position, inclined braces running from the said central brace to the runner and braces adjustable on said inclined braces running therefrom to the outer end of the hub.

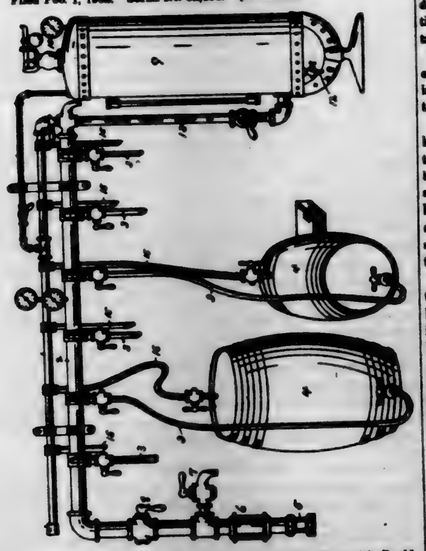
704,291. OVERSEAMING AND BLINDSTITCHING ATTACHMENT FOR SEWING-MACHINES. WILLIAM D. BEAN, New York, N. Y., assignor to William D. Higer, New York, N. Y. Filed Apr. 7, 1900. Serial No. 11,959. (No model.)



Claim.—1. In an overseaming and blindstitching attachment for sewing-machines, the combination of a base-plate, a slide working thereon, a rule-jointed lever operated by the needle-bar and actuating the slide, a ratchet-wheel journaled on the base-plate, a fixed pin on the base-plate, a pawl attached to the slide and having, in addition to the engaging point thereof, two lips at opposite sides of the pawl-pivot contacting with the pin on the base-plate, whereby the pawl is thrown noiselessly into and out of contact with the teeth of the ratchet-wheel without the aid of a spring, a reciprocatory pusher, and operating connections between the ratchet-wheel and the pusher, as and for the purpose set forth.

2. In an overseaming and blindstitching attachment for sewing-machines, the combination of a base-plate, a needle-bar, a pin attached to the needle-bar, a rule-jointed lever, one arm of which is provided with a slot in which said pin works, a fixed pin on the base-plate, a reciprocating slide, a pawl carried thereby and having, in addition to the engaging point thereof, two projecting lips arranged to come in contact with the pin on the base-plate, an intermittently-operated cam actuated by the pawl, a cam-lever operated by the cam, and a reciprocating dismal pusher operated by the cam-lever, as and for the purpose set forth.

704,292. RACKING APPARATUS. DILLON BERRY, Newark, N. J. Filed Feb. 1, 1902. Serial No. 92,196. (No model.)



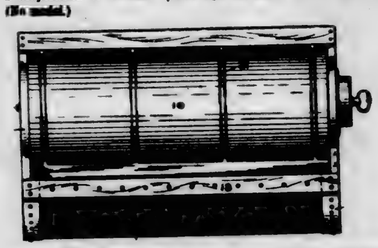
Claim.—1. In a racking apparatus, the combination with liquid-supply means, of a back-pressure tank, had a branched or bifurcated vent-duct having its branches opening into upper and lower points of the back-pressure tank and both providing simultaneously open gas connections between the tank and a package being filled.

2. In a racking apparatus, the combination with a liquid-supply duct, of a back-pressure tank, a vent-duct connecting with the lower part of said tank, and an auxiliary vent-duct of smaller capacity than the first said vent-duct branching therefrom and opening into the upper part of the back-pressure tank, both said ducts permitting simultaneously an escape of gas from a package being filled to the back-pressure tank.

3. In a racking apparatus, the combination of a main liquid-supply pipe and branch tubes, a back-pressure tank, a main back-pressure pipe connected to the said tank and having branch tubes leading from itself and adapted to be connected to packages, and an auxiliary back-pressure duct leading from said main back-pressure pipe, at a point thereon adjacent to its branch tubes, to a point of said tank above its connection with the main back-pressure pipe, said ducts presenting equally available alternative passages for the escape of gas from a package to the back-pressure tank.

4. In a racking apparatus, the combination with suitable liquid-supply means, of a back-pressure tank or reservoir, a main back-pressure pipe leading from said tank and having a plurality of branch tubes adapted to be connected to packages, and an auxiliary back-pressure duct leading from said tank at a higher point than the main pipe and connecting with said main pipe at a plurality of points adjacent to the said branch tubes thereof, both said main pipe and auxiliary duct affording simultaneously open communication with the back-pressure tank.

704,293. INSECT-TRAP. HENRY A. BERLET, Indianapolis, Ind., assignor to the Household Manufacturing Company, Indianapolis, Ind., a Corporation of Indiana. Filed Apr. 25, 1902. Serial No. 104,701. (No model.)



Claim.—1. A trap of the class described including a rotary cylinder with depressions in its surface for bait, and a casing into which a portion of the cylinder extends for entrapping the insects as the cylinder rotates.

2. A trap of the class described including a rotary cylinder made of bright material with depressions in its surface for bait, and a casing into which a portion of the cylinder extends for entrapping the insects as the cylinder is rotated.

3. A trap of the class described including a casing having two chambers, one closed and the other open at the top and separated by a partition having openings leading from the open chamber into the closed chamber, the bottom of said chambers, the outer side of the closed chamber, and the partition below the openings therethrough being made of translucent material, a rotary bait-cylinder horizontally mounted in said open chamber with one side adjacent the partition between said chambers, and a guard-plate secured to the partition immediately above the openings therein and extending toward said cylinder.

4. A trap of the class described including a cylinder with grooves therein for bait, a casing in which said cylinder is horizontally mounted having a chamber in which the lower part of the cylinder extends, leaving the upper half of the cylinder exposed and the bottom of the casing being formed of translucent material and on one side the wall of said chamber closely approaching the cylinder, a guard-plate closing the other side of said chamber which extends toward the cylinder but is spaced therefrom far enough to permit insects on said cylinder to pass it, and means for rotating the cylinder.

5. A trap of the class described including a casing forming a chamber with the upper part open and the lower part made of translucent material, a cylinder mounted in said casing and having its lower portion extending into said chamber, said cylinder being provided with depressions in its surface for bait, means for rotating the cylinder, a guard-plate closing said chamber at one side of the cylinder but spaced sufficiently from the latter to permit insects on the cylinder passing into the chamber, and a guard-plate on the other side of the cylinder and closely approaching the latter.

6. A trap of the class described including a chamber one side of which is formed of translucent material and the opposite side of which is provided with a plate having openings through which the insects may pass, a rotary cylinder mounted adjacent to the side of the chamber having said openings, said cylinder being provided with depressions in its surface for bait, and a guard-plate arranged above said openings for directing the insects thereto.

7. A trap of the class described including a stationary casing with its bottom and side formed of wire-netting, a cylinder mounted horizontally with the lower portion extending into said casing, means for rotating said cylinder, a partition extending longitudinally of the casing for forming a chamber separated from the casing, the lower portion of which is made of translucent material and has openings through it for the passage of insects, and a guard-plate extending from the non-translucent portion of said partition immediately above the openings that approaches the cylinder.

8. A trap of the class described having a casing forming a chamber open at the top, a bait-cylinder made of bright material horizontally mounted in said chamber and closing the same, means for rotating the cylinder, means for supporting the casing in an elevated position, openings through the bottom of the casing through which insects may enter, and a closed chamber beside said open chamber and having openings leading from the open chamber, the bottom and side of said closed chamber being made of translucent material.

9. A trap of the class described including a casing having two longitudinally-extending chambers one open at the top the sides and bottoms of the chambers being formed of wire-netting, a longitudinal partition for separating the chambers the upper portion of which is formed of a bright plate with a series of conical passage-ways through said plate from the open chamber to the other chamber, a cylinder horizontally mounted with the lower portion extending into said open chamber and closing the same, means for rotating the cylinder, a guard-plate extending from the partition at a point above the openings therethrough toward the cylinder but spaced from the cylinder far enough to permit insects on the cylinder to pass it, means for supporting the casing in an elevated position, and a series of conical openings through the bottom of the casing leading into the chamber containing said cylinder.

704,294. LEATHER-LACE CUTTER. GODFREY O. BOEKHARDER, Eau Claire, Wis. Filed June 21, 1901. Serial No. 65,517. (No model.)

Claim.—1. In a lace-cutter the combination of a graduated regulating-plate pivoted on a suitable support, a spring-guide pivoted thereon and having two arms terminating in vertical and horizontal lips and a cutter fixed in the support, adjacent to such lips, as set forth.

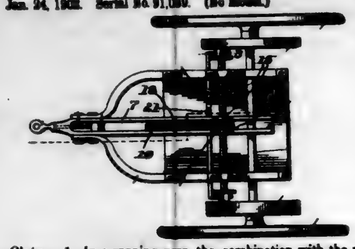
2. In a lace-cutter the combination of a graduated regulating-plate pivoted on a suitable support, a spring-guide pivoted thereon and having two arms terminating in vertical and horizontal lips, a spring-guard between the upper arm of the guide and its clamping thumb-nut, and a cutter-support adjacent to the guide-lips, as set forth.

704,295. NARROW-WARE LOOM. JOHN C. BROOKS, Paterson, N. J., assignor of one-half to Robert H. Sterrett, Paterson, N. J. Filed July 9, 1900. Serial No. 22,922. (No model.)

Claim.—1. In a needle-motion for looms, the combination of an oscillating arm or needle having a weft-tension device, of a weft-delivering finger pivoted at the end of the said arm or needle, a spring attached within the arm or needle, and acting normally to hold the finger in parallelism with the arm or needle, and a stop against which one end of the finger is brought in the oscillation of the arm or needle, whereby the finger is rested against the face of the spring and the loop of weft or filling thread widened so as to facilitate the passage therethrough of the selvage-shuttle, substantially as shown and described.

2. In a loom, a filling-controlling device comprising a filling-inserting needle, a thread-engaging device, and a spring inclosed within said needle, one end of the spring being secured to the needle and the other to the thread-engaging device.

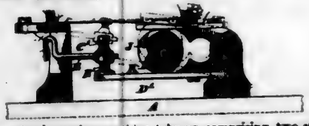
704,296. AUTOMOBILE. JACKSON D. CARRINGTON, Newcastle, Pa.; John S. Whitla administrator of said Carrington, deceased. Filed Jan. 24, 1902. Serial No. 91,089. (No model.)



Claim.—1. In a running-gear, the combination with the rear axle and interior gears mounted thereon, of a pair of bounds secured to the axle and having inwardly-projecting forward ends, a pair of braces secured at their rear ends to the said axle, and having their forward ends connected together and arranged between the forward ends of the said bounds, means for securing the forward end of the braces and the bounds together, a swivel connection secured in the forward ends of the said braces, a driven shaft journaled in bearings secured to the said bounds and having square end portions, pinions slidably mounted on the ends of the said shaft, means for independently operating said pinions into and out of engagement with the said interior gears, and means carried by the said driven shaft to rotate the said pinions, substantially as described.

2. In a running-gear, the combination with the rear axle, gears mounted thereon, of a pair of bounds secured to the axles and having their forward ends projecting inwardly, and their rear ends extending to the rear of the axle, brace-rods secured to the axle, and having their forward ends secured between the said bounds, a driven shaft, pinions slidably mounted on said driven shaft, means to operate said pinions into and out of engagement with said gears, hangers secured to the said bounds to the front and rear of the axle, and a platform supported by the said hangers, substantially as described.

704,297. SEWING-MACHINE TAKE-UP. JOSEPH J. M. CHAUVET and JOHN W. COULTER, New York, N. Y. Filed Aug. 1, 1900. Serial No. 25,482. (No model.)



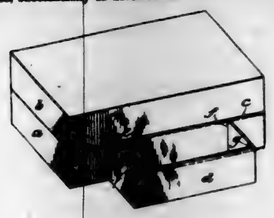
Claim.—1. A sewing-machine take-up comprising two stationary and separated thread-guiding members, a pivoted lever, and means for vibrating the same, and a guide carried by said lever between the other guides and adjustable toward and from the lever-pivot whereby the amount of the take-up may be varied.

2. A sewing-machine take-up, comprising stationary thread-guides, a vibrating take-up lever coöperating therewith, a normally inoperative thread-nipping device between the take-up and thread-supply comprising a lever and its support secured together at one end and adapted to engage the thread in the angle between them, the take-up lever having an arm extending over the thread-nipping lever, and an adjustable member carried by said arm and adapted to engage the movable member of the thread-nipping device before the completion of the take-up stroke.

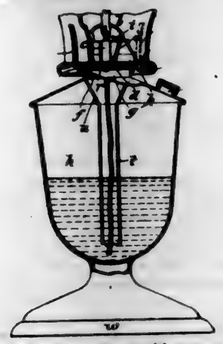
3. The combination with a take-up device, of a thread-nipping or tension device comprising a support and a spring-bar secured by one end to said support and adapted to receive the thread between them in its passage to the take-up, means for guiding the thread between said members and transversely of the spring-bar, a thread-stop extending across the space between spring-bar and support to limit the entrance of the thread between the two, said stop being located in the path of travel of the thread whereby the extent of the entrance of the thread within the angle between the parts of the nipping or tension device is determined, and means carried by the take-up for engaging said spring-bar to press it upon the thread before the completion of the take-up stroke.

704,298. BOX. EDGAR G. CLARK, New York, N. Y., assignor to Richard H. Colgate, Sidney H. Colgate, and Austen Colgate, Orange, N. J., and Gilbert Colgate, New York, N. Y., copartners doing business as Colgate & Company, Jersey City, N. J., and New York, N. Y. Filed Apr. 15, 1902. Serial No. 103,048. (No model.)

Claim.—The combination with a box-body and a cover hinged thereto, of a strip having its ends secured to the box-body and adapted to flex on four lines, whereby said strip may be folded flat against the body and may be extended to form a quadrangular support beneath the cover to retain the same, substantially as described.



704,299. LAMP. FREDERICK J. CLEARE, Montreal, Canada. Filed Feb. 19, 1902. Serial No. 94,502. (No model.)



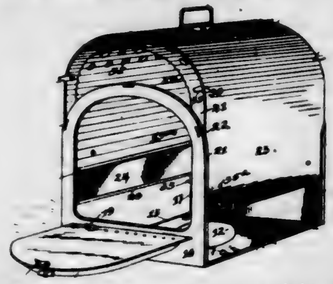
Claim.—1. In a lamp comprising a wick-passage and a chimney-support, the combination with said wick-passage, of a movable device consisting of a plate, a pair of levers fulcrumed between their ends one at each end of said wick-passage and carrying said plate at their upper ends, a contractile spring connected to the lower end of said levers for retaining the same yieldingly in a position with said plate across the exit end of said wick-passage, a movable device bearing upon the chimney carried upon the chimney-support and moving when said chimney is removed, and a link connection between said movable device and the lower end of said levers, whereby said plate will be caused to move to a position across said wick-passage upon the removal of said chimney, substantially as described and for the purpose set forth.

2. In a lamp the combination with a wick-passage and a chimney-supporting tray having a pair of stationary chimney-retaining fingers, of a movable device consisting of a plate, a pair of levers fulcrumed one at each end of said wick-passage and carrying said plate at their upper ends, a spring connected to the lower ends of said levers for retaining same yieldingly in a position with said plate across the exit end of said wick-passage, a pair of yielding fingers bearing upon the chimney carried by the tray, means for movably connecting said fingers to said tray and a pair of links connecting said movable fingers to the lower ends of said levers, substantially as described and for the purpose set forth.

3. The combination with a burner comprising a passage for the illuminant to be burned and a tray for supporting a chimney said tray having a pair of eccentric slots converging toward the center thereof, of a movable device, yielding means for retaining said device across said passage, a pair of angular strips each having a portion projecting upwardly through said slots, the other portion of each being slidably connected to the under side of the tray and means for operatively connecting said angular strips to said movable device, substantially as described and for the purpose set forth.

4. In a lamp the combination with a chimney-supporting tray having a pair of chimney-retaining fingers, a wick-passage; a wick raising and lowering spindle; of a plate; a pair of levers fulcrumed upon said spindle one at each side of said wick-passage and carrying said plate at their upper ends; an annular flange of rounded cross-section integral with and depending from the periphery of said tray; a contractile bailed spring located in said rounded flange and connected at its opposite ends to the lower ends of said levers; a pair of movable chimney-retaining fingers carried upon said tray, and link connections between said movable fingers and the lower ends of said levers, substantially as described and for the purpose set forth.

704,300. KNOCKDOWN OVEN. WILLIAM H. DAHMAN, St. Louis, Mo., assignor to A. Gutsel Manufacturing Company, St. Louis, Mo. Filed Apr. 24, 1902. Serial No. 104,602. (No model.)



Claim.—1. In a knockdown oven, a bottom; end plates extending upwardly from the ends of the bottom, and forming one shipping-piece; and a plate forming side pieces and a top adapted to fit between the end plates and form a second shipping-piece, said pieces carrying means of securing the parts together, substantially as specified.

2. In a knockdown oven, a bottom; end plates extending upwardly from the bottom and formed integrally therewith; a plate forming sides and top adapted to fit between the end plates; a lining mounted in the sides and top as required to make a flexible second shipping-piece; and means carried by said shipping-pieces for securing the parts together, substantially as specified.

3. In a knockdown oven, a bottom; end plates extending upwardly from the ends of the bottom, there being a door in one end plate; a plate forming sides and top and adapted to fit between said end plates; a lining attached to the sides and top to form an air-space; means of securing the parts together; and a shelf adapted to be mounted above the bottom, substantially as specified.

4. In a knockdown oven, a bottom having a heat-opening at its center; flanges extending upwardly from the side edges of the bottom; stop-tongues cut from the bottom, and extending upwardly inside of the flanges; an imperforate end plate extending upwardly from one end of the bottom; a second end plate extending upwardly from the other end of the bottom and having a door-opening; a door attached to the second end plate, all forming a single shipping-piece; a plate forming side pieces and the top adapted to fit between said end plates; flanges extending inwardly from the lower edges of said sides and adapted to fit between the flanges extending upwardly from the bottom and the stop-tongues; a lining mounted within the sides and top to form an air-space, said lining having a limited number of perforations in its upper part, and said lining being flexible; and sheets of asbestos paper outside of the lower parts of said lining, all forming a second shipping-piece; and a shelf adapted to be mounted between the lower edges of said lining and forming a third shipping-piece, substantially as specified.

5. A knockdown oven comprising a bottom having a heat-opening at its center; flanges extending upwardly from the side edges of the bottom; stop-tongues cut from the bottom and extending upwardly from one end of the bottom; a second end plate extending upwardly from the other end of the bottom, and having a door-opening; a door attached to said second end plate for closing said door-opening; flanges extending inwardly from the edges of both of said end plates, there being fastening-tongue openings through said end plates immediately inside of said flanges, all in one shipping-piece; a plate adapted to fit between said end plates and form the side pieces and top, said top being curved; flanges extending inwardly from the lower edges of said sides and adapted to fit between the flanges extending upwardly from the sides of the bottom, and said stop-tongues, so as to hold the side plates in position; spacing-flanges extending inwardly from the ends of the side plates; spacing-blocks extending inwardly from the side plates at points intermediate of their ends; a lining placed in position against the inner faces of said spacing-blocks and the inner edges of said spacing-flanges, so as to form an air-chamber between the lining and side plates and top, said lining being longitudinally corrugated to make it flexible and said lining having a limited amount of perforations to distribute heat from said chamber; bolts inserted through the side plates, through the spacing-blocks, and through the lining to hold the lining removably in position; shelf-flanges extending inwardly from the lower edges of said lining, said flanges being some distance above the bottom; fastening-tongues riveted to the edges of the top plate and

adapted to be inserted through said fastening-tongue openings formed in the end plates, said tongues being bent after insertion through said openings to hold the parts in position; and a handle attached to the top plate, all forming a second shipping-piece; and a shelf adapted to be supported by said shelf-flanges, and forming a third shipping-piece, substantially as specified.

704,801. LEUCOGALLOCYANIN AND PROCESS OF MAKING SAME. CHARLES DE LA HARPE, Basle, Switzerland, assignor to Firm of Dye Works, formerly L. Durand Huguenin & Co., Basle, Switzerland. Filed Feb. 27, 1902. Serial No. 96,995. (Specimens.)

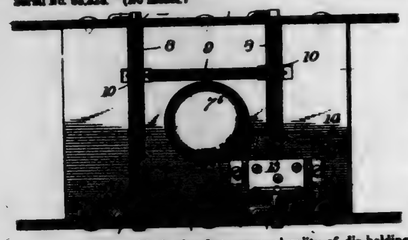
Claim.—1. An improvement in the manufacture of leucogallocyanins, consisting in treating the sulfonic gallocyanins by a reducing agent, substantially as set forth.

2. An improvement in the manufacture of leucogallocyanins, consisting in treating a sulfonic gallocyanin derived from a nitrosoalkylbenzylanilinsulfonic acid by a reducing agent, substantially as set forth.

3. An improvement in the manufacture of the leucogallocyanins, consisting in treating a sulfonic gallocyanin derived from the nitrosoethylbenzylanilinsulfonic acid, by a reducing agent, substantially as set forth.

4. As a new article of manufacture, the sulfonated leucogallocyanin obtained by means of a gallocyanin derived from a nitrosoalkylbenzylanilinsulfonic acid, this sulfonated leucogallocyanin being soluble in hot water with a yellowish-green coloration, in sodium acetate with a pale-blue color and in sulfuric acid with a reddish coloration turning to blue by addition of small quantities of an oxidizing agent.

704,802. HAND-STAMP. JOHN DURAND, Durham, N. C., assignor to The Firm of Durand and Ivey, Union Point, Ga. Filed July 15, 1901. Serial No. 68,223. (No model.)



Claim.—1. In a multicolor hand-stamp, a plurality of die-holding plates, and mechanism to shift part of said plates above or below the plane of the remainder to allow the dies to receive inks of different colors, and to shift the plates to a flush position to print from all the dies at a single impression.

2. A hand-stamp having a plurality of holders movable relative to each other adapted to receive type, and a rock-shaft to shift the holders into different planes.

3. A hand-stamp having a plurality of type-holders, a plurality of plates movable relative to each other, to which the holders are adapted to be attached, and a rock-shaft to move the plates into different planes.

4. A hand-stamp comprising a block or base, stationary and movable plates mounted thereon, type-holders supported by the plates, a rock-shaft connected to the movable plates and adapted to shift them out of plane with the stationary plates.

704,808. REVERSIBLE GALVANIC BATTERY. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to Edison Storage Battery Company, a Corporation of New Jersey. Filed Jan. 8, 1901. Serial No. 42,514. (No model.)

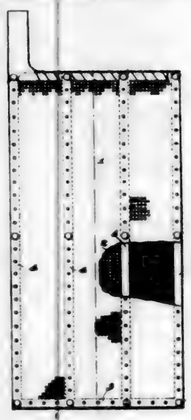
Claim.—1. In a reversible galvanic cell employing an alkaline electrolyte, an oxygen-storing element therefor comprising an intimate mixture of finely-divided oxid of mercury and an inert flake-like conducting material, substantially as set forth.

2. In a reversible galvanic cell employing an alkaline electrolyte, an oxygen-storing element therefor comprising an intimate mixture of flake-graphite and oxid of mercury, substantially as set forth.

3. In a reversible galvanic cell employing an alkaline zincate as the electrolyte, an oxygen-storing element containing finely-divided oxid of mercury and an inert flake-like conducting material, and a plate for receiving the deposited zinc, substantially as set forth.

4. In a reversible galvanic cell, an alkaline zincate as the electrolyte, an oxygen-storing element containing finely-divided oxid of mercury, and a plate of magnesium for receiving the deposited zinc, substantially as set forth.

5. An electrode for a reversible galvanic cell, comprising a receptacle having perforated walls and an active material mixed with flake-graphite in said receptacle, the bulk of the particles of the graphite being larger than such perforations, substantially as set forth.



704,804. REVERSIBLE GALVANIC BATTERY. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to Edison Storage Battery Company, a Corporation of New Jersey. Filed Mar. 1, 1901. Serial No. 49,662. (No model.)

Claim.—1. An active element for an alkaline reversible galvanic battery, comprising a conducting-support and a mixture of oxid of cobalt and an inert flake-like conducting material carried thereby, substantially as set forth.

2. An active element for an alkaline reversible galvanic battery, comprising a conducting-support and a mixture of an oxid of cobalt containing more oxygen than the black oxid (Co_3O_4) and a flake-like inert conducting material carried thereby, substantially as set forth.

3. An active element for an alkaline reversible galvanic battery, comprising a conducting-support and a mixture of a hydrated oxid of cobalt and an inert flake-like conducting material carried thereby, substantially as set forth.

4. An active element for an alkaline reversible galvanic battery comprising a conducting-support, and a mixture of flake-graphite and oxid of cobalt carried thereby, substantially as set forth.

5. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided electrolytically-active iron when charged, and a conducting-support carrying an oxid of cobalt capable of furnishing oxygen on discharge, substantially as set forth.

6. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, and a conducting-support carrying a mixture of flake-graphite and oxid of cobalt capable of furnishing oxygen on discharge, substantially as set forth.

7. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of working, and two elements therein insoluble in such electrolyte, the depolarizing element having for its active material an electrolytically-active oxid of cobalt, substantially as set forth.

8. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, and an oxid of cobalt carried thereby having more oxygen than Co_3O_4, substantially as set forth.

9. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, an oxid of cobalt carried thereby having more oxygen than Co_3O_4, and an inert conducting material intimately mixed with said oxid, substantially as set forth.

10. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, an oxid of cobalt carried thereby having more oxygen than Co_3O_4, and an inert flake-like conducting material intimately mixed with said oxid, substantially as set forth.

11. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, an oxid of cobalt carried thereby having more oxygen than Co_3O_4, and flake-graphite intimately mixed with said oxid, substantially as set forth.

12. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, a hydrated oxid of cobalt carried thereby, and a flake-like inert conducting material intimately mixed with said oxid, substantially as set forth.

13. In a reversible galvanic battery, the combination of an alkaline electrolyte which remains unchanged during all conditions of working, a conducting-support therein, an insoluble oxidizable material carried by said support, a second conducting-support, a hydrated oxid of cobalt carried thereby, and flake-graphite intimately mixed with said oxid, substantially as set forth.

14. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, and another conducting-support carrying oxid of cobalt having when charged electrolytically more oxygen than Co_3O_4, substantially as set forth.

15. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, and another conducting-support carrying a hydrated oxid of cobalt, substantially as set forth.

16. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, another conducting-support carrying oxid of cobalt capable of furnishing oxygen for the oxidation of the iron on discharge, and flake-graphite intimately mixed with said oxid, substantially as set forth.

17. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided oxid of iron when discharged, another conducting-support carrying an oxid of cobalt, and flake-graphite intimately mixed with said oxid, substantially as set forth.

18. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, another conducting-support carrying oxid of cobalt having when charged electrolytically more oxygen than Co_3O_4, and flake-graphite intimately mixed with said oxid, substantially as set forth.

19. In a reversible galvanic battery, an alkaline electrolyte, a conducting-support carrying finely-divided iron when charged, another conducting-support carrying a hydrated oxid of cobalt, and flake-graphite intimately mixed with said oxid, substantially as set forth.

704,805. ELECTRODE FOR BATTERIES. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to Edison Storage Battery Company, a Corporation of New Jersey. Filed May 17, 1901. Serial No. 60,661. (No model.)

Claim.—1. An electrode for a galvanic battery, comprising a support, a plurality of pockets or receptacles carried thereby and arranged in substantially the same plane, each pocket or receptacle being made of elastic metal with corrugated walls, and an active material in said pockets or receptacles, substantially as set forth.

2. An electrode for a galvanic battery, comprising a support, a plurality of pockets or receptacles carried thereby and arranged in substantially the same plane, each pocket or receptacle being made of elastic metal with horizontally-corrugated walls, and an active material in said pockets or receptacles, substantially as set forth.

3. An electrode for a galvanic battery comprising a grid having an opening therein, a pocket or receptacle secured in said opening and having corrugated walls, and an active material in said pocket or receptacle, substantially as set forth.

4. An electrode for a galvanic battery comprising a grid having an opening therein, a pocket or receptacle secured in said opening and having horizontally-corrugated walls, and an active material in said pocket or receptacle, substantially as set forth.

5. An electrode for a galvanic battery comprising a grid having a plurality of openings therein, a pocket or receptacle secured in each opening and having corrugated walls, and an active material in said pockets or receptacles, substantially as set forth.

6. An electrode for a galvanic battery, comprising a support, a plurality of pockets or receptacles carried thereby and arranged in substantially the same plane, each pocket or receptacle being made of interengaging sections of elastic metal with corrugated walls, and an active material in said pockets or receptacles, substantially as set forth.

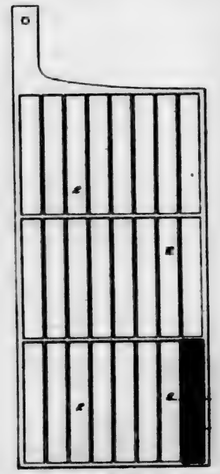
7. An electrode for a galvanic battery comprising a support, a pocket or receptacle having corrugated walls and secured at its edges to said support, and an active material in said pocket or receptacle, substantially as set forth.

8. An electrode for a galvanic battery comprising a support, a pocket or receptacle carried thereby and having perforated outer faces and being formed of two sections, one of which is deeper than the other and the deeper being turned over upon the shallow section, and an active material in said pocket or receptacle, substantially as set forth.

9. An electrode for a galvanic battery comprising a support, a pocket or receptacle carried thereby made of elastic metal and formed of two cup-like sections fitted together, the main face of each section being perforated with numerous perforations within the sides thereof, and an active material in said pocket or receptacle, substantially as set forth.

10. An electrode for a galvanic battery comprising a support, a perforated receptacle carried thereby and made of highly-elastic metal, and an active material in said receptacle so proportioned in bulk in relation to the elasticity of the elastic metal that any changes in volume thereof will be within the elastic limits of the walls of said receptacle, substantially as set forth.

704,806. REVERSIBLE GALVANIC BATTERY. THOMAS A. EDISON, Llewellyn Park, N. J., assignor to Edison Storage Battery Company, a Corporation of New Jersey. Filed June 20, 1901. Serial No. 65,222. (No model.)



Claim.—1. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and an electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

2. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and a mixture of electrolytically-active oxid of a magnetic metal other than iron and a flake-like conducting material carried by the second support, substantially as set forth.

3. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and a mixture of electrolytically-active oxid of a magnetic metal other than iron and flake-graphite carried by the second support, substantially as set forth.

4. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by the conducting-support, a second conducting-support having perforated pockets or receptacles, and an electrolytically-active oxid of a magnetic metal other than iron carried within said pockets or receptacles, substantially as set forth.

5. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by the conducting-support, a second conducting-support having perforated pockets or receptacles, and a mix-

ture of electrolytically-active oxid of a magnetic metal other than iron and an inert flake-like conducting material carried within said pockets or receptacles, substantially as set forth.

6. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by the conducting-support, a second conducting-support having perforated pockets or receptacles, and a mixture of electrolytically-active oxid of a magnetic metal other than iron and flake-graphite carried within said pockets or receptacles, substantially as set forth.

7. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, a mixture of finely-divided copper and a flake-like inert conducting material carried by said support, a second support, and an electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

8. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, a mixture of finely-divided copper and flake-graphite carried by said support, a second support, and an electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

9. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, finely-divided copper carried within said pockets or receptacles, a second conducting-support, and an electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

10. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, a mixture of finely-divided copper and a flake-like conducting material carried within said pockets or receptacles, a second conducting-support, and an electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

11. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, a mixture of finely-divided copper and flake-graphite carried within said pockets or receptacles, a second conducting-support, and electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

12. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, finely-divided copper carried within said receptacles, a second conducting-support having pockets or receptacles, and electrolytically-active oxid of a magnetic metal other than iron carried within the receptacles of the second support, substantially as set forth.

13. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, a mixture of finely-divided copper and an inert conducting material carried within said pockets or receptacles, a second conducting-support having pockets or receptacles, and a mixture of electrolytically-active oxid of a magnetic metal other than iron and a flake-like conducting material carried within the pockets or receptacles of the second support, substantially as set forth.

14. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support having perforated pockets or receptacles, a mixture of finely-divided copper and flake-graphite carried within said pockets or receptacles, a second conducting-support having pockets or receptacles, and a mixture of electrolytically-active oxid of a magnetic metal other than iron and flake-graphite carried within the pockets or receptacles of the second support, substantially as set forth.

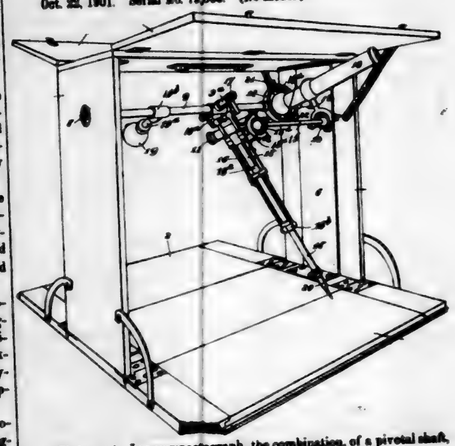
15. In a reversible galvanic battery, the combination of an alkaline electrolyte, a conducting-support, copper carried thereby in such finely-divided form that when subjected to electrical oxidation it does not produce a copper salt soluble in such solution, a second conducting-support, and electrolytically-active oxid of a magnetic metal other than iron carried by the second support, substantially as set forth.

16. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and an electrolytically-active oxid of nickel carried by the second support, substantially as set forth.

17. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and a mixture of electrolytically-active oxid of nickel and a flake-like conducting material carried by the second support, substantially as set forth.

18. In a reversible galvanic battery, the combination of an electrolyte which remains unchanged during all conditions of use, a conducting-support, finely-divided copper carried by said support, a second conducting-support, and a mixture of electrolytically-active oxid of nickel and flake-graphite carried by the second support, substantially as set forth.

704,807. PERSPECTOGRAPH. OTTO EICHENBERGER, Geneva, Switzerland, assignor to Paul Galopin, Geneva, Switzerland. Filed Oct. 22, 1901. Serial No. 79,560. (No model.)

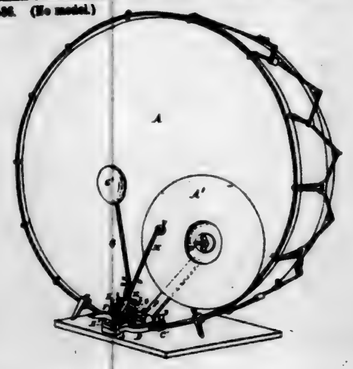


Claim.—1. In a perspectograph, the combination, of a pivotal shaft, standards therefor, a telescope mounted on said shaft, a pencil-holding frame independently mounted on said shaft in a plane at right angles to said telescope, and a rod connecting said telescope and pencil-holding frame, substantially as set forth.

2. In a perspectograph, the combination of a pivotal shaft, standards therefor, a telescope mounted on said shaft, a pencil-holding frame independently mounted on said shaft in a plane at right angles to said telescope, and a rod connecting said telescope and pencil-holding frame at points equidistant from their respective pivotal centers, substantially as set forth.

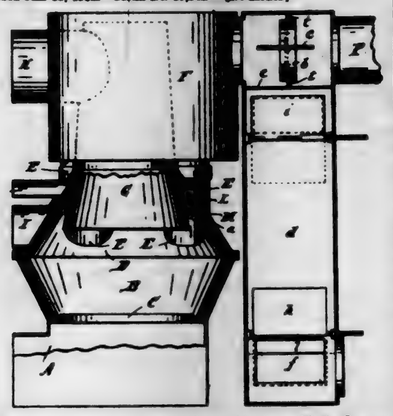
3. In a perspectograph, the combination, of a pivotal shaft supported on suitable standards, a telescope, a ring provided in said shaft, lugs on said telescope for mounting the telescope in said ring, a pencil-holding frame pivotally mounted on said shaft a suitable distance from said telescope and movable in a plane at right angles thereto, and a rod provided with universal joints for connecting with said telescope and pencil-holding frame at similar points relatively to their respective pivotal centers, substantially as set forth.

704,808. PEDAL DEVICE FOR BASS-DRUMS AND CYMBALS. WILLIAM C. L. EVANS, Brooklyn, N. Y. Filed Oct. 4, 1901. Serial No. 77,598. (No model.)



Claim.—In a pedal device for playing the bass-drum and cymbal, the combination of the pedal-lever and its base-plate, with the clamps for attaching the drum and a detachable cymbal-holder, a cymbal-beater and drum-stick on one pivot-lever and the pedal-lever engaging said pivot-lever to operate both said beater and drum-stick.

704,809. HOT-AIR FURNACE. GEORGE H. FOOTE, Dayton, Ohio. Filed Jan. 13, 1902. Serial No. 89,862. (No model.)



Claim.—1. In a hot-air furnace, the combination, with the fire-pot, combustion-chamber, and fuel-magazine, of an air-chamber surrounding only the lower end of the magazine above the combustion-chamber, with air-inlet therefor, and a perforated bottom plate for said air-chamber above the mouth of said magazine to admit the air-blast into the combustion-chamber around the magazine but not at its mouth, substantially as shown and described.

2. In a hot-air furnace, the combination, with a fire-pot, combustion-chamber and heating-drum, of a smoke-retainer, having a direct passage therethrough to the smoke-pipe, and provided with medial partitions forming four passage-ways for the smoke from top to bottom of the furnace, with dampers for controlling said passage-ways, said passage-ways and dampers being so arranged that the products of combustion may be compelled to traverse only two or most passage-ways, when desired, substantially as shown and described.

704,810. MAGAZINE TORPEDO-CANE. JOHN H. FOX, Fostoria, Ohio. Filed Nov. 12, 1901. Serial No. 82,044. (No model.)

Claim.—1. In a repeating torpedo-cane, the combination of a cane-body or the like having a magazine extending from the lower end upward to an inlet; an inner ferrule permanently mounted on the lower end of the body and having a lateral outlet for the magazine; an outer ferrule telescopically mounted over the inner ferrule and adapted to reciprocate thereon to and from contact of the bottom ends of the ferrules; complementary grooves in the outer and inner ferrules; a ball confined within the grooves, adapted to limit the outward movement of the parts, and means to feed torpedoes singly from the outlet of the magazine into the outer ferrule by the reciprocation of the ferrules.

2. In a magazine torpedo-cane, the combination of a cylindriform mortar having interior parallel longitudinal grooves in its wall; a cylindriform firing-plug mounted in the mortar and movable telescopically therein to and from contact with the bottom of the mortar and having exterior grooves in alinement with the grooves of the mortar adapted to fully register therewith when the bottom of the plug is in contact with the bottom of the mortar, and form inclosed bisected bores; balls in the bisected bores thus formed, adapted to prevent the full withdrawal of the plug; a cane-body or the like having its lower end mounted in the firing-plug and provided with a magazine having a lateral outlet through the plug, and means to feed torpedoes singly from the outlet of the magazine into the mortar by the reciprocation of the mortar on the plug or the plug in the mortar.

3. In a torpedo-cane the combination of a cylindriform mortar having a lateral cavity in its interior wall; a cylindriform firing-plug mounted in the mortar and movable telescopically therein to contact with the bottom of the mortar and having a lateral orifice through its wall adapted to register with the cavity in the wall of the mortar when the bottom of the plug is in contact with the bottom of the mortar and to be kept closed by the wall of the mortar when moved out of register with the cavity; and means to prevent the entire withdrawal of the plug from the mortar, and its rotation therein.

4. In a torpedo-cane the combination of a cylindriform mortar having a lateral cavity in its interior wall; a cylindriform firing-plug mounted in the mortar and movable telescopically therein to contact with the bottom of the mortar and having a lateral orifice through its wall adapted to register with the cavity in the wall of the mortar when the bottom of the plug is in contact with the bottom of the mortar and to be kept closed by the wall of the mortar when moved out of register with the cavity; means to prevent the entire withdrawal of the plug from the mortar, a cane-body having its lower end secured in the plug and having a central longitudinal bore extending from the lower end upward to an opening provided with a closure, and a lateral opening from the bore of the cane-body to the lateral orifice of the plug.

5. In a magazine torpedo-cane, the combination of a cylindriform mortar, having an interior longitudinal segmental plane provided with a lateral cavity and a groove extending longitudinally within the plane out of line with the cavity; a cylindriform firing-plug telescopically mounted in the mortar having an exterior segmental plane coinciding with the plane of the mortar, and closing its lateral cavity, and provided with an orifice adapted to register with the cavity and also provided with a groove adapted to register with the grooves of the mortar and form an inclosed bisected bore, when the bottom of the plug is in contact with the bottom of the mortar; a ball in the bisected bore adapted to prevent the entire withdrawal of the plug from the mortar; a cane-body secured in the plug and having a central longitudinal bore extending from the lower end upward to an opening provided with a closure; and a lateral opening from the bore of the cane-body to the lateral orifice of the plug.

6. In a magazine torpedo-cane the combination of a cane-body having a central longitudinal bore extending from the lower end upward to an opening provided with a closure; an inner ferrule permanently mounted on the lower end of the cane-body having a lateral orifice connected with the bore of the cane-body; an outer ferrule telescopically mounted over the inner ferrule and closing its lateral orifice and having a lateral cavity adapted to register with the lateral orifice of the inner ferrule when the bottom of the latter contacts with the bottom of the outer ferrule; complementary coinciding grooves in the coinciding faces of the ferrules; and a ball confined between each pair of complementary grooves.

704,811. FACE-PROTECTOR. MAXIMILIAN GALLEY, Hanover, Germany. Filed Nov. 23, 1900. Serial No. 37,268. (No model.)

Claim.—1. A face-protector comprising a suitable curved imperforate screen adapted to fit around the wearer's forehead and cover his face to a point below the mouth, means for holding the screen in place, and means for holding the screen away from the wearer's face, substantially as set forth.

2. A face-protector comprising a suitably-curved imperforate screen adapted to fit around the wearer's forehead and cover his face to a point below the mouth, a band attached to the upper edge of the screen and adapted to fit upon some part of the wearer's head to secure said screen in place, and means for holding the screen away from the wearer's face, substantially as set forth.

3. A face-protector comprising a suitably-curved imperforate screen adapted to fit around the wearer's forehead and cover his face to a point below the mouth, a band attached to the upper edge of the screen and adapted to fit upon some part of the wearer's head to hold said screen thereto, and a suitable pad on the inner side of the screen and adapted to rest on the wearer's nose, substantially as set forth.

4. A face-protector comprising a suitably-curved screen adapted to fit around the wearer's forehead and cover his face to a point below the mouth, a band attached to the upper part of the screen and adapted to fit upon some part of the wearer's head to hold the screen thereto, and an elastic band connected to the sides of said screen and adapted to fit under the wearer's chin, substantially as set forth.

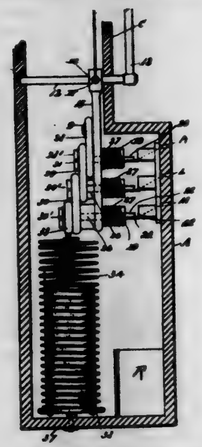
5. The combination with a suitably-curved screen adapted to fit around the wearer's forehead and cover his face, and means for holding said screen in position on the wearer, of an inner band attached to the sides of the screen and adapted to fit over the wearer's mustache, substantially as set forth.

6. A face-protector comprising a suitably-curved screen adapted to fit around the wearer's forehead and cover his face, means for holding the screen in position on the wearer, and an open tray projecting from the lower edge of the screen, into which the scurf, cut hair and the like may fall, substantially as set forth.

7. A face-protector comprising a suitably-curved screen adapted to fit around the wearer's forehead and cover his face to a point below the mouth, means for holding the screen in position on the wearer, a pad attached to the screen and adapted to sit on the wearer's nose, an inner band attached to the side of the screen and adapted to fit over the wearer's mustache, and an open tray projecting from the lower edge of the screen to receive chippings and other debris, substantially as set forth.

8. A face-protector comprising a suitably-curved screen of transparent material, adapted to fit over the wearer's forehead and cover his face to a point below the mouth, and means for attaching said screen to the head, substantially as set forth.

704,812. COIN-ACTUATED MACHINE. PAUL S. GATTOLLIAT, Jersey City, N. J., assignor of two-fifths to William H. Bernard, Jersey City, N. J. Filed June 24, 1901. Serial No. 65,769. (No model.)



Claim.—1. In an apparatus of the class described, the combination with a resistance or tensional device, of a lever suitably fulcrumed adjacent thereto and in connection with said resistance or tensional device, and coin-actuated devices for changing the point of the connection of said lever with said resistance or tensional device longitudinally of said lever, substantially as shown and described.

2. In an apparatus of the class described, a casing, a tensional or resistance device in the bottom of said casing, a lever supported over said device and projecting from the top of said casing, a plurality of pivotal connected links pivotally connected at one end with said lever and at the opposite end with said resistance or tensional device and coin-actuated devices for connecting each of said links with said lever so as to increase the distance between the pivotal support of the lever and its connection with said resistance or tensional device, substantially as shown and described.

3. In an apparatus of the class described, a casing, a tensional or resistance device in the bottom of said casing, a lever pivoted in the top portion of said casing, a plurality of pivotally-connected links, said links being connected at one end to said lever and at the opposite end to said tensional or resistance device, and coin-actuated devices for connecting the opposite links with said lever at different distances from its pivotal support, said casing being also provided in the front thereof with slots corresponding with said links and with said coin-actuated devices and through which a coin may be passed, substantially as shown and described.

4. In an apparatus of the class described, a casing, a tensional or resistance device secured in the bottom of said casing, a lever pivoted in the top portion of said casing, a link pivoted to said lever, a second link pivoted to the first-named link, and in operative connection with the tensional or resistance device, a hollow pivoted stud at the bottom of the first link and coin-actuated devices adapted to be operated by the vibration of the lever, so as to connect the second link with the lever, said devices comprising a pin adapted to lock the second link to the lever by passing into said stud, a spring normally forcing such pin into the unlocking position, a coin-plate having a semicircular cavity in the side of one-half of the diameter of the actuating-coin, a like coin-cavity formed in a coin-shelf secured to the casing, and a slot in the casing through which a coin may be passed, substantially as shown and described.

5. In a device of the class described, the combination with a casing, of a plurality of adjacent coin-slots, a plate having a semicircular coin-receiving cavity with a coin-receiving shelf of less width than one-half the diameter of the coin fitting each cavity located below each of the coin-slots, a pivoted hand-actuated lever carrying a plurality of coin-shelves adapted to coact with the coin-shelves secured to the casing adjacent to the slot so as to receive a coin between them, means carried by such coin-shelves for causing the shelves to be forced backward by the pressure exerted thereon by the coin upon the first movement of the lever, and a plurality of devices each having a different action from the other and adapted to be locked to the lever separately accordingly as the coin is inserted in one slot or the other, substantially as shown and described.

6. In a device of the class described, the combination with a casing, of a shaft vibratorily mounted in the casing, a hand-lever located without the casing secured to the shaft in such manner as to vibrate the same, an actuating-lever secured to the shaft so as to vibrate therewith located within the casing, an air recoil-cylinder closed at the bottom and open at the top located within the casing and secured thereto at the bottom by a pivot-joint, a spiral spring surrounding the cylinder secured to such cylinder at the bottom, a piston within the cylinder, a piston-rod secured to the piston secured to the upper end of the spring, a link pivoted to the upper end of the piston-rod in pivotal connection with the actuating-lever, a coin slot in the casing having a coin-shelf in the inner side of the casing adjacent thereto to receive the coin, and mechanism carried by the actuating-lever adapted to receive a portion of the coin dropped through the slot upon the coin-shelf in such manner that the first movement of the lever will by the pressure exerted upon the coin lock the link to the lever so as to vibrate the same in unison with the lever, substantially as shown and described.

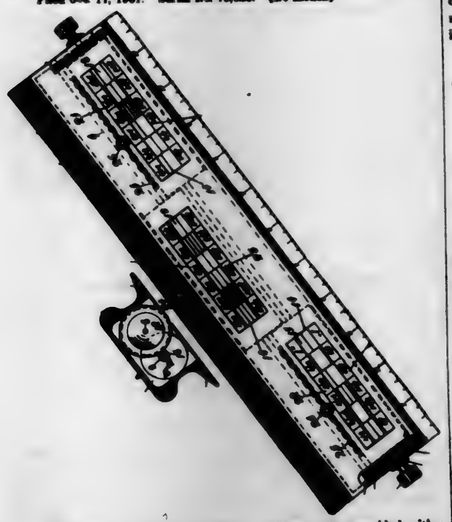
7. In a device of the class described the combination with a casing, of a shaft vibratorily mounted in the casing, a hand-lever located without the casing secured to the shaft in such manner as to vibrate the same, an actuating-lever secured to the shaft so as to vibrate therewith located within the casing, an air recoil-cylinder closed at the bottom and open at the top located within the casing and secured thereto at the bottom by a pivot-joint, a spiral spring surrounding the cylinder secured to such cylinder at the bottom, a piston within the cylinder, a piston-rod secured to the piston secured to the upper end of the spring, a plurality of links pivoted together, the ends of the chain so formed being pivoted at one end to the piston-rod and at the other to the actuating-lever, a like plurality of coin-slots formed in the casing provided on the inner side of the casing with coin-receiving shelves located below the same provided with coin-cavities in the side walls, a like plurality of coin-receiving shelf-plates provided with semicircular cavities merging by gentle curves into outward projections on either side carried by the lever normally pressed away therefrom by suitable springs, and a locking-pin carried by each of said coin-shelves adapted to be forced backward through the actuating-lever so as to lock the lower end of the link adjacent thereto to the lever by the pressure caused by the contact of the outer projections of the coin-shelf against the coin in the vibration of the lever, substantially as shown and described.

8. In a device of the class described, the combination with a casing, of a shaft vibratorily mounted in the casing, a hand-lever located without the casing secured to the shaft in such manner as to vibrate the same, an actuating-lever secured to the shaft so as to vibrate therewith located within the casing, an air recoil-cylinder closed at the bottom and open at the top located within the casing, and secured thereto at the bottom by a pivot-joint, a spiral spring surrounding the cylinder secured to such cylinder at the bottom, a piston within the cylinder, a piston-rod secured to the piston secured to the upper end of the spring, a plurality of links pivoted together, the ends of the chain so formed being pivoted at one end to the piston-rod and at the other to the actuating-lever, a like plurality of coin-slots formed in the casing provided on the inner side of the casing with coin-receiving shelves located below the same provided with coin-cavities in the side walls, a like plurality of coin-receiving shelf-plates provided with semicircular cavities merging by gentle curves into outward projections on either side carried by the lever normally pressed away therefrom by suitable springs, a locking-pin carried by each of said coin-shelves adapted to be forced backward through the actuating-lever so as to lock the lower end of the link adjacent thereto to the lever by the pressure caused by the contact of the outer projections of the coin-shelf against the coin in the vibration of the lever, an indicating-dial, an indicating-hand pivoted to the dial, and means connecting the hand with the vibrating shaft whereby such hand is vibrated upon the vibration of the handle, substantially as shown and described.

9. In a device of the class described, the combination with a casing, of a recoil air-cylinder closed at the bottom and open at the top secured at the bottom to the casing by a flexible joint, a spiral spring secured to the bottom cylinder and surrounding the same, a piston located within the same, a piston-rod secured to the piston, a shaft vibratorily mounted in the casing, a hand-lever vibrating such shaft secured thereto without the casing, an actuating-lever secured to such shaft within the casing, a link 29 pivoted to the lever, a link 29 pivoted to the link 26 upon a pivot-stud having an axle-hole, a like link 30 pivoted in like manner to the link 29 provided with a like stud pivotally secured to the top of the piston-rod, studs 19 secured upon the opposite sides of the actuating-lever, coin-plates 21 provided with a central circular cavity merging at the sides into outward projections 23 reciprocating in the slot and in the studs 19, a locking-pin carried by the coin-plates passing through the actuating-lever and adapted to be forced back into the link adjacent thereto, one of such studs and plates being provided for each of the links, springs located between the coin-shelf and the actuating-lever normally forcing the bolts into the unlocking position, a coin-slot in the casing for each of the links, and a coin-shelf located below each of the slots adapted to coact with each of the coin-shelves carried by the studs upon the lever to receive the coins, substantially as shown and described.

10. In an apparatus of the class described, a casing, a resistance or tensional device mounted in the bottom thereof, a lever suitably fulcrumed adjacent thereto and in connection with said resistance or tensional device and passing through the top of the casing and coin-actuated devices for changing the point of connection of said lever and said resistance or tensional device longitudinally of said lever, said lever being also provided at the upper or outer end thereof with a finger hole or piece, substantially as shown and described.

704,813. RULE. BENJAMIN M. GERARDE, Jersey City, N. J. Filed Oct. 17, 1901. Serial No. 79,088. (No model.)

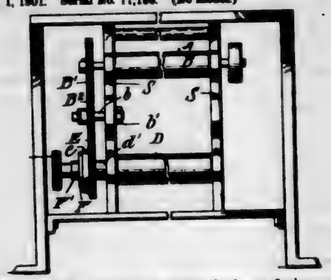


Claim.—1. A scale comprising an oblong casing provided with a plurality of longitudinal shafts geared in connection so that one of said shafts will turn more rapidly than the other, said casing being also provided in the top thereof with a plurality of slots or openings and said shafts being provided with scale-cylinders beneath said slots or openings, and said slots or openings being provided at one side thereof with a scale-index, substantially as shown and described.

2. A rule comprising an oblong casing having a plurality of shafts mounted therein longitudinally thereof and geared in connection in such manner that one of said shafts will turn more rapidly than the other, said casing being also provided in the top thereof over said shafts with slots or openings having a scale-index at the sides thereof, and scale-cylinders mounted on said shafts beneath said slots or openings substantially as shown and described.

3. A scale comprising an oblong casing provided with a plurality of longitudinal shafts geared in connection so that one of said shafts will turn more rapidly than the other, said casing being also provided in the top thereof with a plurality of slots or openings and said shafts being provided with scale-cylinders beneath said slots or openings and said slots or openings being provided at the sides thereof with a scale-index, one of said shafts being also projected through both ends of the casing and being provided at both ends with a knob or handle, substantially as shown and described.

704,814. TAKE-UP FOR LOOMS. FREDERICK C. GERTH, Columbia, Pa., assignor of one-half to Ferdinand W. Kort, Columbia, Pa. Filed Oct. 1, 1901. Serial No. 77,188. (No model.)

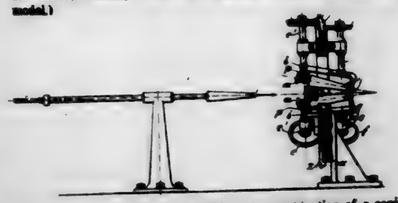


Claim.—The herein-described frictional take-up for looms comprising a take-up roll having a projecting shaft threaded at its end, a collar fixed on the shaft, a pinion rotatably mounted on the end of said shaft between the collar and the threaded portion thereof, a frictional disk slidably mounted on the shaft exterior to the pinion but rotatable with the shaft, a hand-operated nut screwed on the threaded end of said shaft exterior to and engaging the hub of the disk, and a separating-spring placed on the shaft between the disk and pinion, said spring being confined in a recess in the disk; with the outfeed-roll, and gearing for driving said pinion from said outfeed-roll, substantially as and for the purpose specified.

704,815. STOP-COCK FOR GAS-BURNERS. GLENN D. GIBBS, Pittsburg, Pa. Filed Mar. 15, 1902. Serial No. 98,752. (No model.)

Claim.—A gas-cock comprising a valve-casing having oppositely-disposed inlet and outlet ports, a plug-valve fitted to rotate in the casing and having a recess, a shoulder on the valve extending over the recess, a by-pass in said casing, means for regulating the flow of gas through the by-pass, and an indicating-lug carried by the handle of the valve to indicate the position of the valve, substantially as shown and described.

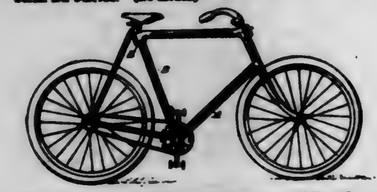
704,816. MACHINE FOR DRAWING TUBES. JOSEF GIESHOLDT, Dusseldorf, Germany. Filed Aug. 23, 1900. Serial No. 28,268. (No model.)



Claim.—In a tube-drawing machine, the construction of a conical hollow axially-movable outer mandrel, with an inner mandrel axially movable within the outer mandrel, a series of conical drawing-rolls, and sepa-

rate means for radially adjusting each end of said rolls, substantially as specified.

704,817. BICYCLE. HARRY R. GILLIS, Hinkwonsin, Ind., assignor of one-half to Mathias Lang, Hinkwonsin, Ind. Filed July 7, 1897. Serial No. 643,722. (No model.)

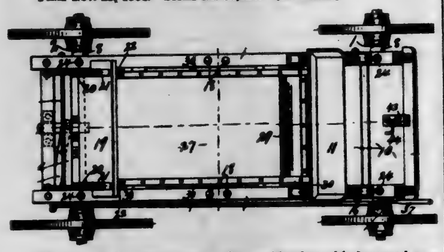


Claim.—1. A detachable brace for bicycles consisting of a substantially U-shaped bar provided at one end with a clamp to engage the steering-head, at the other end with a clamp to engage the upright seat-support, and intermediate the two ends with a clamp engaging the drop portion of the bicycle, substantially as described.

2. A detachable frame-bar for bicycles provided with a clamp at each end set at the proper angle to embrace the steering-head and the seat-supporting bar of a bicycle-frame, and an additional clamp located intermediate of the ends of the bar to engage the front bar of said frame, each clamp consisting of two members curved to conform to the shape of the part or bar to be engaged, one of said members being rigid upon the bar, while the other member has a hinged connection therewith, a perforated flange upon the outer end of each member, and bolts to engage the perforations to secure the members together, substantially as described.

3. In a convertible bicycle, the combination with a removable upper frame-bar, of a detachable brace consisting of a curved bar provided at the ends with means to engage the steering-head and the seat-support and intermediate the two ends with means to engage the drop portion of the frame, substantially as described.

704,818. DUMP-WAGON. BYRON H. GLEASON, Canastota, N. Y., assignor of one-half to Abram T. Van Valkenburgh, Canastota, N. Y. Filed Nov. 26, 1901. Serial No. 83,627. (No model.)



Claim.—1. In a dump-wagon, the combination with front and rear axles, of a frame having parallel side bars mounted on the axles, a transverse tie-rod connecting the intermediate portions of the side bars, a stop-bar secured to the side bars in front of said rod, a second bar connecting the rear ends of the side bars, and a box pivotally mounted resting on the stop-bar and its rear end open and tilting between the other bar and the rod in front of the rear axle.

2. In a dump-wagon, the combination with front and rear axles, of a frame having parallel side bars mounted on the axles, a transverse tie-rod connecting the intermediate portions of the side bars, a seat mounted on the side bars in front of the tie-rod, a tail-board connecting the rear ends of the side bars at the rear of the tie-rod, and a box pivotally mounted on the rod and swinging between the seat and tail-board in front of the rear axle.

3. A dump-wagon comprising front and rear axles, lengthwise side bars connected to the axles, a tie-rod connecting the central portions of the side bars, a transverse bar connecting the rear ends of the side bars, a tail-board rising from the side bars in front of the transverse bar, a seat mounted on the front ends of the side bars in front of the tie-rod, a tilting box mounted on the rod and swinging between the seat and tail-board in front of said transverse bar and rear axle, and a catch for holding the box in normal position.

4. A dump-wagon comprising a frame and a rearwardly-tilting box pivotally mounted on the frame each having inclined stop-faces at the front and at the rear of the pivot for the purpose set forth.

5. A dump-wagon comprising a frame having separated lengthwise side bars, a tilting box pivotally mounted on the frame, and movable between the bars, said bars and box having rub-plates at opposite sides of the pivot and provided with upwardly-converging faces to hold the box from lateral and endwise movement when in its normal position.

6. A dump-wagon comprising a frame having intermediate bearings and transverse bars in front and at the rear of the bearings, a rearwardly-tilting box mounted in said bearings in front of the rear transverse bar and normally resting on the front transverse bar and swinging downwardly in front of the rear transverse bar, and a movable catch mounted on the rear transverse bar and holding the box in its normal position.

7. A dump-wagon comprising a frame having separated lengthwise side bars, a seat fixed to one end of the frame, a tail-board fixed to the opposite end of the frame, journal-bearings secured to the bars and depending therefrom between the seat and tail-board, a rearwardly-tilting box pivotally mounted in said bearings and tilting between the bars and between the seat and tail-board, a stop-bar in front of the bearings to hold the box from tilting, a sliding catch beneath the tail-board to engage the rear end of the box and means at the front of the frame and connected to move the catch to release the box.

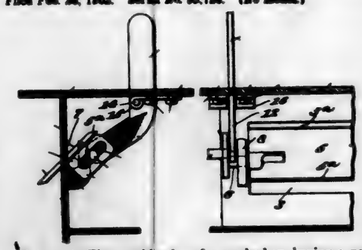
8. In a dump-wagon the combination with a frame having a fixed tail-board, a rearwardly-tilting box mounted on a fixed pivot and having an open rear end, rub-plates on the frame located at the front and at the rear of the pivot and a box having engaging shoulders concentric with the pivot to prevent endwise or lateral movement of said box when in its normal position, a catch to hold the box from tilting, and means for moving the catch to release the box.

9. In a dump-wagon, an open frame, a rearwardly-tilting box having its rear end open, a curved tail-board fixed to the frame and normally closing the open end of the box, rub-plates on the sides of the box and frame for the purpose described, a catch to hold the box from tilting, a lever connected to move the catch from the box, a second lever connected to operate the former lever, and a drum and cable to return the box to its normal position.

10. In a dump-wagon, the combination with separated lengthwise side bars having depending journal-bearings, a tilting box mounted in the bearings between the bars and having its rear end open, a sliding catch movable beneath the rear end of the bottom of the box, a lever having one end connected to the catch and its other end extended laterally beyond the side of the box, a second lever at the front end of the box and connected to the outer end of the former lever to move the catch and release the box, rub-plates on the sides of the frame and box for the purpose set forth, and a drum and cable connected to the box to return the same to its normal position.

11. In a dump-wagon, the combination of parallel side bars, a transverse rod connecting the intermediate portion of the side bars, a rearwardly-tilting dump-box pivotally balanced on the rod, a platform and seat in front of the box mounted upon the side bars, a tail-board at the rear of the box also mounted upon the side bars, a windlass on the platform, a cable having one end connected with the windlass and the other end connected to the front end of the box for returning the box to normal position.

704,819. STOVE-DAMPER. EDWARD H. GLEASON, Neenah, Wis. Filed Feb. 26, 1902. Serial No. 95,720. (No model.)

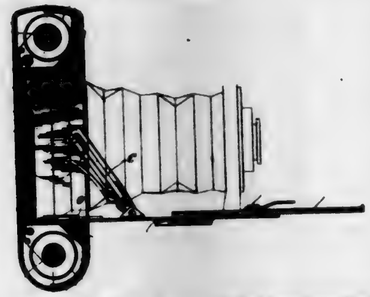


Claim.—1. The combination of a smoke-box having a passage in its wall, and having at opposite sides of said passage devices for pivotally holding a damper-plate, one of said devices being a hook-shaped projection, a damper-plate having pintles engaged with said devices, and having on the outer end of its pintle which is engaged with said hook-shaped projection a slotted arm, and an actuating-lever pivotally mounted and having at its lower end a pin engaged with the slot of said arm, the lower end of said lever being between said arm and the hook-shaped projection, substantially as set forth.

2. The combination of the smoke-box of a stove or range having a passage in its wall, a balanced damper-plate pivotally mounted at said

passage and arranged to control the flow of gases through said passage, an actuating-lever having at one end connection with the damper-plate to move the same and a device carried on the stove or range adjacent to said connected end of the lever and arranged to hold the said connected end against disengagement from the damper-plate, substantially as set forth.

704,820. FOLDING CAMERA WITH ROLL-FILM MAGAZINE. CARL P. GOERZ, Friedenau, near Berlin, Germany. Filed May 1, 1901. Serial No. 58,321. (No model.)

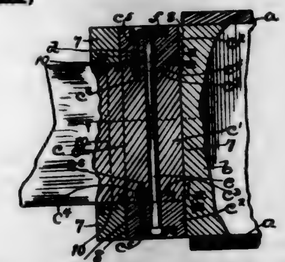


Claim.—1. In a folding camera of the kind hereinbefore described, two frames, one foldable within the other and one carrying film-spools and inclosing film-tubes, means for fastening the film-spools in the corresponding film-tubes, comprising removable covers fastened to rods rotatably guided at the outside of the film-tubes, coiled springs slung around said rods pressing with one of their ends against a collar of said rods and with their other one against an abutment arranged on the outside of the film-tube, pressing the cover against the open end of the tube; substantially as shown and described.

2. In a folding camera of the kind hereinbefore described, a removable frame, film-spools carried thereby, film-tubes inclosing said spools, a spring-actuated axis arranged on one side of the frame and having a light-tight curtain fastened thereto; at the other side of the frame arranged a similar axis provided with means for rotating the same; the free end of said curtain being fastened to said second axis by means of bands or strips, and curved prolongations on the camera-frame embracing said tubes and cooperating with the first-mentioned frame.

3. In a folding camera of the kind described, the combination with the tubes, and a frame connecting them, of the camera-frame over which said frame fits, a cover for said connecting-frame, curved prolongations on the camera-frame to form a light-tight connection between the two tubes and frames, film-spools mounted within said tubes, means for rotating said spools and spring-actuated pivots about which said spools rotate, an axis parallel with the axis of the film-tube and a light-tight curtain fastened thereto and movable in the planes parallel with the film, all substantially as shown and described.

704,821. KNEE-JOINT OR HINGE CONNECTION. GEORGE W. GREENWOOD, Cleveland, Ohio. Filed Mar. 31, 1902. Serial No. 100,843. (No model.)



Claim.—1. A knee-joint or hinge connection between two parts or members of a machine, comprising an open-ended box formed on one part and having a lateral slot 10 extending along its central portion between and a suitable distance from each end of the box, and a journal formed on the other part and having bearing in the aforesaid box, which journal comprises a central section adapted to be passed into or out of the box through the aforesaid slot and two cylindrical end sections having bearing within opposite end portions, respectively, of the box beyond opposite ends, respectively, of and in line with the central journal-section and projecting, at their inner ends, into the said central journal-section; pins extending from within the end journal-sections into the central journal-section, and means holding the said journal-sections in their assembled position, substantially as and for the purpose set forth.

4. A knee-joint or hinge connection between two parts or members of a machine, comprising an open-ended box formed on one part and having a lateral slot 10 extending along its central portion between and a suitable distance from each end of the box, and a journal formed on the other part and having bearing in the aforesaid box, which journal comprises a central section adapted to be passed into or out of the box through the aforesaid slot and two cylindrical end sections having bearing within opposite end portions, respectively, of the box beyond opposite ends, respectively, of the aforesaid slot and arranged, at opposite ends, respectively, of and in line with the central journal-section and projecting, at their inner ends, into the said central journal-section, and means holding the said journal-sections in their assembled position, substantially as and for the purpose set forth.

5. A knee-joint or hinge connection between two parts or members of a machine, comprising an open-ended box formed on one part and having a lateral slot 10 extending along its central portion between and a suitable distance from each end of the box, and a journal formed on the other part and having bearing in the aforesaid box, which journal comprises a central section adapted to be passed into or out of the box through the aforesaid slot and two cylindrical end sections having bearing within opposite end portions, respectively, of the box beyond opposite ends, respectively, of the aforesaid slot and arranged, at opposite ends, respectively, of the central journal-section and projecting, at their inner ends, into the said central section; a bolt extending centrally and longitudinally of and through the said journal-sections and arranged with its head bearing against the outer end of one of the aforesaid end sections, and a nut mounted upon the shank of the bolt at and arranged to bear against the outer end of the other end section of the journal, substantially as and for the purpose set forth.

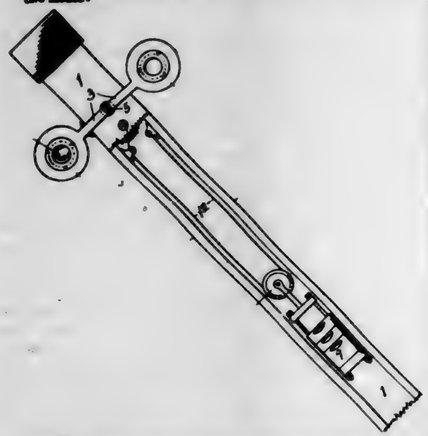
704,822. ELECTRICAL PUSH AND SWITCH. EDGAR G. HARCOURT, Birmingham, England, and MARSHALL B. LLOYD, Minneapolis, Minn. Filed July 9, 1901. Serial No. 67,691. (No model.)

Claim.—1. In a push-button, the combination with the base provided with an apertured flange on its upper side, and a spring-catch projecting through the flange-aperture, of a dome to pass over the said flange and having a groove on its inner side to engage the catch and a recess in its lower edge intersecting the groove; substantially as described.

2. In a push-button, the combination with the base provided with a raised apertured flange, and a curved spring within the flange and having its ends bent outwardly through the flange-apertures to form spring-catches, and the dome having an internal annular groove to engage the catches and a recess in its lower edge intersecting said annular groove; substantially as described.

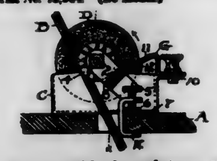
3. In a push-button, the combination with the base provided with a raised annular flange having opposite pairs of apertures, and two opposed curved springs resting against the inner wall of the said flange with their ends projecting through the apertures therein and formed as catches, of a dome fitting over the said flange and provided with an internal annular groove receiving said catches and a recess in its lower edge intersecting said groove; substantially as described.

704,823. AUTOMATIC ELECTRIC SEMAPHORE-SIGNAL. JAMES H. HARPER, Kansas City, Mo. Filed Apr. 26, 1901. Serial No. 57,202. (No model.)



Claim.—In a semaphore, a hollow supporting-column, a transverse rotatable shaft extending therethrough, a signal-arm secured centrally on each end of said shaft and extending in opposite directions therefrom, annular plates carried by the ends of said arms, colored media secured within said annular plates, an electric lamp held at one side of said column between an adjacent pair of said media when said arms are in horizontal position, a notched controller-wheel secured on said transverse shaft within said column, a movable detent for arresting the rotation of said wheel, an electromagnet for disengaging the detent therefrom, a spur-pinion secured on said shaft, a winding-shaft, a winding-drum and a ratchet secured thereon, a gear-wheel mounted rotatably on said winding-shaft, and engaging said pinion, a pawl secured to said gear and engaging said ratchet, a cable secured to said winding-drum, and a weight hung from the cable, for actuating the aforesaid wheels, substantially as described.

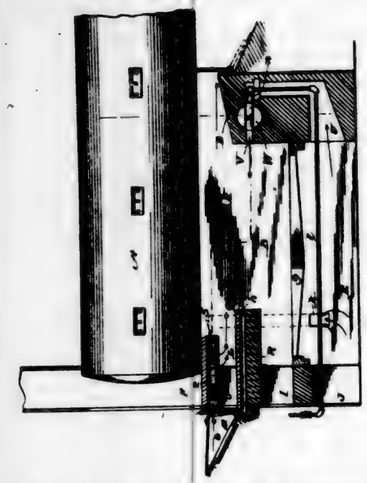
704,824. GRINDING DEVICE. SETH P. HASTINGS, Wellington, Ohio, assignor to George D. Henderson, Cleveland, Ohio. Filed Aug. 31, 1901. Serial No. 73,944. (No model.)



Claim.—1. As a new article of manufacture, a grinding attachment for sewing-machines comprising the rectangular sheet-metal box C, having a side projection 7 at its side and bottom to secure it in place and a side projection 8 to support one end of the grinder-spindle, in combination with a spindle 2 fixed at one end in said projection 7 and at its other end to the opposite side of box C, a rotatable sheave on said spindle and grinding-stone D thereon, and a sheave 4 fixed on said sheave outside of box C, whereby the sheave and sheave and grinder rotate together, substantially as described.

2. A grinder attachment for sewing-machines comprising a grinding-wheel and a supporting-box provided with a rearward projection 10 at its top rigid with the box, in combination with a rigid blade-support G fixed adjustably to said projection and having inclined portion 11 and down portion 12 next to said stone, substantially as described.

704,825. SMOKE-PREVENTING FURNACE. HENRY F. HAYNES, Washington, D. C., assignor of one-third to James Henry Jennings, Washington, D. C. Filed Dec. 14, 1900. Renewed Apr. 19, 1902. Serial No. 103,761. (No model.)



Claim.—1. In a furnace for preventing the formation of smoke the combination with a fire-chamber, of a coking-oven comprising an inwardly-projecting coking-plate, a series of air-channels beneath said plate, a superimposed perforated air-chamber, and suitable passages for conducting to said chamber an air-supply, substantially as described.

2. In a furnace for preventing the formation of smoke the combination with a fire-chamber, of a coking-oven located in the front wall thereof comprising an inwardly-projecting coking-plate, a series of air-channels beneath said plate, a register for closing said channels, a superimposed perforated air-chamber, and suitable passages for conducting to said chamber an air-supply, substantially as described.

3. In a furnace for preventing the formation of smoke the combination with a fire-chamber and ash-pit, of a coking-oven located in the front wall thereof comprising a coking-plate, a superimposed perforated air-chamber, and suitable passages communicating with said chamber at its ends for conducting thereto an air-supply directly from the ash-pit of the furnace, substantially as described.

4. In a furnace for preventing the formation of smoke the combination with a coking-oven, of a hopper for feeding said oven, a partition dividing said hopper into compartments, and a sliding door set at an angle to the furnace-front for controlling the discharge of each compartment, substantially as described.

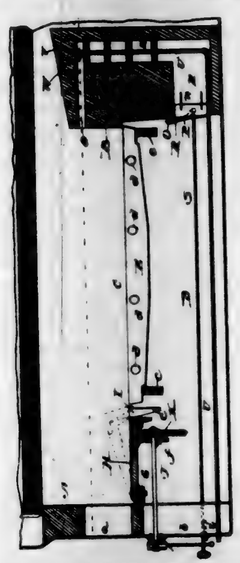
5. In a furnace for preventing the formation of smoke the combination with a coking-oven, of a hopper for feeding said oven, a partition dividing said hopper into compartments, a sliding door set at an angle to the furnace-front for controlling the discharge of each compartment, a lid for the top of said hopper, and stoke-hole doors in its bottom, substantially as described.

6. In a furnace for preventing the formation of smoke the combination with a fire-chamber, ash-pit and bridge-wall, of an air-duct entering said bridge-wall from the ash-pit and terminating in a plurality of diverging flattened ports for introducing heated air into the fire-chamber above the fire to reverse the natural draft thereof, substantially as described.

7. In a furnace for preventing the formation of smoke the combination with a fire-chamber, ash-pit and bridge-wall, of an air-duct entering said bridge-wall from the ash-pit, a plurality of diverging ports communicating with said duct and directed into the fire-chamber, and a series of injector-nozzles for forcing a draft of air through said duct and ports, substantially as described.

8. In a furnace for preventing the formation of smoke the combination with a fire-chamber, ash-pit and bridge-wall, of a feed-water heater in said bridge-wall fitted with a series of transverse tubes, an air-duct entering the bridge-wall from the ash-pit, a plurality of diverging ports communicating with said duct through the tubes aforesaid in the feed-water heater, and suitable injector-nozzles for forcing air through said duct, tubes and ports, substantially as described.

704,826. SMOKE-PREVENTING FURNACE. HENRY F. HAYNES, Washington, D. C., assignor of one-third to James Henry Jennings, Washington, D. C. Filed Mar. 3, 1902. Serial No. 96,435. (No model.)



Claim.—1. In a furnace for preventing the formation of smoke the combination with a fire-chamber and stationary grate-bars, of a dead-plate extending from wall to wall of the furnace and pivotally supported at its outer edge in said walls, and means for raising the dead-plate above the horizontal plane of the stationary grate-bars, substantially as decribed.

2. In a furnace for preventing the formation of smoke the combination with a fire-chamber and stationary grate-bars, of a dead-plate extending from wall to wall of the furnace and pivotally supported at its outer edge in said walls, an auxiliary grate secured to the inner edge of said dead-plate, and means for elevating the dead-plate above the horizontal plane of the stationary grate-bars, substantially as described.

3. In a furnace for preventing the formation of smoke the combination with a fire-chamber provided with stationary grate-bars, of a dead-plate extending from wall to wall of the furnace and pivotally supported at its outer edge in said walls, a downwardly-projecting auxiliary grate secured to the inner edge of said dead-plate, and means for elevating the dead-plate above the horizontal plane of the stationary grate-bars, substantially as described.

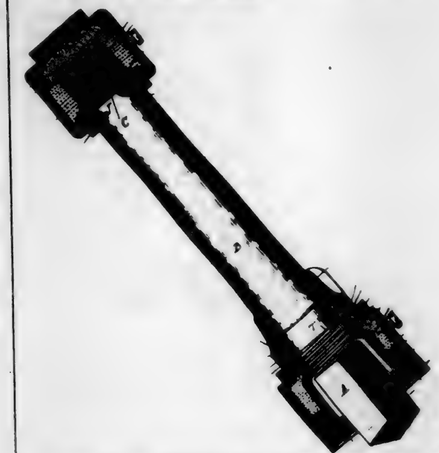
4. In a furnace for preventing the formation of smoke the combination with a fire-chamber and stationary grate-bars of a dead-plate extending from wall to wall of the furnace and pivotally supported at its outer edge in said walls, and a cam beneath said dead-plate for elevating or lowering it, a forwardly-projecting cam-shaft, and a lever applied to said shaft for rotating it, substantially as described.

5. In a furnace for preventing the formation of smoke the combination with a pivotally-supported dead-plate having a serrated surface, of a suitable cam and cam-shaft for elevating or lowering the dead-plate, and a lever applied to said shaft for rotating it, substantially as described.

6. In a furnace for preventing the formation of smoke the combination with a fire-chamber, of main stationary grate-bars offset from each other by laterally-projecting side lugs, a dead-plate extending from wall to wall of the furnace and pivotally supported at its outer edge in said walls, a downwardly-projecting detachable auxiliary grate secured to the inner movable edge of the dead-plate, and means for elevating said dead-plate and auxiliary grate above the horizontal plane of said stationary grate-bars, substantially as described.

7. In a furnace for preventing the formation of smoke the combination with a fire-chamber, ash-pit and bridge-wall, of a feed-water heater in said bridge-wall fitted with a series of transverse tubes, an air-duct entering the bridge-wall from the ash-pit, a plurality of diverging ports communicating with said duct through the tubes aforesaid in the feed-water heater, and suitable injector-nozzles for forcing air through said duct, tubes and ports, substantially as described.

704,827. VEHICLE-AXLE. GUSTAV HEDE, Detroit, Mich., assignor of one-half to Rudolph Mardian, Detroit, Mich. Filed Feb. 18, 1902. Serial No. 94,061. (No model.)

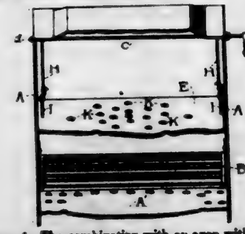


Claim.—1. In a vehicle-axle, the combination with the axle proper, of its spindle, the skein revolubly mounted upon the spindle, two concentrically-arranged and inwardly-extending casings spaced from each other forming therebetween an oil-chamber and carried respectively by the axle and skein, there being an oil-duct leading from said chamber to the spindle, and an annular flange upon one of said casings extending outward and bearing against the other.

2. In a vehicle-axle, the combination with the axle proper, of its spindle, the skein revolubly mounted upon the spindle, two concentrically-arranged and inwardly-extending casings spaced from each other forming therebetween an oil-chamber and threaded respectively upon the axle and skein, there being an oil-duct leading from said chamber to the spindle, and an annular flange integral with the inner casing and projecting outward and having a bearing against said outer casing.

3. In a vehicle-axle, the combination with the axle proper, of its spindle, the skein revolubly mounted upon the spindle, two concentrically-arranged and inwardly-extending casings spaced from each other and carried respectively by the axle and skein, an annular flange upon the inner casing projecting toward and bearing against the outer casing, a packing arranged intermediate of the casings and inwardly of the flange, and a packing-retaining cap engaging both casings.

704,828. OVEN. SARAH A. HENRY, St. Joseph, Mo. Filed Sept. 3, 1901. Serial No. 74,215. (No model.)

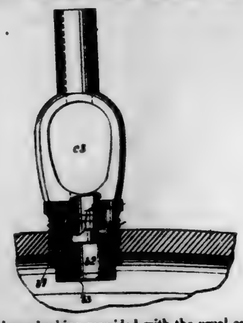


Claim.—1. The combination with an oven without side vents to be set on the top of a gaseous or gas stove over the flame or flames thereof, and its grates, of a single light-metal perforated plate of single thickness adapted to be hung in the oven above the grates, of the horizontal shaft located permanently near top of the oven and its crank and nut on outside of the oven, of the flexible wires having connection with said shaft at points in the oven near the sides and with hooks rigidly set in the plate

near its sides at a line equidistant between the front and back of the oven, substantially as described.

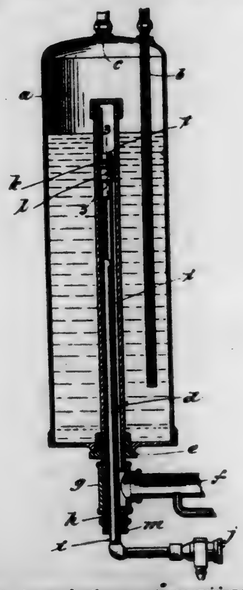
2. The combination with a gas or gasolene stove oven provided with vents or openings in its bottom only, and with a lower grate, of the shaft C, its crank D and nut *d*, the light vertically-adjustable plate E provided with draft-perforations K K and hooks I I, and duplicate flexible wires H H having connection with said shaft near each end and with said plate-hooks, substantially as described and for the purpose specified.

704,329. **MEANS FOR CLOSING CASKS.** JACOB J. HENDRICKS, New York, N. Y. Filed Nov. 1, 1901. Serial No. 80,739. (No model.)



Claim.—A bung-bushing provided with the usual central bore, the upper or outer end of which is enlarged to receive a stopper-placing device, the lower or inner end of said bore being also provided with an enlarged chamber which is formed by an inwardly-directed annular flange at the bottom thereof and a corresponding inwardly-directed flange at the top thereof, the bottom flange being beveled or inclined, substantially as shown and described.

704,330. **APPARATUS FOR HEATING WATER.** EDWIN W. HIXSON, Northampton, Mass. Filed Dec. 6, 1901. Serial No. 84,909. (No model.)



Claim.—1. A water-heating apparatus comprising a reservoir, a heating-pipe extending through the wall of the reservoir, the inner end of which pipe is closed, and the outer end of which is in communication with a steam-generator; a vent-pipe extending into the heating-pipe, means for adjusting the position of the open end of said vent-pipe longitudinally in the heating-pipe relative to the end of the latter, and a thermostatic valve of said vent-pipe outside of the reservoir.

2. A water-heating apparatus comprising a reservoir, a heating-pipe extending through the wall of the reservoir, the inner end of which pipe is closed, and the outer end of which is in communication with a steam-generator; a vent-pipe extending into the heating-pipe, a head on the vent-pipe adapted to provide a partition between the ends of the heating-pipe, said head being slidable in the latter, a thermostatic valve on the outlet end of said vent-pipe, there being a passage for steam through the latter from a point under said head, and thence through said valve to the atmosphere.

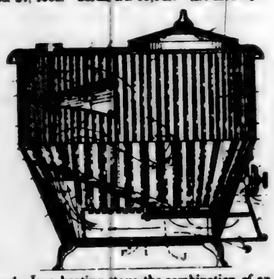
3. In a water-heating apparatus, a reservoir, a heating-pipe in said reservoir adapted to be placed in communication with a source of steam-supply, a vent-pipe in said heating-pipe, means for adjusting the position of the end of said vent-pipe longitudinally in the heating-pipe, and a valve on said vent-pipe, substantially as described.

4. In a water-heating apparatus, a reservoir, a heating-pipe in said reservoir adapted to be placed in communication with a source of steam-supply, a vent-pipe extending into said heating-pipe, means for adjusting the position of the end of said vent-pipe longitudinally in the heating-pipe, and a valve on said vent-pipe outside the reservoir, substantially as described.

5. In a water-heating apparatus, a reservoir, a heating-pipe in said reservoir adapted to be placed in communication with a source of steam-supply, a vent-pipe extending into said heating-pipe, means for adjusting the position of the end of said vent-pipe longitudinally in the heating-pipe, and a thermostatic valve on said vent-pipe outside of the reservoir, substantially as described.

6. In a water-heating apparatus, an adjustable vent-pipe comprising a pipe-section *i*, coupling *p* on the vent-pipe having passages *l*, nipple *g*, supported by the coupling means for closing the end of the nipple, a piston-head on the nipple, means for securing the piston-head on the nipple, and a valve on the outer end of the vent-pipe, substantially as described.

704,331. **HEATING-STOVE.** LINCOLN HOWARD, Savannah, Mo. Filed Feb. 27, 1902. Serial No. 95,845. (No model.)



Claim.—1. In a heating-stove the combination of an inverted conical casing inclosing a combustion-chamber, a corrugated floor, said corrugations forming air-spaces between said floor and the bottom of the casing, a vertically-corrugated fire-pot supported by said floor, a fuel-support its front end connecting with the rear of the stove-grate and its elevated back end with the rear of the fire-pot, a lateral flange at the top of said fire-pot adapted to fit closely around against the stove-casing and provided with semicircular openings in that portion contacting with the rear part of the stove-casing to serve as draft-vents from beneath the combustion-chamber under the grate and fuel support up between the corrugations at the back of the fire-pot and the stove-casing into the space above the fuel-bed, substantially as described and for the purpose specified.

2. In a heating-stove the combination with an inverted conical combustion-chamber and a vertically-corrugated fire-pot open at the lower part of the back thereof and located within said chamber and spaced therefrom to form a heating-chamber, of a fuel-support set back of the stove-grate and elevated at its rear end thereby forming an enlarged upward extension of an air-chamber, of a corrugated floor beneath the fire-pot, spaced therefrom allowing said air-chamber to extend through the entire base of the stove, of a flange on the top of the corrugated fire-pot provided at the rear of the stove with openings adapted to carry the draft of the stove up from said air-chamber and its upward extension into the chamber above the fuel-bed to form perfect combustion with the gas therein, substantially as described and shown.

3. In a heating-stove comprising in combination a combustion-chamber, a heating-drum supported thereon and a perforated check-damper therein spanning that portion adjacent to the flue connection, a vertically-corrugated fire-pot having its lower rear portion cut away, a grate set therein at the front, a fuel-support extending backward from said grate and bearing upward at an angle with its edge adapted to fit into the side and back corrugations of the fire-pot and close the opening made in the fire-pot at the cut-away portion thereof, and a lateral flange on the rim of the fire-pot above said cut-away portion provided with draft-openings at the tops of corrugations, substantially as set forth and shown.

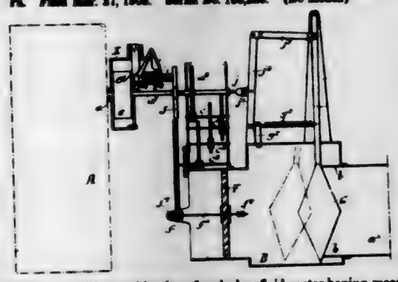
704,882. **NUT-LOCK.** ROBERT D. HUDSON, Vermilion, Va., assignor, by direct and mesne assignments, of two-thirds to Robert O. Horton and Charles F. Patterson, Lynchburg, Va. Filed Sept. 12, 1901. Serial No. 75,202. (No model.)

Claim.—1. A nut-lock comprising a washer having a bolt-opening therein, and a slit extending from one edge of the washer to the opening, the section on one side of the slit being outturned from the remainder of the washer to form a yielding tongue, said tongue being provided on its outer face with a locking-shoulder that extends transversely across the same from the slit to the outer edge and tapers in thickness toward said outer edge.

2. The combination with a bolt, of a nut threaded on the bolt and having an outstanding flange on its outer side edge, and a lock for the nut comprising a washer having an opening through which the bolt passes and a slit extending from one edge of the washer to the opening, the section of the washer on one side of this slit being outturned from the remaining portion of said washer to form a yielding tongue, said tongue being provided on its outer face with a locking-shoulder that extends diagonally across the same from the slit to the outer edge and tapers in thickness toward said outer edge, the outer end of the tongue beyond the shoulder being disposed outside of the nut and beneath but spaced from the flange thereof.

3. The combination with a bolt, of a nut threaded on the bolt and having an outstanding flange on its outer side edge, and a lock for the nut interposed between the article held and the nut, said lock comprising a washer projecting beyond the side edges of the nut, one projecting side of said washer fitting flat against the article to be held, the opposite side constituting a spring-tongue that is raised above the article to be held and is spaced from the flange of the nut a sufficient distance to receive the head of a wrench, whereby, when the wrench is inserted between said flange and tongue, the latter will be forced back and out of engagement with the nut to release the same.

704,888. **SELF-WINDING CLOCK.** CHARLES HERRY, Philadelphia Pa. Filed Mar. 27, 1902. Serial No. 100,220. (No model.)



Claim.—1. The combination of a clock, a fluid-motor having means connecting it to the operating mechanism of said clock, together with means for governing the supply of motive fluid to the fan actuated by said motor through the operating mechanism of the clock, substantially as described.

2. The combination of a clock, a fan connected to the driving mechanism thereof, a valve controlling the flow of fluid to said fan, said valve being operated by the motor through the driving mechanism of the clock, substantially as described.

3. The combination of a clock having a mainspring, a fan having gearing connecting it to the same, a valve governing the flow of fluid to said fan and mechanism between the valve and the spring whereby changes in the position of the spring varies the position of the valve, substantially as described.

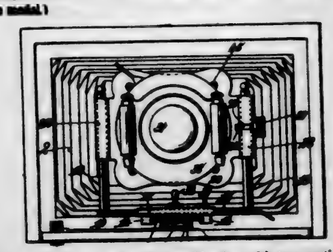
4. The combination of a clock having a mainspring, with a supporting-spindle, a fan for winding said spring, a valve controlling the flow of fluid to the fan, and means for connecting the valve and the spring, the same including mechanism revoluble around said spindle, whereby variations in the distance of a portion of said spring from the spindle are made to operate said valve, substantially as described.

5. The combination of a clock having a mainspring with a spindle, a fan geared to said spindle for winding the spring, a valve controlling the flow of fluid through the fan, a device primarily operated by the fan and revoluble with one end of said spring, together with mechanism for operating the valve, the same being in engagement with said device, substantially as described.

6. The combination of a clock having a spring, a spring-barrel and a spindle connected respectively to the ends of said spring, a fan having gearing operatively connected to the spindle, a piece revolvable with the gear-wheel, having means connecting it to a movable portion of the spring, a valve controlling the supply of fluid to the fan, means for movably suspending the said valve, and a framework connected to the suspending means of the valve, the same being in operative engagement with the piece moved by the spring, substantially as described.

7. The combination of a clock having a spring, a gear-wheel and a spindle connected respectively to the ends thereof, a fan-casing, a fan and a valve therein, gearing connecting the spring-spindle and the fan, means for normally retaining the valve in an open position, levers for operating the valve, a plate connected to said levers, and a device having means connecting it with the spring constructed to act on said plate whereby variations in the position of a portion of said spring move the plate and through said levers operate the valve, substantially as described.

704,884. **CAMERA.** CHARLES E. HUTCHINS, Rochester, N. Y., assignor to Rochester Optical and Camera Company, Rochester, N. Y., a Corporation of New York. Filed Apr. 4, 1902. Serial No. 101,397. (No model.)



Claim.—1. In a camera, the combination with two vertical posts of the lens-front comprising a metallic plate provided centrally with an opening for the insertion of a lens, and having its opposite vertical edges bent up to form sleeves which encircle and are vertically movable on said posts, and means for locking one of said sleeves to the post which it encircles, substantially as described.

2. In a camera, the combination with two vertical posts, of a lens-front comprising a plate provided at its opposite sides with sleeves vertically movable on said posts, one of said sleeves being transversely slotted, a ring disposed in said slot and encircling the post therein, said ring being provided with a threaded shank projecting laterally through said slot, and a nut screwed on said shank and operating to bind the ring on the post, substantially as described.

3. In a camera, the combination with a plate supported on the bed of the camera and provided on its forward and rear edges with inturned overhanging flanges, one of said flanges being longitudinally slotted, of a plate slidably arranged between said flanges transversely to the camera-bed, an oscillatory lever-handle provided at one end with a screw projecting through said slot and tapped in said flanged plate, and a lens-front vertically movable on the sliding plate, substantially as described.

4. In a camera, the combination with a plate supported on the bed of the camera and provided on its forward and rear edges with inturned overhanging flanges, one of said flanges being longitudinally slotted, of a plate slidably arranged between said flanges transversely to the camera-bed, an oscillatory lever-handle provided at one end with a screw projecting through said slot and tapped in said flanged plate, a lens-front vertically movable on the sliding plate, and means for limiting the oscillatory movement of said lever, substantially as described.

5. In a camera, the combination with a plate supported on the bed of the camera and provided on its forward and rear edges with inturned overhanging flanges, one of said flanges being longitudinally slotted, of a plate slidably arranged between said flanges transversely to the camera-bed, and an oscillatory lever-handle provided at one end with a screw pro-

jecting through said slot and tapped in said flanged plate, a lens-front vertically movable on the sliding plate, and a beveled catch arranged to be engaged by said lever-handle and hold the same in its locked position, substantially as described.

6. In a camera, the combination with a bellows, the lens, and the shutter-casing, of the lens-front consisting of a thin centrally-apertured metallic plate, the externally-threaded lens-tube fitted in the rear side of the shutter-casing and projecting through said lens-front, a flanged collar screwed on said lens-tube in rear of the lens-front, and a metallic plate attached to the forward end of the bellows and clamped between the lens-front and the flange on said collar, substantially as described.

704,885. PHOTOGRAPHIC CAMERA. CHARLES E. HUTCHINS, Rochester, N. Y., assignor to Rochester Optical and Camera Company, Rochester, N. Y., a Corporation of New York. Filed Apr. 4, 1902. Serial No. 101,499. (No model.)

Claim.—1. The combination with a camera-box, and a cover for the front of the same, hinged thereto, of a lock for retaining said cover in horizontal position, and a spring secured within said camera-box for throwing open said cover and operating said lock.

2. The combination with a camera-box and a cover for the front of the same, hinged thereto, of links pivoted to said cover, and having a sliding connection with said box, means thrown into operation by the upward movement of the free ends of said links for locking said cover in its horizontal position, and springs secured within said camera-box and acting upon said links for opening said cover and throwing into operation the locking means therefor.

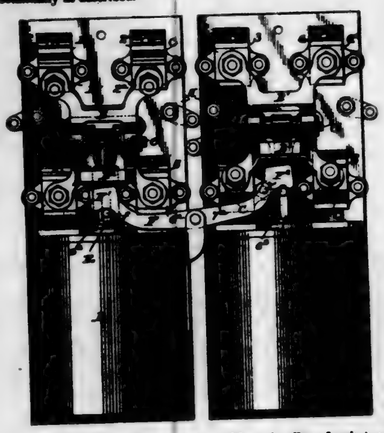
3. The combination with a camera-box and a cover for the front of the same, hinged thereto, of links pivoted to said cover and having elongated slots therein provided with lateral offsets, projections extending inwardly from the sides of the camera-box through said slots and adapted to fit within said offsets for locking said cover in horizontal position, and springs secured within said camera-box and constantly held under tension by said links, whereby said cover is automatically thrown open when the lock for closing the same is released, and whereby the free ends of said links are automatically thrown outwardly, when said cover reaches its horizontal position, to move said offsets into interlocking relation with said projections.

4. The combination with a camera-box and a cover for the front of the same, hinged thereto, of links pivoted to said cover and having elongated slots therein provided with lateral offsets, projections extending inwardly from the sides of the camera-box through said slots and adapted to fit within said offsets for locking said cover in horizontal position, and springs secured at their upper inner ends within said camera-box, extending downwardly and outwardly from their points of attachment to said box, and having their free ends reversely curved to form engaging portions, the said engaging portions lying in constant contact with the inner edges of said links, and said springs being maintained normally under tension by said links, whereby said cover is automatically thrown open when the lock for closing the same is released, and whereby the free ends of said links are automatically thrown outwardly, when said cover reaches its horizontal position, to move said offsets into interlocking relation with said projections.

704,886. REVERSING-SWITCH MOTOR. JOHN D. ISELIN, Yonkers, N. Y., assignor to Otis Elevator Company, Orange, N. J., a Corporation of New Jersey. Filed Apr. 4, 1900. Serial No. 711,711. (No model.)

Claim.—1. In a switch, the combination with a plurality of electrically-operated switch-arms, of a safety device controlled by the movement of one switch-arm and controlling the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession, substantially as described.

2. In a switch, the combination with a plurality of electrically-operated switch-arms, of a safety-arm controlled by the movement of one switch-arm and controlling the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession, substantially as described.



3. In a switch, the combination with a plurality of switch-arms, of independent electrical devices for moving the arms, and a safety device connected to be operated by the moving device of one of the switch-arms and to control the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession, substantially as described.

4. In a switch, the combination with a plurality of switch-arms, of independent devices for moving the arms, and a rocking safety device controlled by the independent moving device of one switch-arm and controlling the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession, substantially as described.

5. In a switch, the combination with a plurality of switch-arms, of independent devices for operating the arms, magnets to move said independent devices, and a safety device connected to be moved by the magnet of one switch-arm and controlling the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession, substantially as described.

6. In a switch, the combination with the pivoted switch-arms, of magnets the cores of which are connected to move the switch-arms, a pivoted safety device, and connections between the cores and the pivoted safety device for moving the latter, substantially as described.

7. In a switch, the combination with the pivoted switch-arms, of magnets for moving the switch-arms, magnet-core extensions connected to the switch-arms and carrying pins, a pivoted safety-arm having extensions engaging the pins, and stops on the switch-arms engaging the extensions, substantially as described.

8. In a switch, the combination with a plurality of switch-arms, each arm carrying a contact at each end, of independent devices for moving the arms, and a safety device controlled by the movement of one switch-arm and controlling the movements of another switch-arm, whereby the switch-arms are operated in a predetermined order or succession substantially as described.

9. In a switch, the combination with the stationary spring-supported contacts, of pivoted switch-arms carrying contacts coöperating therewith, electromagnets for operating the switch-arms, cores connected to the arms, a pivoted safety-arm, pins connected to the cores for operating the safety-arm, and stops on the switch-arms coöperating with the safety-arm, substantially as described.

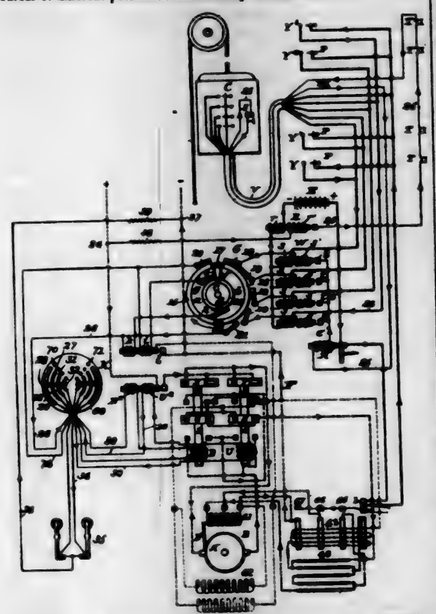
704,887. CONTROLLING SYSTEM FOR ELECTRIC ELEVATORS. JOHN D. ISELIN, Yonkers, N. Y., assignor to Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Jan. 11, 1902. Serial No. 89,341. (No model.)

Claim.—1. In a motor-controlling apparatus, the combination of controlling-circuits of different potentials reciprocally controlling each other, substantially as described.

2. In an apparatus for controlling elevators, the combination of two controlling-circuits of different potentials reciprocally controlling each other, substantially as described.

3. In a motor-controlling apparatus, the combination of controlling-circuits reciprocally controlling each other and derived from different sources, substantially as described.

4. In a motor-controlling apparatus, the combination of controlling-circuits reciprocally controlling each other and derived from separate sources of different potentials, substantially as described.



5. In an electrical controlling system for elevators, the combination with a motor, and car, of a main motor-circuit, a controlling-circuit of lower potential than said main circuit, and means for momentarily energizing the low-potential circuit to start the car and for then rendering said low-potential circuit inoperative, substantially as described.

6. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for rendering said controlling-circuit inoperative after the motor is started, substantially as described.

7. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for rendering said controlling-circuit temporarily inoperative after the motor is started, substantially as described.

8. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for maintaining said controlling-circuit inoperative while the motor is in operation, substantially as described.

9. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for cutting out said controlling-circuit as the motor starts, substantially as described.

10. In an electrical controlling system for elevators, the combination with a motor and its main circuit, of a controlling-circuit derived from a separate source of lower potential than the main circuit, and means for cutting out said separate source as the motor starts, substantially as described.

11. In an elevator, the combination with a motor, car, and stations, of a main circuit for the motor, and means at the stations included in a circuit of lower potential than said main circuit for controlling the operation of the motor, substantially as described.

12. In an elevator, the combination with a motor, car, and stations, of a main circuit for the motor, and means on the car included in a circuit of lower potential than said main circuit for controlling the operation of the motor, substantially as described.

13. In an elevator, the combination with a motor, car, and stations, of a main circuit for the motor, and means on the car and at the stations included in a circuit of lower potential than said main circuit for controlling the operation of the motor, substantially as described.

14. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than said main circuit, and means for rendering the controlling-circuit inoperative when the motor starts, substantially as described.

15. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than said main circuit, and means for rendering the controlling-circuit inoperative after having been energized, substantially as described.

16. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than said main circuit, means at the stations included in said controlling-circuit for controlling the starting of the motor, and means for rendering said controlling-circuit inoperative after the motor has started, substantially as described.

17. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than said main circuit, means on the car included in said controlling-circuit for controlling the starting of the motor, and means for rendering said controlling-circuit inoperative after the motor has started, substantially as described.

18. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than said main circuit, means on the car and at the stations included in said controlling-circuit for controlling the starting of the motor, and means for rendering said controlling-circuit inoperative after the motor has started, substantially as described.

19. In an elevator, the combination with a motor, and its main circuit, of means controlling the starting of the motor included in a circuit of lower potential than said main circuit, and means for rendering said low-potential circuit inoperative after the motor has started, substantially as described.

20. In an elevator, the combination with a motor, car, stations, and main circuit of the motor, of means included in a circuit of lower potential than said main circuit for starting the car to a particular station, and means for rendering said starting means inoperative after once being operated, substantially as described.

21. In an elevator, the combination with a motor, car, stations, and main circuit of the motor, of means included in a circuit of lower potential than said main circuit for starting the car to a particular station, and means for rendering said starting means temporarily inoperative after once being operated, substantially as described.

22. In an apparatus for controlling elevators, the combination with a motor, car, and stations, main circuit of the motor, and controlling devices, of means included in a circuit of lower potential than said main circuit for controlling said controlling devices and starting the car to a particular station, and means for rendering said circuit of low potential inoperative after having started the car, substantially as described.

23. In an electrical controlling system for elevators, the combination with a motor, its main circuit, controlling devices, and circuits therefor, of means included in a circuit of lower potential and derived from a different source than the main circuit for controlling said controlling devices, substantially as described.

24. In an electrical controlling system for elevators, the combination with a motor, its main circuit, controlling devices and circuits therefor, of means included in a circuit of lower potential than the main circuit for controlling said controlling devices, and means for rendering said circuit of low potential temporarily inoperative after having once been energized, substantially as described.

25. In an apparatus for controlling elevators, the combination with a motor, and its main circuit, of motor-controlling devices and circuits therefor, and a circuit of lower potential than the main circuit and derived from a separate source controlling the operation of said controlling devices and their circuits, substantially as described.

26. In an apparatus for controlling elevators, the combination with a motor, and its main circuit, of motor-controlling devices and circuits for the same derived from said main circuit, and a circuit of lower potential than said main circuit derived from a separate source for controlling the operation of said controlling devices and their circuits, substantially as described.

27. The combination with an elevator-motor, of switches, circuits and connections including the switches and motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than the remainder of the circuits, and means for cutting said portion of low potential out of circuit after the motor is started, substantially as described.

28. The combination with an elevator-motor, of switches, circuits and connections including the switches and motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than the remainder of the circuits, and means for automatically cutting said portion of low potential out of circuit as the motor starts, substantially as described.

29. The combination with an elevator-motor, of switches, circuits and connections including the switches and motor for controlling the op-

uration of the motor, the portion of said circuits including the switches being of lower potential than the remainder of the circuits, and means for automatically cutting said portion of low potential out of circuit when one of said switches is operated, substantially as described.

30. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons and switches for each station, controlling-circuits and connections between the push-buttons and motor for controlling the operation of the motor, the portion of said circuits including the push-buttons being of lower potential than the remainder of the circuits, and means for automatically rendering the push-buttons inoperative while maintaining the switches at the stations operative after one of the push-buttons is manipulated, substantially as described.

31. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a circuit including switches for setting the motor in operation, and a circuit including motor-controlling devices, said circuits being so arranged as to reciprocally control each other, substantially as described.

32. In an apparatus for controlling elevators, the combination with an electric motor, of a circuit including switches for setting the motor in operation, and a separate circuit including motor-controlling devices and derived from a separate source, said circuits being so arranged as to reciprocally control each other when one of said switches is operated, substantially as described.

33. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a circuit including switches for setting the motor in operation, and a circuit including motor-controlling devices, said circuits being so arranged that when a switch is manipulated the circuit of the switches closes the circuit of the motor-controlling devices and said latter circuit opens the circuit of the switches, substantially as described.

34. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a circuit including motor-controlling devices, and a circuit of lower potential than the same including switches for setting the motor in operation, said circuits being so arranged as to reciprocally control each other, substantially as described.

35. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a circuit including motor-controlling devices, and a circuit of lower potential than the same including switches for setting the motor in operation, said circuits being so arranged that when a switch is manipulated the circuit of the switches closes the circuit of the motor-controlling devices and said latter circuit opens the circuit of the switches, substantially as described.

36. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices, a circuit including the same derived from the main circuit, switches for setting the motor in operation, and a circuit including the same derived from a separate source of lower potential than the main circuit, said circuits including the motor-controlling devices and switches being so arranged as to reciprocally control each other, substantially as described.

37. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices, a circuit including the same derived from the main circuit, switches for setting the motor in operation, and a circuit including the same derived from a separate source than the main circuit, said circuits including the motor-controlling devices and switches being so arranged as to reciprocally control each other, substantially as described.

38. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons at each station for setting the motor in operation, a circuit including the same, and a circuit including door-switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

39. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons on the car for setting the motor in operation, a circuit including the same, and a circuit including door-switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

40. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons on the car and at the stations for setting the motor in operation, a circuit including the same, and a circuit including door-switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

41. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of switches at each station for setting said motor in operation, a circuit including the same, and a circuit including other switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

42. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of switches on the car for setting the motor in operation, a circuit including the same, and a circuit including switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

43. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of switches on the car and at the stations for setting the motor in operation, a circuit including the same, and a circuit including other switches at the stations and also including devices for controlling the motor, said circuits being so arranged as to reciprocally control each other, substantially as described.

44. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of circuits including door-switches at the stations and also devices for controlling the motor, push-buttons at each station for setting the motor in operation, and a circuit including the same of lower potential than the circuit including the door-switches and motor-controlling devices, said circuits of different potentials being so arranged as to reciprocally control each other, substantially as described.

45. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of circuits including door-switches at the stations and also devices for controlling the motor, push-buttons on the car and at the stations for setting the motor in operation, and a circuit including the same of lower potential than the circuit including the door-switches and motor-controlling devices, said circuits of different potentials being so arranged as to reciprocally control each other, substantially as described.

46. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of a circuit including switches at the stations and also including devices for controlling the motor, other switches at each station for setting the motor in operation, and a circuit including the same of lower potential than the circuit including the motor-controlling devices, said circuits of different potentials being so arranged as to reciprocally control each other, substantially as described.

47. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of a circuit including switches on the car and also including devices for controlling the motor, and a circuit of lower potential than the same, said circuits being so arranged as to reciprocally control each other, substantially as described.

48. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons for each station and a circuit including the same, and motor-controlling devices and a circuit including the same, said circuits being so arranged as to reciprocally control each other, substantially as described.

49. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons for each station and a circuit including the same, and motor-controlling devices and a circuit including the same, said circuits acting reciprocally upon each other, substantially as described.

50. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons for each station and a circuit including the same, and motor-controlling devices and a circuit including the same, said circuits being so arranged that when a push-button is manipulated the push-button circuit closes the circuit of the motor-controlling devices, and said latter circuit opens the circuit of the push-buttons, substantially as described.

51. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons for each station and a circuit including the same, motor-controlling devices and a circuit including the same, and means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, substantially as described.

52. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of push-buttons for each station and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening the circuit of the push-buttons, substantially as described.

53. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices and a circuit including the same, push-buttons for each station, and a circuit including the same of lower potential than the circuit including the motor-controlling devices, said circuits being so arranged as to reciprocally control each other, substantially as described.

54. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices and a circuit including the same, push-buttons for each station, and a circuit including the same of lower potential than the circuit including the motor-controlling devices, said circuits acting reciprocally upon each other, substantially as described.

55. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices and a circuit including the same, push-buttons for each station, and a circuit including the same of lower potential than the circuit including the motor-controlling devices, said circuits being so arranged that when a push-button is manipulated the push-button circuit closes the circuit of the motor-controlling devices and said latter circuit opens the circuit of the push-buttons, substantially as described.

56. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices and a circuit including the same, push-buttons for each station and a circuit including the same of lower potential than the circuit including the motor-controlling devices, and means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, substantially as described.

57. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main motor-circuit, of motor-controlling devices and a circuit including the same, push-buttons for each station and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening the circuit of the push-buttons, substantially as described.

58. In an apparatus for controlling elevators, the combination with a motor, car, stations, and main circuit of the motor, of a circuit derived from the main circuit and including motor-controlling devices, switches at the stations for setting the motor in operation, and a circuit including the same derived from a separate source of lower potential than the main circuit, said circuits derived from the main circuit and the separate source being so arranged as to reciprocally control each other, substantially as described.

59. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons at the stations and a circuit including the same, motor-controlling devices and a circuit including the same, electromagnets in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and an electromagnet in said latter circuit for opening the push-button circuit, substantially as described.

60. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, switches for setting the motor in operation and a circuit including the same, means in the circuit of said switches for closing the circuit of the motor-controlling devices, and means in the circuit of the motor-controlling devices for maintaining the circuit of the same closed, substantially as described.

61. In an apparatus for controlling elevators, the combination with a motor, and its main circuit, of two motor-controlling circuits one including switches for starting the motor and adapted to be opened when the motor is in operation and the other including motor-controlling devices, means in the circuit of said switches for closing the circuit of the motor-controlling devices, and means in the circuit of the motor-controlling devices for maintaining the circuit of the same closed while the motor is in operation, substantially as described.

704,838. CONTROLLING SYSTEM FOR ELECTRIC ELEVATORS.

JESSE D. ILLSLEY, Yonkers, N. Y., assignor to Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Jan. 13, 1902. Serial No. 89,551. (No model.)

Claim.—1. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for rendering a portion of said controlling-circuit inoperative after the motor is started, substantially as described.

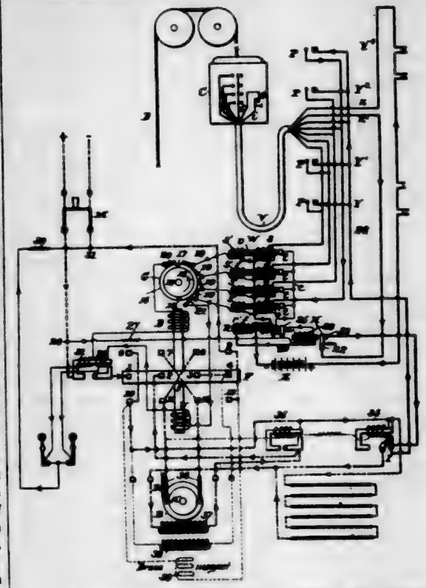
2. In an electric controlling system for elevators, the combination with a motor and car, of a main motor-circuit, a controlling-circuit of lower potential than the main circuit, and means for energizing the controlling-circuit to start the car and for then rendering said circuit in part inoperative, substantially as described.

3. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for rendering a portion of said controlling-circuit temporarily inoperative after the motor is started, substantially as described.

4. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for maintaining a portion of said controlling-circuit inoperative while the motor is in operation, substantially as described.

5. The combination with an electric motor, and its main circuit, of a controlling-circuit of lower potential than the main circuit, and means for cutting out a portion of said controlling-circuit as the motor starts, substantially as described.

6. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than the main circuit, and means for rendering a portion of said controlling-circuit inoperative when the motor starts, substantially as described.



7. In an electrical controlling system for elevators, the combination with a motor, car and stations, of a main circuit for the motor, a controlling-circuit of lower potential than the main circuit, and means for rendering a portion of said controlling-circuit inoperative after said circuit has once been energized, substantially as described.

8. In an electrical controlling system for elevators, the combination with a motor, car, and stations, of a main circuit for the motor, a controlling-circuit of lower potential than the main circuit, means at the stations included in said controlling-circuit for controlling the starting of the motor, and means for rendering a portion of said controlling-circuit inoperative after the motor has started, substantially as described.

9. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of means for controlling the starting of the motor included in a circuit of lower potential than the main circuit, and means for cutting out that portion of the low-potential circuit including the means for controlling the starting of the motor as the motor starts, substantially as described.

10. In an electrical controlling system for elevators, the combination with a motor, car, stations, and main circuit of the motor, of means included in a circuit of lower potential than the main circuit for starting the car to a particular station, and means for rendering that portion of the low-potential circuit which contains the means for starting the car inoperative after having started the car, substantially as described.

11. In an electrical controlling system for elevators, the combination with a motor, its main circuit, controlling devices, and circuits therefor, of means included in a circuit of lower potential than the main circuit for controlling said controlling devices, and means for rendering a portion of said controlling-circuit inoperative after said controlling devices have been operated, substantially as described.

12. In an electrical controlling system for elevators, the combination with a motor, its main circuit, controlling devices, and circuits therefor, of means included in a circuit of lower potential than the main circuit for controlling said controlling devices, and means for rendering a portion of said controlling-circuit inoperative after it has once been energized, substantially as described.

13. In the electrical controlling system for elevators, the combination with a motor, its main circuit, controlling devices, and circuits therefor, of means included in a circuit of lower potential than the main circuit for controlling said controlling devices, and means for rendering a portion of said controlling-circuit inoperative after it has once been energized while maintaining the remainder energized, substantially as described.

14. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of motor-controlling devices and circuits therefor, a circuit of lower potential than the main circuit for controlling the operation of said controlling devices and their circuits and means for rendering a portion of said controlling-circuit inoperative after said controlling devices have been operated, substantially as described.

15. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of controlling devices and circuits therefor, operative means included in a circuit of lower potential than the main circuit for controlling the operation of said controlling devices and their circuits, and means for cutting out a portion of the low-potential circuit as the motor starts, substantially as described.

16. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of motor-controlling devices and circuits for the same derived from the main circuit, a circuit of lower potential than said main circuit derived from a separate source of power for controlling the operation of said controlling devices and their circuits, and means for cutting out a portion of said controlling-circuit when the motor-controlling devices are operated, substantially as described.

17. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of motor-controlling devices with circuits for the same derived from said main circuit, means for controlling said devices and their circuits included in a circuit derived from a separate source of lower potential than said main circuit, and means for rendering a portion of said low-potential circuit inoperative when the motor-controlling devices are operated, substantially as described.

18. In an electrical controlling system for elevators, the combination with a motor, and its main circuit, of motor controlling devices with circuits for the same derived from said main circuit, means for controlling said devices and their circuits included in a circuit derived from a separate source of lower potential than said main circuit, and means for rendering a portion of said low-potential circuit inoperative when the motor-controlling devices are operated while maintaining the remainder of said low-potential circuit operative, substantially as described.

19. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of switches corresponding to the floors and stations, circuits and connections of high and low potential including the switches and the motor for controlling the operation of the motor, and means for rendering a portion of the circuits of low potential inoperative as the motor starts, substantially as described.

20. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of switches corresponding to the floors and stations, circuits and connections of high and low potential including the switches and the motor for controlling the operation of the motor, and means for cutting out a portion of the low-potential circuits after the car has started, substantially as described.

21. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of switches corresponding to the floors and stations, circuits and connections of high and low potential including the switches and the motor for controlling the operation of the motor, and means for cutting out a portion of the low-potential circuits after the car has started while maintaining the remainder operative, substantially as described.

22. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches, circuits and connections including the switches and the motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than said main circuit, and means for automatically cutting out a portion of said circuit of lower potential when one of the switches is operated, substantially as described.

23. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches on the car, circuits and connections including the switches and the motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than said main circuit, and means for automatically cutting out a portion of said circuit of lower potential when one of the switches is operated, substantially as described.

24. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches at the stations, circuits and connections including the switches and the motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than said main circuit, and means for automatically cutting out a portion of said circuit of lower potential when one of the switches is operated, substantially as described.

25. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches, circuits, and connections including the switches and the motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than said main circuit, and means for rendering a portion of the circuit of lower potential inoperative after the motor has started while maintaining the remainder of said low-potential circuit operative, substantially as described.

26. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches on the car, circuits and connections including the switches and the motor for controlling the operation of the motor the portion of said circuits including the switches being of lower potential than said main circuit, and means for rendering a portion of the circuit of lower potential inoperative after the motor has started while maintaining the remainder of said low-potential circuit operative, substantially as described.

27. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of a main circuit for the motor, switches at the stations, circuits and connections including the switches and the motor for controlling the operation of the motor, the portion of said circuits including the switches being of lower potential than said main circuit, and means for rendering a portion of the circuit of lower potential inoperative after the motor has started while maintaining the remainder of said low-potential circuit operative, substantially as described.

28. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons for each station and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons while maintaining another portion of said circuit closed, substantially as described.

29. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons for each station and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, substantially as described.

30. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons for each station and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, and means in said shorter circuit for maintaining the circuit of the motor-controlling devices closed, substantially as described.

31. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons on the car and at the stations, a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons while maintaining another portion of said circuit closed.

32. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons on the car and at the stations and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, substantially as described.

33. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons on the car and at the stations and a circuit including the same, motor-controlling devices and a circuit including the same, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, and means in said short circuit for maintaining the circuit of the motor-controlling devices closed, substantially as described.

34. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons for each station and a circuit including the same, and motor-controlling devices and a circuit including the same, electromagnets in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, an electromagnet in said latter circuit for closing a short circuit around the push-buttons and said magnets when the push-button circuit is opened, a magnet in said shorter circuit for maintaining the circuit of the motor-controlling devices closed, and other magnets in the circuit of the motor-controlling devices for maintaining the circuit of the same closed, substantially as described.

35. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons for each station and a circuit including the same of lower potential than the circuit including the motor controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in the latter circuit for opening a portion of the push-button circuit including the push-buttons and maintaining another portion of said circuit closed, substantially as described.

36. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons for each station and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, substantially as described.

37. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons for each station and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, and means in the said shorter circuit for maintaining the circuit of the motor-controlling devices closed, substantially as described.

38. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in the latter circuit for opening a portion of the push-button circuit including the push-buttons and maintaining another portion of said circuit closed, substantially as described.

39. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, substantially as described.

40. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, and means in the said shorter circuit for maintaining the circuit of the motor-controlling devices closed, substantially as described.

41. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and at the stations and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in the latter circuit for opening a portion of the push-button circuit including the push-buttons and maintaining another portion of said circuit closed, substantially as described.

42. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and at the stations and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, and means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, substantially as described.

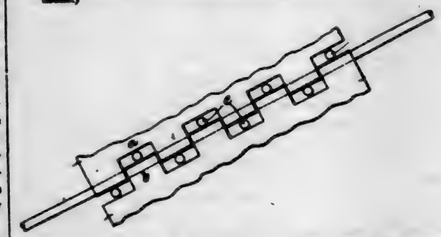
43. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of motor-controlling devices and a circuit including the same, push-buttons on the car and at the stations and a circuit including the same of lower potential than the circuit including the motor-controlling devices, means in the push-button circuit for closing the circuit of the motor-controlling devices when a push-button is manipulated, means in said latter circuit for opening a portion of the push-button circuit including the push-buttons and closing a shorter circuit around the same, and means in the said shorter circuit for maintaining the circuit of the motor-controlling devices closed, substantially as described.

44. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons and switches for each station, controlling-circuits and connections between the push-buttons, switches and the motor for operating the motor, the portion of said circuits including the push-buttons and switches being of lower potential than the remainder of the circuits, and means for automatically rendering the push-buttons inoperative while maintaining the switches operative when one of the push-buttons is manipulated, substantially as described.

45. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons and switches on the car, controlling-circuits and connections between the push-buttons, switches and the motor for operating the motor, the portion of said circuits including the push-buttons and switches being of lower potential than the remainder of the circuits, and means for automatically rendering the push-buttons inoperative while maintaining the switches operative when one of the push-buttons is manipulated, substantially as described.

46. In an apparatus for controlling elevators, the combination with a motor, car, and stations, of push-buttons and switches on the car and at the stations, controlling-circuits and connections between the push-buttons, switches and the motor for operating the motor, the portion of said circuits including the push-buttons and switches being of lower potential than the remainder of the circuits, and means for automatically rendering the push-buttons inoperative while maintaining the switches operative when one of the push-buttons is manipulated, substantially as described.

704,889. METHOD OF WEAVING WIRE. CHARLES W. JAMES, Philadelphia, Pa. Filed Mar. 26, 1901. Serial No. 53,907. (No specimens.)



Claim.—1. The herein-described process of weaving heavy wire, which consists in arranging straight warp-wires parallel with one another, moving said warp-wires forward step by step in the direction of their length, permanently crimping the consecutive wires in suitable dies in alternately opposite directions after each movement, thereby forming a series of loops extending transversely of the fabric and inserting a weft-wire into each shed or series of loops thus formed.

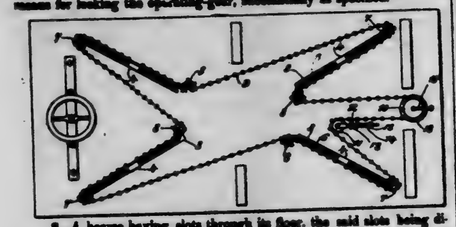
2. The herein-described process of weaving heavy wire, which consists in arranging straight warp-wires parallel with one another, moving said wires step by step in the direction of their length, forming simultaneously two series of loops extending transversely of the fabric after each movement by making a permanent reverse bend in each wire, the adjacent bends in consecutive wires extending in alternately opposite directions, and inserting a weft-wire into each shed or series of loops thus formed.

3. The herein-described process of weaving heavy wire which consists in arranging straight warp-wires parallel with one another, moving said warp-wires forward step by step in the direction of their length, permanently crimping the consecutive wires in suitable dies in alternately opposite directions after each movement, thereby forming a series of loops extending transversely of the fabric and inserting a weft-wire into each shed or series of loops thus formed, and then compressing the warp-wires upon the weft-wires.

4. The herein-described process of weaving heavy wire, which consists in arranging straight warp-wires parallel with one another, moving said wires step by step in the direction of their length, forming simultaneously two series of loops extending transversely of the fabric after each movement by making a permanent reverse bend in each wire, the adjacent bends in consecutive wires extending in alternately opposite directions, and inserting a weft-wire into each shed or series of loops thus formed, and then compressing the warp-wires upon the weft-wires.

704,840. HEARSE. DAVID JOHNSON, Waterloo, Ill. Filed Feb. 4, 1902. Serial No. 92,894. (No model.)

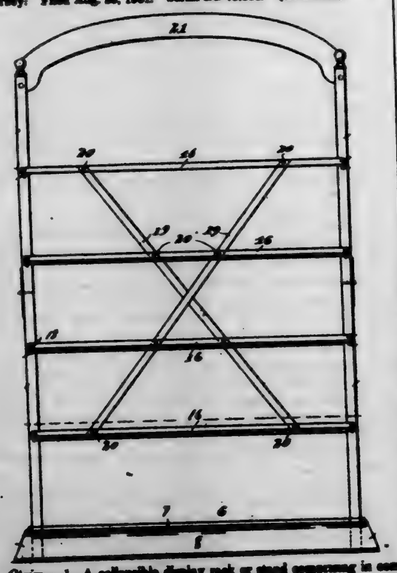
Claim.—1. A hearse having slots in its floor, the said slots being divergent with relation to a central point, guide-rods extended along said slots, clamping-blocks movable on the said rods within the slots, sprocket-pinions arranged at the ends of the slots, a chain engaging with the several sprocket-pinions and also having connection with the several clamping devices, an operating-gear having connection with said chain, and means for locking the operating-gear, substantially as specified.



2. A hearse having slots through its floor, the said slots being divergent with relation to a central point, guide-rods extended along said slots on the lower side of the hearse bottom or flooring, clamping-blocks movable on said rods, sprocket-pinions at the ends of the slots, a sprocket-chain engaging with the several pinions and also having connection with the clamping-blocks, an operating-gear with which the chain engages, and a spring-pressed take-up roller for the chain, substantially as specified.

3. A hearse having divergent slots through its flooring, guide-rods extended along said slots at the under side of the flooring, blocks movable on said rods within the slots, sprocket-pinions at the ends of the slots, a sprocket-chain engaging with the several pinions and also having connection with the several blocks, an operating-gear with which the chain engages, a crank for said gear and consisting of spring metal, a plate between the gear and the lower side of the flooring of the hearse, the side plate being provided with a series of perforations, and a pin carried by the crank for engaging in any one of the said perforations, substantially as specified.

704,841. COLLAPSIBLE DISPLAY RACK OR STAND. FREDERICK C. JOHNSTON and GEORGE H. MERRELL, Brooklyn, N. Y., assignors to the National Biscuit Company, Chicago, Ill., a Corporation of New Jersey. Filed Aug. 23, 1901. Serial No. 73,061. (No model.)

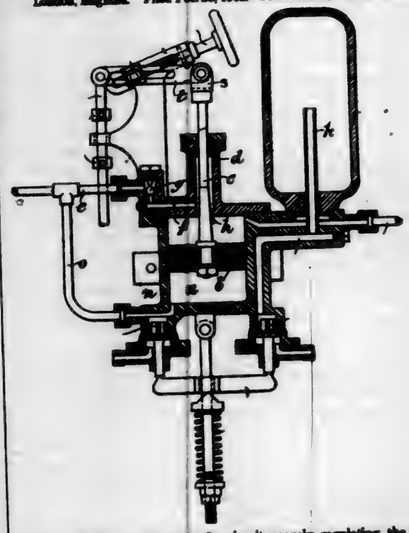


Claim.—1. A collapsible display rack or stand comprising in combination, a rectangular base, a series of uprights formed in a plurality of hinged sections and at their lower ends supported in said base, a series of suitably-spaced rounds connecting the uprights at each side of the structure, a series of shelves resting on said rounds and cut out at their ends to engage said uprights, and one or more diagonally-disposed braces secured to and uniting the rear edges of said shelves, substantially as described.

2. A collapsible display rack or stand, the same having a base, a series of hinged uprights or corner-posts removably supported therein, a series of removable shelves carried by said uprights, a removable tie-bar connecting the upper ends of said uprights on opposite sides of the structure, and one or more diagonal braces connecting the shelves along their rear edges, the elements enumerated being all of substantially the same length whereby they may be compactly assembled when the stand is knocked down, substantially as and for the purposes described.

3. A collapsible display rack or stand comprising in combination a rectangular hollow base having square holes formed through the top at the several corners thereof, two pairs of hinged and foldable uprights square in cross-section and at their lower ends passing through said holes in the base, a series of suitably-spaced rounds rigidly connecting the two uprights of each pair, a series of shelves at their ends overlying and resting upon said rounds and further having their ends cut out near the corners thereof to engage the side and inner walls of the uprights, a pair of removable diagonal braces applied to the rear edges of the shelves, and a removable tie-bar connecting the opposite side uprights of the structure at their upper ends, said base, shelves, braces, tie-bar, and sections of uprights being constructed of substantially uniform length, as and for the purposes described.

704,842. FEED-WATER, BURNER, OR LIKE REGULATOR. JOHN JOHNSTON, London, England, assignor to Archibald Edward Dobbs, London, England. Filed Feb. 26, 1902. Serial No. 95,723. (No model.)



Claim.—1. An apparatus for simultaneously regulating the feed-water supply and heating arrangements for steam-boilers in accordance with the variations in boiler-pressure consisting of, a cylinder divided by a piston into two chambers, one in constant communication with the boiler and the other interpolated between the feed-supply and the boiler, and a conical or like piston-rod for controlling the feed-outlet from the latter chamber and connected to the burner-supply or furnace-draft regulating arrangements, substantially as hereinbefore described.

2. An apparatus for simultaneously regulating the feed-water supply and heating arrangements for steam-boilers in accordance with the variations in boiler-pressure consisting of, a cylinder, a piston therein, an opening in the cylinder-cover connecting one side of the piston with a passage leading to the boiler and fitted with a non-return valve, a second passage leading from the feed-supply to the same side of the piston and fitted with an air vessel and relief-valve, a passage leading from the boiler to the other side of the piston and fitted with a safety-valve, a conical piston-rod, passing through the aforesaid opening in the cylinder-cover and connected to a rocking lever, a fulcrum for said lever and screw adjustment therefor, and a rod provided with stops and connecting said rocking lever with the burner-supply or furnace-draft regulator, substantially as hereinbefore described.

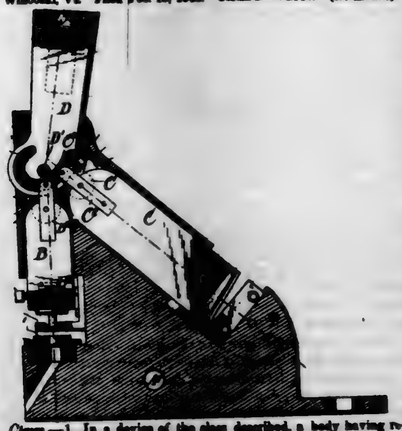
3. In an apparatus for simultaneously regulating the feed-water supply and heating arrangements for steam-boilers in accordance with the boiler-pressure, comprising a cylinder fitted with a piston acted upon on one side by boiler-pressure and on the other by feed-pump pressure the piston-rod controlling both the feed-supply and heating arrangements, the combination of a safety-valve and a relief-valve one connected to the boiler side of the piston and the other to the feed side and both adjusted by the same lever and spring substantially as hereinbefore described.

704,843. WRIST-SUPPORTING ATTACHMENT FOR PIANO FORTES. ARMIN H. JOSSE, Boston, Mass. Filed Oct. 31, 1901. Serial No. 80,584. (No model.)

Claim.—1. A wrist-supporter for pianofortes, comprising angular brackets having loop-shaped horizontal portions adapted to be clamped against the piano-frame under the keyboard, and vertical standard portions, provided at their upper ends with vertical guides, said brackets being formed of wire, a horizontal wire bar connecting said brackets, an elongated rest having vertical arms at its ends which are movable in said guides and are slidingly connected thereby with the standard portions of the brackets to effect a vertical adjustment of the rest, and means for securing the arms and rest at any point within the limits of their vertical adjustability.

2. A wrist-supporter for pianofortes composed of two wire parts, one part comprising loop-shaped horizontal portions adapted to be clamped against the piano-frame under the keyboard, vertical standard portions provided at their upper ends with vertical guides and with set-screws co-operating with said guides, said horizontal and vertical portions constituting brackets, and a horizontal portion connecting said brackets, the other part comprising an elongated horizontal rest and vertical arms at its ends adapted to move in said guides and to be secured therein at various heights by said set-screws, the said arms having eyes adapted to slide on said standard portions.

704,844. COMBINED PUNCH AND SHEARS. JOHN F. KIDDER, Winooski, Vt. Filed Feb. 15, 1902. Serial No. 94,317. (No model.)



Claim.—1. In a device of the class described, a body having recesses therein, plunger and shearing pistons located in said recesses, and a pivoted lever having a cam-face adapted to successively bear upon said pistons; substantially as specified.

2. In a device of the class described, a body having recesses therein, plunger and shearing pistons located in said recesses, a pivoted lever having a cam-face adapted to successively bear upon said pistons and a trunk or way in said lever, and connectors extending from said pistons to said trunk; substantially as specified.

3. In a device of the class described, a body having recesses therein, plunger and shearing pistons located in said recesses, a pivoted lever having a cam-face adapted to successively bear upon said pistons and a trunk or way in said lever, connectors extending from said pistons to said trunk, a bearing-roller carried by said connectors and disposed in said trunk, and a bearing-roller upon the upper contact end of each piston; substantially as specified.

4. In a device of the class described, a body portion, a reciprocating piston, a contact-roller pivoted at the upper end thereof, an operating-cam pivotally mounted in said body, a connector disposed within a recess upon one face of said piston, a track or way in said cam provided with an outlet-opening at one end thereof, and a projection from said connector extending into said track or way and carrying a contact-roller opposite the roller upon the piston; substantially as specified.

5. In a device of the class described, a body portion, a reciprocating piston mounted thereon, an operating-cam pivotally mounted in said body and having a track or way provided with an outlet-opening at one end thereof, and a connector adapted to enter said track through said opening and at its opposite end secured to said piston; substantially as specified.

6. In a device of the class described, a body portion, a reciprocating punching-piston mounted therein, a punch carried thereby, a die-cast in said body beneath said punch provided with a discharge-channel extending outwardly therefrom, a die located upon said seat, a cleaner disposed above said die, an operating-cam above said punch provided with a cam-face for engaging the same and with a retracting-groove or way having an outlet-opening at one end, and a connector extending from said piston to said groove or way; substantially as specified.

7. In a device of the class described, a reciprocating shearing-piston, means for operating the same, a blade carried by said piston, and a blade adjustable upon its base by oscillation relative to the blade carried by said piston; substantially as specified.

8. In a device of the class described, a reciprocating shearing-piston, means for operating the same, a blade carried by said piston, a stationary blade having a bearing at its base beneath said piston-blade, an angle-iron for oscillating said stationary blade, a screw extending through an enlarged aperture in said angle-iron into the body, and adjustable set-screws mounted in said angle-iron for the purpose of varying the relative relation of said blades by oscillating the fixed blade; substantially as specified.

9. In a device of the class described, a casting having a vertical piston-channel, a piston-channel disposed obliquely thereto, pivoting-ears at the upper end of said channels, transverse openings at the lower portions thereof disposed within vertical and inclined faces, pistons located in said channels, and an operating-cam pivoted between said ears and connected to both of said pistons; substantially as specified.

10. In a device of the class described, a casting having a vertical piston-channel, a piston-channel disposed obliquely thereto, pivoting-ears at the upper end of said channels, transverse openings at the lower portions thereof, pistons located in said channels, and an operating-cam pivoted between said ears and connected to both of said pistons; substantially as specified.

11. In a device of the class described, a casting having a vertical piston-channel, a piston-channel disposed obliquely thereto, pivoting-ears at the upper end of said channels, transverse openings at the lower portions thereof, pistons located in said channels, an operating-cam pivoted between said ears and connected to both of said pistons, and a die-receiving recess beneath said vertical channel and provided with a discharge-channel leading obliquely outward therefrom; substantially as specified.

12. In a device of the class described, a casting having a vertical piston-channel, a piston-channel disposed obliquely thereto, pivoting-ears at the upper end of said channels, transverse openings at the lower portions thereof, pistons located in said channels, an operating-cam pivoted between said ears and connected to both of said pistons, a die-receiving recess beneath said vertical channel and provided with a discharge-channel leading obliquely outward therefrom, and an adjustable-blade holder mounted upon the lower face of the recess at the bottom of the obliquely-inclined piston-channel; substantially as specified.

704,845. COMBINED RAKE AND STACKER. JOHN H. KINNAMAN, Russell, Kans. Filed May 10, 1901. Serial No. 59,512. (No model.)

Claim.—1. In a combined hay rake and stacker, a rake consisting of an upright back member, a forwardly-extending toothed member disposed at an angle to the back member and pivotally connected thereto, brackets attached to the toothed rake member and provided with latch-keepers, and a latch-rod mounted on the upright rake member and having latches adapted to engage with said keepers, combined with an upright rake-supporting frame on which the back member of said rake is fitted, means for limiting the back rake member to sliding movement on said rake-supporting frame, means for bodily raising the rake, and a trip

mechanism disposed in the path of said latch-rod and adapted for engagement automatically therewith on the elevation of said rake to a predetermined position.

2. In a combined hay rake and stacker, the combination of a wheeled carrying-frame, and upright rake-supporting frame pivoted thereon and provided with depending stirrups, and adjusting devices connected to said upright frame for shifting the latter to different inclined positions, a two-part rake having its members pivoted together and one of said members limited to slidable movement on said upright frame and adapted to be lowered into engagement with said depending stirrups, a latch mechanism for holding said members of the rake in rigid operative relation, coacting guide devices on the wheeled frame and the rake, and adapted to maintain the latter in fixed relation to said frame when the rake is lowered into engagement with the stirrups, a projection disposed on the upright frame in the path of the latch mechanism, and mechanism for bodily hoisting the rake.

3. In a hay rake and stacker, the combination, with a wheel-supported frame, a vertical frame pivoted upon the wheel-supported frame, and an adjustable trip carried by the pivoted frame, of a support having roller-bearings upon the pivoted frame, a rake hinged to said support, a shaft carried by the support, latches secured to said shaft, keepers carried by the rake and adapted for engagement with said latches, an arm projected from the shaft and arranged to be engaged by said trip, and means, operated by the movement of the machine, for raising the rake, substantially as described.

4. In a hay rake and stacker, the combination, with a wheel-supported frame, an upright frame pivotally connected with the wheel-supported frame, said upright frame being provided with a forwardly-extending upper section, and a trip secured to the said upright frame, of a support having roller-bearings upon the upright frame and adapted to travel thereon, a rake having hinged connection with said support, latches carried by the support, keepers for the latches carried by the rake, an arm operating the latches and adapted for engagement with the trip on the upright frame, a series of ropes attached to the upper portion of the upright frame and passed over palleys attached to the head of the rake and over palleys at the upper portion of the upright frame, theses over palleys carried by the wheel-supported frame, the ropes being connected at their rear ends, and a drag or anchor attached to the said connected ropes, as and for the purpose specified.

5. In a combined hay rake and loader, the combination with an upright frame, of a two-part rake having members pivoted together and arranged for one member to travel on the upright frame, a latch mechanism between the rake members, means for hoisting the rake, means for tripping the latch, and a spring connecting the members of the rake and held normally in an inactive condition by maintenance of the rake members in an operative condition, said spring being movable vertically with the rake as a part thereof and adapted to be brought automatically into service on the release of the latch by the tripping device and the dropping of one rake member to a dumping-position.

6. In a combined hay rake and stacker, the combination of a wheeled base-frame, an upright frame pivotally mounted thereon, and provided with stirrups arranged to depend below the axis of the wheeled frame, a rake having one member thereof provided with carrying-wheels, that are arranged to travel upon the upright frame and to descend into engagement with said stirrups, means for tilting the upright frame, and bringing the rake into operative position, to collect the load, and mechanism for bodily hoisting the rake, substantially as described.

7. In a combined hay rake and stacker, a rake consisting of an upright slatted member, an outwardly-extending toothed member, connected pivotally with the said upright member, brackets attached to the outwardly-extending member and provided with keepers, and a latch-rod mounted on the upright member and provided with latches for engagement with said keepers, combined with an upright frame on which the back member of the rake is mounted, means for limiting the back rake member to slidable movement and in a vertical path to said upright frame, trip devices supported on said upright frame and adapted to actuate the latch-rod, and means for bodily hoisting said rake, substantially as described.

8. In a combined hay rake and stacker, a rake consisting of an upright member provided with carrying-wheels facing in directions at right angles to each other, an outwardly-extending member pivoted to said upright member, brackets fast with said outwardly-extending member and provided with keepers, a latch-rod mounted on the upright member, and having a rearwardly-extending arm, latches fast with the latch-rod, and arranged for engagement with said keepers, and a spring connected with said arm on the latch-rod, combined with an upright frame, on which the rollers of the back rake member are adapted to travel, and a trip mounted on the upright frame in the path of said arm on the latch-rod.

9. In a combined hay rake and stacker, the combination of a wheeled supporting-frame provided with a suitable cross-bar, an upright rake-supporting frame having the depending stirrups and the yokes which are loosely engaged with said cross-bar, a main lever mounted on a wheeled frame and adapted to be held in different positions by suitable locking devices, a segment carried by the main lever, an auxiliary lever fulcrumed on the main lever and adapted for engagement with said segment, operative connections between the upright frame and the auxiliary lever, a rake slidably mounted on the upright frame and adapted to be lowered into engagement with the stirrups, and a hoisting mechanism for said rake.

704,846. TOY MILK-WAGON. HARRY T. KIRSHNER, Keene, N. H. Filed Aug. 6, 1901. Serial No. 71,079. (No model.)

Claim.—1. The herein-described toy cart, comprising integral top and side pieces, said side pieces being provided with projections, a bottom member having slots to receive said projections, and having an upwardly and forwardly projecting end, said upwardly and forwardly projecting end being provided with transverse slots and spring-shafts having hooked ends passing through said slots, substantially as described.

2. The herein-described toy cart, comprising integral top and side pieces, said side pieces being provided with projections, a bottom member having slots to receive said projecting members and having an upwardly and forwardly projecting end, said upwardly and forwardly projecting end being provided with transverse slots and the side pieces being provided with slots; and spring-shafts having hooked ends engaging said slots; substantially as described.

704,847. RAILROAD SIGNALING SYSTEM. ALLEN W. KNEE, Syracuse, N. Y., assignor of one-third to Frank J. Mann, Syracuse, N. Y. Filed Mar. 7, 1902. Serial No. 97,196. (No model.)

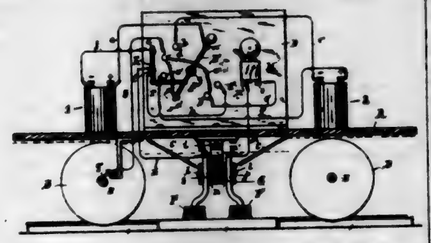
Claim.—1. An electric signaling system for railways constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a switch for cutting out and in said sources whereby the current is used from only one source at a time, a conductor connected to the circuit and provided with a brush or other device maintained permanently in contact with one of the axles or wheels of the locomotive or car, a pair of separate and independent metallic brushes or other contact devices connected to the electric circuit and carried on the locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed along the railway parallel to and between the track-rails and disposed in the path of said contact-brushes to effect the sounding of the alarm, means along the railway adapted to automatically form a cross in the electric circuit for the purpose of either preventing or stopping the sounding of the alarm, and manually-operated means carried on the locomotive or car for forming said cross.

2. An electric signaling system for railways constructed and arranged as follows: a locomotive or car equipped with a normally open circuit having two sources reversely connected thereto and including suitable alarm devices, a switch for cutting out and in said sources whereby the current is used from only one source at a time, a conductor connected to the circuit and provided with a brush or other device maintained permanently in contact with one of the axles or wheels of the locomotive or car, a pair of separate and independent metallic brushes or other contact devices connected to the electric circuit and carried on the locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed along the railway parallel to and between the track-rails and disposed in the path of said contact-brushes to effect the sounding of the alarm, means along the railway adapted to automatically form a cross in the electric circuit for the purpose of either preventing or stopping the sounding of the alarm, and manually-operated means carried on the locomotive or car for forming said cross.

3. An electric signaling system constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors extending from the respective sources, means adapted to connect either of said pairs, a switch for cutting out and in said sources whereby the current is used from only one source at a time, for the purpose set forth, the track-rails suitably connected to the electric circuit a pair of separate and independent metallic brushes or other contact devices connected with the circuit and carried on said locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed parallel to and between the track-rails and in the path of said contact-brushes to effect the sounding of the alarm, and means for forming a cross in the electric circuit between said track-rails and circuit-closing rail to either prevent or stop the sounding of the alarm.

4. An electric signaling system constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors extending from the respective sources, a movable metallic arm adapted to connect either of said pairs of terminals, a switch operated by said arm and serving to cut said sources out and in whereby the current is used from only one source at a time, for the purpose set forth, a conductor connected to the circuit and provided with the suitable contact device maintained permanently connected to either one of the axles or wheels of the locomotive or car, a pair of separate and independent metallic brushes or other contact devices connected to the circuit and carried on said locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed parallel to and between the track-rails and in the path of said contact-brushes to effect the sounding of the alarm, and means for forming a cross in the electric circuit between said track-rails and circuit-closing rail to either prevent or stop the sounding of the alarm.

5. An electric signaling system constructed and arranged as follows: a locomotive or car, equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, means connected to the circuit for cutting out and in said sources whereby the current is used from only one source at a time for the purpose set forth, the track-rails suitably connected to the electric circuit, a pair of separate and independent metallic brushes or other contact devices also connected to the circuit and carried on said locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed parallel to and between the track-rails and in the path of said contact-brushes to effect the sounding of the alarm, and means adapted to automatically form a cross in the electric circuit between said track-rails and the circuit-closing rail to either prevent or stop the sounding of the alarm.



6. An electric signaling system constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of main electric terminals for the conductors extending from the respective sources, a pivoted metallic arm adapted to connect either of said pairs of terminals, a suitably-pivoted switch-lever provided with a pair of terminals to which the respective sources are connected, said lever and latter terminals being so related as to permit the said sources to be cut out and in whereby only one source is used at a time, a conductor permanently connecting said main terminals and one of the axles or wheels of the locomotive or car, a pair of separate and independent and metallic brushes or other contact devices connected to the electric circuit, and carried on said locomotive or car and disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed parallel to and between the track-rails and in the path of said contact-brushes to effect the sounding of the alarm, means for automatically forming a cross in the electric circuit between said track-rails and circuit-closing rail to either prevent or stop the sounding of the alarm, and manually-operated means carried on said car or locomotive for forming said cross.

7. An electric signaling system constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of main electric terminals for the conductors extending from the respective sources, a pivoted metallic arm adapted to connect either of said pairs of terminals, a suitable pivoted switch-lever provided with a pair of terminals to which the respective sources are connected, said lever and latter terminals being so related as to permit the said sources to be cut out and in whereby only one source is used at a time, a conductor permanently connecting said main terminals and one of the axles or wheels of the locomotive or car, a pair of separate and independent metallic brushes or other contact devices connected to the electric circuit, and carried on said locomotive or car, said contact-brushes being disposed one in front of the other to travel over the road-bed of the railway a circuit-closing rail disposed parallel to and between the track-rails and in the path of said contact-brushes to effect the sounding of the alarm, means along the railway-track adapted to automatically form a cross in the electric circuit between said track-rails and circuit-closing rail to either prevent or stop the sounding of the alarm, a pair of auxiliary electric terminals in the electric circuit, and connected respectively to the conductor leading to the axle or wheel and to a conductor leading to one of said contact-brushes, said auxiliary terminals being disposed to be connected by the aforesaid pivoted arm whereby said cross may be formed.

8. An electric signaling system constructed and arranged as follows: a locomotive or car equipped with a normally open electric circuit having two batteries or sets of batteries reversely connected thereto and including suitable alarm devices and provided with a switchboard, a pair of main electric terminals on the switchboard for the conductors leading from respective batteries, a metallic arm pivoted to said switchboard and adapted to connect either of said pairs of terminals, a metallic switch-lever also pivoted to the switchboard and provided with a pair of electric terminals to which the respective batteries are connected, said lever being adapted to move into contact with either of said latter terminals to cut out and cut in the batteries whereby only one battery is used at a time, an insulated bar or rod connecting the aforesaid pivoted arm and lever for operating said parts simultaneously, a conductor permanently connecting one of each pair of main terminals with one of the axles or wheels of the locomotive or car, a pair of metallic contact-brushes included in the electric circuit and connected respectively to the alarm devices and aforesaid switch-lever, said brushes depending from the locomotive or car and disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail disposed parallel to and between the track-rail and in the path of said contact-brushes to effect the sounding of the alarm, means along the railway adapted to automatically form a cross in the electric circuit between said track-rails and circuit-closing rail, to either prevent or stop the sounding of the alarm, a pair of auxiliary electric ter-

minals in the circuit and entered to the switchboard, a conductor connecting one of said auxiliary terminals to the switch-lever and the other auxiliary terminal connected to the conductor leading to the axle or wheel, and both of the latter terminals being disposed to be connected by the aforesaid pivoted metallic arm whereby a cross may be formed in the electric circuit.

9. An electric block-signaling system for railways constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, means on the locomotive for cutting out and in said sources to cause the current to flow from only one source at a time and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, the track-rails being suitably connected to the electric circuit of both locomotives, a pair of separate and independent metallic brushes carried on each locomotive and connected to the electric circuit thereof, and disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact devices to effect an alarm on a locomotive passing singly over a section of the circuit-closing rail and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section and moving in opposite directions, and thus the alarm on each locomotive is either prevented or stopped from sounding.

10. An electric block-signaling system for railways constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors leading from the respective sources, means adapted to connect either of said pairs, a switch for cutting out and in said sources to cause the current to flow from only one source at a time, and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, the track-rails being suitably connected to the electric circuit of both locomotives, a pair of separate and independent metallic brushes carried on each locomotive and connected to the electric circuit thereof, and disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact devices to effect an alarm on a locomotive passing singly over a section of the circuit-closing rail, and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section simultaneously, and thus the alarm on each locomotive is either prevented or stopped from sounding.

11. An electric block-signaling system for railways constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors leading from the respective sources, a pivoted metallic arm adapted to connect either of said pairs, a switch operated by said arm and adapted to cut out and in said sources to cause the current to flow from only one source at a time and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, the track-rails being suitably connected to the electric circuit of both locomotives, a pair of separate and independent metallic brushes carried on each locomotive and connected to the electric circuit thereof and disposed one in front of the other to travel over the road-bed of the railway, and a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact-brushes to effect the sounding of an alarm on a locomotive passing singly over a section of the circuit-closing rail and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section, simultaneously, and thus the alarm on each locomotive is either prevented or stopped from sounding.

12. An electric block-signaling system for railways constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors leading from the respective sources, a pivoted metallic arm adapted to connect either of said pairs of terminals, a switch operated by said arm, a second pair of terminals connected to the respective sources and disposed to be connected singly with the switch to cause the current to flow from only one source at a time and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, the track-rails being suitably connected to the electric circuit of both locomotives, a pair of separate and independent metallic brushes carried on each locomotive and connected to the electric circuit thereof and disposed one in front of the other to travel over the road-bed of the railway, a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact-brushes to effect an alarm on a locomotive passing singly over a section of the circuit-closing rail and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section simultaneously and thus the alarm on each locomotive is either prevented or stopped from sounding.

13. An electric block-signaling system constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of electric terminals for the conductors leading from the respective sources, a pivoted metallic arm adapted to connect either of said pairs of terminals, a switch-lever, an insulated bar or rod connecting said arm and switch-lever whereby said parts operate in unison, a second pair of terminals connected to the respective sources and disposed to separately make contact with said switch-lever to cause the current to flow from only one source at a time and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, a conductor on each locomotive permanently connecting the electric terminals thereon to one of the axles or wheels of the locomotive to include the track-rails in both electric circuits, a pair of metallic brushes carried separately and independently on each locomotive, each pair of contact-brushes being arranged one in front of the other and disposed to travel over the road-bed of the railway, and a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact-brushes to effect a sounding of an alarm on a locomotive passing singly over a section of the circuit-closing rail and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section simultaneously and thus the alarm on each locomotive is either prevented or stopped from sounding.

14. An electric block-signaling system constructed and arranged as follows: a plurality of locomotives moving on the same track and each equipped with a normally open electric circuit having two sources reversely connected thereto and including suitable alarm devices, a pair of main electric terminals for the conductors leading from the respective sources, a pivoted metallic arm adapted to connect either of said pairs of main terminals, a switch-lever, an insulated bar or rod connecting said arm and switch-lever whereby said parts operate in unison, a second pair of terminals connected to the respective sources and disposed to separately make contact with said switch-lever to cause the current to flow from only one source at a time and to permit a locomotive moving in one direction to use a source connected reverse to that of a locomotive moving in the opposite direction, a conductor on each locomotive permanently connecting the electric circuit thereon to one of the axles or wheels of the locomotive to include the track-rails in both electric circuits, a pair of metallic brushes carried separately and independently on each locomotive, each pair of contact-brushes being arranged one in front of the other and disposed to travel over the road-bed of the railway, a circuit-closing rail composed of overlapping sections insulated apart and disposed along the road-bed in the path of said contact-brushes to effect the sounding of the alarm on a locomotive passing singly over a section of the circuit-closing rail and whereby a cross is formed in the electric circuit of both locomotives traveling over said rail-section simultaneously and thus the alarm on each locomotive is either prevented or stopped from sounding, a pair of auxiliary terminals connected to the respective sources in the circuit of each locomotive, and disposed to be connected by the aforesaid pivoted metallic arm to form said cross.

704,848. GRINDING-MACHINE. JOSEPH E. LAPOINTE, Hyde Park, Mass. Filed Jan. 3, 1902. Serial No. 88,312. (No model.)

Claim.—1. In a grinding-machine, the combination with a grinding member, of a work-holder, and automatic means for imparting a compound movement to the work-holder consisting of a bodily oscillation and an oscillatory rotation.

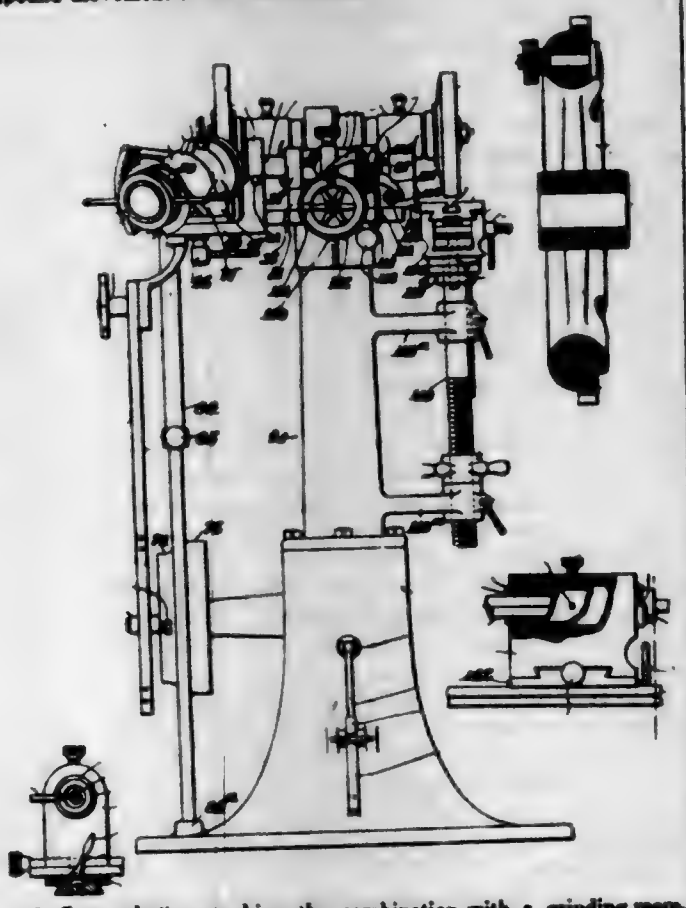
2. In a grinding-machine, the combination with a grinding member, of a work-holder, and automatic means for simultaneously imparting a movement of translation and an oscillatory movement of rotation to the work-holder.

3. In a grinding-machine, the combination with a grinding member, of a work-holder, and automatic means for simultaneously imparting a movement of translation in a curved path and a movement of rotation to the work-holder.

4. In a grinding-machine, the combination with a grinding member and a work-holder, of means for laterally moving the grinding member and work-holder relatively to one another, and automatic means for imparting a compound movement to the work-holder.

5. In a grinding-machine, the combination with a grinding member and a work-holder, of means for moving the grinding member laterally of the work-holder, and automatic means for imparting a compound movement to the work-holder.

6. In a grinding-machine, the combination with a grinding member and a work-holder, of automatic means for moving the grinding member laterally of the work-holder, and automatic means for imparting a compound movement to the work-holder.



7. In a grinding-machine, the combination with a grinding member and a work-holder, of means for securing a feeding movement of the grinding member and work-holder toward and from one another, and automatic means for imparting a compound movement to the work-holder.

8. In a grinding-machine, the combination with a grinding member and a work-holder, of automatic means for feeding the work-holder toward the grinding member, and automatic means for imparting a compound movement to the work-holder.

9. In a grinding-machine, the combination with a grinding member and a work-holder, of automatic means for moving the grinding member laterally of the work-holder, and means for simultaneously imparting a compound movement to the work-holder and a feeding movement toward the grinding member.

10. In a grinding-machine, the combination with a grinding member, of a work-holder, automatic means for imparting a compound movement to the work-holder, and adjusting means whereby any component of the compound movement may be varied.

11. In a grinding-machine, the combination with a rotary grinding member, an oscillatory work-holder and a continuously-operative driver, of means connected with the driver for moving the grinding member laterally of the work-holder, and a throw-out device between the moving means and driver.

12. The combination with a grinding member, of a work-holder mounted for a bodily movement of oscillation, a continuously-operative driver, and a connector between the driver and work-holder.

13. The combination with a grinding member, of a work-holder mounted for a bodily movement of oscillation, a continuously-operative driver, and an adjustable connector between the driver and work-holder.

14. The combination with a grinding member, of a work-holder mounted for a bodily movement of oscillation, a continuously-operative driver, a connector between the driver and work-holder, and means for varying the point of connection between the driver and connector.

15. The combination with a grinding member, of a work-holder mounted for a bodily movement of oscillation, a continuously-operative driver, a two-part connector between the driver and work-holder, and means for varying the angle between the parts of the connector.

16. The combination with a grinding member, of an oscillatory work-holder, and means mounted upon the work-holder for imparting to an oscillatory portion thereof a movement of rotation.

17. The combination with a grinding member, of an oscillatory work-holder, and means pivoted upon the work-holder and connected to a fixed point for imparting to a portion of said work-holder a movement of rotation.

18. The combination with a grinding member, of a casing, a clamping member provided with teeth and rotatably mounted in the casing, a gear turning upon the casing and meshing with the teeth of the clamping member, and means for controlling the movement of the gear.

19. The combination with a grinding member, of a casing, a clamping member provided with teeth and rotatably mounted in the casing, a gear turning upon the casing and meshing with the teeth of the clamping member, and a connector between the gear and a fixed point.

20. The combination with a grinding member, of a casing, a clamping member provided with teeth and rotatably mounted in the casing, a gear turning upon the casing and meshing with the teeth of the clamping member, and an adjustable connector between the gear and a fixed point.

21. The combination with a grinding member, of a casing, a clamping member provided with teeth and rotatably mounted in the casing, a gear turning upon the casing and meshing with the teeth of the clamping member, a two-part connector between the gear and a fixed point, and means for varying the length of the connector.

22. The combination with a grinding member, of a casing, a clamping member provided with teeth and rotatably mounted in the casing, a gear turning upon the casing and meshing with the teeth of the clamping member, a guard-arm fixed to the casing and extending over the gear, a wearing-plate interposed between the guard-arm and gear, and means for controlling the movement of the gear.

23. The combination with a grinding member, of an oscillatory support, a work-holder mounted thereon, means for adjusting the angle of the work-holder with the grinding member, and means for rotating a portion of the work-holder.

24. The combination with a grinding member, of an oscillatory support, a work-holder mounted thereon, the work-holder and support being provided with a suitable scale and index, means for clamping the work-holder in the desired position, a continuously-operative driver, and a connector between the driver and work-holder.

25. The combination with a grinding member, of a casing, a rotatable clamping member mounted in the casing, and a gear for rotating the clamping member, said gear and clamping member being provided with detent mechanism for determining their relative position.

26. The combination with a grinding member, of a casing, a rotatable clamping member mounted in the casing and provided with notches, a gear for rotating the clamping member, and a detent upon the gear for engaging the notches.

27. The combination with a grinding member, of a casing, a rotatable clamping member mounted in the casing and provided with a plurality of sets of notches one notch of which is common to all the sets, a gear for rotating the clamping member, and a detent upon the gear for engaging the notches.

28. The combination with a grinding member, of a work-holder, means for continuously oscillating the work-holder toward and from the grinding member, and means for intermittently moving the work-holder toward the grinding member.

29. The combination with a movable grinding member, of a carriage, a work-holder mounted upon the carriage, and means whereby the movement of the grinding member causes an advance of the carriage.

30. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, an actuating member moving with the carriage, and ratchet mechanism connecting the feed-screw and actuating member.

31. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a spring-pressed actuating member moving with the carriage, a contact member with which the actuating member coöperates, and ratchet mechanism connecting the feed-screw and actuating member.

32. The combination with a movable grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a spring-pressed actuating member moving with the carriage, an elongated contact member moving with the grinding member with which the actuating member coöperates, and ratchet mechanism connecting the feed-screw and actuating member.

33. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a spring-pressed actuating member moving with the carriage, a contact member with which the actuating member coöperates, and ratchet mechanism connecting the feed-screw and actuating member and operating under the action of the spring to turn the feed-screw.

34. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, an actuating member moving with the carriage, and adjustable ratchet mechanism connecting the feed-screw and actuating member.

35. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, an actuating member moving with the carriage, ratchet

mechanism connecting the feed-screw and actuating member in which slip is permitted, and a stop with which the carriage may coact.

36. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, an actuating member moving with the carriage, ratchet mechanism connecting the feed-screw and actuating member in which slip is permitted, a stop with which the carriage may coact, and means for adjusting the position of the stop.

37. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a shaft journaled in the carriage, a finger fixed to the shaft, a movable roll with which the finger contacts, a ratchet mounted upon the shaft, and a ratchet-wheel upon the feed-screw which is engaged by the ratchet.

38. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a shaft journaled in the carriage, a finger fixed to the shaft, a contact member with which the finger coacts, a ratchet mounted upon the shaft, and a two-part ratchet-wheel upon the feed-screw which is engaged by the ratchet, said ratchet-wheel having a connection between the parts permitting them to slip relatively to one another.

39. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a shaft journaled in the carriage, a finger fixed to the shaft, an elongated contact-roll with which the finger coacts, a spring serving to hold the finger against the roll, a ratchet mounted upon the shaft, and a ratchet-wheel upon the feed-screw which is engaged by the ratchet.

40. The combination with a grinding member, of a movable carriage, a work-holder mounted upon the carriage, a feed-screw for advancing the carriage, a shaft journaled in the carriage, a finger fixed to the shaft, an elongated contact-roll with which the finger coacts, a spring serving to hold the finger against the roll, means for adjusting the tension of the spring, a ratchet mounted upon the shaft, and a ratchet-wheel upon the feed-screw which is engaged by the ratchet.

41. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, a casing mounted upon the support, a clamping device carried by the casing, and means connected with the support for rotating the shaft.

42. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, and means for adjusting the point of attachment of the support to the shaft.

43. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, and means for varying the position of the shaft whereby the support may be adjusted laterally of the grinding member.

44. The combination with a grinding member, of a rotatable shaft, an arm fixed to the shaft, a table extending from the arm substantially parallel to the shaft, a casing mounted upon the table, a clamping device carried by the casing, and means connected with the support for rotating the shaft.

45. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, a casing mounted upon the support, a clamping device carried by the casing, a driving-wheel, and a rod connecting the support and driving-wheel.

46. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, a casing mounted upon the support, a clamping device carried by the casing, a driving-wheel provided with a projection, and a rod connected with the support and provided with a slot adapted to receive the projection.

47. The combination with a grinding member, of a rotatable shaft a support fixed to the shaft, a casing mounted upon the support, a clamping device carried by the casing, a driving-wheel provided with an adjustable projection, and a rod connected with the support and provided with a slot adapted to receive the projection.

48. The combination with a grinding member, of a rotatable shaft, a support fixed to the shaft, a casing mounted upon the support, a clamping device carried by the casing, a driving-wheel, a rod connecting the support and driving-wheel formed in two parts pivotally joined together, and means for clamping the parts together.

49. The combination with a grinding member, of a work-holder comprising a casing, a clamping device rotatably mounted in the casing, gearing for rotating the clamping device, and means carried by the casing for securing the clamping device against rotation when desired.

50. The combination with a grinding member, of a work-holder comprising a casing provided with a movable section, a clamping device rotatably mounted in the casing, gearing for rotating the clamping device, and a screw for forcing the movable section against the clamping device.

51. The combination with a grinding member, of a work-holder comprising a casing provided with a movable section, a clamping device rotatably mounted in the casing, gearing for rotating the clamping device, a screw for forcing the movable section against the clamping device, and packing interposed between the adjacent edges of the movable section and the casing.

52. The combination with a work-holder, of a grinding-head movably mounted in proximity thereto and provided at its under side with a slot, an operating member journaled beneath the head and provided with an eccentric projection extending into the slot, and means for rotating the operating member.

53. The combination with a work-holder, of a grinding-head movably mounted in proximity thereto and provided at its under side with a slot, an operating member journaled beneath the head and provided with an eccentric projection extending into the slot, a continuously-operative driver, and a connector between the operating member and driver movable into and out of coaction with said driver.

54. The combination with a work-holder, of a grinding-head movably mounted in proximity thereto and provided at its under side with a slot, an operating member journaled beneath the head and provided with an eccentric projection extending into the slot, a continuously-operative driver, a connector between the operating member and driver movable into and out of coaction with said driver, a lever for moving the connector from coaction with the driver, a spring for holding the connector normally in engagement with the driver, and a look for the lever.

55. The combination with a work-holder, of a grinding-head mounted to slide upon ways and provided with a transverse slot between the ways, a crank member journaled between the ways and provided with a crank-pin extending into the slot, a shaft connected to the crank member through a universal joint, a driving-shaft, a worm fixed thereto, a worm-wheel upon the shaft meshing with the worm, and a treadle connected with the shaft.

56. In a grinding-machine, the combination with a shaft, of a plate fixed thereto, a grinding-wheel abutting against the plate, and being free to turn in contact therewith, a second plate on the opposite side of the grinding-wheel movable along the shaft but held against rotation thereon, and means for forcing the last-named plate against the wheel and a wheel against the first-named plate to secure said wheel against rotation upon the shaft.

57. In a grinding-machine, the combination with a shaft, of a plate fixed thereto, a grinding-wheel abutting against the plate, a second plate on the opposite side of the grinding-wheel splined to the shaft, and a screw taking into the end of the shaft and serving to force the last-named plate against the wheel.

58. In a drill-grinding machine, the combination with a grinding member, of a holder adapted to support the drill to be ground with its axis at an acute angle both to vertical and horizontal planes passing through the point of contact of the tool and grinding-surface, and means for moving the holder toward and from the grinding member.

59. In a drill-grinding machine, the combination with a grinding member, of a holder adapted to support the drill to be ground with its axis at an acute angle both to vertical and horizontal planes passing through the point of contact of the tool and grinding-surface, and means for moving the holder toward and from the grinding member in a curved path.

60. In a drill-grinding machine, the combination with a grinding member, of a holder adapted to support the drill to be ground with its axis at an acute angle both to vertical and horizontal planes passing through the point of contact of the tool and grinding-surface, and automatic means for moving the holder toward and from the grinding member in a curved path.

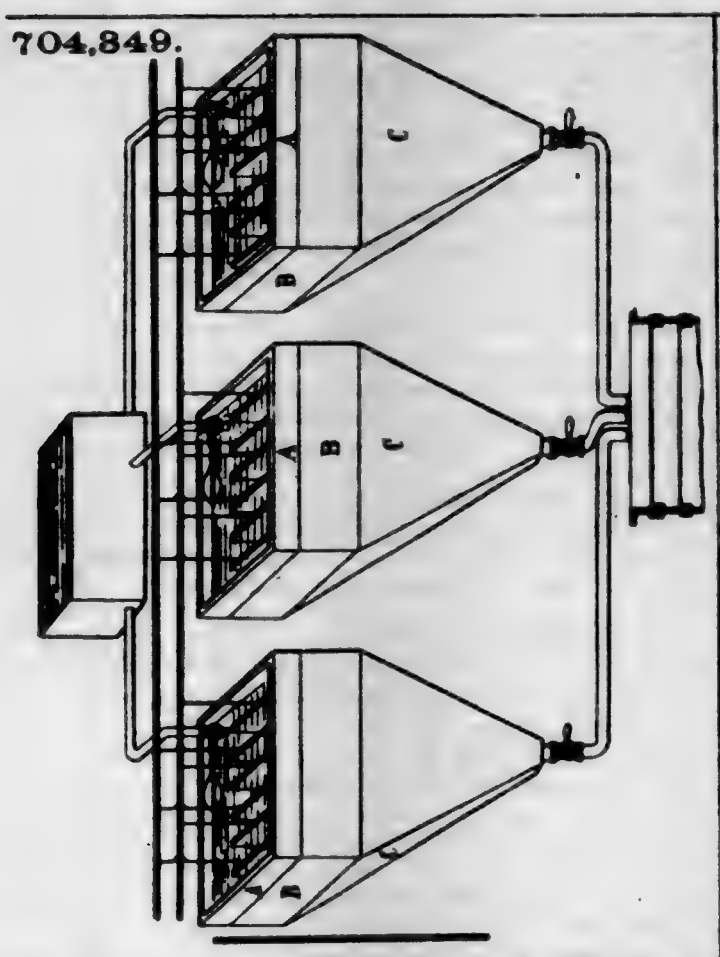
61. In a drill-grinding machine, the combination with a grinding member, of a holder adapted to support the drill to be ground with its axis at an acute angle both to vertical and horizontal planes passing through the point of contact of the tool and grinding-surface, means for securing a feeding movement of the grinding member and holder toward and from one another, and means for moving the holder toward and from the grinding member in a curved path.

62. In a drill-grinding machine, the combination with a grinding member, of a holder adapted to support the drill to be ground with its axis at an acute angle both to vertical and horizontal planes passing through the point of contact of the tool and grinding-surface, means for moving the grinding member and holder relatively to one another, and means for moving the holder toward and from the grinding member in a curved path.

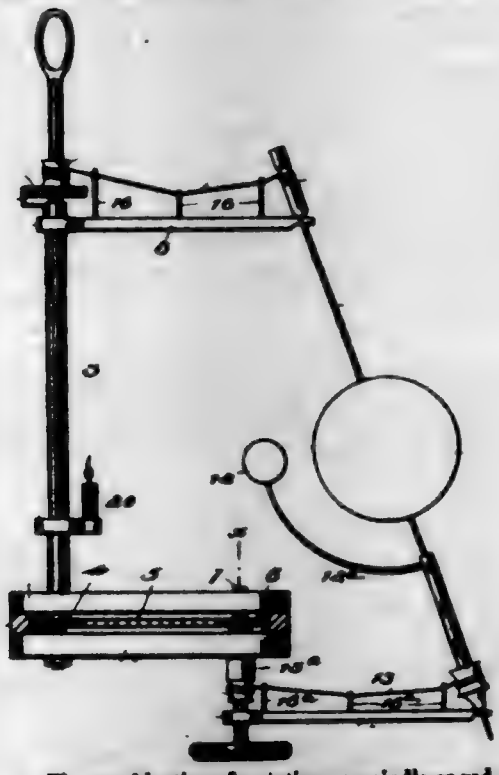
704,349. PROCESS OF MANUFACTURING RICE-STARCH OR OTHER AMYLACEOUS SUBSTANCES. EUGÈNE LESCUYER, Estaires, and JÉRÔME LESCUYER, Paris, France. Filed Mar. 15, 1901. Serial No. 51,293. (No specimens.)

Claim.—The process of manufacturing starch, which consists in treating the starchy substances with successive alkaline solutions of decreasing strength and in washing and milling the same, and finally subjecting the mass to the action of an alternating electric current while in an alkaline solution.

704,849.



704,850. TELLURIAN. JAMES A. B. LOVETT, Mountsville, Ala. Filed Oct. 3, 1901. Serial No. 77,461. (No model.)



Claim.—1. The combination of a stationary spindle or rod, a hollow or tubular shaft thereon carrying an illuminant, a second shaft geared to the former shaft, arms secured to said shafts, means stretched from the free ends of said arms for carrying a globe or sphere at an angle corresponding to that of the axis of the earth, and means for actuating said shafts and arms, substantially as set forth.

2. The combination of a spindle or rod, a hollow shaft thereon carrying an illuminator, a second shaft geared to the former shaft, arms fixed to said shafts, and a wire or rod extending from the free ends of said arms at an angle corresponding to the earth's axis, and a sphere or globe centrally secured to said wire or rod, substantially as described.

3. The combination of a spindle or rod, a hollow shaft thereon carrying an illuminator, a second shaft, arms fixed to said shafts, and a wire or rod extending from the free ends of said arms at an angle corresponding to the earth's axis, and a sphere or globe centrally secured to said wire or rod, said shafts having pinions belted together, substantially as described.

4. The combination of a stationary spindle or rod, a rotary shaft concentric to said rod and carrying an illuminant, a second shaft geared to the first-referred-to shaft, arms fixed to said shafts, a shaft or axis having a corresponding angle to that of the earth's axis and bearing a globe representing the earth and journaled in or carried by said arms, and means for imparting an axial motion to the shaft or axis bearing the earth-globe, substantially as described.

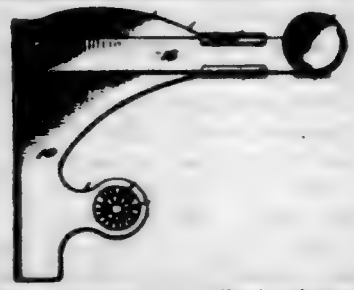
5. The combination of a stationary spindle, a rotary shaft concentric to said spindle and carrying an illuminant, a second shaft geared to the first-referred-to shaft, arms fixed to said shafts, a shaft or axis having a corresponding angle to that of the earth's axis bearing a globe representative of the earth and carried by said arms, and pulleys belted together and fixed to said spindle and the earth-globe-bearing axis or shaft, substantially as described.

6. The combination of a stationary spindle or rod, a rotary shaft concentric to said spindle and carrying an illuminant, a second shaft geared to the aforesaid shaft, arms carried by said shafts, a globe-bearing shaft or axis carried by said arms and arranged at an angle corresponding to the earth's axis, means for imparting an axial motion to said globe-bearing shaft, a shaft concentric to said globe-bearing shaft and, itself, carrying a globe representative of the earth's satellite, and means for actuating said last-referred-to shaft, substantially as described.

7. The combination of a stationary spindle or rod, a shaft concentric to said spindle and carrying an illuminant, a second shaft geared to the aforesaid shaft, a globe-bearing shaft or axis arranged at an angle corresponding to that of the earth's axis and a shaft bearing a second globe representative of the earth's satellite and having a pulley belted to a fixed pulley arranged concentrically with said second shaft, substantially as described.

8. The combination of a stationary spindle or rod having a fixed pulley or spool, a rotary shaft concentric to said spindle and bearing an illuminant, a second shaft geared to the aforesaid shaft, arms fixed to said shafts, a pulley having its support arranged concentric to said second shaft, a globe-bearing shaft or axis carried by said arms arranged at an angle corresponding to that of the earth's axis and having a fixed pulley or spool, a cord or line wound or coiled around the pulley or spool of said globe-bearing shaft and connected to the pulley or spool of said stationary spindle, a second globe-bearing shaft arranged concentric to the aforesaid globe-bearing shaft, and a line or cord coiled around the pulley or spool of second globe-bearing shaft and connected to the pulley or spool arranged concentrically to said second shaft, substantially as described.

704,851. CURTAIN-POLE AND SHADE-ROLLER BRACKET. GEORGE L. LYONS, Bradford, Pa. Filed Aug. 15, 1901. Serial No. 72,106. (No model.)



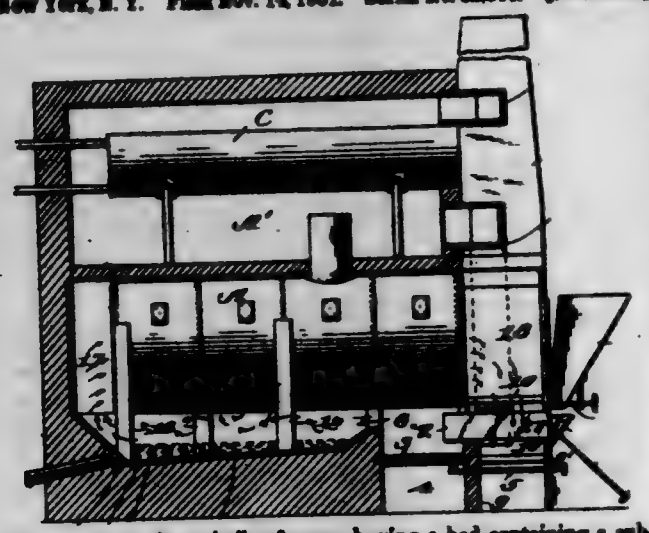
Claim.—In a curtain-pole and shade-roller bracket, a bracket member having means for attachment to a window or a door frame or a like support, the body of the bracket member being provided with an outwardly-extending arm and slideways formed at the top and bottom portions of said arm at its inner face, and a shorter arm also outwardly extending and located at a point below the vertical center of the bracket, the lower and shorter arm having means for receiving a trunnion of a shade-roller, a slide in the shape of a bar or plate which has guided movement in the said slideways, terminating in a disk formation at its outer end, and a segmental receiver for a curtain-pole, having its open portion facing in an upward direction, which receiver is connected with the bottom portion of the outer disk formation of the said movable plate or bar, extending inwardly at a right angle from the outer terminal of the said adjustable plate or bar, as and for the purpose described.

704,852. REVOLVING TRIMMER FOR PHOTOGRAPHIC PRINTS. JOSEF MATHEIS, Bolton, Conn., assignor to the Anthony & Scovill Company, New York, N. Y., a Corporation of New York. Filed Mar. 18, 1902. Serial No. 98,773. (No model.)

Claim.—A trimmer having a spindle, the upper part of which is reduced in size and adapted to engage with the handle of the instrument and a slotted and cylindrical lower part in which the cutting-disk is mounted, said cutting-disk itself and a removable axis therefor, comprising a

straight section adapted to pass through holes in the cylindrical part of the spindle and through the cutting-disk, and an elastic curved section adapted to spring about and embrace the cylindrical portion of the spindle and arranged to rest fully exposed on the exterior thereof, for the purpose set forth.

704,858. STEAM-BOILER FURNACE. HARRISON B. HEBER, New York, N. Y. Filed Nov. 14, 1901. Serial No. 82,208. (No model.)



Claim.—1. A steam-boiler furnace having a bed containing a substance capable of fusing by heat, a boiler free of such substance, and a fire-box, the products of combustion from which are adapted to pass between said boiler and bed to heat the boiler and fuse such substance, and such substance when fused serving to apply radiant heat to the boiler.

2. A steam-boiler furnace, having a bed provided with a substance capable of fusing by heat, a boiler above said bed, and a fire-box, the products of combustion from which are adapted to pass between said boiler and bed, to heat the boiler and fuse said substance, and the latter when fused serving to apply radiant heat directly to the boiler.

3. A steam-boiler furnace, having a bed provided with a substance capable of fusing by heat, a boiler above said bed, a fire-box, the products of combustion from which are adapted to pass between said boiler and bed, to heat the boiler and fuse said substance, and the latter when fused serving to apply radiant heat directly to the boiler, and a coking-retort adapted to be heated by such products of combustion, and to discharge its gases into said fire-box.

4. A steam-boiler furnace having a concaved bed, the concavity of which is adapted to contain a substance capable of fusing by heat, a plurality of staggered partitions extending partially across and rising from said bed and connected with the walls of the furnace, a fire-box the products of combustion from which are adapted to pass between said boiler and concaved bed to heat the boiler and fuse such substance, and the latter when fused serving to apply radiant heat to the boiler.

5. A steam-boiler furnace having a bed provided with a substance capable of fusing by heat, a boiler above said bed, a fire-box the products of combustion from which are adapted to pass between said boiler and bed to heat the boiler and fuse such substance, and the latter when fused serving to apply radiant heat directly to the boiler, a coking-retort adapted to deliver its gas into such fire-box, imperforate partitions connected with the walls of the furnace at opposite sides of said retort to thereby form a chamber for inclosing said retort, a conduit for delivering such products of combustion into said chamber and a second conduit adapted to carry the products of combustion from said chamber.

6. A steam-boiler furnace having a bed provided with a substance capable of fusing by heat, a boiler above said bed, a fire-box the products of combustion from which are adapted to pass between said boiler and bed, to heat the boiler and fuse such substance, and the latter when fused serving to apply radiant heat to the boiler, a row of horizontally-disposed coking-retorts adapted to deliver their gas into the fire-box, superposed horizontal walls above and below said retorts and connected with the side walls of the furnace to form a chamber, a conduit connected with one end of said chamber for delivering products of combustion into one end of said chamber, and a second conduit connected with the opposite end of said chamber for carrying off the products of combustion therefrom.

7. A steam-boiler furnace, having a bed provided with a substance capable of fusing by heat, a boiler above said bed, a fire-box, the products of combustion from which are adapted to pass between said boiler and bed to simultaneously heat the boiler and fuse said substance, and the latter when fused serving to apply radiant heat directly to the boiler, a stack, a chamber in communication with the stack, and adapted to receive the products of combustion, and a coking-retort extending through said chamber, said the inner end thereof being located in the fire-box.

8. The combination of a combustion-chamber provided with a substance capable of fusing by heat, a receptacle arranged in said combustion-chamber, and a fire-box the products of combustion from which are adapted to pass between said receptacle and said substance, to heat said receptacle and fuse such substance, and such substance when fused serving to apply radiant heat to said receptacle.

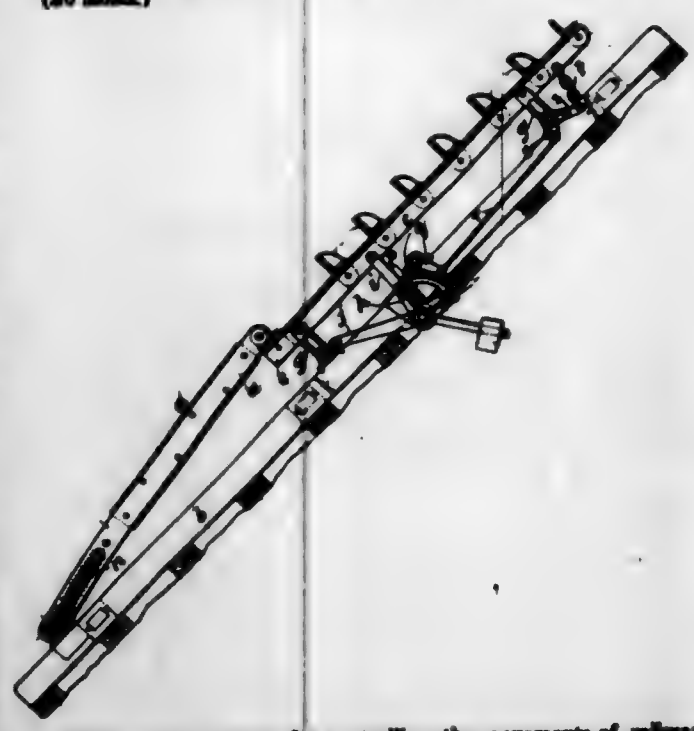
9. A steam-boiler furnace having a combustion-chamber provided with a concaved bottom containing a substance capable of fusing by heat, a boiler above said concaved bottom, a fire-box the products of combustion from which are adapted to pass between said boiler and concaved bottom, to simultaneously heat the boiler and fuse such substance, and the latter when fused serving to apply radiant heat to the boiler, a plurality of staggered partitions extending partially across and rising from said concaved bottom, a chamber adapted to receive the products of combustion after the same have passed from said combustion-chamber, and a coking-retort extending through said last-mentioned chamber and its inner end being situated in the fire-box.

10. A steam-boiler including a concaved bed, a mass in the concavity of said bed capable of fusing by heat, a plurality of staggered partitions extending partially across and rising from said bed, and connected with the walls of the furnace, a retort, a grate between said retort and concaved bed, a steam-boiler having flues and arranged above said bed, a chamber inclosing said retort and communicating with the flues of the boiler, a second chamber above the boiler and in communication with the first chamber, a water-heater in said second chamber, and a stack connected with said second chamber.

11. A steam-boiler furnace, having a bed provided with a substance capable of fusing by heat, a boiler above said bed, a series of retorts, a fire-box having grates located between the retorts and furnace-bed, and the products of combustion from the fire-box being adapted to pass between said boiler and bed, to simultaneously heat said boiler and fuse said substance, and the latter when fused serving to apply radiant heat directly to the boiler, and a flue-chamber in communication with the front end of the boiler and inclosing said retorts, and in communication with the boiler-stack.

12. A steam-boiler furnace including a bed having a concavity, a substance in said concavity capable of fusing by heat, a plurality of staggered half-partitions in the furnace-bed, a series of retorts, a fire-box intermediate the retorts and furnace-bed, a series of hot-air tubes or pipes along the walls of the furnace, communicating with the fire-box, a flue or tubular boiler above said concavity and fire-box, and the products of combustion from the latter being adapted to pass between said boiler and concavity and serving to heat the boiler and fuse such substance and the latter when fused serving to apply radiant heat directly to the boiler, a flue-chamber connected with the front end of such boiler and passing around said retorts, and a chamber above the boiler containing a water-heater, communicating with a flue which surrounds said retorts, and in communication with the stack.

704,854. APPARATUS FOR CONTROLLING RAILWAY-WAGONS IN LOADING OR UNLOADING. JOHN D. MILLER and ROBERT YATES, Coatbridge, Scotland. Filed Apr. 22, 1902. Serial No. 104,206. (No model.)



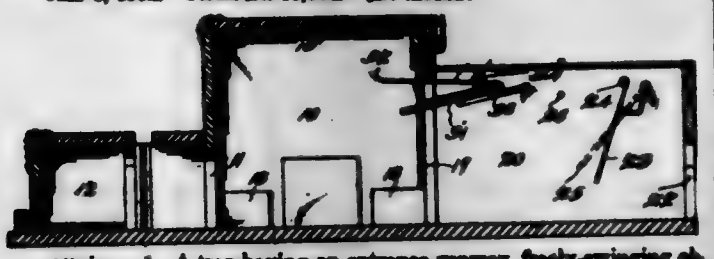
Claim.—1. Apparatus for controlling the movements of railway-wagons composed of an inclined lever-bar or brake-bar located and pivoted between the rails and adapted to act as a brake upon the wagon-axle, and

means such as levers operated by an attendant for lowering and raising the said brake-bar to graduate the progressive forward movement of the wagon, substantially as described.

2. Apparatus for controlling the movements of railway-wagons comprising an inclined lever or brake bar located and pivoted between the rails and a catch-bar pivoted thereto and furnished with projecting paws adapted to engage with the axle or other fixture on the wagon and means such as levers for supporting and operating said catch-bar to bring the paws successively into engagement with the wagon-axle, substantially as described.

3. Apparatus for controlling the movements of railway-wagons upon inclines comprising in combination a lever or brake bar extending longitudinally between the rails and pivoted yieldingly to beams secured to the sleepers, a catch-bar provided with upwardly-projecting catches hinged to said brake-bar and pivotally guided from the beams a supporting-link centered on said bar a brake-wheel or quadrant connected to said supporting-link and operated by hand or power and a brake-shoe adapted to automatically act upon the quadrant on the lowering of the catch-bar, substantially as described.

704,855. ANIMAL-TRAP. James S. Moon, Nevada, Mo. Filed Jan. 8, 1902. Serial No. 88,676. (No model.)

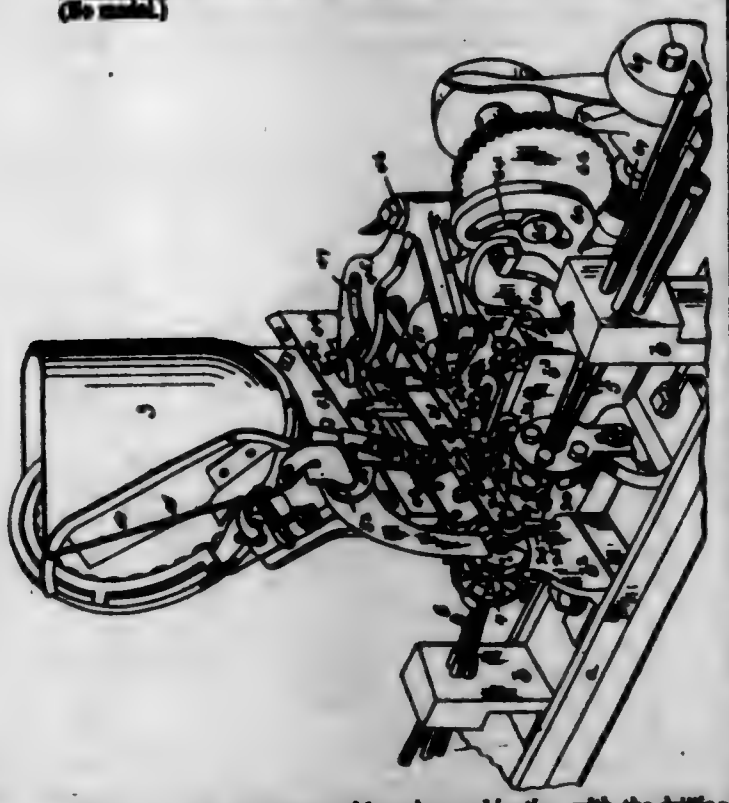


Claim.—1. A trap having an entrance-runway, freely-swinging obstructing-bars disposed across the same, means to raise said obstructing-bars, a gate in said runway, behind the said bars, means to raise said gate and secure the same against outward movement, and obstructing-bars connected to and carried by said gate, free to swing inwardly therefrom and prevented by the gate from moving outwardly, substantially as described.

2. A trap provided with a swinging gate at the entrance thereto, a crank-shaft disposed adjacent to said gate and provided with a crank-handle, and means for locking said handle in adjusted position and holding said gate against outward movement.

3. A trap provided with a swinging gate at the entrance thereto, a crank-shaft disposed in front of said gate and having a crank-handle connected therewith, and pins disposed at various points on said trap for engaging said handle and holding it in adjusted position for locking the gate in the desired position.

704,856. BUTTON-MACHINE. THOMAS F. MOSSMEY, West Orange, N. J., assignor of two-thirds to James H. Ashworth and David D. Ashworth, New York, N. Y. Filed Dec. 9, 1901. Serial No. 85,152. (No model.)



Claim.—1. In a button-machine, the combination with the drilling and counterboring tools and means for operating the same, of a carriage or slide movable reciprocally in a direction approximately parallel with said drilling and counterboring tool and supporting means for feeding the buttons to the tools, and means for reciprocating said slide or carriage, comprising a wheel having an eccentric-pin, and means for rotating said wheel, a lever having a cam-slot and an arm or link connecting said lever and slide, the latter being irregularly moved thereby.

2. In a button-machine, the combination with the bed-plate having a slideway, and drilling and counterboring tools and means for operating said tools, of a carriage or slide adapted to move reciprocally on said slideway and supporting a button-receptacle and means for feeding the buttons to said tools, and means for reciprocating said slide comprising a worm-wheel and means for rotating the same, a slotted lever fulcrumed on the bed-plate and an arm or link connecting said lever and slide, substantially as set forth.

3. In a button-machine, the combination with the bed-plate having a slideway, drilling and counterboring tools and means for operating said tools, of a slide or carriage arranged on said slideway and carrying a button-receptacle and means for transferring the buttons from the said receptacle to a point in line with the drilling and counterboring tools, said slide having an arm or link projecting therefrom, a cam-lever, fulcrumed on the bed-plate and near its free end pivotally connected to said arm, and having a cam-slot, a worm-wheel having an eccentric-pin working within said cam-slot, a coöperating worm-wheel arranged on a shaft and a pulley on said shaft with the said coöperating worm-wheel, substantially as set forth.

4. In a button-machine, the combination with the bed-plate having a slideway and drilling-tool and counterboring-tools, a slide or carriage arranged in said slideway, and having button-clutching means, means for reciprocally moving said slide or carriage, a transverse slide arranged on the first said slide or carriage and having rack-teeth, means for reciprocating the last said slide, an oscillating button-feed having a pinion meshing with said rack-teeth, a button-setting arm adapted to push the button from the button-feed into the chuck while the latter is distant from the drilling and counterboring tools, means for operating said button-setting arm, counterboring and drilling tools between which the chuck is movable, a cam-lever having a curved slot, a wheel having an eccentric-pin working in said curved slot, means for rotating said wheel and means for transferring movement from the cam-lever to the slide or carriage having the chuck, substantially as set forth.

5. In a button-machine, the combination with the drilling and counterboring tools and means for operating the same of a chuck moving back and forth between said tools, and means for thus moving said chuck, said chuck being open to receive the button and said chuck being provided with clutching-slides, means for operating said parts, a setting-arm 26, having a hollow finger, a spring for releasing said setting-arm from the chuck and means for operating the setting-arm to effect a thrust of the button from the button-feed arm into the chuck a button-feed arm and means for operating the same, all substantially as set forth.

6. In a button-machine, the button-chuck herein described, comprising a bracket having a central perforation with slots at opposite sides thereof, slides having pins extending through said slots, a ring arranged at the opposite side of said bracket from said slides and having tangential grooves, and means for turning said ring on said bracket and effecting a clutching or releasing movement of the slides, substantially as set forth.

7. In a button-machine, the button clutch or chuck comprising a perforated bracket having means for clutching the button, and a ring adapted to be oscillated on said clutch to effect an opening or closing of the button-clutching means, said ring having an arm having a pin 15, a lever 16, engaging the pin 15, to oscillate the ring, and means for reciprocating said lever, substantially as set forth.

8. In a button-machine, the button-clutching means comprising a slide *c*, carrying a bracket, means for operating said slide *c*, a bracket having slides 10, means for holding the button between said bracket-slides 10, a ring adapted to operate said slides to release or grasp the button, said ring having an arm 14, and pin 15, a spring for turning the ring in one direction on the bracket and a train of mechanism operated by the slide *c*, for turning the ring in the opposite direction, substantially as set forth.

9. In a button-machine, the button-clutching means comprising a slide *c*, carrying a clutch or chuck, bracket, means for operating said slide *c*, slides 10, on said bracket, means for holding the button between said bracket-slides 10, a ring adapted to move said slides oppositely and a train of mechanism actuated by the slide *c*, and transmitting movement to said slides 10, substantially as set forth.

10. The combination with the slide *c*, said chuck carried thereby and adapted to be opened to release the button, of the lever 16, fulcrumed on said slide *c*, and adapted to travel therewith, of the block 19, adapted to enter into engagement with said lever to turn the same and effect an opening of the chuck, substantially as set forth.

11. The combination with the slide *c*, and chuck carried by said slide and adapted to be opened to release the button, of the lever 16, adapted to open the chuck and a hinged block adapted to raise said lever as said lever travels with said slide *c*, to effect an opening of the chuck, substantially as set forth.

12. The combination with the slide *c*, and chuck, carried by said slide and adapted to be opened to release the button, of the lever 16, fulcrumed on said slide and connected to the chuck, a slide 20, carrying a hinged block and a lever 22, operating the slide 20, and acted upon by the slide *c*, substantially as set forth.

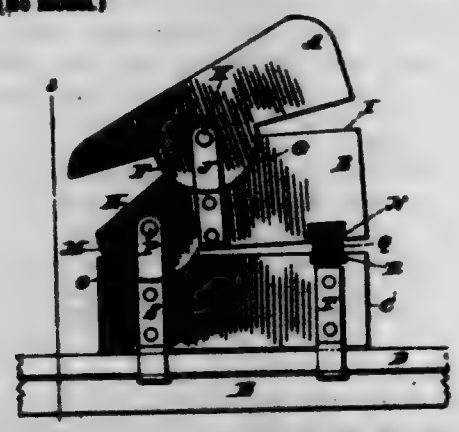
13. The combination with the slide *c*, having a pin 30, and a chuck carried thereby, of the lever 16, fulcrumed on said slide and connected to the chuck, a slide 20, carrying a hinged block adapted to raise the said lever, a slotted lever adapted to operate the slide 20, and adapted to be operated by the pin 30, to hasten the engagement of the block and lever 16, substantially as set forth.

704,857. DEVICE FOR UNTYING HARD KNOTS. JOHN W. MUTTON, Boston, Mass. Filed Aug. 30, 1901. Serial No. 73,840. (No model.)

Claim.—1. As an article of manufacture a device for untying hard knots composed of cord having two free ends, a loop formed in said cord between the ends thereof, and means for attaching one of said free ends to the portion of said cord between the ends thereof by a sliding connection.

2. As an article of manufacture a device for untying hard knots, which consists of a cord, a ring attached to said cord between the ends thereof, and a loop formed by doubling one of the free ends of said cord upon itself and passing said free end through said ring.

704,858. BILGE-BLOCK. JAMES MCCULLOUGH, Rosebank, N. Y., assignor to the Schmidt-Perrin Manufacturing Company, Jersey City, N. J., a Corporation of New Jersey. Filed Nov. 14, 1901. Serial No. 82,192. (No model.)



Claim.—1. A bilge-block comprising the tiltable upper section A, the intermediate section B and the base-section C, said upper section A having the curved bearing F to enter and turn within the recess G in the intermediate section B, and said intermediate section B having at its inner end the curved bearing M to enter and turn within the recess O in the lower section C, combined with means for inclining and maintaining in an inclined position said intermediate section B, substantially as set forth.

2. A bilge-block comprising the tiltable upper section A, the intermediate section B, and the lower or supporting section C, said section A having the central curved bearing F to engage the bearing-recess G in the intermediate section B, and said section B having at its inner end the curved bearing M to engage the recess O in the base-section C, combined with a wedge intermediate the outer ends of said sections B, C, said sections B, C, being respectively provided with the grooves N, R, to receive said wedge; substantially as set forth.

3. A bilge-block comprising the tiltable upper section A, the intermediate section B and the lower section C, said section A being substantially of wedge outline and centrally pivotally supported upon the section B, the upper surface of said section B being at its inner end inclined so as to permit of the automatic tilting action of the section A and also to receive the lower surface of the inner end of the section A when necessary upon a sufficient inclination of said section A, combined with means for hinging the inner end of the section B, and means for elevating and permitting the lowering of the outer end of said section B; substantially as set forth.

4. In a bilge-block the upper section A of wedge outline and having at the central part of its lower surface the curved bearing F, combined with the section B having in the central portion of its upper surface the bearing-recess G to receive said bearing F, and also having at the inner side of said recess G the inclined surface H and at the other side of said recess the substantially horizontal surface I, whereby the outer end of said block or section A may when said section is in a substantially horizontal position, find a firm support upon said surface I, and when said section is tilted to its other extreme the inner end of said block A may find a firm bearing upon said inclined surface H, and whereby also when said block A is tilted in any of its intermediate positions, it will find a firm support through the bearing F upon the walls of the recess G; substantially as set forth.

704,859. DOMESTIC GARBAGE-BURNER. FRANK E. MCGURRIN, Salt Lake City, Utah. Filed Sept. 12, 1901. Serial No. 75,215. (No model.)

Claim.—1. In a domestic garbage-burner, the combination of a casing having flue-openings, a movable hopper having openings in its walls located within the casing and a removable garbage-basket adapted to fit within the hopper; substantially as described.

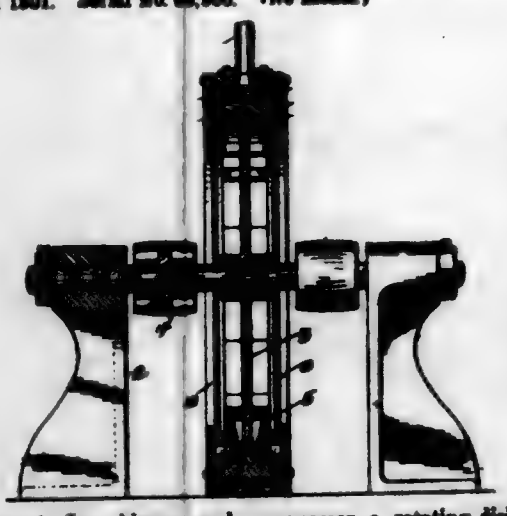
2. In a domestic garbage-burner, the combination of a casing having flue-openings, a movable hopper having open back and sides and a removable garbage-basket adapted to fit within the hopper; substantially as described.

3. In a domestic garbage-burner, the combination of a casing having flue-openings, a movable hopper having openings in its walls located within the casing and a removable garbage-basket adapted to fit within the hopper and having an opening therein and means for closing the opening; substantially as described.

4. In a domestic garbage-burner, the combination of a casing having flue-openings, a movable hopper located within the casing and having open back and sides and a removable garbage-basket adapted to fit within the hopper and having an opening within and means for closing the opening; substantially as described.

5. In a domestic garbage-burner, the combination of a casing having flue-openings, a garbage-basket of wire-netting having an opening in its back and means for closing the opening and means for removably sustaining the basket within the casing; substantially as described.

704,860. BLOWER AND COMPRESSOR. CHRISTIAN NEUHAUS, St. Louis, Mo., assignor to the Natural Power Co., St. Louis, Mo. Filed July 3, 1901. Serial No. 66,960. (No model.)



Claim.—1. In a blower and compressor, a rotating disk; a ring fixed upon each side of said disk at its periphery, there being angular compression-passages formed within said rings, said passages being funnel-shaped in cross-section; stationary rings mounted beside the first-mentioned rings and extending outwardly and forming close joints with

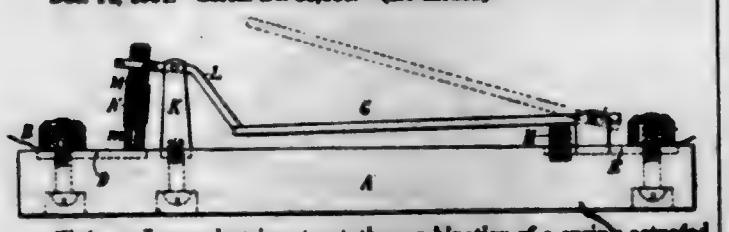
the first-mentioned rings; and an outer stationary casing connecting the outer edges of said stationary rings, substantially as specified.

2. In a blower and compressor, a rotating disk; a ring fixed upon each side of said disk at its periphery; funnel-shaped angular passages formed in said rings; stationary rings mounted beside the first-mentioned rings and extending outwardly; flanges extending inwardly from the inner edges of said stationary rings and forming close joints with said rotatable rings; and an outer stationary casing connecting the outer edges of said stationary rings, substantially as specified.

3. In a blower and compressor, a shaft; a rotating disk mounted upon the shaft; a ring fixed upon each side of said disk at its periphery; funnel-shaped angular passages formed in said rings; stationary rings mounted beside the first-mentioned rings and extending outwardly; flanges extending inwardly from the inner edges of said stationary rings and forming close joints with said rotatable rings; rings extending inwardly toward the shaft from the inner peripheries of said stationary rings and forming air-retainers; and an outer stationary casing connecting the outer edges of said stationary rings to form an air-chamber to receive the air passing through the openings in said rotating rings, substantially as specified.

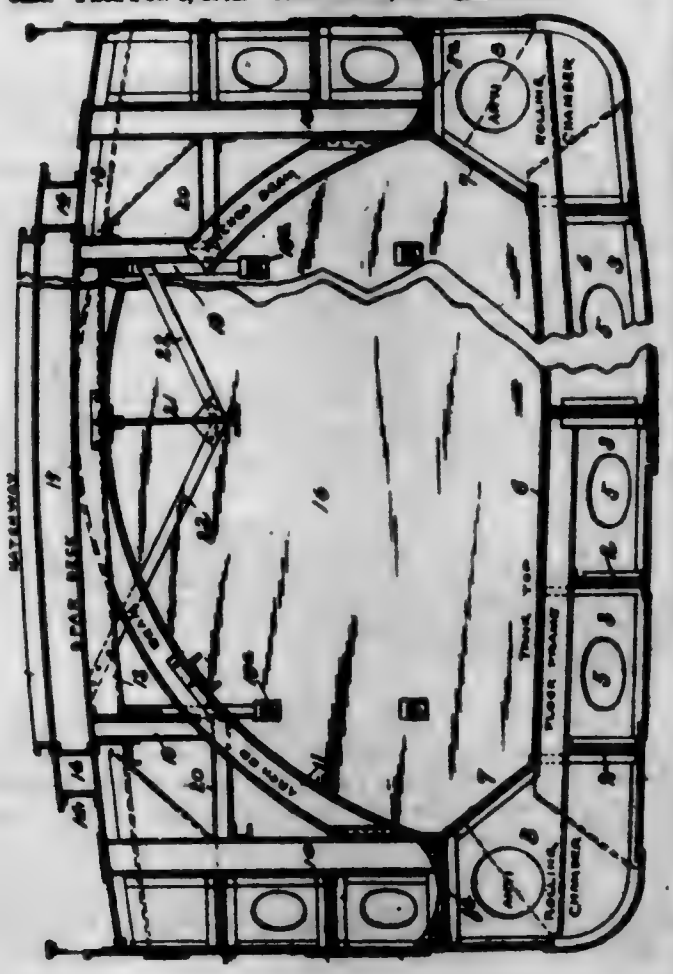
4. In a blower and compressor, a rotary disk; rings fixed upon the sides of said disk at its periphery; angular air-passages formed through said rings, said passages turning laterally at their outer ends; a band surrounding said disk and rings and forming the outer sides of the air-passages to deflect the air laterally; and an air-chamber around the disk to receive the air, substantially as specified.

704,861. ELECTRIC CUT-OUT. OSCAR H. CRESSY, Brooklyn, N. Y., assignor of one-half to Oscar F. Maris, New York, N. Y. Filed Dec. 14, 1901. Serial No. 86,033. (No model.)



Claim.—In an electric cut-out, the combination of a spring-actuated lever, a catch-lever, an expansible rod adjustably carried by the catch-lever, a terminal plate on which the expansible rod rests, and a resistance-wire around the said rod and completing the circuit from said plate to the catch-lever, as and for the purpose set forth.

704,862. BULK-CARGO VESSEL. JOSEPH H. OLSHAM, Cleveland, Ohio. Filed Feb. 6, 1902. Serial No. 92,802. (No model.)



Claim.—1. In a vessel the combination of arched girders spanning the hold of the vessel, transverse deck-girders headed on the sides of the vessel and supported centrally by said arched girders, substantially as described.

2. In a hull, the combination with transverse deck-girders, transversely-extending arched girders spanning the hold and supporting said deck-girders, longitudinal girders connected to said transverse girders and designed to form a hatch-deck, and transverse bulkheads supporting said longitudinal girders, substantially as described.

3. In a vessel, the combination with a deck, of deck-girders extending transversely the hold of the vessel and supporting said deck, and circular arched girders spanning the hold and supporting said deck-girders, substantially as described.

4. In a bulk-cargo vessel, the combination with a hull divided by transverse bulkheads, of longitudinally-extending arched girders supporting said deck and footed on said bulkheads, substantially as described.

704,868. SWITCH-STAND ATTACHMENT. HARLOW F. OSE, Wendling, Oreg. Filed Feb. 1, 1902. Serial No. 92,190. (No model.)

Claim.—1. The combination with a switch-stand, comprising a turning post and a hand-lever attached thereto, of a shaft carried movable on the post parallel thereto, a signal carried by the shaft, and a connection between the shaft and hand-lever.

2. The combination with a switch-stand, comprising a turning post and a hand-lever attached thereto, of a shaft hingedly carried on the post alongside of the same, a signal carried by the shaft and a connection between the shaft and hand-lever, said connection including a transverse arm on the shaft, and a link attached to the arm and to the hand-lever.

3. The combination with a switch-stand, comprising a turning post and a hand-lever attached thereto, of a shaft carried to move on the post, a signal carried by the shaft, and a connection between the shaft and hand-lever, the said shaft being connected to the post by means of hinges so as to swing around the same.

4. The combination with the switch-stand and with the post or shaft mounted therein and connected with the switch, of a hand-lever attached to said shaft, a second shaft, means movably mounting said shaft, a crank-arm on the second shaft, a link connecting the crank-arm and hand-lever, and a signal connected with the second shaft.

5. The combination with the switch-stand, of a hand-lever connected with the switch, a movably-mounted shaft, a signal connected therewith a crank-arm on the shaft and a link connecting the crank-arm and hand-lever.

704,864. SOAP. HARRY C. PEPPER, New Kensington, Pa. Filed Nov. 4, 1901. Serial No. 81,077. (No specimens.)

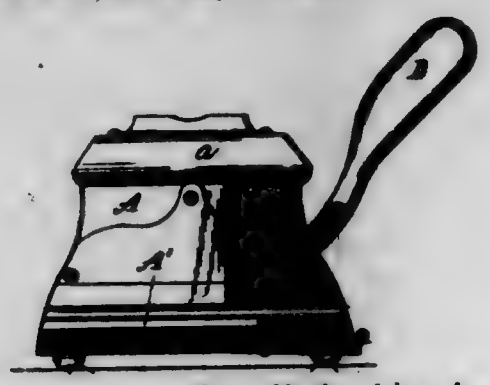
Claim.—1. A soap containing hydrated alumina disseminated through it; substantially as described.

2. A soap cake having powdered hydrate of alumina disseminated through its mass; substantially as described.

704,865. CRAYON-SHARPENER. ANDREW P. PETERSON, Racine, Wis. Filed Dec. 26, 1901. Serial No. 87,203. (No model.)

Claim.—1. In a crayon-sharpener, the combination of the casing, the movable divergent cutter, the horizontal guides therefor, the pivoted lever and connections for reciprocating said cutters, substantially as described.

2. In a crayon-sharpener, the combination of the casing, the reciprocating cutters, the crayon-stops, and the lever and connections for reciprocating the cutters, substantially as described.



3. In a crayon-sharpener, the combination of the casing, the reciprocating slide, the cutters mounted thereon, the lever for operating said slide, and the guide fingers or springs arranged beside the path of the cutters, substantially as described.

4. In a crayon-sharpener, the combination of the casing, the reciprocating slide, the cutters thereon, the lever and connections for reciprocating said slide, the crayon-stops and the holding-springs beside and projecting beyond the stops, substantially as described.

5. In a crayon-sharpener, the combination of the casing, having an opening or slot in its upper end, a slide adapted to reciprocate in said slot, the cutters attached to slide and the lever and connections for reciprocating said slide; with the pairs of guide-springs above the slide at each end of the slot, and the cover, substantially as and for the purpose described.

6. In a crayon-sharpener, the combination of the casing having an opening or slot in its upper end, guides at the side of the slot, a slide mounted upon and between said guides, the cutters mounted on said slide, the pivoted lever and connections for operating said slide, the stops above and at each end of the slot in the casing, the pairs of springs beside the stops projecting inwardly beyond the same, and the cover having a slot for insertion of the crayon during the sharpening operation, substantially as and for the purpose described.

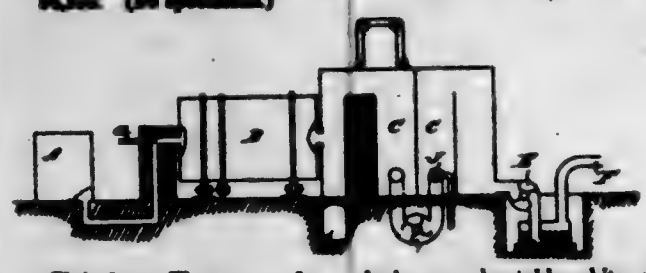
7. The combination of the casing having an opening in its top, hinged bottom plates closing the base of casing, a slide reciprocatable in said opening, and cutters on said slide; with a bent lever pivoted at its bend to the base of casing and having one end bifurcated and engaging said slide, and its other end projecting out of the casing, the stops, and guide-springs at each end of the opening in top of casing, and the removable cover, for the purpose and substantially as described.

704,866. WROUGHT-METAL BARREL. ELWOOD C. PHILLIPS, Chicago, Ill., assignor of three-fourths to Charles P. Barrett, Chicago, Ill. Filed Mar. 29, 1902. Serial No. 100,402. (No model.)

Claim.—1. A wrought-metal barrel or the like comprising a pair of outer sections having internally-screw-threaded ends, and tapered bores adjacent thereto, and a central connecting-section having primary differential and screw-threaded extensions, and secondary tapered extensions, adapted to have engagement with the tapered bores of the end sections, substantially as set forth.

2. A wrought-metal barrel or the like comprising a pair of outer sections having internally-screw-threaded ends, and tapered bores adjacent thereto, lining-sheets arranged within said end sections, a central connecting-section having primary differential and screw-threaded extensions and secondary tapering extensions, and a lining-sheet fitting the interior of the central section and having its ends folded over the secondary extensions thereof, substantially as set forth.

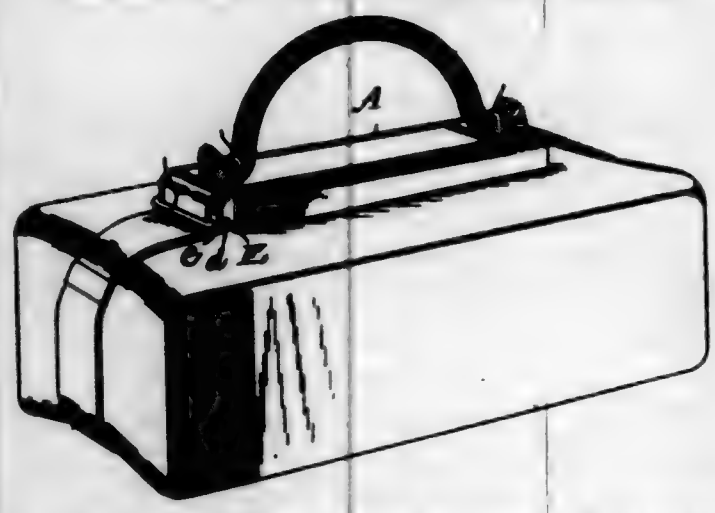
704,867. PROCESS OF MAKING WHITE ANTIMONY OXID. ARTHUR S. PLEWS, London, England. Filed Feb. 14, 1902. Serial No. 94,326. (No specimens.)



Claim.—1. The process for producing merchantable white oxid of antimony direct from the ore by exposing the said ore at a bright red heat to make a smokeless current of gases, and periodically changing the said gases from a reducing to an oxidizing atmosphere and back again until the antimony is volatilized, condensing the fumes in the presence of aqueous vapor and collecting the condensed products substantially as set forth.

2. The process for producing merchantable white oxid of antimony direct from the ore, which comprises the following steps: roasting the crushed ore with smokeless fuel in a quick draft at a bright red heat, periodically changing the flame from an oxidizing to a reducing flame and vice versa as long as antimony fumes continue to be evolved, subjecting the antimony fumes to the action of steam escaping under pressure, and collecting the mingled combustion products and steam in condensing-chambers having means for absorbing any traces of antimony from the exit-gases.

704,868. PACKAGE-CARRIER. ORLANDO H. PUFF, Independence, Iowa. Filed Dec. 13, 1901. Serial No. 85,726. (No model.)



Claim.—1. In a package-carrier the combination of the bar, the staple-shaped keeper attached to one end thereof, the catch-plate slidably mounted on the keeper, and the strap attached at one end to the bar and having its free end passed through the keeper and between the catch-plate and end of bar, substantially as described.

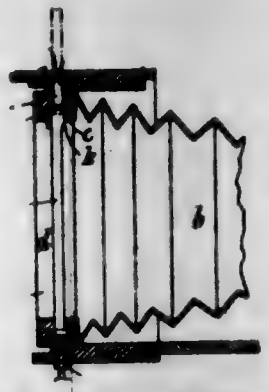
2. In a package-carrier, the combination of the bar, the hand-loop, and the strap attached at one end to the bar; with a staple-shaped keeper fastened to one end of the bar, the catch-plate strung on the legs of the keeper and movable to and from the end of bar, said catch-plate having its upper edge bent toward the bar and serrated, substantially as and for the purpose set forth.

704,869. COMBINED LEVEL AND PLUMB. ROBERT W. PRITT, Julia, W. Va. Filed Mar. 20, 1902. Serial No. 100,574. (No model.)

Claim.—In a tool of the character described, a body or stock having a slot in one end, a blade adapted to fold and slide in said slot and provided with a series of openings, and a spring-catch at one side of the stock to engage with any one of the openings in the blade and hold it in adjusted position, substantially as set forth.

704,870. PHOTOGRAPHIC CAMERA. HENRY P. PEARSE, London, England. Filed Apr. 24, 1902. Serial No. 104,594. (No model.)

Claim.—1. Means for fitting a plate-holder to roll-film holders and roll-film cameras, consisting of a case provided with a slot communicating with the interior thereof; means in continuation of said slot whereby the plate-holder is guided to and located in a position parallel with and immediately in front of a film without displacing the latter, said means being adapted, in conjunction with the plate-holder, to exclude light from said film; and means for rendering said slot light-proof, substantially as set forth.



2. In roll-film holders and cameras, the combination of the case provided with a slot; a plate-holder adapted to pass through said slot; a back frame adapted to locate and retain the plate-holder in a parallel position immediately in front of a film and so as to exclude light therefrom; and means for rendering the slot light-proof, substantially as set forth.

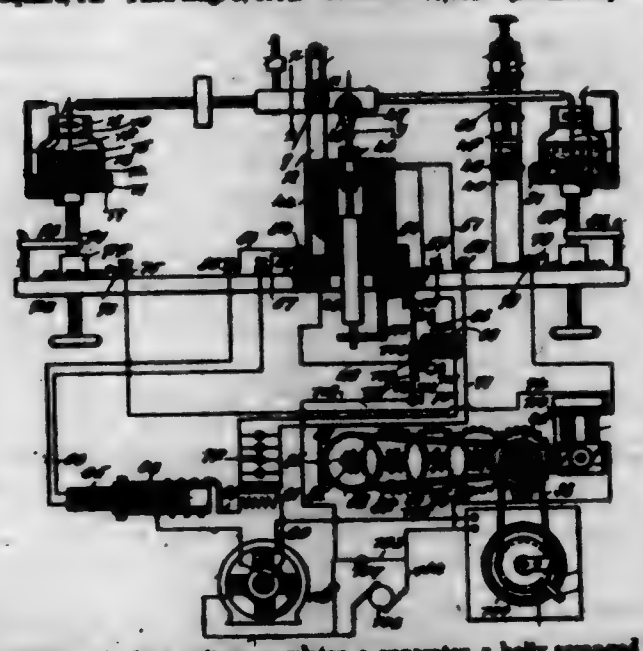
3. The combination with roll-film holders and cameras, of the case thereof provided with a slot; a plate-holder approximately fitting said slot; a back frame provided with grooves formed in continuation of said slot; a self-closing light-trap at the inner end of said slot; and means for excluding dirt and dust from said slot and assisting to exclude light, substantially as set forth.

4. In a camera, the combination with roll-film holders and the case thereof provided with a slot, the back frame thereof provided with grooves, said slot and groove adapted to receive a plate-holder in front of the film without displacing the same, of a sliding cover adapted to be moved across said slot in the case, and means to render said cover self-closing, substantially as described.

5. In a camera, the combination with the case thereof provided with a slot and a back frame provided with grooves, said slot and grooves adapted to receive a plate-holder, of a push-pin suitably connected with the case and adapted to assist in removing the plate-holder therefrom.

6. In a camera, the combination with the case thereof provided with a slot and the back frame provided with grooves registering with the slot, said slot and grooves adapted to receive a plate, of means for closing the inner end of said slot to prevent light passing through said slot into the camera, and means for closing the outer end of said slot.

704,871. VOLTAGE-REGULATOR. THOMAS H. PERRY, Kennett Square, Pa. Filed Aug. 5, 1901. Serial No. 70,961. (No model.)



Claim.—1. In a voltage-regulator, a generator, a helix arranged in circuit with the generator, a rheostat for the generator, a circuit for operating the rheostat, a balance-beam controlled by the helix and having contacts at its ends, liquid-containing receptacles, conducting liquid in the receptacles and in connection with the rheostat-operating circuit, adjustably mounted above and below one end of the beam, and an adjustable counterweight on the beam, substantially as specified.

2. In a voltage-regulator for a generator, a helix arranged in circuit with the generator, an electromagnet in the circuit normally holding a rheostat-controlling circuit open, a rheostat in a circuit with the main generator, electrically-controlled means for operating the rheostat, an induction-coil, an exciting-coil for the induction-coil and in circuit with the generator, and a helix surrounding the first-named helix and having connection with the induction-coil, substantially as specified.

3. A voltage-regulator in connection with a generator, comprising a helix in circuit with the generator, a rheostat for the generator, a motor for the rheostat, shunt-circuit from the exciter-circuit in which the motor is arranged, a balance-beam controlled by the helix, said balance-beam being in the shunt-circuit, contacts carried by the balance-beam, and contacts arranged in the shunt-circuit and adjustable relatively to the first-named contacts, substantially as specified.

4. In a voltage-regulator, a generator, a rheostat for the generator, a motor for controlling the rheostat, a shunt-circuit from the exciter-circuit in which the said motor is arranged, a helix arranged in circuit with the generator, a balance-beam arranged in the shunt-circuit and controlled by said helix, contacts carried by said beam, liquid-containing vessels into which said contacts extend, supports for said vessels, means for adjusting the supports vertically, contacts fixed in the vessels and in said shunt-circuit, and an electromagnet in the main circuit of the generator for controlling the motor-circuit, substantially as specified.

5. In a voltage-regulator for a generator, a shunt-circuit from the exciter-circuit, means arranged in said shunt-circuit for operating a rheostat for the generator, means for closing said shunt-circuit, comprising a balance-beam having contacts at its ends coacting with fixed contacts, a supporting-yoke for said beam, fulcrum-points on the beam supported in said yoke, and means carried by the yoke for limiting the lateral movement of said points relatively to the yoke, substantially as specified.

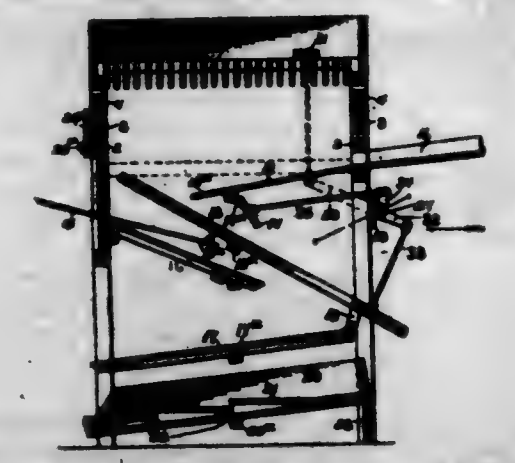
6. In a voltage-regulator for a generator, a helix, an electromagnet arranged in circuit between said helix and said generator, a transformer in a circuit with the generator, an induction-coil controlled by a circuit from the generator, a helix surrounding the first-named helix and in electrical connection with the induction-coil, and contacts arranged in the shunt-circuit and controlled by the first-named helix for regulating the voltage of the generator, substantially as specified.

7. In an electrical regulator, a liquid-containing receptacle, a liquid conductor in the receptacle, a contact fixed in the receptacle, a contact movable into and out of the liquid conductor, a vertically-adjustable post, a cup-shaped holder on said support for receiving the receptacle, and a packing arranged between said cup-shaped holder and the receptacle, substantially as specified.

8. In an electric regulator, a liquid-containing receptacle, a liquid conductor in the receptacle, a non-conducting liquid on the conducting liquid, a fixed contact in the vessel, a contact movable in the non-conducting liquid and into and out of the conducting liquid, a screw-post or support, a brake for holding said post as adjusted, a metal cup on said post for receiving the receptacle, and an absorbent material between the receptacle and said cup, substantially as specified.

9. In an electric conductor, a vessel for holding liquid, a conducting liquid in the vessel, a fixed contact extended into the liquid, a contact movable into and out of the liquid, and a valve or stopper carried by the movable contact for closing the opening of the vessel, substantially as specified.

704,872. GOLD-SAVING MACHINE. CHARLES RANDS, Vancouver, Canada. Filed Sept. 10, 1901. Serial No. 74,874. (No model.)



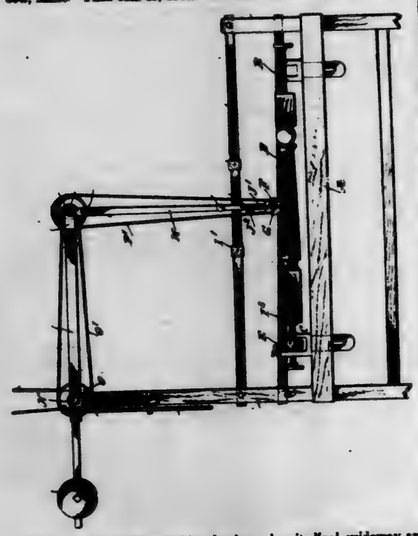
Claim.—1. In a machine for the purpose specified, having a steel open framework adapted to receive a series of baffles and screens; a rectangular frame surmounting such, and sustained on pivots at its ends; a grizzly having three raised sides, and resting by means of curved rockers on the pivoted frame; and means whereby such grizzly may be rocked and tilted in cross motion, substantially as described.

2. In a machine for the purpose specified, in combination with a grizzly suitably supported on pivots and rockers over an open framework; within such frame, the sloping dead-plate 12 having perforations at its lower end; the grizzly 13 so pivoted below such that its slope may be varied; the flap-door 14 pendent on pins from the lower part of the dead-plate 12; the rake 15 slidable in the sides of the machine, the times of which are pitched to enter the spaces between the grizzly-bars at its farthest slope; the dead-plate 16 adapted to throw the dirt toward the opposite end of the machine; the perforated screen-plate 17 pivoted at its center and linked to the lower end of the grizzly 13; and the chute-box 20 pivoted at its center and provided with stepped perforated receiving-plates and screen-riffles, with means whereby its slope may be varied as desired.

3. In a machine of the class described, having a receiving-grizzly to which a rocking and tipping movement may be imparted, surrounding an open framework; in combination with a series of baffles and screens within such frame; the shaft 27 in bearings 26 fixed to the frame; the levers 28, 32 and 34 fixed to the shaft 27; the rod 30 connecting the receiving-grizzly cross-frame 4 to the lever 28; the rods 35 connecting levers 34 to the flap-door 14; the rod 33 connecting the lever 32 to the lower end of the pivoted grizzly 13, and the links 18 connecting the lower end of 13 to the end of the screen 17; by means of which these various parts are moved as specified by the tipping movement of the receiving-grizzly.

4. In a machine for the purposes described, a supporting-frame, shaking-screens and baffles mounted thereon, a rectangular frame pivotally mounted on the top of the supporting-frame to rock in lateral directions over the said supporting-frame, a grizzly having three raised sides, and having rocker-bearings on the pivoted frame extended lengthwise of said pivoted frame, and a hand-operated means for simultaneously imparting a rocking motion to the pivoted frame crosswise of the supporting-frame, and of the grizzly lengthwise of the pivoted frame, substantially as shown and for the purposes described.

704,873. WOOD-FLUTING MACHINE. EDWARD RAWSON, Moscow, Idaho. Filed Jan. 15, 1902. Serial No. 89,855. (No model.)



Claim.—1. A fluting-machine, having a longitudinal guideway arranged over the work, an arm guided longitudinally in the said guideway and free to move up and down, an arbor journaled on the said arm and arranged to carry the working tool, and a counterbalanced walking-beam on which the said arm is pivoted, as set forth.

2. A fluting-machine, having a longitudinal guideway arranged over the work, an arm guided longitudinally in the said guideway and free to move up and down, an arbor journaled on the said arm and arranged to carry the working tool, a counterbalanced walking-beam on which the said arm is pivoted, and a driving-gear for the said arbor and carried by the arm and walking-beam, as set forth.

3. A fluting-machine, having an arbor for carrying the working tool, an arm, in one end of which the arbor is journaled, the other end being provided with a fork, a vertically-disposed guideway on the arm, a guide-bar extending through the said guideway, a counterbalanced walking-beam having a forked end, a shaft pivotally connecting the fork of the arm with the fork of the walking-beam, pulleys on the said shaft and the said arbor, and a belt for connecting the pulleys with each other, as set forth.

4. A fluting-machine, having a longitudinal guideway provided with stops and arranged over the work, an arm guided longitudinally in the said guideway and free to move up and down, the arm having a gage-shoe, a counterbalanced walking-beam on which the said arm is fulcrumed, an arbor journaled in the free end of the said arm, and a driving-gear for the arbor and carried by the said arm and the said walking-beam, as set forth.

5. A fluting-machine having an arbor for carrying the working tool, a pivoted arm free to move up and down and in one end of which the arbor is journaled, a bracket on the said arm, and a gage-shoe having a shank adjustable vertically and transversely on the said bracket, as set forth.

6. A fluting-machine having an arbor for carrying the working tool, an arm on the lower end of which the arbor is journaled, a counterbalanced beam on which the arm is pivoted, a bracket on the said arm, a gage-shoe having a shank adjustable on the said bracket, a guard arranged over the working tool, and means for driving the arbor, as set forth.

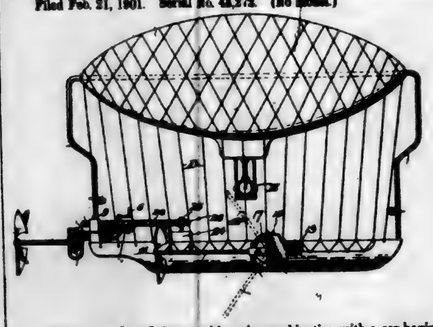
7. A fluting-machine having an arbor for carrying the working tool, an arm in which the arbor is journaled, the said arm being mounted to swing and to move up and down, a vertically-disposed guideway on the arm, and a fixed guide-bar extending through the guideway and provided with adjustable stops, as set forth.

704,874. OIL-BURNER. ERNST B. RAYBOLD, St. Louis, Mo. Filed Aug. 19, 1901. Serial No. 72,564. (No model.)

Claim.—1. An oil-burner, comprising a tube and a globe connected thereto, a chamber carried within the tube and opening into the globe and adapted to receive oil, means for heating the oil within the chamber, means for distributing the oil within the globe, and means for delivering the oil from the globe into a furnace, substantially as specified.

2. The improved oil-burner, comprising a tube adapted to be connected to a furnace, a chamber located within the tube adapted to receive the oil before it is admitted into the furnace, means for heating the oil within the chamber, a valve for controlling the flow of the oil from the chamber, a second valve for controlling the flow of oil into the furnace, and means for simultaneously operating said valves, substantially as specified.

704,875. FLYING-MACHINE. JOEL T. RICE, Hot Springs, Ark. Filed Feb. 21, 1901. Serial No. 48,272. (No model.)



Claim.—1. In a flying-machine, the combination with a car having drive-shafts at opposite forward ends thereof, carriers pivoted to the shafts, gear and sprocket wheels fixed on the same shafts, propellers with shafts pivoted to the carriers having pinions on the rear ends thereof meshing with the fixed gear-wheels, means connected to the sprocket-wheels and to a motor whereby to rotate the propeller-wheels, the rear ends of the carriers being bent upwardly and rearwardly and pivoted to opposite ends of a curved rack-bar, a pinion meshing with said rack-bar, and a crank-arm on said pinion so as to shift the propeller-wheels in unison in the same direction, substantially as specified.

2. In a flying-machine, the combination with a car having a rotating shaft extending transversely across the same and extending on opposite sides thereof, having on opposite ends gear-wheels, a segmental rack on said shaft with integral bent arms to form bearings, propeller-shafts with wheels mounted in the bearings of the arms, the rear ends of the propeller-shafts having bevel-gears inclosed within said bends of the arms and meshing with said gear-wheels, a sprocket-wheel secured on the first-mentioned rotating shaft, means connected to said sprocket-wheel and with suitable gearing of a motor, of a second transversely centrally arranged shaft provided with a sprocket-wheel, a pinion on said shaft meshing with said segmental rack, a sprocket-wheel with an operating crank-arm, a chain connected thereto and to the sprocket-wheel on the second transversely-arranged shaft, substantially as specified.

704,876. CULTIVATOR. JAMES D. RIDDLE, Chatham, Va. Filed Mar. 6, 1902. Serial No. 96,998. (No model.)

Claim.—1. The combination with a main beam, of shovel-beams lying at opposite sides thereof and having their forward ends pivotally connected thereto, a cross-head pivoted intermediately to the main beam and having its opposite ends longitudinally bifurcated, the top and bottom members of the cross-head being provided with corresponding perforations, the shovel-beams being received within the respective bifurcations of the cross-head, and pivots for engagement with the perforations to adjustably connect the shovel-beams to the cross-head.

2. The combination with a main beam having a substantially horizontal longitudinal slot, of a shovel-beam pivoted to the main beam to swing in the substantially horizontal plane of the slot and capable of being swung into and out of the slot.

3. The combination with a main beam having a substantially horizontal longitudinal slot, of shovel-beams lying at opposite sides of the main beam with their forward ends pivoted within the slot to swing in the substantially horizontal plane of said slot, the depth of the latter being at least equal to the thickness of each shovel-beam, and the latter being adapted to lie within the slot at one and the same time.

4. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides of the main beam and capable of being adjusted into the slot of the main beam.

5. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides thereof and having their forward ends pivotally connected within the slot and also capable of being swung into the slotted portion of the main beam.

6. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides thereof, and a cross-head intermediately pivoted to the main beam and having its opposite ends pivotally connected to the shovel-beams, whereby the latter may be swung into the slotted portion of the main beam.

7. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides thereof, and a cross-head intermediately pivoted within the slot of the main beam and having its opposite ends pivotally connected to the shovel-beams, the cross-head being freely movable within the main beam and capable of being reversed, whereby the shovel-beams may be alternately shifted one in front of the other and also swung inwardly into the slotted portion of the main beam.

8. The combination with a longitudinally-slotted main beam, of shovel-beams located at opposite sides of the main beam and pivotally connected within the slotted portion thereof and capable of adjustment into and out of said slotted portion, and means for locking the shovel-beams within the slotted portion of the main beam and also when lying externally at opposite sides thereof.

9. The combination with a longitudinally-slotted main beam having a pair of handles extended rearwardly therefrom, of shovel-beams located at opposite sides of the main beam, pivotally connected within the slotted portion thereof and capable of being swung into and out of said slotted portion, means for locking the shovel-beams within the slotted portion of the main beam and also when disposed externally thereof, and means in reach of an operator when standing at the rear end of the handles for controlling the locking means.

10. The combination with a longitudinally-slotted main beam, of shovel-beams located at opposite sides thereof and pivotally connected within the slotted portion of the beam and also capable of being swung into said slotted portion, and locking means which is capable of embracing the shovel-beams when disposed within the main beam, and also capable of being inserted between the shovel-beams and the main beam to lock the former beams when adjusted externally of the main beam.

11. The combination with a longitudinally-slotted main beam, of shovel-beams located at opposite sides and pivotally connected within the slotted portion thereof and also capable of being swung into said slotted portion, and an inverted substantially U-shaped locking-clip mounted upon the main beam, and constructed to have its opposite end portions embrace the shovel-beams when swung into the slotted portion of the main beam, and also to be inserted between the shovel-beams and the main beam when the former beams are swung outwardly from the main beam.

12. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides and having their forward ends pivotally connected within the slotted portion thereof and also capable of being swung into said slotted portion, and a spring-actuated inverted substantially U-shaped locking-clip mounted upon the main beam in rear of the pivotal connection of the shovel-beams, the opposite end portions of the clip being constructed to embrace the shovel-beams when swung into the main beam, and also to be inserted between the shovel-beams and the main beam when the former beams are swung outwardly from the main beam.

13. The combination with a longitudinally-slotted main beam, of shovel-beams lying at opposite sides and having their forward ends pivotally connected within the slotted portion thereof and also capable of being swung into said slotted portion, an inverted substantially U-shaped locking-clip mounted upon the main beam in rear of the pivotal connection of the shovel-beams, the opposite end portions of the clip being constructed to embrace the shovel-beams when swung into the main beam, and also to be inserted between the shovel-beams and the main beam when the former beams are swung outwardly from the main beam, and a spring having one end connected to the main beam and its free end connected to the clip to normally hold the latter depressed.

14. The combination with a longitudinally-slotted main beam, of shovel-beams located at opposite sides and having their forward ends pivotally connected within the slotted portion of the main beam, whereby the shovel-beams are capable of being swung into and out of the slotted portion of the main beam, the rear ends of the shovel-beams being offset laterally outward so as to be separated by an interspace when the forward portions are swung into the slotted portions of the main beam.

15. The combination with a longitudinally-slotted main beam, of shovel-beams located at opposite sides and pivotally connected within the slotted portion of the main beam and capable of adjustment into and out of said slotted portion, and means for locking the shovel-beams within the slotted portion of the main beam.

16. The combination with a longitudinally-slotted main beam, having a pair of handles extending rearwardly therefrom, shovel-beams located at opposite sides of the main beam, pivotally connected within the slotted portion thereof and capable of being swung into and out of said slotted portion, means for locking the shovel-beams within the slotted portion of the main beam, and means in reach of an operator when standing at the rear end of the handles for controlling the locking means.

17. The combination with a longitudinally-slotted main beam, of opposite shovel-beams to lie within the slotted portion of the main beam and capable of being alternately shifted one in advance of the other, and means for locking the shovel-beams within the main beam.

18. The combination with a longitudinally-slotted main beam, of a cross-head intermediately pivoted within the slotted portion thereof, shovel-beams pivoted to the respective ends of the cross-head and capable of being swung into the slotted portion of the main beam alternately one in advance of the other, the rear end portions of the shovel-beams being offset laterally, and means for locking the shovel-beams when shifted one in advance of the other.

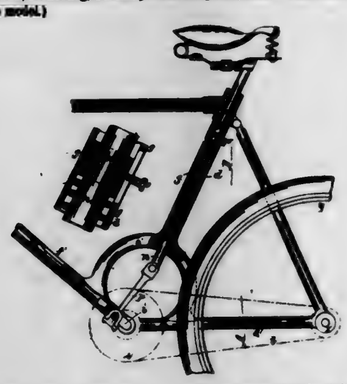
19. The combination with a longitudinally-slotted main beam, of front and rear cross-heads intermediately pivoted within the slotted portion of the main beam, shovel-beams located at opposite sides of the main beam, pivotally connected to corresponding ends of the front and rear cross-heads, and also capable of being swung into the slotted portion of the main beam and alternately shifted one in advance of the other, and means for locking the shovel-beams when located within the slot of the beam and also when located exteriorly of the beam.

20. The combination with a longitudinally-slotted main beam, of a front cross-head pivoted intermediately within the main beam and having opposite reduced arms, a rear cross-head pivoted intermediately within the main beam and having longitudinally-bifurcated ends, shovel-beams

located at opposite sides of the main beam with their rear ends received within the bifurcated portions of the rear cross-head and pivotally connected thereto, the front ends of the shovel-beams being bifurcated to receive the respective ends of the cross-head, pivotal connections between the front ends of the shovel-beams and the front cross-head, and means for locking the shovel-beams in differently-adjusted positions.

21. The combination with a longitudinally-bifurcated main beam, of a front cross-head intermediately pivoted within the main beam and having opposite reduced arms, a rear cross-head intermediately pivoted within the beam and having bifurcated ends, the opposite sides of the bifurcated portions being provided with a plurality of corresponding perforations, shovel-beams located at opposite sides of the main beam and capable of being received within the slotted portion thereof, the forward ends of the shovel-beams being bifurcated and pivotally embracing the respective ends of the front cross-head, the rear end portions of the shovel-beams being offset laterally, received within the bifurcated portions of the rear cross-head and provided at their rear ends with standards, detachable fastenings piercing the shovel-beams and corresponding perforations of the rear cross-head, cultivator-shovels carried by the standards, a pair of handles inclined upwardly and rearwardly from the top of the main beam, braces rising from opposite sides of the main beam and connected to the handles, a vertically-movable inverted substantially U-shaped clip embracing the main beam in rear of the front cross-head with its opposite pendent end portions capable of embracing the shovel-beams when lying within the main beam and also of being inserted between the main beam and the shovel-beams to lock the latter when adjusted away from the main beam, a spring to maintain the clip at its lowermost position, and a controlling-rod connected to the clip and extended to the rear ends of the handles for convenience in manipulation.

704,877. MEANS FOR PROPELLING VEHICLES. ANDREAS RIEDER, Flensburg, Germany. Filed Sept. 20, 1901. Serial No. 75,998. (No model.)

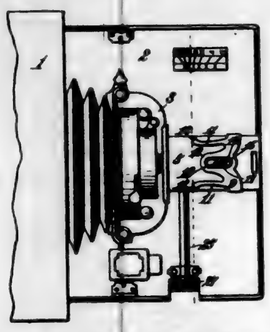


Claim.—The combination, in a vehicle-frame, of a front brace, a pair of side bars, a forked arch connecting the front brace with the two side bars, a crank-shaft journaled at the junction of the front brace and side bars, a tubular upright open at both ends, supported at its lower end in the arch, bushed or thickened at its lower end and provided with a longitudinal slot, a saddle-post slidably mounted in the tubular upright and projecting at the upper and lower ends thereof, a pitman connecting the lower end of the saddle-post with the crank-shaft, a spring coiled about the saddle-post in the tubular upright and having a lower bearing upon a thickened or bushed portion of said upright, a ring adjustable on the saddle-post and forming the upper bearing of the spring, and a set-screw projecting through the slot in the tubular upright and serving to secure the ring to the saddle-post in any adjustment within the limit of the length of the slot, substantially as described.

704,878. PHOTOGRAPHIC-CAMERA ATTACHMENT. JOHN A. ROBERTSON and CHARLES E. HUTCHINS, Rochester, N. Y., assignors to Rochester Optical and Camera Company, Rochester, N. Y., a Corporation of New York. Filed Mar. 13, 1902. Serial No. 98,107. (No model.)

Claim.—1. In a camera, the combination with a guideway, of a lens-carriage adjustable thereon, a locking device adjustably arranged on the guideway and constructed and arranged to engage the lens-carriage and automatically lock the latter at a predetermined point when the lens-carriage is drawn out, substantially as described.

2. In a camera, the combination with a guideway, of a lens-carriage adjustable thereon, a locking device movably arranged on said guideway toward and from the carriage, means for locking said locking device on the guideway, and means carried by the lens-carriage and arranged to be automatically engaged by said locking device to lock the lens-carriage at a predetermined point when drawn out, substantially as described.



3. In a camera, the combination with a guideway, of a lens-carriage movably arranged on said guideway, a locking device carried by said guideway and arranged to automatically engage the lens-carriage and lock the latter at a predetermined point when drawn out, and means for adjusting said guideway backward and forward, substantially as described.

4. In a camera, the combination with a guideway, of a lens-carriage movably arranged thereon, of a locking device comprising a plate adjustably mounted on said guideway and provided with spring-fingers adapted to engage and interlock with the lens-carriage, substantially as described.

5. In a camera, the combination with a guideway and a lens-carriage movably arranged thereon, a locking device comprising a plate having depending flanges which engage the opposite sides of said guideway and having spring-fingers constructed and arranged to engage the lens-carriage and lock the latter in place, substantially as described.

6. In a camera, the combination with a guideway and a lens-carriage movably arranged thereon, of a locking device comprising a plate provided at its opposite sides with depending flanges arranged to engage the opposite sides of said guideway and having a centrally-slotted portion, a set-screw passing through said slotted portion and holding said plate in place, the said plate being provided with spring-fingers having beveled heads adapted to engage corresponding recesses in the lens-carriage, substantially as described.

7. In a camera, the combination with a guideway, of a lens-carriage movably arranged thereon, a locking device on the guideway and comprising a plate secured to the guideway and having two horizontal spring-fingers provided on the outer sides of their ends with laterally-projecting beveled heads, and two ribs on the lens-carriage arranged to straddle and compress said spring-fingers and provided on their adjacent faces with notches adapted to be engaged by said beveled heads, substantially as described.

704,879. PHOTOGRAPHIC VIEW-FINDER. JOHN A. ROBERTSON and CHARLES E. HUTCHINS, Rochester, N. Y., assignors to Rochester Optical and Camera Company, Rochester, N. Y., a Corporation of New York. Filed Mar. 13, 1902. Serial No. 98,108. (No model.)

Claim.—1. A view-finder casing, comprising a body portion consisting of an integral piece of sheet metal bent up into substantially a right-angular prismatic shape, a flanged cap fitted over the upper open end of said body portion, an objective fitted in the vertical front portion of said casing, a reflector fitted in the rear inclined portion thereof, and a magnifying-lens fitted in the said cap, substantially as described.

2. In a view-finder casing, comprising a body portion consisting of an angular piece of sheet metal bent up into substantially a right-angular

prismatic shape and having fitted in its front portion an objective, and in its rear inclined portion a reflector, a spring fitted within said casing and holding said reflector in its seat, a cap fitted over the upper open portion of the body of the casing and a magnifying-lens fitted within said cap, substantially as described.

3. In a view-finder, the combination with a casing comprising a body portion formed of an integral piece of sheet metal bent up into substantially right-angular prismatic shape and having fitted in its front vertical portion an objective, a reflector seated against the rear inclined portion of the casing, a spring for holding said reflector to its seat and consisting of a resilient wire bent intermediate its ends to encircle the objective and resting against the vertical front side of the casing, and terminating in parallel rearwardly-inclined arms that bear against the edges of the reflector, and a cap fitted over the upper open end of said casing and provided with a magnifying-lens, substantially as described.

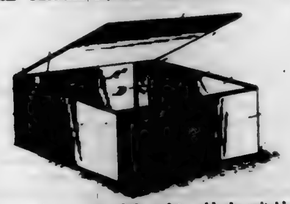
4. In a view-finder, a casing comprising a body portion consisting of an integral piece of sheet metal bent up into substantially a right-angular prismatic form and provided in its front vertical edge with an objective, and in its rear inclined portion with a reflector, of a flanged cap fitted over the upper, open end of said casing, and a lens fitted within said cap and resting on the opposite upper side edges of the casing, substantially as described.

5. In a view-finder, a casing comprising an integral piece of sheet metal bent up into substantially a right-angular prismatic form, and having an objective fitted in its vertical front face, and a reflector against its rear inclined face, the opposite upper side edges of said casing being concaved, of a flanged arch-shaped apertured cap fitted over the upper open end of said casing, and a lens fitted within said cap and resting on said concaved edges, substantially as described.

6. In a view-finder, a casing comprising an integral piece of sheet metal bent up into substantially a right-angular prismatic form, and having an objective fitted in its vertical front face, and a reflector against its rear inclined face, the opposite upper side edges of said casing being provided with upwardly-projecting tongues, a lens resting on said upper edges between said tongues, and a flanged cap fitted over the upper open end of said casing, substantially as described.

7. In a view-finder casing, the combination with a bracket-arm adapted to be secured to a camera, of a view-finder provided with an attaching-bracket pivoted to said bracket-arm, said attaching-bracket having a V-shaped extension, and a spring supported on said bracket-arm and arranged at its free end to bear against either of the sides of said V-shaped extension to hold the finder in either a vertical or a horizontal position, substantially as described.

704,880. COLLAPSIBLE CARTON. CHARLES H. RUSSELL, Manistee, Mich. Filed Mar. 27, 1902. Serial No. 100,257. (No model.)



Claim.—1. A carton consisting of two blanks suitably scored, one of which forms the top, bottom and rear walls thereof, the other blank forming the front and end walls and laps thereto, and means secured to said laps for detachably securing the same to the rear wall.

2. A carton consisting of two blanks suitably scored, one of which comprises three members forming respectively the top, bottom and back wall thereof, the other blank comprising members forming the front wall and ends of the carton, the end members being provided with laps lying against the inner face of the back wall of the carton, detachable fasteners securing said laps to the back wall and means for securing the front wall and top and bottom members of the carton together.

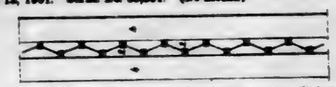
3. A carton consisting of two blanks suitably scored, one of which comprises three members forming respectively the top, bottom and rear wall thereof, the other blank comprising the front and end portions of the carton, the said end portions being provided with laps having attaching means secured thereto, said laps being adapted to lie against and be detachably secured to the inner face of the back wall, whereby the body portion of the carton may be collapsed and lie flat against the back wall thereof.

4. In a carton the combination of a blank scored and bent to form the top, bottom and back wall thereof, slots in the top and bottom members, a second blank scored and bent to form the front walls, end walls and laps thereto, said laps lying against the inner face of the back wall of the carton, slots in said laps, slots in said back wall registering with the slots in the laps, removable fasteners passed through and secured in said registering slots, a fastener secured in the front wall of the carton and provided with members adapted to pass through the slots in the top and bottom of the carton and be bent over, thereby locking the said parts together substantially as shown and described.

5. In a carton the combination with a body portion provided with hinged cover and bottom of an independent fastener secured to the body portion, said fastener consisting of a main or body portion and oppositely-extending arms adapted to extend over and fasten the said cover and bottom against the body portion.

6. In a carton the combination with a body portion having hinged cover and bottom, said cover and bottom provided with openings near their edges, of an independent fastener secured to the said body portion, and consisting of a head and two oppositely-extending arms, said arms being adapted to pass through the openings in the cover and bottom and be bent over the edges of the cover and bottom and fasten the same against the top and bottom edges of the said body portion.

704,881. LACING DEVICE. EMILE SAVOYE, Paris, France. Filed Dec. 13, 1901. Serial No. 85,501. (No model.)

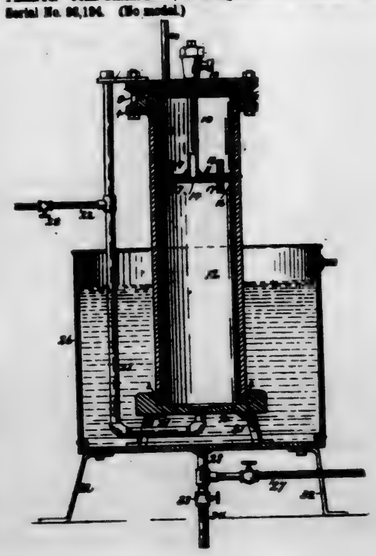


Claim.—1. In a lacing device with eyelets having their axes in alinement, an eyelet formed of coiled metallic thread, comprising a series of helical spirals spaced at intervals from one another and curved on the outer side against which the lacing should rest, in combination with the parts arranged to be secured to the objects to be connected by the lacing.

2. In a lacing device with eyelets having their axes in alinement, an eyelet of coiled metallic thread, comprising a series of helical spirals arranged on the outside of the part to which the eyelet is attached, said spirals being arranged a certain distance apart and following a meridian line convex on the inside, in combination with parts arranged to be secured to the objects to be connected by the lacing.

3. In a lacing device with eyelets having their axes in alinement, an eyelet of coiled metallic thread comprising a series of helical spirals arranged a certain distance apart and formed by the coiling of a continuous thread, one of the ends of said thread being arranged to be fixed to one of the objects to be connected by the lacing, and the other end being free so that the lacing can be introduced between the said ends into the spirals.

704,882. AMMONIA-PURIFIER FOR REFRIGERATING PLANTS. JOHN BERENDSEN, Washington, D. C. Filed Mar. 14, 1902. Serial No. 98,194. (No model.)



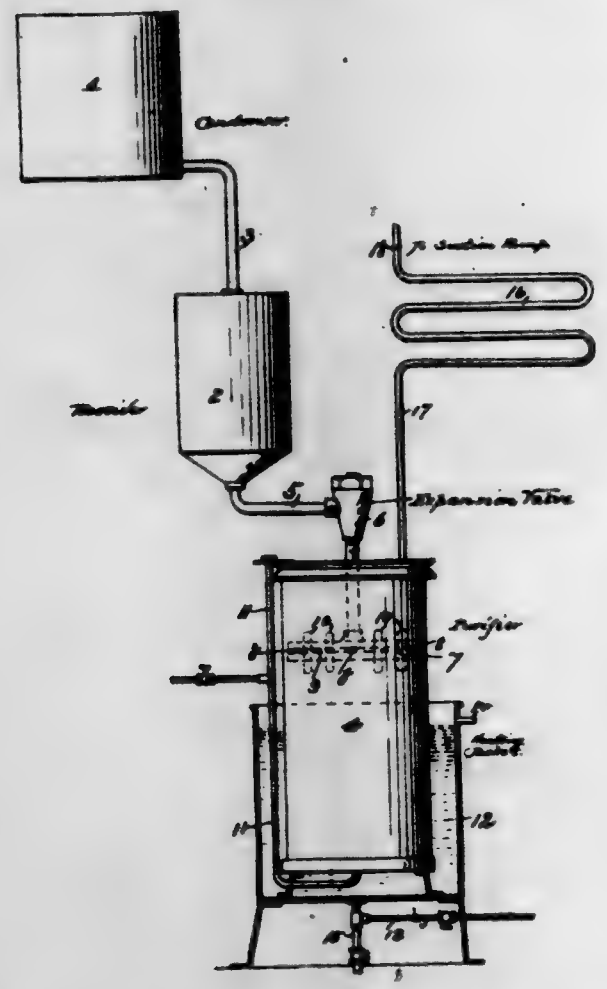
Claim.—1. The combination of an expansion-valve for effecting initial vaporization, and an ammonia-purifier provided with a diaphragm separating the purifier into a liquid-chamber and a gas-chamber, said diaphragm being constructed to distribute the liquid ammonia in the liquid-chamber, means for heating the liquid-chamber, means for conducting gas from the liquid-chamber to the gas-chamber, a discharge-pipe for the gas-chamber, and means for removing the impurities from the liquid-chamber.

2. An ammonia-purifier consisting of a receptacle provided with means for attachment to a liquid-ammonia receiver of a refrigerating plant, a diaphragm permanently separating the receptacle into a liquid and a gas chamber and provided with means for distributing the liquid ammonia, means of communication between said chambers, a connection with the gas-chamber leading to a suction-pump, a discharge for impurities from the liquid-chamber, and means for warming the liquid-chamber.

3. An ammonia-purifier for refrigerating plants, consisting of a receptacle permanently separated into a liquid-chamber and a gas-chamber by a diaphragm having means for distributing liquid ammonia and means of communication between said chambers, a suitable discharge for each chamber, and means for warming the liquid-chamber.

4. An ammonia-purifier for refrigerating plants, consisting of a receptacle having a liquid-supply, a diaphragm having radial passages and a peripheral discharge for distributing liquid ammonia and separate passages for gas extending through said diaphragm, a liquid-chamber below the diaphragm provided with a discharge for impurities, a gas-chamber above the diaphragm provided with means of attachment with a suction-pump, and means for warming the liquid-chamber.

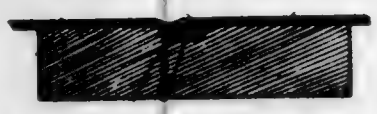
704,883. PROCESS OF PURIFYING REFRIGERANTS IN CIRCULATION IN REFRIGERATING PLANTS. JOHN SCHEIDEMAN, Washington, D. C. Filed Apr. 19, 1902. Serial No. 103,723. (No specimens.)



Claim.—1. The process of purifying a refrigerant in circulation in a refrigerating plant, which consists in collecting liquid refrigerant the product of condensation, vaporizing said liquid, then collecting the impurities from the refrigerant, vaporizing the refrigerant contained in said impurities, commingling the products of the several vaporizations and delivering these gases directly to the refrigerating-coils of the plant.

2. The process of purifying a refrigerant in circulation in a refrigerating plant, which consists in collecting liquid refrigerant the product of condensation, vaporizing said liquid, then collecting the impurities from the refrigerant, vaporizing the refrigerant contained in said impurities, commingling the products of the several vaporizations and delivering these gases directly to the refrigerating-coils of the plant, and removing the impurities.

704,884. BACKSTAY FOR CARRIAGE-TOPS. ROBERT C. SCHERMERHORN, Union City, Ind. Filed May 12, 1902. Serial No. 107,001. (No model.)



Claim.—A backstay comprising a textile filling, and a leather portion arranged on and turned over the textile filling, and made up of pieces of leather, enameled at one side; the said pieces of leather having the end portions of their enameled sides arranged together and connected by through-and-through stitches, and one of the pieces having a lap-welt disposed over the seam formed by said stitches.

704,885. HYDRAULIC BORING APPARATUS. GEORG SCHMIDT, Charlottenburg, Germany. Filed May 17, 1902. Serial No. 107,758. (No model.)

Claim.—1. In a hydraulic boring apparatus, the combination with the boring-tool of a piping suspended on springs and a check-valve between the piping and the tool for automatically checking the circulating water at a certain speed of the latter, substantially as and for the purpose described.

2. In a hydraulic boring apparatus, the combination with the boring-tool of a piping suspended on springs and a check-valve between the piping and the tool, the check-valve comprising a valve-chamber with an inlet and outlet opening and a weighted or spring-actuated valve for closing the outlet-opening of the valve-chamber at a certain speed of the circulating water, substantially as and for the purpose described.

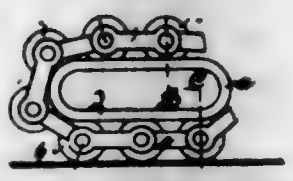
3. In a hydraulic boring apparatus, the combination with the boring-tool of a piping suspended on springs and a check-valve between the piping and the tool, the check-valve comprising a valve-chamber with an inlet and outlet opening, a valve-spring the tension of which is capable of being adjusted, substantially as and for the purpose described.

704,886. APPARATUS FOR FILLING BOTTLES OR JUGS WITH BEER. ADOLF SCHROEDTER, Berlin, Germany. Filed Jan. 12, 1901. Serial No. 43,018. (No model.)

Claim.—In an apparatus for filling bottles or jugs with carbonated liquids, the combination with a filling-tube connected with a source of liquid-supply and means for automatically opening and closing said filling-tube, of a counter-pressure device, comprising pump-cylinders with weighted pistons, means for connecting said cylinders together, an automatic air-discharge device and a float-valve located between said cylinders and a vertically-reciprocable filling-head through which said filling-tube reciprocates, and means for reciprocating said filling-tube and filling-head, substantially as set forth.

704,886.

704,887. MEANS FOR MOVING HEAVY LOADS. ARTHUR SCHULZ, Friedenau, Germany. Filed Apr. 12, 1902. Serial No. 102,826. (No model.)



Claim.—1. In means for moving heavy loads, the combination of a frame adapted to carry the load and circumferentially grooved in its outer face, and an endless chain composed of link-cheeks pivotally connected at their ends, having central longitudinal elongated slots, and spaced-apart and trunnioned rollers journaled and engaging in the groove of the frame, in said slots, said rollers being of decreasing thickness from their centers toward their circumferences, substantially as and for the purposes set forth.

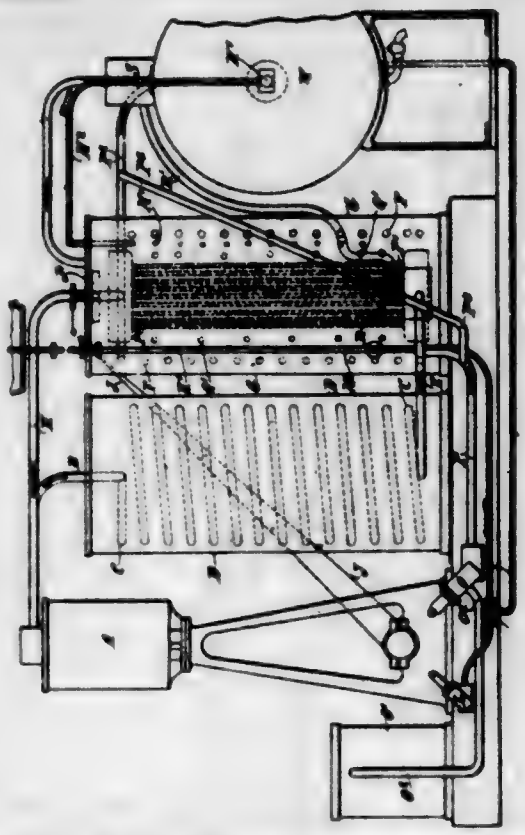
2. In means for moving heavy loads, the combination of a frame adapted to carry the load, circumferential flanges on the said frame and an endless chain, comprising link-cheeks, pins pivotally connecting the said link-cheeks, rollers tapering toward the circumference, trunnions centrally secured to the said rollers and journaled in oblong slots in the said link-cheeks, and ribs on the ends of the said link-cheeks, adapted to travel on the said circumferential rim-flanges, the parts being constructed, arranged and working substantially as and for the purpose set forth.

704,888. BELT-TIGHTENER. GEORGE A. SCHWIDER, Akron, Ohio. Filed Feb. 5, 1902. Serial No. 92,694. (No model.)

Claim.—1. The combination with a belt, and a fixed roller therefor, of a roller for the other end of said belt, bearings for said roller movable to and from the fixed roller, cams abutting said bearings, and means for operating said cams to control the position of said bearings and roller.

2. The combination with a belt, and a fixed roller therefor, of a roller for the other end of said belt, bearings for said roller consisting of bars having a slotted engagement with bolts or pins on the frame, cams abutting the inner ends of said bars, a shaft to which said cams are fixed, and an operating-lever for said shaft.

704,889. ART OF AGING OR TREATING SPIRITS. RICHARD C. SCOTT, Liverpool, England. Filed Feb. 24, 1902. Serial No. 95,441. (No model.)



Claim.—1. The herein-described art of treating spirit by cooling it to about 32° Fahrenheit or below and spraying it in a stream of constantly-changing air at a warmer temperature.

2. The herein-described art of treating spirit by cooling it to about 32° Fahrenheit or below and spraying it in a stream of constantly-changing air alternately at a warmer temperature and at about 32° Fahrenheit or below.

704,890. HAIR-CURLER. ALESSANDRO G. B. SCURI, Liege, Belgium. Filed Dec. 30, 1901. Serial No. 87,785. (No model.)

Claim.—1. In a device of the type set forth, the combination of a comb shaped to fit the upper lip, a correspondingly-shaped plate movably carried by the front of said comb and adapted normally for engagement therewith, a depending handle secured to the lower portion of the comb, means engaging the front of the said plate for actuating said plate out of engagement with the comb, means for operating said last-named means, substantially as described.

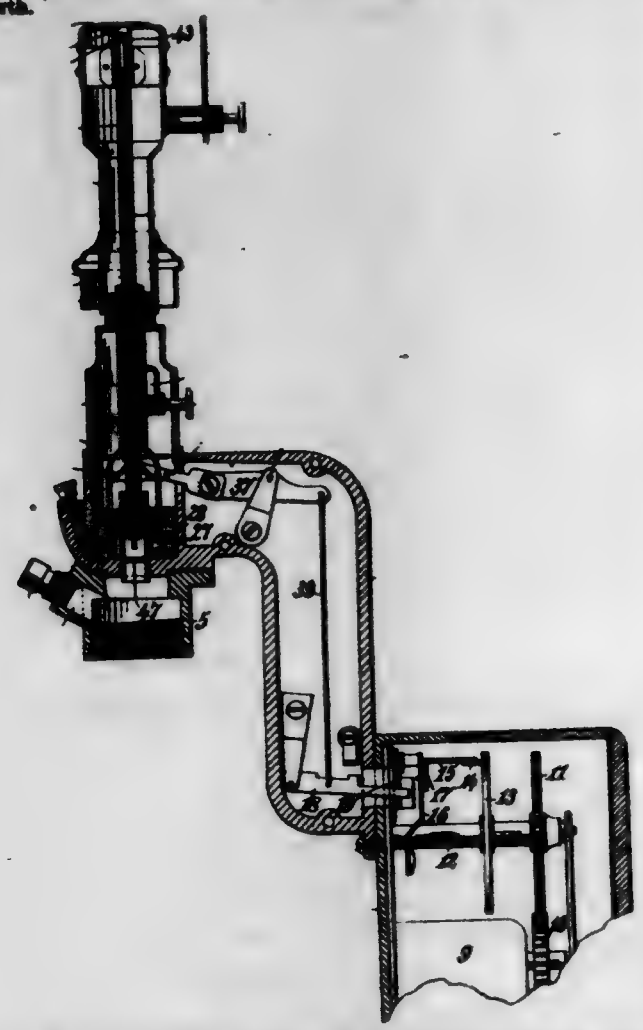
2. In a device of the type set forth, the combination of a comb shaped to fit the upper lip, and carrying a depending handle, a correspondingly-shaped plate, an extension carried by the front of the comb at its upper portion, a lever pivotally secured to the extremity of said extension and carrying a handle at its lower portion, a right-angular arm secured centrally of the lever and having its free end pivotally secured to the front face of the plate, the plate having a downward movement, substantially as described.

704,891. AUTOMATIC GAS-LIGHTING MECHANISM. ALBERT R. SHAW, West Medford, Mass. Filed Sept. 30, 1901. Serial No. 77,018. (No model.)

Claim.—1. A gas-supply pipe, a gas-burner attached thereto, a valve controlling the supply of gas to said burner, a time mechanism, and connecting mechanism between the time mechanism and said valve, whereby the valve is controlled by said time mechanism, combined with a protecting-lantern having its base portion located intermediate the time mechanism and said valve, for the purpose set forth.

2. A gas-supply pipe, a gas-burner attached thereto, a valve controlling the supply of gas to said burner, a time mechanism, a casing for said time mechanism, connecting mechanism between the time mechanism and said valve, whereby the valve is controlled by the time mechan-

ism, combined with a protecting-lantern having its base portion located intermediate the time mechanism and said valve, and an inclosing casing for said connecting mechanism passing through the base portion of the lantern and forming a means by which the time mechanism and its inclosing casing are suspended from said gas-supply pipe, for the purpose set forth.



3. In an automatic gas lighting and extinguishing device for a street-lamp, a lantern, a gas-supply pipe entering the lantern, a burner in the lantern, a valve controlling the supply of gas to said burner, a time mechanism, and connecting mechanism between said time mechanism and valve including two levers and a connecting-rod between said levers, one lever engaging the valves within the lantern and the other lever engaged and acted upon by the time mechanism outside the lantern, whereby the bottom of the lantern will be located intermediate the time mechanism and the valve, for the purpose set forth.

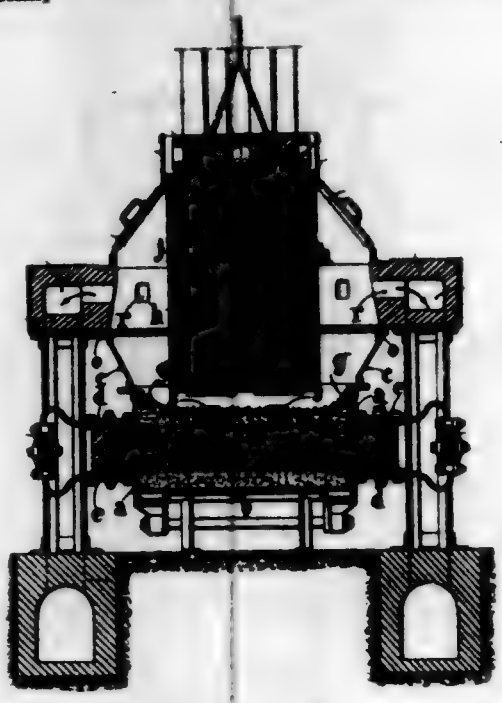
4. In an automatic gas lighting and extinguishing device, a burner, a valve controlling the supply of gas to the burner, a time mechanism, a casing for the time mechanism and a connecting mechanism between the time mechanism and the gas-controlling valve engaging the valve at a plane above the casing for the time mechanism, adapted to receive a protecting-lantern having its base portion located intermediate the time mechanism and the gas-controlling valve, for the purpose set forth.

704,892. SHIRT-VEST. GEORGE W. SHECKELLS, Baltimore, Md. Filed Sept. 24, 1901. Serial No. 76,287. (No model.)

Claim.—1. A garment comprising a vest having a shirt-bosom disposed therein, said bosom being attached at its upper edges to the vest at the shoulder-seams thereof and a neckband attached to the upper edges of the bosom and the back of the vest and adapted for attachment of a collar thereto, the bosom being unattached at its side and bottom edges and lying behind the front of the vest.

2. A garment comprising a vest having its back and its front formed double, sleeves attached to the back and the linings of the front sections only, and a bosom attached to the upper portion of the vest and having a neckband, said band being attached also to the upper edge of the back of the vest.

704,893. MANUFACTURE OF IRON, MANGANESE, AND ALLOYS OF THESE METALS BY AID OF ELECTRICITY. ALBERT SIMON, Bordeaux, France. Filed Feb. 27, 1901. Serial No. 48,120. (No specimens.)

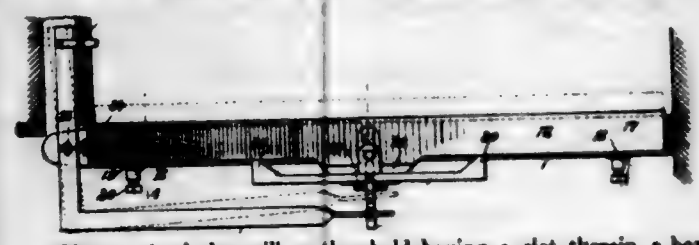


Claim.—A process of manufacturing iron, manganese and the alloys of such metals, consisting in adding to the material to be treated carbon, and an electrolyte consisting of fluorid of calcium, in sufficient quantity, to dissolve the material and then subjecting the mass to the action of a continuous electric current to cause the electrolytic decomposition and the keeping of the material in a fluid condition, substantially as described and for the purpose set forth.

704,894. RAILROAD-TIE. BENJAMIN H. SMITH, Shippensburg, Pa. Filed Feb. 5, 1902. Serial No. 92,632. (No model.)

Claim.—The herein-described tie formed of plastic or molten material and provided upon its under side with means to engage the contiguous part of the road-bed whereby a longitudinal and lateral slipping movement will be prevented, in combination with a reinforcing bar or bars fitting a groove in a contiguous part of the tie and means to hold said reinforcing-bars in place and additional means cooperating with said tie and bars to engage the track-rails and lock them in union with said parts, all combined substantially as specified and for the purpose set forth.

704,895. AUTOMATIC THRESHOLD. CHARLES R. SOWDEN, Basin, Mont. Filed Sept. 3, 1901. Serial No. 74,103. (No model.)



Claim.—1. A door-sill or threshold having a slot therein, a box-frame to which the door-sill or threshold is attached, a weather-strip extending practically from end to end of the box-frame and capable of moving in the slot of the sill or threshold, a lifting-bar having bearing at its ends against the lower edge of the weather-strip, and a lever in operative and adjustable connection with the said lifting-bar, which lever is operated by the movement of the door as the said door is opened and closed.

2. The combination with a sill or threshold having a longitudinal opening therein, a box-frame to which the sill or threshold is attached, a weather-strip having vertical movement in the frame and adapted to extend through the slot in the sill or threshold, an equalizing-bar carried by the said frame and having engagement with the threshold-strip at both

sides of its center, guides for the said equalizing-bar, which equalizing-bar is likewise a lifting-bar, a lever connected with the equalizing-bar, adapted in one position of the lever to raise the equalizing-bar, and a plunger carried by the lever and adapted to be operated by a door while opening or closing, as described.

3. In automatic thresholds, the combination, with a box-frame, a sill or threshold attached to the upper portion of the box-frame and provided with a longitudinal opening therein, a weather-strip mounted to slide vertically in the said box-frame and extend through the openings in the said sill, stop devices carried by the said frame, and in adjustable engagement with the lower edge of the weather-strip at its end portions, and an equalizing or lifting bar having bearing against the bottom of the weather-strip at each side of its center, of a shifting device for the lifting or equalizing bar, which shifting device has guided movement in the said frame, an elbow-lever fulcrumed upon the box-frame, having one end connected with the said shifting device, and a plunger connected with the opposite end of said lever, adapted to be operated by the opening and closing of a door, as described.

4. A door-sill or threshold having a slot therein, a frame to which the door-sill or threshold is attached, a weather-strip mounted to slide vertically in said slot, stop devices for the end portions of the weather-strip carried by said frame for engagement with the lower edge of the weather-strip, and devices for raising and lowering the weather-strip, acting thereon at points each side of the center of the weather-strip, substantially as described.

5. In automatic thresholds, a frame, a sill or threshold carried by the upper portion of the frame and having an opening therein, a weather-strip mounted to slide in the frame and through the opening in the sill, stop devices for adjustable engagement with the weather-strip, and devices for raising and lowering the weather-strip, as set forth.

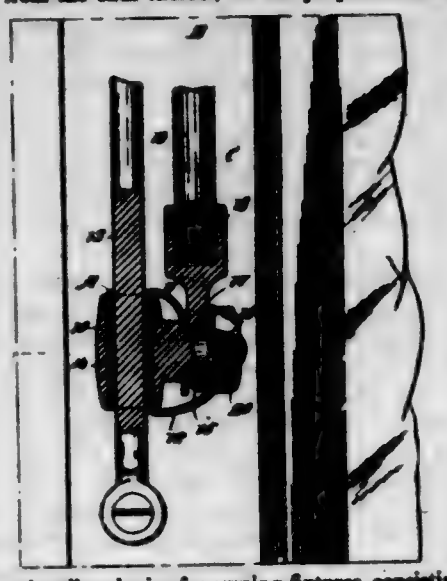
704,896. FENCE-MAKING MACHINE. ELZA E. STEWART, New Ramley, Ohio. Filed Jan. 20, 1902. Serial No. 90,448. (No model.)

Claim.—1. In a fence-making machine, the combination of a supporting-frame, a shaft journaled vertically in the frame and provided with a pinion and with worm-gears, a horizontal drive-shaft carrying a gear-wheel meshing with the pinion, an operating device connected to said drive-shaft, bearings upon the frame, and twister-heads having worm-gears meshing with the worm-wheels on the vertical shaft, journals turning in said bearings and flanges to hold said wheel against displacement, substantially as described.

2. In a fence-making machine, the combination of a supporting-frame, a shaft journaled vertically in the frame and provided with a pinion and with worm-gears, a horizontal drive-shaft carrying a gear-wheel meshing with the pinion, an operating device connected to said drive-shaft, twister-head supports and bearings upon the frame, each consisting of opposing side plates, one of said plates being divided and having coinciding segmental notches, and twister-heads, each having gear-teeth to mesh with a worm-gear, a journal turning in the bearing formed by the walls of said notches, and a flange arranged between the plates and holding the head against displacement, substantially as and for the purpose set forth.

704,897. ANTIRATTLER FOR AWNING-FIXTURES. JAMES SULLIVAN, New York, N. Y. Filed Oct. 25, 1901. Serial No. 79,666. (No model.)

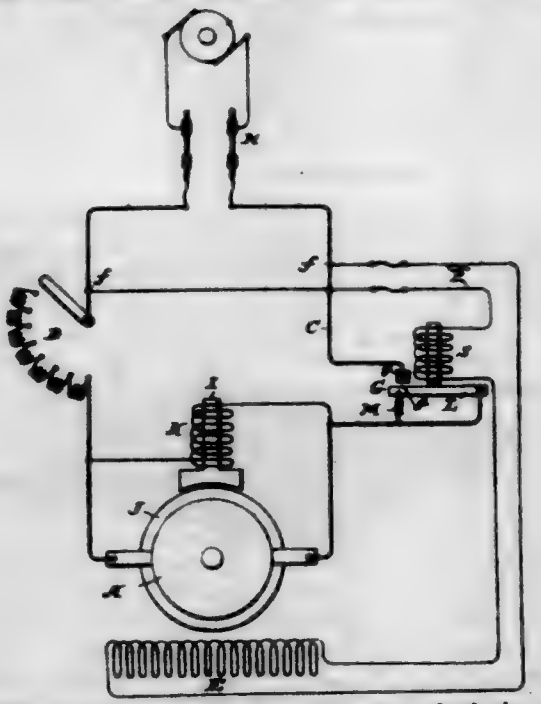
Claim.—1. An antirattling device for awning-fixtures, consisting of a strip of pliable material such as leather, having an enlarged intermediate portion or body-section and apertured tube extending from opposite sides of the body-section, the body-section being adapted to be bent about an axis parallel to the length of the strip into tubular form, and the tube bent outward from the ends thereof, for the purpose described.



2. An antirattling device for awning-fixtures, consisting of a strip of leather provided with a rectangular body, and apertured tube extending from opposite sides of the said body, one tab being longer than the other, for the purpose described.

3. In awning-fixtures, the combination, with a guide-rod, a sleeve mounted to slide on the rod and provided with a threaded projection, and a socket for a member of the awning-frame mounted to turn upon the projection from the said sleeve, of an antirattling device consisting of a strip of leather or a like material, comprising a body-section and apertured tube extending from opposite sides of the body-section, the body-section being bent to cylindrical form and introduced into the said sleeve, the tube extending respectively from the top and bottom of the sleeve, one tab being passed over the projection of the sleeve, entering the space between the socket and the sleeve, the other tab being also passed over the projection from the sleeve, engaging with the opposite face of the said socket, and a lock-nut located on the said projection and engaging with the upwardly-carried tab of the antirattling device, for the purpose set forth.

704,898. SAFETY DEVICE. AUGUST SIEBEL, Yonkers, N. Y., assignor to Otis Elevator Company, East Orange, N. J., a Corporation of New Jersey. Filed Oct. 12, 1901. Serial No. 78,480. (No model.)



Claim.—1. The combination of a motor, and a brake-magnet connected in a shunt to the armature-circuit and controlled by the field-circuit, substantially as described.

2. The combination of a motor, a field-circuit normally closed in shunt to the mains, and a switch in the armature-circuit controlled by an electroresponsive device in said field-circuit, substantially as described.

3. The combination of a motor, a field-circuit normally closed in shunt to the mains, and a normally open switch in the armature-circuit controlled by an electroresponsive device in said field-circuit, substantially as described.

4. The combination of a motor, a field-circuit normally closed in shunt to the mains, a switch in the armature-circuit, and means controlled

by the said field-circuit for closing and opening said switch, substantially as set forth.

5. The combination of a motor, its armature-circuit and shunt field-winding, and means in the circuit of the shunt field controlling the armature-circuit, and a brake controlled by the armature-circuit, substantially as described.

6. The combination of a main circuit and a motor, its shunt field-winding, and an electroresponsive device therein controlling contacts in the main circuit, a main-circuit switch and an electroresponsive device energized from the main circuit and controlling a brake, substantially as described.

7. The combination of a main circuit and a motor, its shunt field-winding and an electroresponsive device therein controlling the operation of a switch in the main circuit, another switch in the main circuit for starting the motor, and an electroresponsive brake-controlling device connected to the main circuit in such a manner as to become deënergized when the circuit of the field-winding becomes deënergized, substantially as described.

8. The combination of a main circuit and a motor, its shunt field-winding and an electroresponsive device therein controlling the operation of a switch in the main circuit, another switch in the main circuit for starting the motor, and an electroresponsive brake-controlling device connected in shunt with the main circuit in such manner as to become deënergized when the main circuit is broken, substantially as described.

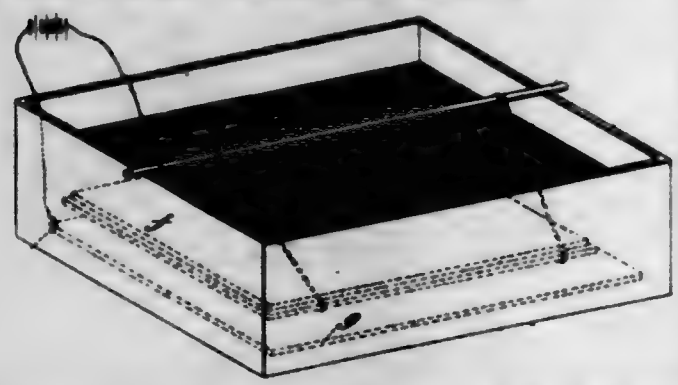
9. The combination of a main circuit and a motor, its shunt field-winding and an electroresponsive device therein controlling the operation of a switch in the main circuit, another switch in the main circuit for starting the motor, and an electroresponsive brake-controlling device adapted to be deënergized when the circuit of the shunt field-winding is broken, substantially as described.

10. The combination of a main circuit and a motor, its shunt field-winding and an electroresponsive device therein controlling the operation of a switch in the main circuit, a brake, and an electroresponsive brake-controlling device adapted to apply the brake when the field-winding becomes deënergized, substantially as described.

11. The combination of a source of supply and a main circuit, an armature connected thereto, starting and controlling switches in the main circuit, a shunt field-circuit connected to the main circuit at points between the source of supply and said starting and controlling switches, and an electroresponsive device in said field-circuit controlling said controlling-switch, substantially as described.

12. The combination of a source of supply and a main circuit, an armature connected thereto, starting and controlling switches in the main circuit, a shunt field-circuit connected to the main circuit at points between the source of supply and said starting and controlling switches, an electroresponsive device in said field-circuit controlling said controlling-switch, and an electroresponsive brake-controlling device connected to points on the main circuit between the starting and controlling switches and the armature, substantially as described.

704,399. STAINED-GLASS WINDOW OR SIMILAR OBJECT AND PROCESS OF MAKING SAME. JULIUS TALSAU, Philadelphia, Pa., assignor of one-half to Henry W. Scattergood, Philadelphia, Pa. Filed Dec. 16, 1899. Serial No. 572,318. (No model.)



Claim.—1. The method of uniting sections of glass or tile, which consists in arranging such sections on a support with their adjacent edges apart, said support provided with a conducting-surface along the spaces between the edges of the sections, and then electrodepositing metal upon said support until the spaces between such sections are filled by the deposited metal.

2. The process of framing or uniting electrically non-conductive objects, such as glass in stained-glass transparencies, which consists in arranging such objects upon an electrically-conductive backing or foundation, in given design, with their adjacent edges apart, and then electrically depositing metal in the spaces between such adjacent edges and around the boundary of the object, substantially as described.

3. The process of framing or uniting electrically non-conductive objects, such as glass in stained-glass transparencies, which consists in arranging such objects upon an electrically-conductive backing or foundation, in given design, with their adjacent edges apart, and then electrically depositing metal in the spaces between such adjacent edges and around the boundary of the object, and finally stripping off the backing or foundation, substantially as described.

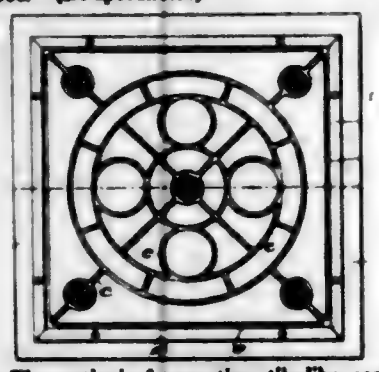
4. As an improved article of manufacture, a stained-glass window or other object, composed of a number of pieces of essentially electrically non-conductive material, and a continuous and homogeneous frame of electrodeposited metal between the adjacent edges of the component pieces and around the perimeter of the article as a whole, substantially as described.

5. The method of uniting sections or pieces of glass and other electrically non-conductive material, which consists in arranging such sections upon a conducting-support, with their edges apart, and then electrodepositing metal upon said support until the spaces between such sections are filled by the deposited metal.

6. The method of mounting sections or pieces of glass and other electrically non-conductive material, which consists in arranging the sections or pieces in any desired manner on a conducting-surface, exposing the whole in the electrolytic bath until the interstices between the sections or pieces are filled by the deposit formed on the conducting-surface, and then removing the conducting-surface to expose the faces of the complete product.

7. The method of mounting sections of glass and other electrically non-conductive material, which consists in arranging the sections or pieces in the desired manner on a temporary conducting-surface on a removable support, exposing the whole in the electrolytic bath until the interstices between the sections are filled by the deposit formed on the conducting-surface, then removing the support and conducting-surface to expose the faces of the complete product.

704,400. METHOD OF FRAMING GLASS. JULIUS TALSAU and HENRY W. SCATTERGOOD, Philadelphia, Pa. Filed June 30, 1897. Serial No. 643,266. (No specimens.)



Claim.—1. The method of mounting tile-like sections which consists in arranging the sections in the desired manner on a support with spaces between the sections, the support being provided with a conducting-surface along the spaces between the edges of the sections, exposing the whole in an electrolytic bath until the interstices between the sections are filled with the deposit formed, then continuing the exposure until the deposited metal is in the form of an I-beam.

2. The method of framing sections of glass and other material, which consists in providing a wax-like support with a conducting-surface, arranging the sections on such surface in the desired relation and with spaces between them, exposing the whole in an electrolytic bath until the interstices between the sections are filled with the deposit made on the exposed conducting-surfaces, then melting off or otherwise detaching the support.

3. The method of framing sections of glass and other material, which consists in providing a body of wax to which the glass may be temporarily applied, and having a conducting-surface, arranging the objects on such surface in the desired relation and with spaces between them, exposing the whole in an electrolytic bath and depositing in the spaces the material of the electrolyte, and then removing from the bath and melting off or otherwise detaching the wax, substantially as described.

4. The method of framing sections of glass and other material, which consists in providing a fugitive body to which the glass may be temporarily applied, and having a conducting-surface, arranging such fugitive body upon a support having non-fugitive projections below the surface of the fugitive body, arranging the objects to be framed on such surface, and in the desired relation, and with spaces between them, exposing the whole in an electrolytic bath, and depositing in the spaces the material of the electrolyte, and then removing from the bath and displacing the fugitive body down to or below the outer edges of the non-fugitive projections on the support, substantially as described.

5. The method of framing pieces of glass or other substance, which consists in providing a temporary support for such pieces, arranging the pieces on such support in the desired relation and with intervening spaces, providing a metallic or metallized foundation in said spaces, removing the object from the bath and then filling or partly filling the spaces above such foundation with a suitable material and confining it between the foundation and the pieces, and then removing from the temporary support, substantially as described.

6. The method of framing pieces of glass or other substance, which consists in providing a temporary support for such pieces, arranging the pieces on such support in the desired relation and with intervening spaces, forming a metallic or metallized foundation in said spaces, removing the object from the bath, then filling or partly filling the spaces above such foundation with a suitable material, finishing the surface of the filling by electrodeposition of metal, and then removing from the temporary support, substantially as described.

7. The method of framing pieces or sections of glass or other material, which consists in providing a removable conducting-surface, placing thereon the pieces or sections in proper relation and with intervening spaces, depositing a metallic foundation in said spaces, then filling the spaces with alternate layers of metallic filings and electrically-deposited metal, and then removing the removable conducting-surface, substantially as described.

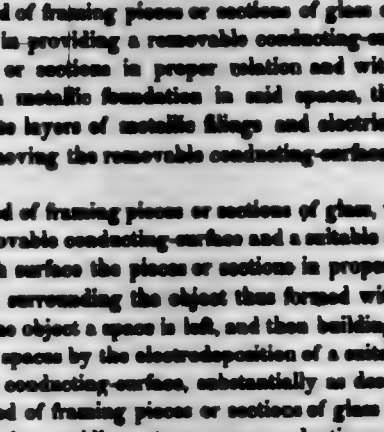
8. The method of framing pieces or sections of glass, which consists in providing a removable conducting-surface and a suitable support therefor, placing on such surface the pieces or sections in proper relation with intervening spaces, surrounding the object thus formed with a frame between which and the object a space is left, and then building up the framing in said several spaces by the electrodeposition of a suitable metal, and then removing the conducting-surface, substantially as described.

9. The method of framing pieces or sections of glass or other material, which consists in providing a temporary conducting-surface, placing thereon the pieces in proper relation and with intervening spaces, exposing in the electrolytic bath and depositing metal in the interstices, removing the conducting-surface so as to expose both sides of the product, and forming ledges on the exposed surfaces of the deposited metal to overhang the edges of the glass or other pieces, by a further exposure in the electrolytic bath, substantially as described.

10. The method of framing pieces or sections of glass or other material, which consists in providing a temporary support having a conducting-surface, and arranging thereon the pieces or sections in proper relation and with intervening spaces, exposing the object in an electrolytic bath and depositing the metal in such spaces against the conducting-surface, removing the object from the bath and support, and again exposing in the bath, substantially as described.

11. As an improved article of manufacture, a stained-glass window, or other object, having a frame or framing composed of a foundation of electrodeposited metal arranged between the edges of the pieces or sections which form parts of the window or other object and within the plane of their faces, and a superstructure of finely-divided filling material bound in between the foundation and the said pieces or sections, substantially as described.

704,401. METHOD OF FRAMING GLASS. JULIUS TALBOT, Philadelphia, Pa., assignor of one-half to Henry W. Suttergood, Philadelphia, Pa. Filed Mar. 22, 1898. Serial No. 674,513. (No model.)

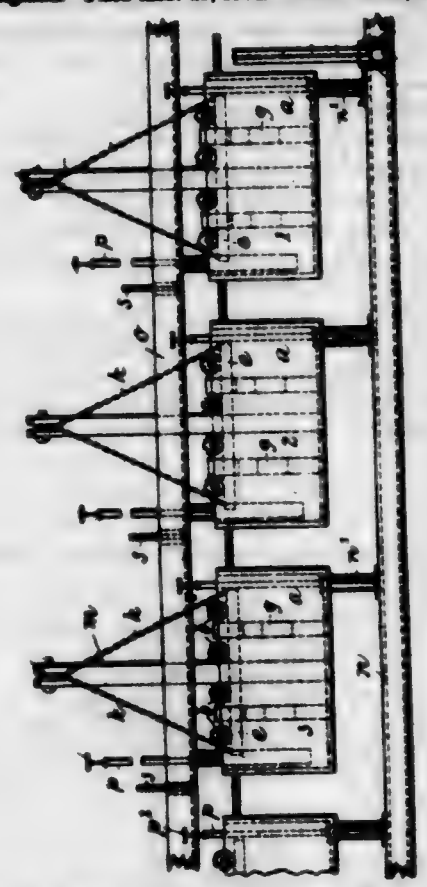


Claim.—1. The method of uniting pieces of glass or other material, which consists in arranging such pieces on a support to hold them in relative position with spaces between them, then providing an electric conductor on such support in proximity to such spaces, then exposing in an electrolytic bath and electrodepositing on such conductor and within such spaces until the spaces are entirely filled with deposited metal, so as to form an electrodeposited holding-frame therefor.

2. The method of electroglazing glass and other substances, consisting in providing a support upon which the several pieces are placed in such manner as to have their adjacent edges slightly separated, some cementitious or adhesive material being interposed between the support and the pieces, the spaces between the pieces being provided with an electric conductor, then inserting the object into an electrolytic bath and depositing material upon the electric conductors between the several pieces, and then removing the support.

3. The method of forming a series of pieces of glass or other substances into a body, consisting in placing the several pieces upon a support in such manner that their adjacent edges will be slightly separated, a quantity of cementitious or adhesive material being interposed between the pieces and the support, then applying electrically-conducted material in the spaces between the several pieces, then immersing the body in an electrolytic bath and depositing metal between the parts to be connected, and thereby connecting the pieces to adapt them to receive a surrounding frame, the support being removed or retained as desired.

704,402. BLEACHING-VAT. FRANK TAYLOR, Dough, and ALEXANDER COOKE and ROBERT W. D. MONTGOMERY, Belfast, Ireland, assignors to the Linhouse Process Bleaching Company, Limited, Cornhulme, England. Filed Mar. 15, 1901. Serial No. 51,570. (No model.)



Claim.—1. In combination, a vat having a discharge-opening, a delivery-trough for liquids above same having a discharge-opening above the trough, a discharge-trough beneath the vat, plugs for the discharge-openings both of the delivery-trough and the vat each comprising a cylinder, means for compressing air in same, a flange on the cylinder resting on the receptacle, a perforated extension of the cylinder below such flange, a further smaller flange adapted to pass into the opening of the receptacle and an elastic surrounding wall for the chamber formed between such flanges adapted to be expanded in the opening by the air-pressure in the cylinder.

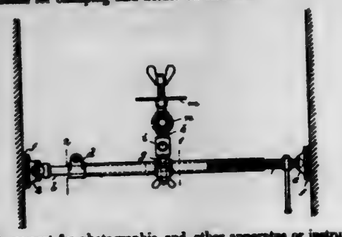
2. In combination, a liquid-receptacle having an opening therein, a plug for such opening comprising a cylinder, piston, and operating means for the latter, a flange on the cylinder resting on the receptacle, a perforated extension of the cylinder below such flange, a further smaller flange adapted to pass into the opening of the receptacle and an elastic surrounding wall for the chamber formed between such flanges adapted to be expanded in the opening by the action of the piston.

704,403. ADJUSTABLE SUPPORT FOR PHOTOGRAPHIC OR SIMILAR APPARATUS. PETER TRILL, Cologne, Germany. Filed Aug. 9, 1901. Serial No. 71,457. (No model.)

Claim.—1. A support for photographic and other apparatus or instruments comprising a rod carrying adjusting devices for securing it between two fixed surfaces; and a holder for the apparatus adjustable laterally and circumferentially on said rod and means for clamping said holder on said rod.

2. A support for photographic and other apparatus or instruments comprising a rod having adjustable devices at the ends thereof to permit

of a securing thereof between two surfaces at varying angles; and a holder for the apparatus adjustable laterally and circumferentially on said support and means for clamping said holder on said rod.



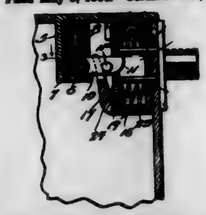
3. A support for photographic and other apparatus or instruments comprising a rod; extensions adjustably located at the ends thereof; and pads jointed to said extensions, whereby the rod may be fixedly mounted at varying angles between two surfaces.

4. A support for photographic and other apparatus or instruments comprising a rod; extensions adjustably located at the ends thereof; pads jointed to said extensions, whereby the rod may be fixedly mounted at varying angles between two surfaces; and a holder for the apparatus adjustable laterally and circumferentially on said support.

5. A support for photographic and other apparatus or instruments comprising a rod; extensions adjustably located at the ends thereof; pads jointed to said extensions, whereby the rod may be fixedly mounted at varying angles between two surfaces; and a holder for the apparatus adjustable laterally and circumferentially on said support, said holder being offset from the axis of said support.

6. A support for photographic and other apparatus or instruments comprising a rod; extensions adjustably located at the ends thereof; pads jointed to said extensions, whereby the rod may be fixedly mounted at varying angles between two surfaces; a holder for the apparatus adjustable laterally and circumferentially on said support, said holder being offset from the axis of said support; and a plate pivotally carried by said holder.

704,404. FASTENER FOR LABEL-HOLDERS. JOHN R. THORUP, Rantoul, Ill. Filed May 3, 1901. Serial No. 58,505. (No model.)



Claim.—1. The combination with a holder of the class set forth, a movable closure for one end of the holder, a rotatable spindle supported by the holder and having a catch-arm with a cross-pin therein, an inwardly-extending slotted striker secured to the closure, and a spring-actuated slotted catch-plate also carried by the closure and normally positioned outwardly from the striker.

2. In a device of the class set forth comprising a casing and a movable closure for one end thereof, a catch device movably supported by the casing and located on the interior of the latter, said catch device being operative from the exterior of the casing, a vertically-disposed catch-plate and an upwardly and inwardly extending striker carried by the closure, the catch-plate being freely movable and having a slot therein, and means for exteriorly operating the catch-plate.

3. In a device of the class set forth, the combination of a casing having a movable closure at one end, a catch device movably supported by and located interiorly of the casing, and a striker and catch-plate hold by the closure, the catch-plate being vertically disposed and freely movable to and from the striker and having a slot therein, the catch device and catch-plate having exteriorly-located operating means.

4. In a device of the class set forth, the combination of a casing having a movable closure at one end, a catch device movably supported by an interior portion of the casing and having exteriorly-located operative means, an inwardly and upwardly extending striker carried by the closure to receive the catch device, and a slidable plate with an opening therein also carried by the closure and operating to prevent release of the catch device from the striker until cleared from the end of said catch device.

704,405. WATER-WHEEL. SANFORD M. THURMAN, YUMA, ARIZ. Filed Nov. 2, 1901. Serial No. 80,957. (No model.)

Claim.—A water-wheel having at each end a series of radial arms, inclined braces extending from the outer end of one radial arm to the middle portion of the next radial arm, paddles hinged along their outer edges to the point where the outer ends of the radial arms and the outer ends of the inclined braces converge and unite to form the outer angles of the wheel, the said inclined braces also forming rests or supports for the paddles when receiving the water-pressure substantially as described.

704,406. SHUTTLE FOR SEWING-MACHINES. HARRIET R. TRAUT, London, England. Filed Mar. 21, 1899. Serial No. 709,825. (No model.)

Claim.—1. A vibratory shuttle provided with an arm to retain the loop of the needle-thread during the reverse movement of the shuttle, the arm being secured near the heel of the shuttle and extending in a plane above the lower edge of the shuttle in the direction of the shuttle-nose, substantially as described.

2. A vibratory shuttle provided with an arm to retain the loop of the needle-thread during the reverse movement of the shuttle, the arm being secured near the heel of the shuttle, and having its free end terminated between the heel and the nose of the shuttle, substantially as described.

3. A vibratory shuttle provided with an arm to retain the loop of the needle-thread during the reverse movement of the shuttle, the arm being secured near the heel of the shuttle, and extending in the direction of the nose of the shuttle, the arm having its outer edge curved, and being of greatest width at its center, substantially as described.

4. A vibratory shuttle provided with a loop-retaining arm secured near the heel thereof, the arm extending in the direction of the shuttle-nose and thereby adapted upon the reverse movement of the shuttle to release the loop at a point where it will not be engaged by the descending needle, substantially as described.

5. A lock-stitch vibratory shuttle provided with a loop-retaining arm secured near the heel of the shuttle, the arm extending in the direction of the shuttle-nose, but terminating short of the shuttle-nose and thereby adapted upon the reverse movement of the shuttle to release the loop at a point where it will not be engaged by the descending needle, substantially as described.

704,407. WRENCH. EDWARD L. UTLEY, Fayetteville, N. C. Filed Nov. 5, 1901. Serial No. 81,211. (No model.)

Claim.—1. In a wrench, the combination with a hollow handle provided with a fixed jaw and provided internally with a toothed rack, of a movable jaw having a shank adjustably fitted in the hollow handle, a pawl carried by said shank, means for normally holding one end of the pawl in engagement with the rack, and a thumb-piece carried by the other end of pawl and projecting through an elongated slot formed in the side of the handle opposed to the rack, substantially as described.

2. In a wrench, the combination with a hollow handle provided with a fixed jaw and provided internally with a toothed rack, of a movable jaw having a shank movably fitted in the hollow handle and longitudinally slotted from side to side intermediate its ends, a pawl disposed in said slot and fulcrumed therein intermediate its ends, said pawl being provided at one end with a tooth adapted to engage the rack and at its other end with a thumb-piece projecting through an elongated slot formed in

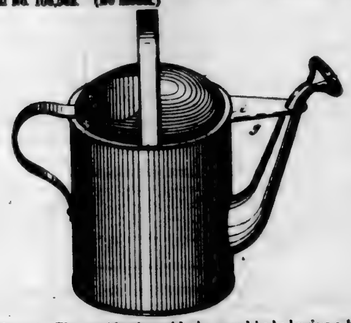
the hollow handle, and means for normally holding the pawl in engagement with the rack, substantially as described.

3. In a wrench, the combination with a hollow handle provided with a fixed jaw and provided internally with a toothed rack each tooth of the rack having a straight and an inclined face, the inclined faces of the teeth being disposed toward the fixed jaw, of a movable jaw having a shank movably fitted in the hollow handle and longitudinally slotted from side to side intermediate its ends, a pawl disposed in said slot and fulcrumed therein intermediate its ends, said pawl being provided at one end with a tooth adapted to engage the rack and at its other end with a thumb-piece projecting through an elongated slot formed in the hollow handle, and a spring arranged to normally hold the pawl in engagement with the rack, substantially as described.

4. In a wrench the combination with a hollow handle provided with a fixed jaw and provided internally with a toothed rack, each tooth of the rack having a straight and an inclined face, the inclined faces of the teeth being disposed toward the fixed jaw, of a movable jaw having a shank movably fitted in the hollow handle and longitudinally slotted from side to side intermediate its ends, two pawls of unequal length disposed in said slot and fulcrumed therein intermediate their ends, each of said pawls being provided at one end with a tooth adapted to engage the rack and at its other end with a thumb-piece projecting through a slot formed in the hollow handle, and springs arranged to normally hold the pawls in engagement with the rack, substantially as described.

5. In a wrench, the combination with a hollow handle provided with a fixed jaw and provided internally with a toothed rack, each tooth of the rack having a straight and an inclined face, the inclined faces of the teeth being disposed toward the fixed jaw, of a movable jaw having a shank movably fitted in the hollow handle, a pivoted pawl carried by said shank and provided with a tooth adapted to engage the rack, the teeth of the rack and pawl being so constructed and arranged that when the pawl is swung into and out of engagement with the rack the point of the pawl-tooth will move in the arc of a circle divergent from the adjacent abutting face of the corresponding rack-tooth and the beveled spaces of said teeth will clear one another without touching, substantially as described and for the purpose specified.

704,408. SPOUT-BRACE FOR SHEET-METAL VESSELS. CHARLES L. WAGANER, Baltimore, Md., assignor to National Enameling & Stamping Co., a Corporation of New Jersey. Filed May 9, 1902. Serial No. 106,562. (No model.)



Claim.—1. The combination with the vessel-body having a breast and spout, of a sheet-metal brace having a tang end secured to the said body at the joinder of the body-wall and breast and provided at its other end with an opening formed entirely within its margin, said opening receiving and entirely surrounding the spout, and the marginal edge of the brace extending across said brace in contact with the upper surface of the same, as set forth.

2. A sheet-metal vessel, comprising a body provided at its upper edge with a recess; a spout secured to said body; a brace provided at one end with an opening which receives the said spout and provided at its other end with tangs taking through said recess; and a breast having its marginal edge interlocked with the upper edge of the vessel-body and extending over said brace in contact with the upper surface of the same whereby to secure said brace to the body, as set forth.

704,409. ORE-TESTING TABLET. HENRY H. WAY, Custer, S. D., assignor of one-half to Harry B. Griffith, Custer, S. D. Filed Feb. 7, 1901. Serial No. 46,267. (Specimens.)

Claim.—1. As a new article of manufacture, a composition tablet for testing ores comprising a fuel and a decomposable compound containing oxygen for burning said fuel, said oxygen-furnishing compound being employed in proportions sufficient to burn said fuel to produce a reducing heat and also fluxing reagent reducing agents as described.

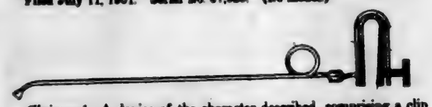
2. As a new article of manufacture, a composition tablet for testing ores comprising a fuel, and a decomposable compound containing oxygen for burning said fuel, said oxygen compound being in greater proportion by weight than the fuel as described.

3. As a new article of manufacture, a composition tablet for testing ores comprising charcoal and potassium nitrate, the potassium nitrate being in excess by weight.

4. As a new article of manufacture, a composition tablet for testing ores comprising a fuel and a decomposable compound supplying both oxygen for burning the fuel and cyanid of potassium for reducing the ores, substantially as described.

5. As a new article of manufacture, a composition tablet for testing ores comprising charcoal sixteen parts by weight, and nitrate of potassium twenty-seven parts by weight, substantially as described.

704,410. LEAF-HOLDER. CALVIN P. WEAVER, Bloomsburg, Pa. Filed July 11, 1901. Serial No. 67,823. (No model.)

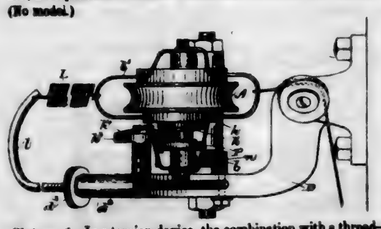


Claim.—1. A device of the character described, comprising a clip provided with pins, a clamping-plate hinged upon the pins, a packing arranged between the clamping-plate and one of the arms of the clip, means for forcing the plate against the support, and a spring-arm projecting from the clip and having a plurality of coils arranged at different angles to each other.

2. In a device of the character described, the combination with a U-shaped clip, the lower arm of which is formed with two diametrically opposite pins, a clamping-plate adapted to rest on the upper face of said arm and having extensions bent to form barrels and encircling said pins, a screw for forcing said clamping-plate against the support and a spring-arm arranged vertically of the top of said clip, for the purpose described

---

704,411. TENSION DEVICE. HAROLD A. WEBSTER, Haverhill, Mass., assignor to the Goodyear Shoe Machinery Company, Portland, Me., a Corporation of Maine. Filed July 30, 1898. Serial No. 688,422. (No model.)



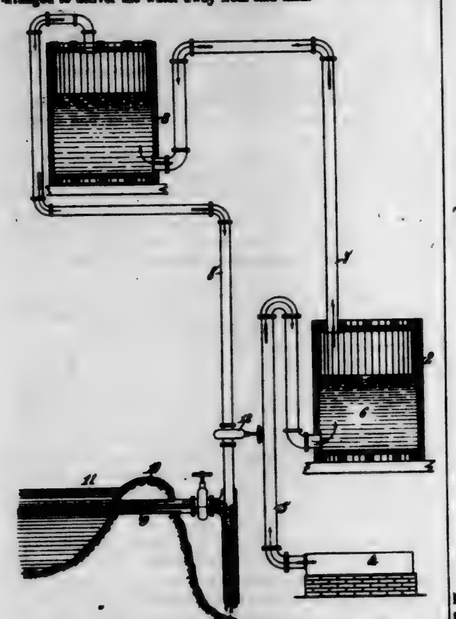
Claim.—1. In a tension device, the combination with a thread-truck capable of rotation and lateral movement, of a clutch to hold said truck from rotation opened and closed by the lateral movement of said truck, means controlled by the pull of the thread for imparting the said lateral movement to said truck, substantially as described.

2. In a tension device, the combination with a thread-truck, of a clutch comprising two clutch members capable of relative lateral movement toward and from each other, one of said clutch members being held to rotate with said truck and the other held from rotation, and means controlled by the pull of the thread to effect a relative lateral movement of said clutch members to engage and disengage the clutch members, substantially as described.

704,412. APPARATUS FOR MAKING SULFUROUS ACID. WILLIAM WEIDEL, Appleton, Wis. Filed Feb. 10, 1902. Serial No. 93,413. (No model.)

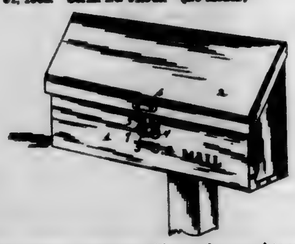
Claim.—1. In an apparatus for making sulfurous acid, the combination with a tank, of a sulfur-burner communicating with said tank, an aspirator-ejector one leg of which is horizontally disposed and the other leg

of which is vertically di-posed, the ends of the legs being open, means for passing a stream of liquid through the open end of the vertical leg, and a suction-pipe connected with said tank and inserted into the vertical leg of the ejector, the lower end of the suction-pipe being situated below the horizontal leg of the ejector and being of less external diameter than the internal diameter of the vertical leg of said ejector and the latter being arranged to deliver the water away from said tank.



2. In an apparatus for making sulfurous acid, the combination of a plurality of tanks, piping connecting said tanks, a sulfur-burner, piping connecting said sulfur-burner with the primary tank, an ejector, means for passing a body of water through said ejector, and a suction-pipe connected respectively with the secondary tank and the ejector, and the latter being arranged to deliver the water away from said secondary tank.

704,418. HASP-FASTENER. ADA L. WESTON, Dover, Ohio. Filed Jan. 31, 1902. Serial No. 91,942. (No model.)

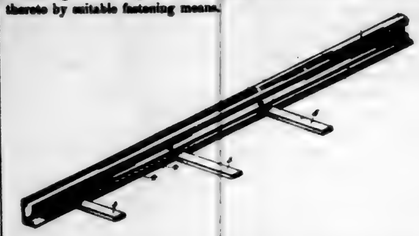


Claim.—The combination with a staple secured to a stationary portion of a box or inclosure, of a hasp secured to a cover or movable portion, the said hasp being formed of an integral loop, the sides of which pass one on each side of the staple, and the looped extremity being turned upward to engage the upper edge of the staple substantially as described.

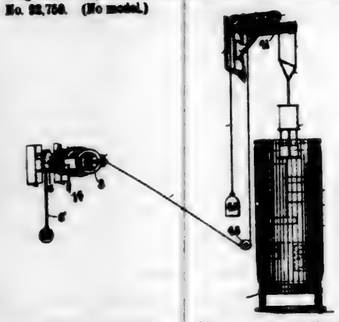
704,414. RAILWAY-SWITCH. WILLIAM WHARTON, Jr., Philadelphia, Pa., assignor to William Wharton, Jr., & Company, Incorporated, Philadelphia, Pa., a Corporation of Pennsylvania. Filed May 6, 1902. Serial No. 106,106. (No model.)

Claim.—1. In a railway-switch, the combination of a switch-rail and a reinforcing-bar having two longitudinal strengthening-ribs.

2. In a railway-switch, the combination of a switch-rail and a reinforcing-bar attached thereto having two longitudinal strengthening-ribs and connecting-rods having their ends fitting between said ribs and attached thereto by suitable fastening means.



704,415. BLUE-PRINTING APPARATUS. SAMUEL B. WEHRY, Pittsburg, Pa., assignor to the Pittsburgh Blue Print Company, Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 5, 1902. Serial No. 92,750. (No model.)



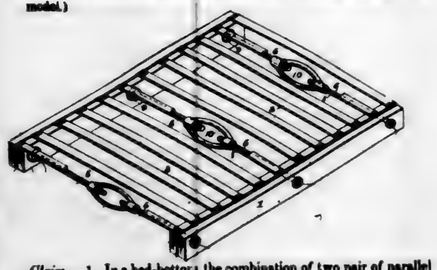
Claim.—1. A printing-drum, a lamp, an escapement mechanism for lowering the lamp into the drum, and a catch for preventing the operation of the said mechanism.

2. A printing-drum, a lamp, a winding-drum, connections between the winding-drum and the lamp, an escapement mechanism for governing the speed of the winding-drum, said winding-drum and escapement being separable to permit the free turning of the former.

3. A printing-frame, a lamp, a winding-drum, a pair of cords for suspending the lamp, an escapement mechanism for governing the travel of the lamp, and a weight, one of the cords being connected to the drum and the other, to the weight.

4. A printing-frame, a lamp, a winding-drum, a pair of cords for suspending the lamp, an escapement mechanism for governing the travel of the lamp, and a weight, the drum being separable from the escapement-wheel to permit the free turning of the former, one of the cords being connected to the drum and the other to the weight.

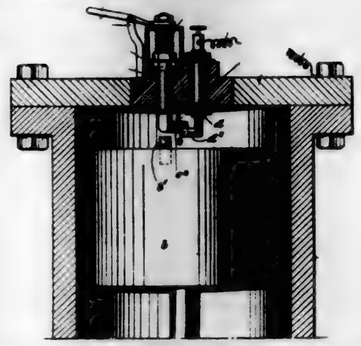
704,416. SPRING BED-BOTTOM. CHARLES B. WHITE and FRANKLIN WHITE, Landover, Md. Filed Apr. 4, 1902. Serial No. 101,410. (No model.)



Claim.—1. In a bed-bottom, the combination of two pair of parallel side members, bowed springs having downturned ends which ends are engaged by said side members, tie-rods passing through apertures in said side members, nuts mounted on said rods to clamp said parallel side members together to hold said springs, and turnbuckles connecting said tie-rods, substantially as described.

2. In a bed-bottom, the combination of two pair of parallel side members, bowed springs having downturned ends which ends are engaged by said side members, tie-rods passing through transverse apertures in said side members and provided with heads which bear on the outer faces of the outer member of said pairs of parallel side members, nuts mounted on said tie-rods and bearing on the inner faces of said side members to clamp them together and hold said springs, and turnbuckles connecting said tie-rods, substantially as described.

704,417. IGNITER. CHARLES A. WILKINSON, Worcester, Mass. Filed Oct. 15, 1901. Serial No. 78,726. (No model.)



Claim.—1. An electrical igniter for internal-combustion engines, comprising two conducting-pins mounted in the cylinder-head in parallelism with each other, one of said pins being movable longitudinally by the pressure of the piston thereon, and said pin having a laterally-turned toe at its inner end, and the other pin being insulated from the cylinder-head and having a laterally-turned fork at its inner end, and means for pressing on the first-named or movable pin to hold its toe yieldingly between the members of the fork on the second-named pin.

2. An electrical igniter for internal-combustion engines, comprising a plug fitted in the cylinder-head, a conducting-pin fitted rigidly in the plug and insulated therefrom, said pin having at its inner end a laterally-turned fork, a second pin mounted in the plug parallel with the first pin and arranged to slide longitudinally under pressure from the piston, said pin having a laterally-turned toe bearing normally between the members of the fork, means for pressing the second pin yieldingly in place, and a key working between the second pin and the plug to prevent said pin from turning.

704,418. BRICK-KILN. THOMAS M. WILSON, Layton, Pa. Filed Oct. 26, 1901. Serial No. 80,089. (No model.)

Claim.—1. The combination of a kiln, furnaces immediately adjacent each other communicating with the kiln, and a transversely open partition-wall separating the furnaces.

2. The combination of a kiln having a furnace-opening, a furnace structure inclosing the opening and containing two immediately adjacent furnaces, and a transversely open partition-wall separating the furnaces.

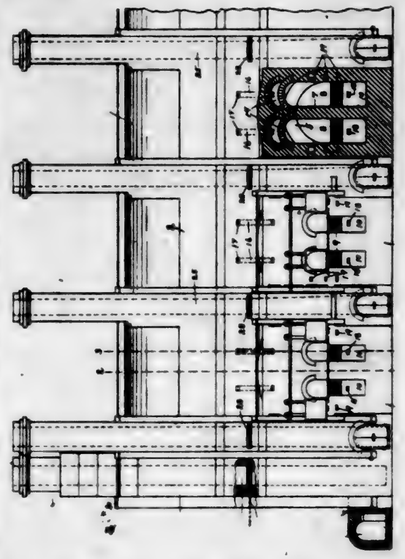
3. The combination of a kiln having an opening in its wall, two adjacent furnaces communicating with the kiln through said opening, and a partition separating said furnaces and intersecting the kiln-wall above the opening.

4. The combination of a kiln having an opening in its wall, two adjacent furnaces communicating with the kiln through said opening, and a vertical partition separating the furnaces, the partition extending through the kiln-opening and above the same, thereby laterally bracing the kiln-wall above the opening.

5. The combination of a kiln having an opening in its wall, two adjacent furnaces communicating with the kiln through said opening, and a vertical partition separating the furnaces, the partition having a transverse opening through which the furnaces communicate, said partition extending through the kiln-opening and above the same on the inner and outer sides of the kiln-wall, thereby laterally bracing the same.

6. The combination of a kiln having an opening, a furnace structure inclosing the opening and a portion of the kiln-wall adjacent the opening, and a lateral reinforcement within the furnace structure for the said inclosed portion of the wall.

7. The combination of a kiln having an opening, a furnace communicating with the kiln through the opening, and a transverse wall intersecting the kiln-wall immediately above the said opening and laterally bracing the same.



8. The combination of a kiln having an opening, a furnace structure without the kiln and inclosing the opening and communicating with the kiln through the opening, and a lateral reinforcement within the furnace for the portion of the kiln-wall immediately over said opening.

9. The combination of a kiln having an open floor, flues extending inward from the outer wall of the kiln and into which the floor opens, a dampered chimney connection for each flue, an additional flue communicating with each of the inwardly-extending flues, and means for inducing a draft in said additional flue.

10. The combination of a kiln having an open floor, flues extending inward from the outer wall of the kiln and into which the floor opens, an additional flue communicating with each of the inwardly-extending flues, and a separate dampered chimney connection for each of said flues.

11. The combination of a kiln having an open floor, flues extending inward from the outer wall of the kiln and into which the floor opens, a dampered chimney connection for each of said flues, an additional flue communicating with each of the inwardly-extending flues, and means adapted to be connected to said additional flue for either drawing air therefrom or forcing air thereinto.

12. The combination of a kiln having an open floor, two separated flues extending longitudinally of the floor adjacent the center thereof, transverse flues communicating at their inner ends with said longitudinal flues, and separate dampered chimney connections for said longitudinal and transverse flues.

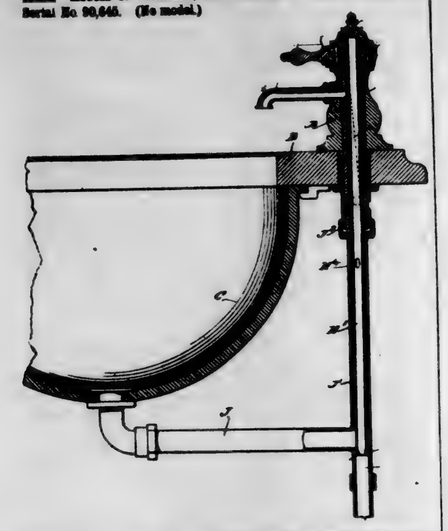
13. The combination of a kiln having an open floor, three separate flues extending longitudinally of the kiln-center, dampered chimneys for opposite ends of said flues in the end walls of the kiln, transverse flues extending inward from the side walls of the kiln and communicating with the outer two of said longitudinal flues, and dampered chimneys in the side walls of the kiln for the said transverse flues.

14. The combination of a series of kilns, two flues—each having a separate dampered connection with each kiln, and means interposed between and connecting said flues for drawing air from one flue and forcing it into the other flue.

15. The combination of a series of kilns, flues beneath the kiln-floors into which the latter open, and flues at opposite ends of and common to all the kilns and having dampered connection with each kiln through the said underfloor flues.

16. The combination of a series of kilns, two flues each having dampered connection with each kiln, air drawing and forcing mechanism connected to and adapted to draw air from one of said flues, a drier, and a dampered connection between said mechanism, the other of said flues, and the drier, whereby air may be drawn from any one kiln and forced into any other kiln or into the drier.

704,419. FIXTURE FOR WASHSTANDS, BATH-TUBS, OR THE LIKE. ADOLPH P. WIEDOLPH, New York, N. Y. Filed Jan. 21, 1902. Serial No. 90,045. (No model.)



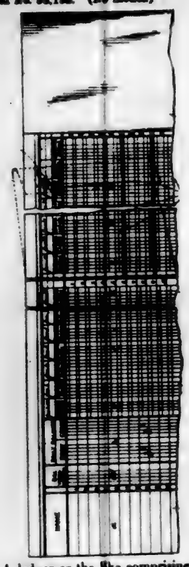
Claim.—1. A fixture for washstands, bath-tubs and the like, comprising a valve-body having a discharge-spout and connected with a hot-water supply and a cold-water supply, an elongated valve-plug mounted to turn in the said valve-body, and having separate longitudinal grooves in its peripheral face winding partially around the valve-plug, one for connection at the lower end with the hot-water supply and the other for connection at the lower end with the cold-water supply, the grooves being diametrically opposite each other at their lower ends and on the same side of the plug at their upper ends and adapted to register singly or simultaneously at their upper ends with the said discharge-spout, as set forth.

2. A fixture for washstands, bath-tubs and the like, comprising a valve-body having a discharge-spout and connected with a hot-water supply and a cold-water supply, an elongated valve-plug mounted to turn in the said valve-body and having separate longitudinal grooves in its peripheral face winding partially around the valve-plug, one for connection at the lower end with the hot-water supply and the other for connection at the lower end with the cold-water supply, the grooves being diametrically opposite each other at their lower ends and on the same side of the plug at their upper ends and adapted to register singly or simultaneously at their upper ends with the said discharge-spout, and a vertically-sliding valve for controlling the discharge of the waste water, the said valve having its valve-stem extending through the said valve-plug, as set forth.

3. A fixture for washstands, bath-tubs or the like, comprising a valve-body having a discharge-spout and connected with a hot-water supply and a cold-water supply, a valve-plug mounted to turn in the said valve-body, having separate grooves in its peripheral face, one for connection at one end with the hot-water supply and the other for connection at one end with the cold-water supply, the grooves being adapted to register singly or simultaneously at their other ends with the said discharge-spout, a valve for controlling the discharge of the waste water the said valve having its valve-stem extending through the said valve-plug, and means for controlling the said valve-stem from the said valve-plug to lift the valve off its seat, as set forth.

4. A fixture for washstands, bath-tubs and the like, comprising a valve-body having a discharge-spout and connections for a hot-water supply and a cold-water supply, and having a hollow stem extending downwardly, a valve-plug mounted to turn in the said valve-body, having separate grooves in its peripheral face, one for connection at one end with the hot-water supply and the other for connection at one end with the cold-water supply, the grooves being adapted to register singly or simultaneously at their other ends with the said discharge-spout, a waste-pipe for the washstand, bath-tub or the like connected to the hollow stem at the lower end of the inlet-valve body at a point external to the basin or tub, a valve adapted to be seated in the waste-pipe, and having a hollow stem extending through a bore in the hollow stem of the inlet-valve body and having overflow-openings discharging into the latter to allow the overflow of the bowl to discharge through the hollow stem and its valve, as set forth.

704,420. LEDGER. JOSEPH B. WISE, Austin, Tex. Filed Mar. 14, 1902. Serial No. 98,192. (No model.)



Claim.—1. A ledger or the like comprising long leaves, each provided with a name-space, a single designated "daily-balance" column, adjacent to the name-space, and a series of designated "daily-entry" columns for one month's business, and short leaves between and of less length than the long leaves and each beginning with a designated "monthly-balance" column, followed by a series of designated "daily-entry" columns for one month's business; the short leaves being of a length that when laid over on the long leaves the name-space and "daily-balance" spaces will be exposed to view, and the latter serve for use with all of the other columns; substantially as described.

2. A ledger or the like, comprising long leaves each having a name-space, a designated "transfer-balance" column, a single designated "daily-balance" column, and a series of designated "daily-entry" columns for one month's business, and short leaves between and of less length than the long leaves and each beginning with a designated "monthly-balance" column followed by a series of designated "daily-entry" columns for one month's business; the short leaves being of a length that when laid over on the long leaves the name-space, "transfer-balance" column and the "daily-balance" column will all be exposed to view and the latter serve for use with all of the other columns; substantially as described.

3. A ledger or the like, provided with long leaves each having a single designated "daily-balance" column and short leaves beginning with a designated "monthly-balance" column to fall adjacent to the said single "daily-balance" column, when the short leaf is laid on the long leaf to facilitate the recording of the balances in ink from the "daily-balance" column on the last day of the month and thereby obviating the necessity of folding the edge of the short leaf upon itself; substantially as described.

4. A ledger or the like, provided with a vertical name-space, next a designated vertical transfer-balance column, next a single vertical designated "daily-balance" column, next a single vertical designated "monthly-balance" and followed by a series of vertical "daily-entry" columns; all of the before-mentioned columns exposed to view at the same time, for the purposes set forth.

704,421. ATTACHMENT FOR FRUIT CAN OR JAR COVERS. GEORGE R. WOODBURY, Charlotte, Mich. Filed Aug. 15, 1901. Serial No. 72,205. (No model.)

Claim.—1. An attachment for a jar or can top as set forth, comprising a lower encircling device with depending lips at diametrically opposite points having outwardly-beveled lower edges, and means for securing the encircling device in immovable relation to the top of a can or jar.

2. An attachment of the class set forth having a lower encircling device for the top of a can or jar provided with pairs of diametrically-opposed lips depending below the same and formed with outwardly-beveled lower edges.

3. An attachment of the class set forth, comprising a lower encircling band with pairs of diametrically-disposed lips depending therefrom and having outwardly-beveled lower edges, arms rising from the said band, one of said arms having an inwardly-extending lip, a clamping-screw mounted in the opposite arm, and a grip to which the upper ends of the arms are secured.

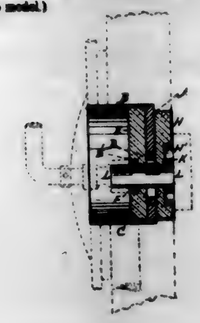
704,422. LAMP-BURNER. HENRY H. REHERMAN, Harvel, Ill. Filed Oct. 23, 1901. Serial No. 80,455. (No model.)

Claim.—A lamp-burner embodying a base or body having thereon, a perforated floor 3 and a cone 6, the cone being closely hinged to the floor 3 at one point and having an inward concave bend below its upper convex contour and also having on the inner side at a point opposite the hinged connection a downwardly and inwardly inclined curved flange 14 at an elevation above the lower edge of the cone, and a filling-tube passing through and supported by the floor and correlative parts of the burner, said tube diverging toward the upper end and inclined upwardly and outwardly and the upper end cut away to form a concave seat corresponding in curvature to that of the lower portion of the cone so that the inner convex part of the latter will snugly fit against the upper end of the tube and close the same, the said flange bearing against the upper portion of the tube when the cone is closed.

704,423. WALL-PLATE OR SHIELD FOR ELECTRIC WIRES. BOYD W. ALLEN, Boston, Mass. Filed Feb. 26, 1902. Serial No. 95,513. (No model.)

Claim.—A wall-plate or shield for electric wires, comprising a plate adapted to be secured to the wall around the aperture through which the electric wires extend, said plate being formed with a central hole through which said wires can project, and with a peripheral flange extending forward therefrom; a cover provided with a peripheral flange adapted to fit over and be thereby secured to the flange of the said plate, said cover being provided with a central hole; and a tube or ring of non-conductive material secured to the cover within said central opening, substantially as set forth.

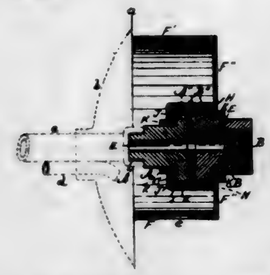
704,424. JUNCTION-BOX FOR ELECTRIC WIRES IN BUILDINGS. BOYD W. ALLEN, Boston, Mass. Filed Feb. 26, 1902. Serial No. 95,514. (No model.)



Claim.—1. In a junction-box of the character described, the metallic main portion comprising the wall A formed with a large hole D and provided with suitable flanges B, C; a pair of slabs of porcelain or other insulating material held against the rear and front surfaces of said wall; and a nipple adapted to receive a fixture extending through said porcelain slabs and through the central portion of the hole in the wall of the box, said hole being larger in diameter than the nipple, whereby the nipple is entirely out of electrical contact with the metallic portion of the box, substantially as described.

2. In a junction-box of the character described, the metallic main portion comprising the wall A formed with the large hole D and provided with suitable flanges B, C; the slab E of porcelain or other insulating material within the box and next the inner surface of the wall thereof; the slab H of porcelain or other insulating material next the outer wall of the box; a nipple extending through coincident holes in said slabs and through the central portion of the large hole D; and nuts on the nipple setting against the inner and outer surfaces of the inner and outer slabs respectively, the inner slab being recessed around its hole to correspond in size and shape with the nut next said slab, and the outer slab being formed with a recess around its hole large enough to allow the nut next said slab to rotate, substantially as set forth.

704,425. JUNCTION-BOX FOR ELECTRIC WIRES IN BUILDINGS. BOYD W. ALLEN, Boston, Mass. Filed Mar. 5, 1902. Serial No. 97,283. (No model.)



Claim.—1. In a junction-box of the character described, a split nipple or pair of nipples set reversely with each other, and provided with a gas-passage; the case of the junction-box inclosing said nipple and retaining in position and holding together the two parts thereof by means of its shape alone; a layer of insulating material between the two portions of the split nipple; and a layer of insulating material between the split nipple and that portion of the box which surrounds the nipple and holds its parts together, substantially as described.

2. In a junction-box of the character described, the split nipple comprising the two parts A, B provided with the adjacent portions A'' and B'' larger in diameter than the portions A and B; the cone F', F'' formed with the annular shoulder H, tubular portion I and inwardly-bent portion J, corresponding substantially with the shape of, and inclosing the adjacent portions of the split nipple; a layer of insulating material between adjacent portions of the nipple, and a layer of insulating material between the nipple and said portions H, I and J, substantially as set forth.

704,426. COMBINED AMMUNITION AND WATER CARRIER AND LITTER. HERBERT F. L. ALLEN, Washington, D. C., assignor to American Military Equipment Co., Washington, D. C., a Corporation of West Virginia. Filed Nov. 21, 1901. Renewed June 13, 1902. Serial No. 111,573. (No model.)

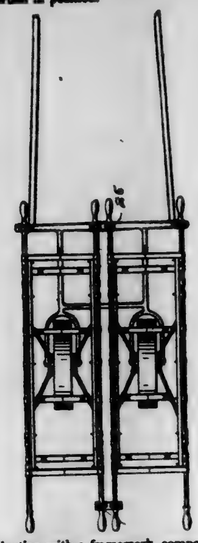
Claim.—1. A vehicle comprising a frame collapsible widthwise, a supporting-wheel, and an axle-bearing with which the sides of the frame have hinged connection.

2. A vehicle comprising a frame collapsible widthwise, a supporting-wheel, and an axle-bearing with the ends of which the sides of the frame have hinged connection.

3. A vehicle comprising a collapsible framework, a supporting-wheel, and an axle-bearing with which said framework has hinged connection, and water-tank adapted to be supported by said framework and when in place preventing the collapse of the framework.

4. A vehicle comprising a collapsible framework, a supporting-wheel, and an axle-bearing with which said framework has hinged connection, water-tank adapted to be supported by said framework and when in place preventing the collapse of the framework, and folding legs having hinged connection with said framework.

5. The combination with a collapsible framework composed of sides and folding braces, of removable water-tank which will prevent the collapse of the frame when in position.



6. The combination with a framework, composed of sides and folding braces hinged to said sides, of removable water-tank supported by said framework, said tank having legs hinged thereto upon which to support the tank when removed from the framework.

7. The combination with a framework consisting of sides and folding braces, said sides having cleats or ledges connected with their inner surfaces, said removable ammunition-boxes supported thereon, said boxes when in position preventing the collapse of the frame.

8. The combination with a framework consisting of sides and folding braces, said sides having cleats or ledges connected with their inner surfaces, and removable ammunition-boxes supported thereon, said boxes when in position preventing the collapse of the frame, and hooks projecting inwardly from the framework to receive a stretcher thereon.

9. The combination with a framework consisting of sides and folding braces, said sides having cleats or ledges connected with their inner surfaces, and removable ammunition-boxes supported thereon, said boxes when in position preventing the collapse of the frame, hooks projecting inwardly from the framework to receive a stretcher thereon, and water-tanks removably supported on the framework.

10. The combination of a framework consisting of sides and folding braces hinged thereto, folding straps extending across from side to side, and water-tanks removably supported on said straps.

11. The combination with a framework, consisting of sides and folding braces, of an axle-bearing, a wheel adapted to turn thereon, arms connected with the ends of the axle-bearing, and rigid braces having hinged connection with said arms and secured to the sides.

12. The combination with a framework, consisting of sides and folding braces, of an axle-bearing, a wheel adapted to turn thereon, arms connected with the ends of the axle-bearing, and rigid braces having hinged connection with said arms and secured to the sides, and folding braces extending across from one rigid brace to the other opposite.

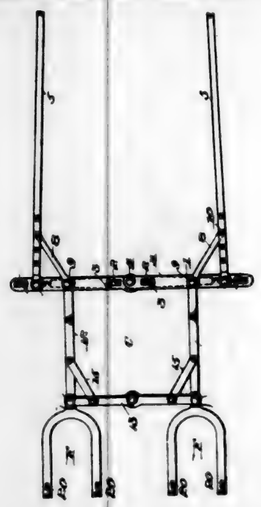
13. The combination with a framework, consisting of sides and folding braces, of an axle-bearing, a wheel adapted to turn thereon, arms connected with the ends of the axle-bearing, and rigid braces having hinged connection with said arms and secured to the sides, folding braces extending across from one rigid brace to the other opposite, and folding legs connected with the framework.

14. The combination with a pair of vehicles collapsible widthwise and supported each on a central wheel, of coupling means for securing them together and means by which they are attached to a draft-animal.

15. The combination with a pair of vehicles collapsible widthwise and supported each on a central wheel, of coupling means for securing them together and means by which they are attached to a draft-animal, said means connected with the axles of each wheel.

16. The combination with a pair of vehicles collapsible widthwise and supported each on a central wheel, of coupling means for securing them together and means by which they are attached to a draft-animal, said means connected with the axles of each wheel, and having a pair of forks at the rear end which span the wheels and are connected to the axles thereof.

704,427. PORTABLE AMMUNITION AND WATER CARRIER AND LITTER. HERBERT F. I. ALLEN, Washington, D. C., assignor to American Military Equipment Co., Washington, D. C., a Corporation of West Virginia. Filed Dec. 4, 1901. Serial No. 84,704. (No model.)



Claim.—1. A collapsible draft appliance having forks swiveled at its rear end whereby the appliance is capable of attachment to the axle of the vehicle.

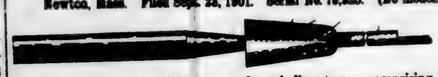
2. A collapsible draft appliance comprising a folding cross-bar and brace, draft-bars, means for attaching the appliance to the draft-animal, and rigid braces.

3. A collapsible draft appliance comprising a folding cross-bar and brace, draft-bars, means for attaching the appliance to the draft-animal, and forks swiveled to the rear ends of the draft-bars, said forks constructed and adapted for attachment to the axle of the vehicles to which the appliance is connected.

4. A collapsible draft appliance comprising draft-bars, folding cross-bar and brace, said parts pivotally connected together, shafts or thills pivotally connected with the cross-bar, rigid braces connecting the folding brace with the draft-bars and the cross-bar with the shafts or thills, and a singletree pivoted to the cross-bar by the same bolt which connects the sections of the cross-bar together.

5. The combination with a pair of collapsible vehicles, of a cross-bar made in sections capable of folding together, means connected therewith for the attachment of a draft-animal, clamps for connecting the cross-bar to the side bars of the vehicles, and means for connecting the rear ends of the vehicles together.

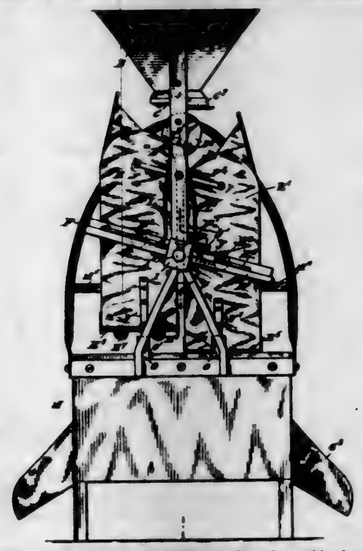
704,428. DEVICE FOR GRINDING TAPERS. WILLIAM Y. ALLEN, Newton, Mass. Filed Sept. 23, 1901. Serial No. 76,225. (No model.)



Claim.—1. A dental instrument for grinding tapers, comprising a shaft having at one end a head provided with a conical cavity which is axially concentric with said shaft and corresponds with the taper to be ground, the walls of said cavity being free from cutting devices and being made of rigid material of greater wear-resisting qualities than the material to be operated upon, substantially as described.

2. A dental instrument for grinding tapers, consisting of a head provided at one end with means whereby it may be rotated, and hollowed out in the form of a conical cavity, said cavity being formed to correspond with the taper to be ground and having its interior surface free from cutting devices, and said head being provided with a hole extending from its exterior to its interior, near the inner end of the latter, substantially as described.

704,429. AUTOMATIC WEIGHING-MACHINE. FRANK BAETA, Islip, N. Y. Filed Oct. 10, 1901. Serial No. 78,198. (No model.)



Claim.—1. In an automatic weighing-machine, the combination with a hopper, a scale-beam and suitable receptacles under the control of said scale-beam, of a shiftable stream-deflector, and connecting-rods between said beam and the stream-deflector, said connecting-rods located on opposite sides of the axis of movement of said deflector and the scale-beam and operable to shift the deflector immediately following the beginning of the descent of either loaded receptacle, whereby the deflector is at once shifted when the receptacle is fully loaded.

2. In an automatic weighing-machine, the combination with a hopper, a scale-beam and suitable receptacles under the control of said scale-beam, of a shiftable stream-deflector, and connecting-rods between said beam and the stream-deflector, said connecting-rods being movable endwise and in opposite directions simultaneously, one rod on the descent of one loaded receptacle acting to immediately shift the stream-deflector and the other rod serving to lock the stream-deflector in its changed position.

3. In an automatic weighing-machine, the combination with a hopper, a scale-beam and suitable receptacles under the control of said scale-beam, of a shiftable stream-deflector, and connecting-rods between said beam and the stream-deflector, said connecting-rods acting alternately on the stream-deflector and with a pushing movement and on opposite sides of the axis of adjustment of said stream-deflector.

4. In an automatic weighing-machine, the combination with a hopper, a scale-beam and suitable receptacles under the control of said scale-beam, of a shiftable stream-deflector, and connecting-rods between said beam and the stream-deflector, said connecting-rods being slidably fitted to the stream-deflector and having projections arranged to act against said deflector on the up-and-down movements of said rods, and means disposed in the path of the rod projections and operable to disengage the latter temporarily from operative connection with the shifter.

5. In an automatic weighing-machine, the combination with a scale-beam, of receptacles carried thereby, and having hinged drop-bottoms each provided with a closing device, a catch for normally locking the drop-bottom in a closed position, and a trip in the path of said catch, said trip having a slotted part disposed in the path of the catch and yieldable upwardly to allow the bottom to be closed immediately following the discharge of the load.

6. In an automatic weighing-machine, the combination with a scale-beam, and receptacles controllably thereby, of hinged bottoms to said receptacles, a catch for locking each bottom in a closed position, a trip disposed in the path of each catch, said trip being yieldable freely in one direction and allowing the bottom to be closed immediately following the discharge of the load from the receptacle, and means for closing the bottom while the receptacle is lowered and independently of the position or action of the companion receptacle.

7. A weighing-machine having a shifting and locking device for a stream-deflector, comprising rods mounted to move alternately up and down on opposite sides of the stream-deflector shaft, each of the rods having a lug below its upper end, and plates on the stream-deflector shaft projecting at opposite sides thereof and adapted to be engaged by the said rods and their lugs, as set forth.

8. A weighing-machine having a shifting and locking device for a stream-deflector, comprising rods mounted to move alternately up and down on opposite sides of the stream-deflector shaft, each of the rods having a lug below its upper end, and plates projecting from the stream-deflector shaft at opposite sides thereof, the said lugs being located above and below the axis of the stream-deflector shaft and the lower plate having slots for guiding the rods, as set forth.

9. A weighing-machine having a shifting and locking device for a stream-deflector, comprising rods mounted to move alternately up and down on opposite sides of the stream-deflector shaft, each of the rods having a lug below its upper end, and plates projecting from the stream-deflector shaft at opposite sides thereof, the said lugs being located above and below the axis of the stream-deflector shaft and the lower plate having slots for guiding the rods, the ends of the rods being adapted to engage the under side of the upper plate and the lugs on the said rods being adapted to rest on top of the lower plate, as set forth.

10. In an automatic weighing-machine, the combination with a movable load-receiver, and a drop-bottom therefor, of a catch for said bottom, and a trip disposed in the path of said bottom, said trip occupying a fixed relation to the downward movement of the catch and being yieldable freely to impingement of the catch on the upward movement of said load-receiver.

11. A weighing-machine having a receptacle and a drop-bottom therefor, hinged to the receptacle at one side, a locking-catch on the receptacle for engaging the free end of the drop-bottom, and a releasing device for the catch, to open the latter on the downward movement of the receptacle, said releasing device consisting of a trip having an inclined upper end formed with a slot, the lower end of the trip being held against movement in one direction, and a pin carried by the said catch and adapted to engage the said inclined end, to swing the catch out of engagement with the free end of the bottom, the pin being also adapted to pass through the end of the slot, as set forth.

12. A weighing-machine having a receptacle and a drop-bottom therefor hinged to the receptacle at one side, a locking-catch on the receptacle for engaging the free end of the drop-bottom, a releasing device for the catch to open the latter on the downward movement of the receptacle, a counterbalancing-weight for the drop-bottom, and a fixed spring-arm acting as a stop for the said drop-bottom, and also acting to start the bottom on its return or closing movement, as set forth.

13. A weighing-machine, having a hopper, and a valve on the discharge end of said hopper, said valve comprising two slidable plates mounted to move toward and from each other and across said discharge end, centrally-fulcrumed levers pivoted to said valve-plates and adapted to impart equal play thereto and to maintain said valve-plates in parallel relation, and an arm projecting from one of said valve-plates.

14. In an automatic weighing-machine, the combination with a frame, a hopper, and a stream-deflector, of a bell-shaped scale-beam fulcrumed on the frame and provided at its rear side with a right-angular extension, receptacles in said scale-beam in front of the extension thereof and pivoted to the beam, a link pivoted to the frame and to said receptacles to maintain the latter in parallel relation to each other, and a vertically-shiftable poise mounted in said extension of the bell-shaped scale-beam.

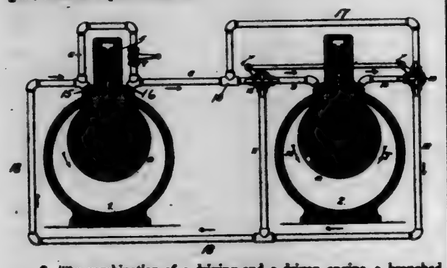
15. In an automatic weighing-scale, the combination of a bell-shaped scale-beam, provided at its rear side with a vertically-shiftable poise and having the longitudinal bars or rods F', F² receptacles pivoted within the scale-beam, a counterbalancing-poise adapted to be fixed on one bar or rod, a supplementary poise shiftable to variable positions on the other bar or rod, a hopper, and a shiftable stream-deflector.

704,430. SPEED REGULATING AND REVERSING DEVICE FOR POWER-TRANSMITTING MECHANISM. FRANK H. BATES, Philadelphia, Pa., assignor, by mesne assignments, to William Wolcomte Bates, Philadelphia, Pa. Filed Jan. 13, 1901. Serial No. 43,572. (No model.)

Claim.—1. The combination of a driving and a driven engine, a branched inlet and a branched exhaust pipe to each engine, a direct connection between a branch of the inlet and a branch of the exhaust pipes of the driving and also of the driven engine, a pipe connecting a branch of the inlet-pipe 15 of the driving-engine with a branch of the exhaust-pipe 10 of the driven engine, a pipe connecting a branch of the exhaust 16 of the driving-engine with a branch of the inlet 9 of the driven engine, and a pipe 11 connecting said two latter pipes, substantially as described.

2. The combination of a driving and a driven engine, a branched inlet and a branched exhaust pipe to each engine, a direct connection between a branch of the inlet and a branch of the exhaust pipes of the

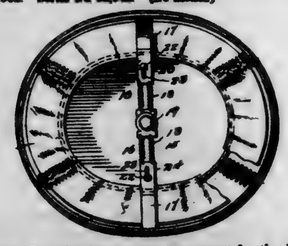
driving and also of the driven engine, a pipe connecting a branch of the inlet 15 of the driving-engine with a branch of the exhaust 10 of the driven engine, a pipe connecting a branch of the exhaust 16 of the driving-engine with a branch of the inlet 9 of the driven engine, and a pipe 11 connecting said two latter pipes, a valve in the inlet-pipe 9 of the driven engine having said pipe 11 connected to one of its openings, and a valve at the point of branching of the discharge-pipe of the driven engine, substantially as described.



2. The combination of a driving and a driven engine, a branched inlet and a branched exhaust pipe to each engine, a direct connection between a branch of the inlet and a branch of the exhaust pipes of the driving and also of the driven engine, a pipe connecting a branch of the inlet 15 of the driving-engine with a branch of the exhaust 10 of the driven engine, a pipe connecting a branch of the exhaust 16 of the driving-engine with a branch of the inlet 9 of the driven engine, and a pipe 11 connecting said two latter pipes, a valve in the inlet-pipe 9 of the driven engine having said pipe 11 connected to one of its openings, and a valve at the point of branching of the discharge-pipe of the driven engine, and means whereby said valves may be simultaneously operated, substantially as described.

4. The combination of a driving and a driven engine, a branched inlet and a branched exhaust pipe to each engine, a direct connection between a branch of the inlet and a branch of the exhaust pipes of the driving and also of the driven engine, a pipe connecting a branch of the inlet 15 of the driving-engine with a branch of the exhaust 10 of the driven engine, a pipe connecting a branch of the exhaust 16 of the driving-engine with a branch of the inlet 9 of the driven engine, and a pipe 11 connecting said two pipes, a valve in the inlet-pipe 9 of the driven engine and a second valve at the point of branching of the exhaust-pipe 10 of the driven engine, said first valve being constructed to permit the inlet 9 of the driven engine to communicate directly with its point of branching or with said pipe 11 as will and the second valve being constructed to connect the exhaust of the driven engine to either of its branches at will; substantially as described.

704,431. HAT-BOX. JOSEPH M. BEAN, Washington, D. C. Filed Feb. 7, 1902. Serial No. 93,942. (No model.)



Claim.—1. In a hat-box, a movable support for the brim of the hat, and a cushion-rest for the said support located beneath the same.

2. In a hat-box, a vertically-movable brim-rest consisting of a frame having a cushion-body, and a cushion-support for the said rest located beneath the same.

3. The combination with a hat-box, of a stay comprising elastic and inelastic sections and secured to the box so as to bear on the hat to hold it in the box.

4. A hat-box having an interior yieldingly-supported brim-rest, and a separate elastic fastening-stay having supplemental yielding holding means.

5. In a hat-box, the combination with the supporting means for the hat, of a supplemental holder for the hat comprising holding means engaging the brim portion.

6. In a hat-box, the combination with the supporting means for the hat, of a supplemental holder for the hat carried by the casing and comprising holding means engaging the brim portion.

7. In a hat-box, the outer case, a vertical yieldable brim-rest arranged within the case and cushion-supports for the said rest located beneath the same.

8. In a hat-box, the outer case, an interior brim-rest yieldably supported within the case, and guiding means for the brim-rest located beneath the same.

9. In a hat-box, the outer case, and a yieldable continuous brim-rest provided with swelled retaining-bosses for engagement with the riser portions of the hat-brim.

10. In a hat-box, the outer case, an interior yieldable brim-rest, a plurality of cushion-supports for the rest, and guiding means for the rest.

11. In a hat-box, the outer case, an interior holding-bracket, a yieldable brim-rest having a plurality of guiding-stems loosely engaging the bracket, and spring-cushions interposed between the bracket and the end side of the said brim-rest.

12. In a hat-box, the combination with the outer case, of a yieldable brim-rest, and a yieldable crown-receiver arranged within the case, said brim-rest and said crown-receiver having an operative connection.

13. In a hat-box, the outer case, a vertical yieldable brim-rest having cushion-supports, and a crown-receiver cushioned to yield in any direction.

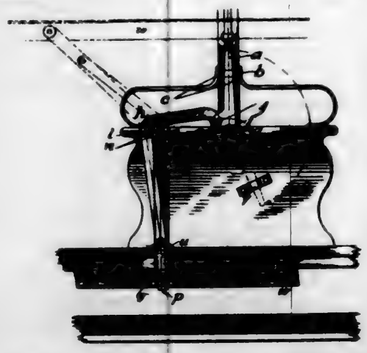
14. In a hat-box, the outer case, a crown-receiver arranged within the case and having a cushion-support at the bottom, cushion-braces interposed between the sides of the receiver and the sides of the case, and a vertical yieldable brim-rest yieldingly supported upon the crown-receiver.

15. In a hat-box, the combination with the interior supporting means for the hat, of a fastening-stay consisting of separate yielding members detachably connected and each provided with a supplemental holder for the hat.

16. In a hat-box, the combination with the interior supporting means for the hat, of a fastening-stay consisting of separate yielding members detachably connected and each provided with a yielding supplemental holder for the hat.

17. In a hat-box, the combination with the supporting means for the hat, of a fastening-stay consisting of separate yielding members detachably connected and each comprising a spring-section, an inelastic section and a holding device, said holding device being provided with an independently-yielding hat-engaging pin or member adapted to extend within and engage each portion of the hat-body.

704,432. GUARD-RAIL FOR STREET-CARS. WILLIAM S. BRADLEY, Philadelphia, Pa. Filed May 3, 1902. Serial No. 105,280. (No model.)



Claim.—1. A movable guard-rail for a car combined with supporting and adjusting mechanism arranged as described to swing the rail transversely to the car when in its lower position and longitudinally to the car when in its upper position.

2. A movable guard-rail for a car combined with operative mechanism and hung upon arms hinged upon an axis parallel with the longitudinal lines of the car and arranged to swing from a position extending inwardly beneath the car-body to a position extending outwardly from the car substantially as described.

3. A movable guard for a car consisting of a rail extending parallel with the car-body, a hinged arm supporting the same and having a rigidly-attached pinion, a vertically-adjustable rack engaging said pinion and operative mechanism for moving the rack up and down substantially as shown and described.

4. The combination in a car; of a longitudinal guard-rail arranged beside the car, arms for supporting and swinging the same transversely to the car, a lifting-link for operating said arms and also swinging the rail longitudinally and vertically, a connecting-bar connected to said link, and a hand-lever fulcrumed to the car and also to the connecting-bar, said connecting-bar having its end next to the hand-lever bent downwardly and adapted to pass over and below the fulcrum of the hand-lever to lock below the same substantially as described.

5. The combination in a car; of a longitudinal guard-rail arranged beside the same, arms for supporting and moving the guard-rail transversely to the car, a lifting-link for operating said arms and also swinging the rail longitudinally and vertically, a connecting-bar connecting at one end to the said link, a short crank also connected to the link at the same point and turning on a stationary axis, a hand-lever having a stationary axis and jointed to the connecting-bar, both ends of the said connecting-bar being bent down to lock substantially as described.

6. The combination in a car; of a longitudinal guard-rail arranged beside the same, arms for supporting and moving the guard-rail transversely to the car, a lifting-link for operating said arms and also swinging the rail longitudinally and vertically, a hanger-bar forming at its lower end a guide for the connection of the link and swinging arm, a connecting-bar connecting at one end to said link, a short crank also connected to the link at the same point and turning on a stationary axis, a hand-lever having a stationary axis and jointed to the connecting-bar, both ends of said connecting-bar being bent down to lock substantially as described.

7. The combination in a car; of a longitudinal guard-rail arranged beside the same, arms for supporting and moving the guard-rail transversely, one of said arms having a rigidly-connected pinion, a vertically-sliding rack meshing with such pinion, a hanger-bar having a guide at its lower end for the rack, a lifting-link connected to the rack, a connecting-bar jointed to the top of the link, a short crank also connected to the link at the same point and turning on a stationary axis, a hand-lever having a stationary axis and jointed to the connecting-bar, both ends of said connecting-bar being bent down to lock substantially as described.

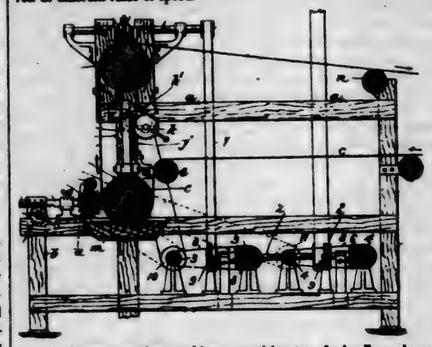
704,433. SASH-FASTENER. ADOLPH BRAUER, Seattle, Wash. Filed Feb. 14, 1902. Serial No. 94,072. (No model.)

Claim.—In a sash-fastener, the combination with a window-frame having a vertically-disposed corrugated strip thereon, of a sash having a dog mounted in the side stile and pivotally attached at its upper end, the lower extremity of the dog being enlarged to form a head and provided with corrugations to engage the said strip, a spring interposed between the lower extremity of the dog and an adjacent portion of the stile, a link attached to the lower extremity of the dog, a socket secured to the inner side of the stile and having an opening therein, and a shank projecting through the socket and connected to the inner end of the link, the outer extremity of the shank being in the form of a head.

704,434. PAPER-COATING MACHINE. JOSEPH CHEVALIER, Holyoke, and NAPOLÉON LABRIE and EDWARD LABRIE, Chicopee, Mass. Filed Jan. 21, 1902. Serial No. 91,295. (No model.)

Claim.—1. A paper-coating apparatus comprising two feed-rolls adapted to be partially encircled by the paper located in separated relation one above the other; a receptacle for liquid coating material within which a portion of the lower feed-roll is immersed, means for adjusting said lower feed-roll toward and from the upper roll, and means for rotating the latter at a higher rate of speed than the former; a roll having an adjustably-yielding contact with said lower roll, and means for rotating said upper feed-roll at a higher rate of speed than the lower roll.

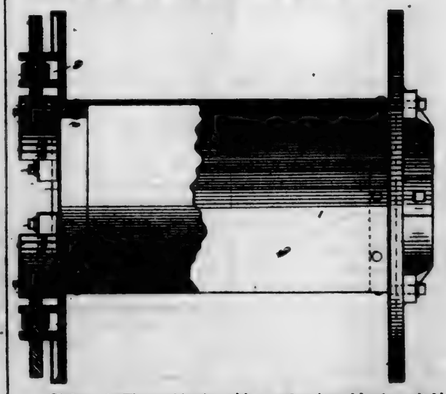
2. A paper-coating machine comprising two feed-rolls adapted to be partially encircled by the paper, a receptacle for the liquid coating material, one of said rolls being in contact with the latter, a roll having a yielding contact with the feed-roll running in the coating material, and adjustable relative thereto, means for rotating said feed-rolls at different rates of speed, and means for rotating said roll in contact with the feed-roll at different rates of speed.



3. A paper-coating machine comprising two feed-rolls, and means for rotating them at different rates of speed, composed of separate cone-pulleys for driving each of said feed-rolls, shiftable belts for said cone-pulleys whereby the feed-rolls may be rotated at different rates of speed, combined with a roll having a yielding contact with one of said feed-rolls, and means for adjusting said roll relative to said feed-roll.

4. A paper-coating machine comprising two feed-rolls adapted to be partially encircled by the paper located in separated relation one above the other; a receptacle for liquid coating material within which a portion of the lower feed-roll is immersed, means for adjusting said lower feed-roll toward and from the upper wiper-roll, and means for rotating the latter at a higher rate of speed than the former; a roll having an adjustably-yielding contact with said lower roll, means for rotating said wiper-roll at a higher rate of speed than the lower roll, a brush bearing on said upper feed-roll, and means for imparting reciprocating movements to said brush, and-wise.

704,435. SPOOL FOR SAND-REELS, &c. KEITON CRESKEBIRE, Oil City, Pa. Filed Jan. 6, 1902. Serial No. 88,912. (No model.)



Claim.—1. The combination with a sand-reel spool having suitable heads, one of said heads provided with a clamp-guide, of clamps movable on said guide to and from the axis of the spool, means for adjusting said clamps along said guide to and from the axis of the spool, and means for binding said clamps on the guide after adjustment thereon, substantially as and for the purpose specified.

2. The combination with a sand-reel spool having suitable heads, one of said heads provided with parallel clamp-guides oppositely disposed with relation to the axis of the spool, of oppositely-disposed adjustable clamps which travel on said parallel clamp-guides, and a screw for each of said clamps centrally disposed with relation to its clamp for adjusting said clamps on the guides to and from the axis of the spool, substantially as and for the purpose specified.

3. The combination with a sand-reel spool having suitable heads, one of said heads provided with parallel clamp-guides having scales marked thereon, of a plurality of clamps, and means for adjusting said clamps on the clamp-guides to and from the axis of the spool, substantially as and for the purposes specified.

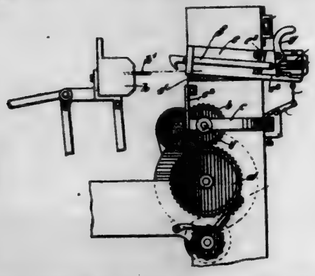
4. The combination with a sand-reel spool having suitable heads, one of said heads provided with parallel beveled clamp-guides, of a plurality of adjustable clamps having guideways which correspond with and engage said beveled clamp-guides said clamps slotted for the reception of set-screws, and set-screws for confining said clamps to said beveled guides after adjustment thereon, substantially as and for the purposes specified.

5. In a sand-reel spool, the combination with a suitable drum of a head having oppositely-disposed arc-shaped flanges, oppositely-disposed parallel clamp-guides connecting said arc-shaped flanges, adjustable clamps movable on said parallel clamp-guides, means for adjusting said clamps on said guides to and from the axis of the spool, and means for binding said clamps to the clamp-guides of the head after adjustment, substantially as and for the purposes specified.

6. In a sand-reel spool, the combination with the head thereof provided with oppositely-disposed flanges and oppositely-disposed parallel clamp-guides, said flanges and guides arranged around the axis of the spool, of oppositely-disposed clamps movable on said guides to and from the axis of the spool, adjusting-screws which pass through the concentric flanges, and nuts for said screws between said concentric flanges, substantially as and for the purposes specified.

7. In a sand-reel spool, the combination with the head thereof provided with oppositely-disposed concentric flanges, of parallel slotted clamp-guides arranged on opposite sides of the axis of the spool, clamps movable on said clamp-guides to and from the axis of the spool, screws for adjusting said clamps, nuts for said screws arranged between the concentric flanges, and set-screws which pass through the slots of the clamps and into the clamp-guides, substantially as and for the purposes specified.

704,486. MEANS FOR STOPPING LOOMS AT INTERVALS. GEORGE A. CLAFF, Paterson, N. J., assignor of two-fifths to John J. Powers, Paterson, N. J. Filed Dec. 3, 1901. Serial No. 84,508. (No model.)



Claim.—1. In a loom attachment, the combination with a part of the loom moving in a fixed path, of a device connected with the loom for throwing the loom out of gear, a carrier on which said device is mounted, and means operated periodically from the loom for moving said carrier.

2. In a loom attachment, the combination with a part of the loom moving in a fixed path and provided with an eye, of a hook mounted to slide and connected with the loom to throw it out of gear, the hook being adapted to be engaged by the said eye, means for normally holding the hook out of the path of the eye, and releasing means for the hook operated periodically from the loom, for the purpose specified.

3. In a loom attachment, the combination with a part of the loom, said part moving in a fixed path, of a hook connected with the loom to throw it out of gear, a carrier on which the hook is mounted to move into and out of the path of the said part of the loom, means for normally holding the carrier with the hook in inactive position, and trip devices for said means, the trip devices being operated periodically from the loom, for the purpose specified.

4. In a loom attachment, the combination with a part of the loom, said part moving in a fixed path, of a hook connected with the loom to throw it out of gear, the hook being adapted to be actuated by said part of the loom, means for normally holding the hook out of the path of the said part of the loom, and trip devices for said means, the trip devices being operated periodically from the loom, for the purpose specified.

5. In a loom attachment, the combination with a part of the loom, said part moving in a fixed path, of a carrier, a hook mounted thereon and connected with the loom to throw it out of gear, a stop normally engaged with the carrier to hold it with the hook out of the path of said part of the loom, and devices for releasing the dog to move the hook into the path of said part of the loom, the said devices being operated periodically from the lever.

6. In a loom attachment, the combination with the clock driven in time with the loom, of a cam attached to the clock, a lever actuated from the cam, a fulcrumed carrier connected with said lever, a device mounted on said carrier and connected with the loom to throw it out of gear, the said device being adapted to be moved into the path of a part of the loom and to be engaged thereby for the purpose specified.

7. In a loom attachment, the combination with a clock driven in time with the loom, of a cam on the clock, a lever actuated from the cam, a carrier, a hook mounted on the carrier and connected with the loom to throw it out of gear, the hook being adapted to be engaged by a part of the loom moving in a fixed path, a stop for holding the carrier with the hook normally out of the path of the said part of the loom, and a connection between the lever and the carrier, for the purpose specified.

8. In a loom attachment, the combination with the batten provided with an eye, of a hook connected with the loom to throw the same out of gear, a fulcrumed support on which the hook is mounted to slide, and means operated periodically for moving said support to carry the hook into the path of the eye, for the purpose specified.

9. In a loom attachment, the combination with the batten of the loom provided with an eye, a dial driven in time with the loom, and a stationary pointer for indicating on said dial, of a cam on the face of the dial, a lever actuated from the cam, a counterweighted fulcrumed carrier, a hook mounted to slide on the carrier, a cord passing over pulleys and connecting the hook with the shipper of the loom to throw the loom out of gear, the hook being adapted to be engaged by the eye on the batten a pivoted stop for holding the carrier with the hook normally out of the path of the eye of the batten, and a cord connecting the lever and the carrier, for the purpose specified.

10. In a loom attachment, the combination with a part of the loom moving in a fixed path, of a hook connected with the loom to throw it out of gear and mounted to move longitudinally and also to swing in a vertical plane, the said hook being adapted to be engaged and moved longitudinally in one direction by said part of the loom to throw the loom out of gear, a spring for holding the hook normally in the opposite direction, means for normally holding the hook raised and out of the path of said part of the loom, and a releasing device for said means operated periodically from the loom to permit the hook to swing into the path of said part of the loom, for the purpose specified.

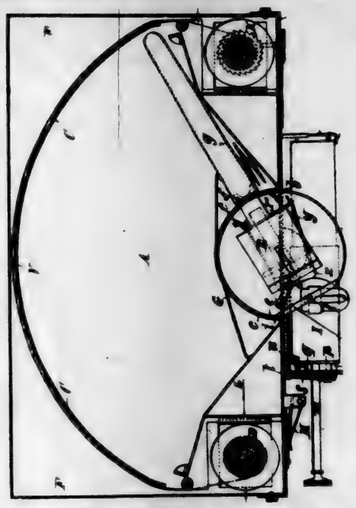
704,487. BELT FASTENER, CLASP, OR BUCKLE. MARIA COCHRAN, New York, N. Y. Filed June 6, 1901. Serial No. 63,366. (No model.)

Claim.—1. The combination of a belt having a suitable clasp or buckle, and a hook applied to the back of said clasp or buckle, said hook having a shank portion adapted and arranged to stand away from the back of the clasp or buckle and thereby adapted to lie beneath or back of the waistband of an outer garment, and the hook being formed with an upturned point adapted to engage the cloth of an undergarment, substantially as described.

2. The combination of a belt having a suitable clasp or buckle, and a hook applied as an attachment to the back of said clasp or buckle and adapted for holding the belt in place, said hook having a shank portion adapted to stand away from the back of the buckle or clasp and projecting downwardly beneath or back of the waistband of an outer garment, and the hook thus formed and applied being provided with an outwardly and upwardly projecting point adapted to engage the cloth of an undergarment, substantially as described.

3. A device adapted to be applied as an attachment to ladies' belts and adapted for holding the front of such belt down in place, consisting of a wire with its end portions bent back in opposite directions to form a reversely-bent hook, one of such hook portions being adapted for attachment to the back of a belt buckle or clasp, so as to have the shank portion of the hook stand away from the back of such buckle or clasp, and the lower upturned hook portion being provided with a hook-point for engaging the cloth of an undergarment, the said shank portion by standing away from the back of the buckle or clasp being adapted for insertion back of the waistband of an outer garment, substantially as described.

704,488. PANORAMIC HAND-CAMERA. NAPOLEON COMTE, Paris, France. Filed Dec. 5, 1900. Serial No. 39,234. (No model.)



Claim.—1. In a camera for photographing panoramic views, a rotatable drum, a lens mounted in said drum, a light-shaft movable with the drum and through which the lens is adapted to project rays of light onto a sensitized surface, a shutter mounted in and movable with the drum, motor mechanism for rotating the drum, a detent for holding the motor mechanism set and adapted to be operated to release the motor mechanism, and shutter-opening means operated simultaneously with the release of the motor mechanism.

2. In a camera for photographing panoramic views, a rotatable drum, a lens mounted in said drum, a light-shaft movable with the drum and through which the lens is adapted to project rays of light onto a sensitized surface, a shutter mounted in and movable with the drum, motor mechanism for rotating the drum, a detent for holding the motor mechanism set and adapted to be operated to release the motor mechanism, shutter-opening means operated simultaneously with the release of the motor mechanism, and means automatically closing the shutter at the proper time.

3. In a camera for photographing panoramic views, a rotatable drum, a lens mounted in said drum, a light-shaft movable with the drum and through which the lens is adapted to project rays of light onto a sensitized surface, a shutter mounted in and movable with the drum, motor mechanism for rotating the drum, a detent for holding the motor mechanism set and adapted to be operated to release the motor mechanism, shutter-opening means operated simultaneously with the release of the motor mechanism, means automatically closing the shutter at the proper time, a curved transparent-glass plate so mounted that the end of the light-shaft travels in proximity with its concave surface, a sensitized film stretched over the convex surface of the glass plate, and means for moving the film.

4. In a camera, the combination with a rotatable drum and a lens mounted therein for projecting rays of light onto a sensitized surface, of means for rotating said drum consisting of a fixed cylinder having a vent-opening at one end, a piston operating in conjunction with the cylinder and adapted when moved in one direction by the operator to draw air into the cylinder through the vent-opening, a spring placed under tension by the said movement of the piston and adapted to impart a reverse movement to the piston expelling the air from the cylinder through the vent-opening, and connections for imparting movement from the piston to the drum.

5. In a camera, the combination with a rotatable drum and a lens mounted therein for projecting rays of light onto a sensitized surface, of means for rotating said drum consisting of a fixed cylinder having a vent-opening at one end, a piston operating in conjunction with the cylinder and adapted when moved in one direction by the operator to draw air into the cylinder through the vent-opening, a spring placed under tension by the said movement of the piston and adapted to impart a reverse movement to the piston expelling the air from the cylinder through the vent-opening, a detent for holding the motor mechanism set and adapted to be operated to release the motor mechanism, shutter-opening means operated simultaneously with the release of the motor mechanism, and means automatically closing the shutter at the proper time.

6. In a camera, the combination with a rotatable drum, a lens mounted therein for projecting rays of light onto a sensitized surface, of means for rotating said drum consisting of a fixed cylinder having a vent-opening at one end, a piston operating in conjunction with the cylinder and adapted when moved in one direction by the operator to draw air into the cylinder through the vent-opening, a spring placed under tension by the said movement of the piston and adapted to impart a reverse movement to the piston expelling the air from the cylinder through the vent-opening, a detent for holding the piston against said reverse movement and the spring under tension but adapted to be manipulated by the operator to release the piston, and connections for imparting movement from the piston to the drum.

7. In a camera, the combination with a rotatable drum, a lens mounted therein for projecting rays of light onto a sensitized surface, and a shutter movable with the drum, of means for rotating said drum consisting of a fixed cylinder having a vent-opening at one end, a piston operating in conjunction with the cylinder and adapted when moved in one direction by the operator to draw air into the cylinder through the vent-opening, a spring placed under tension by the said movement of the piston and adapted to impart a reverse movement to the piston expelling the air from the cylinder through the vent-opening, a detent for holding the piston against said reverse movement and the spring under tension but adapted to be manipulated by the operator to release the piston, connections from the detent to the shutter whereby the latter is opened simultaneously with the release of the piston, and connections for imparting movement from the piston to the drum.

704,489. THERMAL PROTECTOR FOR ELECTRIC CIRCUITS. FRANK B. COOK, Chicago, Ill. Filed July 29, 1896. Serial No. 600,970. (No model.)

Claim.—1. A heat-coil protector consisting of an inclosing shell, interior insulating material, a heat-coil, a concave socket, a convex head fitted therein, fusible material between the face of the socket and the face of the head, and means for holding a spring contact-strip or contact-strips.

2. In a heat-coil-protective apparatus an inclosing shell of insulating material, a body of interior insulating material, a collar of conducting material secured to one end of the body of interior insulating material, a spring-contact connected to and held by said collar, another collar held at the other end to the inclosing shell, a spring-contact connected to and held by said latter collar, a concave socket and concave head fitted therein and fusible material between the face of the socket and the face of the head.

3. The combination with a heating-coil, of a small quantity of conducting material adapted to be fused by the heat of the coil, a switch-spring held under tension by said fusible conducting material, and an electric circuit including said heating-coil, fusible material and spring-switch in series, whereby the fusing of said fusible material permits the movement of said spring-switch to open the circuit; substantially as described.

4. The combination with a small resistance-coil, of a spool of good heat-conducting material upon which the coil is wound, a stem secured to said spool by easily-fusible solder, a spring adapted to move said stem out of contact with the spool when the solder is fused, and an electric circuit including said coil, spool, solder and stem in series; whereby the detachment of said stem from the spool effects the opening of the circuit.

5. The combination with a heat-coil, of a small quantity of conducting material adapted to be fused by the heat of the coil, a spring-switch held under tension by said fusible conducting material, and an electric circuit including said heat-coil, fusible material and spring-switch in series, together with an earth connection and a normally open circuit thereto whereby the spring-switch when released closes said normally open circuit.

6. A normally closed circuit comprising an instrument to be protected, a line, a heat-coil and a spring-switch, together with a normally open circuit to earth only, and means operated by the heat-coil whereby the spring-switch closes the normally open circuit and opens the normally closed circuit.

7. A normally closed circuit comprising an instrument to be protected, a line, a heat-coil, a spring-switch in series with the heat-coil, a normally open branch to earth, and means operated by the heat-coil to cause the spring-switch to open the normally closed circuit and close the normally open earth branch.

8. A spring or springs, a separable conductor, fusible material interposed between and holding the parts or sections of said conductor together, and a heat-concentrating member which, fusing the material, permits the spring to separate the conductor and open the circuit, said heat-concentrating member and springs being serially included in the circuit.

9. A normally closed circuit comprising an instrument to be protected, a line, a heat-concentrating member, and a spring-switch, together with a normally open circuit to earth only, and means operated by the heat-coil whereby the spring-switch closes the normally open circuit and opens the normally closed circuit.

10. The combination with a heat-concentrating device, of a small quantity of conducting material adapted to be fused by the said heat-concentrating device, a spring-switch held under tension by said fusible conducting material, and an electric circuit including said heat-concentrating device, fusible material, and spring-switch in series, with an earth connection and the normally open circuit thereto, whereby the spring-switch when released closes said normally open circuit.

11. In a heat-coil apparatus, a pair of springs, a removable member held by the said springs, the heads of said member engaged by said springs, an inclosing shell, an insulating-block within said inclosing shell, a heat-coil, a stem held within the insulating-block, a connector-face held on the stem, said insulating-block, stem and connector-face being held by one spring-head and another stem projected from the other head carrying a connector-face, said faces being normally held together by fusible material.

12. A device for automatically opening a circuit and establishing connection with the ground, comprising a suitable spring, a post insulated from and subject to the tension of said spring, a heat-concentrating member and fusible material arranged between said spring and said post, the fusible material being adapted and arranged to be fused by the said heat-concentrating member and to hold the said spring under tension, a circuit including said spring, post and heat-concentrating member in series, an insulated stop limiting the movement of said spring when released by the fusing of said material, and a grounded conductor connected with said stop, whereby the said spring when released opens said circuit and establishes connection with the ground.

13. A conductor made in sections and formed with a headed end portion, a flat spring having a notched end adapted to removably engage said headed end portion, a member removably engaging the other end of said conductor and subject to the tension of said spring, said member and spring being insulated from each other, a connection holding the sections of the conductor together, and a heat-concentrating member arranged to cause said connection to weaken and break, so as to allow said spring to pull the conductor-sections apart.

14. A conductor made in sections and having its opposite ends formed with reduced headed portions, a connection holding the sections together, flat supports insulated from each other and having their ends notched to receive said reduced headed portions, one of said supports being flexed or sprung so as to pull on the said connection, and a heat-concentrating member arranged to cause said connection to weaken and break, so as to allow the flexed support to pull the conductor-sections apart.

15. The combination of two conductor parts extending one within the other, a connection holding the two parts together, a heat-coil on one of said parts, said heat-coil being adapted to cause said connection to weaken and break, a support removably engaging the outer end of one of said parts, and a spring removably engaging the outer end of the other part, the said support, heat-coil and spring being serially included in a circuit, and the said support and connection being normally subject to the tension of said spring, whereby the two parts extending one within the other are moved apart or separated upon the weakening or breaking of said connection.

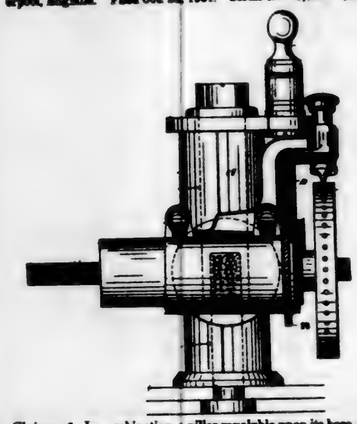
16. The combination of a separable conductor, a connection holding the sections of the conductor together, a heat-concentrating member arranged to cause the said connection to weaken and break, a tubular shell inclosing the heat-concentrating member, a support removably engaging one end of the separable conductor, and a spring removably engaging the other end of the same and exerting spring tension upon said connection, the said spring and support being insulated from each other, and the said support being also subject to the tension of said spring.

17. A thermal cut-off comprising a stem and wire, connected by solder, in a coil of wire, between two posts, one of which is a spring pulling upon the solder, away from the other, all in the circuit.

18. The combination of a suitable support, a flat spring insulated from said support, a conductor made in sections and adapted to be inserted between said support and spring, solder uniting the sections of said conductor, a heat-coil associated with said solder, an electric circuit including said support, solder, heat-coil and spring in series, and a stop adapted to limit the movement of said spring and to be connected with a grounded conductor, the said solder and support being normally subject to the tension of said spring, and the said spring when released by the fusing of the solder operating to establish connection between the circuit and the grounded conductor.

19. The combination of two metal parts extending one within the other, solder uniting said parts, a heat-coil wrapped around one part adjacent to the solder, a support and a spring insulated from each other, the said support and solder being normally subject to the tension of said spring, an electric circuit including said spring, heat-coil, solder and support in series, the said spring causing the two metal parts to move relatively when the solder is melted by the heat-coil, a grounded conductor, and means whereby the said spring when released operates to establish connection between the said circuit and the said grounded conductor.

704,440. LATHE AUXILIARY APPLIANCE. SAMUEL H. CROKER, Liverpool, England, assignor of one-half to John William Barnes, Liverpool, England. Filed Oct. 26, 1901. Serial No. 79,972. (No model.)



Claim.—1. In combination, a pillar revolubly upon its base, a screwed rod parallel with and journaled in the cap of said pillar, a bracket bored to receive the pillar and screwed rod and threading with the latter whereby it may be adjusted vertically on the pillar, a face on said bracket and a bevel-groove therein receiving a beveled button on a quill-holder, a quill within said holder, means for adjusting and for locking such parts, a mandrel journaled in the quill, and means for rotating the mandrel, forming a lathe-tool or work holder, as described.

2. In combination, a pillar and a keyway therein, a bracket capable of vertical movement on said pillar and keyway, a screwed spindle journaled on the pillar and threading a nut on the bracket, by which the latter is moved, a knife-edge, and a scale on the pillar proportionate to the thread on the spindle, means for indicating partial revolutions of the spindle, whereby the bracket movement is graduated, a quill-holder revolubly on said bracket and containing a quill, and a rotating mandrel journaled axially in said quill, forming a lathe-tool or work holder, as described.

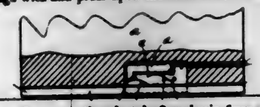
3. In combination, a revolvable pillar supporting an axially-adjustable bracket, a face on said bracket parallel with the axis of the pillar, a bevel-groove in said face with a semicircular finish, receiving a beveled button on a quill-holder, a follower in said groove completing a socket for said button, a stud for tightening the follower on the button whereby the quill-holder is revolubly on and may be locked to said bracket, a quill in said holder and a rotating mandrel in the quill, forming a lathe-tool or work holder, as described.

4. In combination, a quill-holder revolubly on a bracket adjustably supported on a revolvable pillar, a quill held rigidly therein, and a mandrel journaled in the quill with projecting extremities carrying an implement and an index-wheel respectively, and a detent carried by a bracket on said quill-holder, said detent controlling the rotation of the mandrel and implement by engaging the index-wheel, forming a lathe-tool or work holder, as described.

5. In combination, a quill-holder revolubly on a bracket adjustably supported on a revolvable pillar, a quill in said holder and a mandrel in said quill, an index-wheel on the mandrel engaged by a detent carried by a bracket, a beveled slot in said holder receiving the said detent-bracket and a lock-nut on said quill-holder for retaining said bracket in its socket, forming a lathe-tool or work holder, as described.

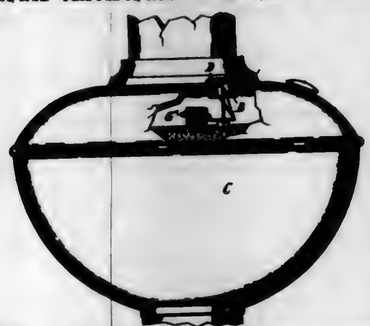
704,441. MEANS FOR PREVENTING DUST, DRAFT, AND RAIN FROM ENTERING UNDER DOORS. JOHN CROWTHER, Invercargill, New Zealand. Filed Jan. 15, 1902. Serial No. 89,888. (No model.)

Claim.—1. A drop-board or shutter extending across the width of the door and fitting within a groove in the bottom edge thereof, a lever pivoted above it which is connected therewith, a rod or shaft extending internally through the door and projecting beyond the edge thereof and connected with the lever, in combination with a small two-armed lever pivoted within the hinge-jamb of the doorway and so adjusted with regard to the door that when the same is closed the projecting end of the rod or shaft shall engage with one arm of the lever, while the edge of the door shall engage with and press upon the other arm, as herein specified.



2. In means for preventing dust draft and rain from entering under doors, a drop-board or shutter extending across the width of the door and fitting within a groove in the bottom edge of the door and extending across the width thereof, a drop-board or shutter fitting within the groove, a frame secured within the groove, a two-armed lever pivoted to the frame, above the drop-board, a bow-spring secured to the top edge of the drop-board by means of pins passed through slots therein, a connecting-piece connecting one arm of the lever with the center of the bow-spring, and means whereby the lever may be depressed and raised, as the door is closed and opened, as herein specified.

704,442. FILLING-INDICATOR. LOUIS F. DOELLINGER, Davenport, Iowa. Filed Feb. 14, 1902. Serial No. 94,068. (No model.)



Claim.—1. The improvement in indicating devices substantially as herein described, consisting of the supporting-tube provided in its inner side with the longitudinal grooves and with the sockets leading outwardly therefrom, the cap on said tube and having a sight-opening, the carrier having a lower cross-bar, side bars or arms, and studs or stems extending laterally from said arms, and fitted to the supporting-tube with the stems or studs in the sockets and the side bars lying in the longitudinal grooves of such tube, and the indicator having a main plate, ears thereon pivoting on the cross-bar of the carrier, a float-supporting arm, and an arm extending upwardly between the side bars of the carrier and provided at its upper end with a head operating within the supporting-tube, substantially as and for the purposes set forth.

2. In an indicator substantially as described, the combination with the supporting-tube having the internal longitudinal grooves, sockets leading outwardly therefrom, the carrier having a cross-bar and side bars or arms lying within said longitudinal grooves, and studs or stems projecting into the sockets, and the rocking indicator proper pivoted upon the cross-bar of the carrier, substantially as set forth.

3. An indicator substantially as described, comprising the carrier having a cross-bar and opposite spring side bars, and the indicator proper having a lever composed of a main plate, ears thereon pivoted on the cross-bar of the carrier, and float supporting and indicating arms, substantially as set forth.

4. The combination with the supporting-tube having internal longitudinal grooves, and sockets leading therefrom, of the carrier having the spring side bars to fit in said grooves and the studs or stems to fit in the sockets, and the rocking indicator proper supported by said carrier, substantially as set forth.

5. The combination of the supporting-tube, the carrier having the opposite side bars engaged at their upper ends with said tube, and the indicator proper pivoted to said carrier and having an indicating-arm operating between the side bars of the carrier and a float-supporting arm, substantially as set forth.

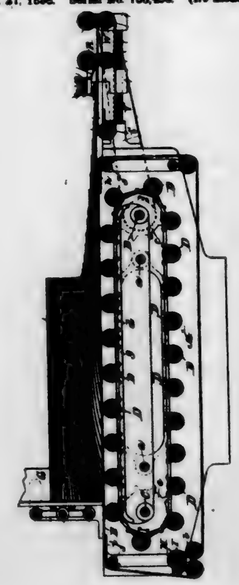
6. An indicating device substantially as described, consisting of the support, the carrier comprising a lower cross-bar and arms for connection with the support and the indicator having the indicating devices and the ears provided with bearings for the cross-bar of the carrier and fitted to said bearings to facilitate the connection of the said parts, substantially as set forth.

704,448. COMBINED CRIB AND TABLE. HARRY S. DORAN, Brooklyn, N. Y. Filed Dec. 10, 1901. Serial No. 85,316. (No model.)

Claim.—1. In a combined crib and table, a supporting-frame, supporting-pins extending in direction of each other from the supporting-frame, the said pins being oblong in cross-section, having two flattened opposing faces and two opposing circular faces, and a box-body having keyhole-slots in opposite sections adapted to receive the said supporting-pins, as and for the purpose set forth.

2. In a combined crib and table, the combination with a supporting-frame provided with uprights, and supporting-pins horizontally extending in direction of each other from the said uprights, the said supporting-pins being oblong in cross-section, having opposing flat faces and opposing cylindrical faces, of a body-section comprising a bottom board and end boards, and side rails fixed to the bottom board and end boards, the said end boards being provided with centrally-located transverse keyhole-slots, the enlarged portions of which slots are near the upper edges of the end boards, auxiliary rails having hinged connection with the fixed rails of the box-body, the said auxiliary rails being adapted to stand vertically on the fixed rails or to fold inwardly therefrom over the bottom of the box-body, and fastening devices for the hinged or auxiliary rails, substantially as shown and described.

704,444. PAPER-FEEDER. EDWARD DURKEE, Newton, Mass. Filed Dec. 27, 1898. Serial No. 700,436. (No model.)



Claim.—1. In a sheet-feeder and in combination with devices for fanning out the sheets from a pile, said devices acting on the surface of the pile, an apron between said devices and surface, and means for preventing and permitting a forward movement of said apron to determine the rapidity of said fanning out and the extent of offset of the sheets, substantially as set forth.

2. In a sheet-feeder the combination with rollers acting on the surface of a pile of sheets maintained in position opposite said rollers, and devices for operating said rollers, an apron between said rollers and surface, and means for preventing and permitting a forward movement of said apron to regulate said fanning out and the offset of the sheets, substantially as set forth.

3. In a sheet-feeder in which the sheets are fanned out by action of devices on the surface of a pile of sheets, the combination of several bands between said devices and surface, and means for preventing and permitting a forward movement of one of said bands independently of another of said bands, substantially as set forth.

4. In a sheet-feeder in which the sheets are fanned out by action of rollers on a pile of sheets maintained in position opposite said rollers, the combination of several bands between said rollers and surface, and means for preventing and permitting a forward movement of one of said bands independently of another of said bands, substantially as set forth.

5. In a sheet-feeder in which the sheets are fanned out by action of devices on the surface of a pile of sheets maintained in position opposite said devices, the combination of several endless bands, a part of each band being between said devices and surface, means for guiding and restraining the movement of one of said bands, means for guiding and restraining another of said bands, and devices operated by the forward edge of said fanned-out sheets for controlling said means independently of each other, substantially as set forth.

6. In a sheet-feeder in which the sheets are fanned out by action of rollers on the surface of a pile of sheets maintained in position opposite said rollers, the combination of several endless bands, a part of each band being between said rollers and said surface, two independent shafts on each of which is a roll having a frictional grip on one of said bands, a ratchet-wheel on each of said shafts, a pawl for each of said wheels, means for reciprocating said pawls, and a latch to prevent action of each of said pawls on the corresponding ratchet-wheel, and a device operated by the front edge of the fanned-out sheets for controlling said latch, substantially as set forth.

7. In combination with mechanism for fanning out sheets from a pile of sheets by action of devices on the surface of the pile, two endless bands, a part of each band being between said devices and pile to have a forward movement, and means operated by electricity for controlling the movement of said bands, substantially as set forth.

8. In combination with mechanism for fanning out sheets from a pile of sheets by action of rollers opposite the surface of the pile, two endless bands, a part of each band being between said rollers and pile and to have a forward movement by action of said rollers thereon, and means for gaging said forward movement controlled by electricity and the edge of the fanned-out sheets, substantially as set forth.

9. In combination with mechanism for fanning out sheets from a pile of sheets embodying rollers acting on the surface of the pile, two endless bands, a part of each band being between said rollers and pile to have a forward movement by action of said rollers thereon, two rolls to revolve independently of each other, each roll having a frictional grip on one of said bands, a ratchet-wheel connected with each of said rolls to revolve therewith, a lever bearing a pawl for each of said wheels, means for swinging said levers, and a latch operated electrically and controlled by means of the edge of said sheets to engage with each of said levers, substantially as set forth.

10. In combination with an endless band in part between the surface of a pile of sheets and devices opposite said surface to act on said pile and band, means for gripping said band and preventing the movement thereof, an electromagnet for releasing said means and permit movement of said band and a contact-breaker in position to be operated by said sheets moved by said devices and in circuit with said magnet, substantially as set forth.

11. In combination with two endless bands and means for causing movement of sheets from a pile and movement of said bands which are in part on the surface of said pile acted on by said means, a device for gripping each of said bands independently of the other band, mechanism embodying an electromagnet for releasing each of said devices and thus permitting motion of the corresponding band, an electric circuit for each magnet, and a contact-breaker in each circuit in position to be operated by said sheets moved by said means, substantially as set forth.

12. The combination with means for fanning out sheets from a pile, an endless band in part on the surface of said pile operated on by said means, and a device for gripping the edge of the outermost sheet and drawing out this sheet, of an electric circuit, a contact-breaker and electromagnet in said circuit, said breaker being in near position to said device and to be operated by said sheet, and mechanism controlled by said magnet for permitting and restraining the movement of said band, substantially as set forth.

13. In combination with mechanism for fanning out sheets from a pile, two electric circuits, an electromagnet and contact-breaker in each circuit, and a device governing the movement of said sheets controlled by said magnets, said contact-breakers being one at the rear of the other in the path of the fanned-out sheets, substantially as set forth.

14. In combination with mechanism for fanning out sheets from a pile, two electric circuits, an electromagnet in each circuit, an adjustable contact-breaker in each circuit, one of said breakers being at the rear of the other in the path of said sheets, and a device governing the movement of said sheets controlled by said magnets, substantially as set forth.

15. In combination with mechanism for fanning out sheets from a pile, embodying two bands which intervene between the fanning-out devices and said pile, two devices, each governing the movement of each of said bands independently of the other, two electromagnets controlling each of said devices, an electric circuit for each of said magnets, and contact-breakers for each of said circuits in the path of said sheets, substantially as set forth.

16. The combination of mechanism for fanning out sheets from the bottom of a pile, embodying rollers forming a support for the pile, devices causing a forward movement of that part of the sheets at either side of the pile independently of the forward movement of that part of the same sheets at the other side of the pile, and means for governing the action of said devices controlled by the front edges of the sheets, substantially as set forth.

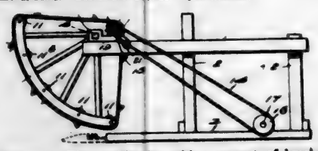
17. In combination with devices acting on the surface of a pile of sheets to move the sheets forward, two endless bands intervening (as to a part of each) between said devices and the pile, mechanism for gripping said bands and for preventing or permitting the forward movement of one of said bands independently of the other band, means operated by the front edges of the sheets for controlling the action of said mechanism, and adjustable rolls located as required to seize and carry each sheet moved forward the necessary distance by said devices, substantially as set forth.

18. A paper-feeder embodying mechanism for moving forward the sheets of a pile individually one on another, a table or support over which the sheets pass, two rolls which receive each sheet therebetween, located transversely with reference to said table and adjustable lengthwise of said table, and means operated by the front edges of the sheets for controlling the action of said mechanism, connected with the supports of said rolls to be adjusted therewith in combination with a folding or other machine to be fed, and devices for moving one of said rolls out of contact with the other roll, substantially as set forth.

19. In a paper-feeder and in combination with mechanism for moving forward the sheets of a pile one on another, a device governing the movement of said sheet embodying a ratchet-wheel, a pivoted lever bearing a pawl to engage with said wheel, means for swinging said lever in the direction for the pawl to engage with said wheel, a stop to permit or prevent a reverse motion of the lever and pawl, another stop adjustable to gage the further return of the lever and pawl, and means controlling the action of said stops operated by the sheets as they move forward, substantially as set forth.

20. In mechanism for controlling the movement forward of sheets from a pile of sheets the combination of a ratchet-wheel and pawl therefor, means for carrying said pawl to and fro in a suitable path with reference to said wheel, a latch to prevent the return motion of said pawl as required, an adjustable latch to prevent the further return of said pawl if required, and an adjustable stop to limit the return movement of said pawl, two electric circuits, an electromagnet in each circuit in position to operate one of said latches, and a contact-breaker in each of said circuits and in the path of said sheets, substantially as set forth.

704,445. ENDLESS-CHAIN REEL. JAMES M. DUNAGAN, Hood River, Oreg., assignor of one-half to Robert J. Glen, Mora, Oreg. Filed June 3, 1901. Serial No. 63,746. (No model.)



Claim.—1. The combination with a support, of brackets pivotally secured to the support, a quadrantal frame rigidly secured to the brackets, a drive-shaft journaled on said brackets, sprocket-chains mounted upon the shaft and frame, acute-angular projections secured to the links of the chains, and slats seated upon the projections whereby they are secured at an acute angle with relation to the chains, and adapted to pass edgewise between the standing stalks of grain.

2. In a reel for harvesters, the combination with a supporting-frame, of a shaft secured to said frame, quadrantal frame members secured to said shaft, sprocket-wheels or pulleys on the curved guide-pieces of the frame members, a drive-shaft carrying coöperating pulleys, and mounted in rear of and above said first-mentioned shaft, belts or sprocket-chains passed around said pulleys or sprocket-wheels, and slats connected to the belts.

3. In a reel for harvesters, the combination with a supporting-frame; of brackets having their rear ends downwardly curved and provided with perforations by means of which said brackets are pivotally secured to said supporting-frame, sockets upon the forward ends of said brackets, bearings upon said brackets in rear of and elevated above said sockets, a bar or shaft rigidly mounted in said sockets, a series of radial arms projecting from said bar or shaft, a curved guide-bar carried by each series of arms and forming therewith a quadrantal frame, said guide-bars being provided with sprockets, a drive-shaft journaled in said bearings, sprockets mounted on said drive-shaft to coöperate with the first-mentioned sprockets, sprocket-chains passed around the sprockets on the guide-bars and drive-shaft, and slats set at an acute angle on said chains.

4. The combination with a supporting-frame; of brackets pivotally secured to said supporting-frame, sockets upon the forward ends of said brackets, bearings upon said brackets in the rear of and elevated above said sockets, a bar or shaft rigidly mounted in said sockets, a frame carried by said bar or shaft, sprockets upon said frame, a drive-shaft journaled in said bearings, sprockets mounted on said drive-shaft to coöperate with the first-mentioned sprocket, sprocket-chains carried by the sprockets, and slats set at an acute angle on said chains.

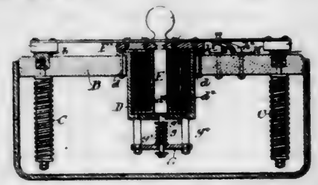
704,446. WATCH-DIAL ILLUMINATOR. FREDERICK M. DURKEE, Newton, Mass., assignor of one-half to Ulric Blatter, Jamaica Plain Boston, Mass. Filed Sept. 26, 1901. Serial No. 76,652. (No model.)

Claim.—1. A watch-dial illuminator comprising a casing having an open back, the top and bottom of the casing having flexible conducting-clips adapted to contact with the top and bottom of a battery-cell inserted through the said open back, said casing having means for engagement with a supporting device, and having a watch-holder at its front, a bracket projecting outwardly beyond the watch-holder, an incandescent lamp engaged with the outer portion of the bracket and electrically connected with said clips, and a circuit-closer connected with the said clips.

2. A watch-dial illuminator comprising a casing having an open back, the top and bottom of the casing having flexible conducting-clips adapted to contact with the top and bottom of a battery-cell inserted through the said open back, said casing having a perforated ear at its upper end and having a watch-holder at its front, a bracket projecting outwardly beyond the watch-holder, an incandescent lamp engaged with the outer portion of the bracket and electrically connected with said clips, and a flexible cable composed of wires connected with the clips and provided with a circuit-closer at its free end.

704,447. PROTECTIVE OPERATING DEVICE FOR ELECTRIC MOTORS. ARTHUR C. EASTWOOD, Cleveland, Ohio, assignor to the Electric Controller & Supply Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 16, 1901. Serial No. 82,539. (No model.)

Claim.—1. The combination with an operating device for electrical apparatus, said device having contact-plates, of a contact-arm for said plates, means acting upon said arm to return it to its off position when it is moved therefrom, and means for holding said arm at a level such that it will contact with said plates, with means operative upon said arm at its center of rotation for moving the arm away from said level whereby it is allowed to return to its off position without engaging the contact-plates, substantially as described.



2. The combination with an operating device for electrical apparatus, said device having contact-plates, of a contact-arm for said plates, means for acting upon said arm to return it to its off position when it is moved therefrom, and a magnet for holding said arm at a level such that it will contact with said plates as long as the magnet is energized, with means for moving the arm away from said level when the magnet is deënergized, whereby said arm is allowed to return to its off position without engaging the contact-plates, substantially as described.

3. An operating device for electrical apparatus, said device having contact-plates connected to resistances, a rotatable arm having electrical mechanism for holding it in engagement with the plates when the controller is operated, means for moving the arm at right angles to the plane of its rotation away from the level of said plates, and means for returning the arm to its off position when it has been so moved away from said level, substantially as described.

4. An operating device for electrical apparatus, the same having contact-plates connected to resistances, a movable arm operative in connection with the plates for throwing more or less of said resistance into circuit, means operated by an electric current for retaining the arm in working relation with the contact-plates, and means for moving the arm away from the level of the plates when the said arm-retaining means are out of action, and means for returning the arm to its off position when it has been so moved away from said level, substantially as described.

5. An operating device for electrical apparatus, said device having contact-plates connected to resistances, a rotatable arm having a magnet for holding it in engagement with the plates when the controller is operated, means for moving the arm at right angles to the plane of its rotation away from the level of said plates when the magnet is deënergized, and means for returning the arm to its off position when it has been so moved away from said level, substantially as described.

6. An operating device for electrical apparatus, said device having contact-plates connected to resistances, a rotatable arm having a magnet for holding it in engagement with the plates when the controller is operated, means for moving the arm at right angles to the plane of its rotation away from the level of said plates when the magnet is deënergized, means for returning the arm to its off position when it has been so moved away from said level, and means for preventing movement of the arm from its full-on position as long as said magnet is energized, substantially as described.

7. An operating device for electrical apparatus, said device having contact-plates connected to resistances, a contact-arm for said plates rotatably carried by the controller, a spring acting to retain said arm in its off-position, a magnet having an armature fixed to the arm, a second spring acting to move the armature away from the magnet and a stop for retaining the arm in its full-on position against the action of the first spring, substantially as described.

8. An operating device for electrical apparatus, said device having contact-plates and a contact-arm, said controller being provided with means for retaining the arm in contact with the plates as long as current flows normally through the supply-mains, said controller also having means for moving the arm away from the contact-plates and returning it to the off position without engagement with said plates upon the cessation of the flow of current, substantially as described.

9. An operating device for electrical apparatus, said device having plates electrically connected to resistances and an arm, carried on a rotatable bar, for contacting with the plates, means for returning the arm to its off position when it has been moved therefrom, means for moving the bar longitudinally and thereby moving the said arm away from the said plates, with a magnet electrically connected so as to be energized when current flows in the supply-mains, said magnet holding the arm at a level

to contact with the plates, against the action of the means for moving said bar longitudinally, substantially as described.

10. The combination of an operating device for electrical apparatus, said device carrying a magnet, a movable core to said magnet having fixed to it a rotatable contact-arm, contact-plates on the controller connected to resistances and placed to be engaged by said arm, a spring acting on said core to force it away from the magnet, said spring holding the contact-arm away from the level of the contact-plates when the magnet is deënergized, a spring acting on the arm to return the same to its off position and a stop on the controller engaging the contact-arm when it is in a full-on position and preventing its rotation as long as the magnet is energized, substantially as described.

11. In an operating device for electrical apparatus, a magnet having a core movable into and out of said magnet and rotatable within the magnet, an armature fixed to said core and carrying a contact-arm, contact-plates therefor placed to be engaged by the arm when the armature is magnetically held to the magnet, a spring-controlled stop on the device holding the arm in its full-on position, with means for moving the armature so that the arm is free to pass over the stop, and means for returning said arm to its off position, substantially as described.

12. In a device of the character described, a magnet-frame held to the insulating-plate of the controller, a magnet and an armature therefor, a rotatable core for the magnet fixed to the armature, a bar projecting from said core, a yoke carried by the magnet-frame, a spring on said bar tending to force the core and armature away from the magnet, and a contact-arm fixed to the armature, said arm being at a level to engage the contact-plates of the device when the magnet is energized, and being held away from the same when the magnet is deënergized, substantially as described.

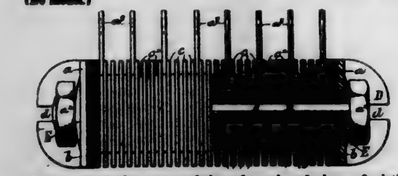
13. In a protective operating device for electric motors, the combination of a controller having a number of contact-plates connected to resistances and a contact-arm whereby said resistances are successively cut out of circuit with the armature of the motor, a magnet in series with the field of the motor, with means whereby the magnet holds said arm in engagement with the contact-plates so long as the field of the motor is energized, and means for moving said arm off of the contacts and then returning it to its off position upon the failure of the current, substantially as described.

14. In a current-controlling device for electrical apparatus, the combination of contact-plates connected to resistances, a contact-arm for said plates provided with means for holding it in engagement with certain of the plates when the device is in operation, together with means for automatically moving said arm away from the level of said contact-plates upon the cessation of the flow of current in the device, substantially as described.

15. In a protective operating device for electrical apparatus, the combination of contact-plates, a contact-arm for the same, a magnet for holding said arm in engagement with said contacts as long as the device is in operation and mechanism for moving said arm away from the level of the plates upon the cessation of the flow of current through the device, substantially as described.

16. A protective operating device for electrical apparatus, having contact-plates connected to resistances, a contact-arm for the plates, a magnet connected in series with the circuit through said device and operative upon said arm when current flows through the device to hold the same in engagement with the contact-plates, together with means for moving the arm away from the plane of the contact-plates upon the cessation of the flow of current through the device, substantially as described.

704,448. RHEOSTAT. ARTHUR C. HASTWOOD, Cleveland, Ohio, assignor to the Electric Controller and Supply Company, Cleveland, Ohio, a Corporation of Ohio. Filed Apr. 10, 1902. Serial No. 102,234. (No model.)



Claim.—1. A rheostat consisting of a series of plates of relatively high electrical conductivity having coatings of relatively low conductivity, with means yieldingly holding said plates in contact with one another, said plates being connected to each other through said coatings, substantially as described.

2. A rheostat consisting of a series of plates of relatively high electrical conductivity having coatings of relatively low conductivity, certain of said plates extending beyond the edges of others and thereby providing heat-radiating surfaces, with means yieldingly holding said plates in contact with one another, substantially as described.

3. A rheostat consisting of a series of plates of relatively high electrical conductivity having coatings of relatively low conductivity, said plates having openings through them and having certain of their number extending beyond the others, a supporting member extending through said openings having means for yieldingly retaining the plates in contact with one another, substantially as described.

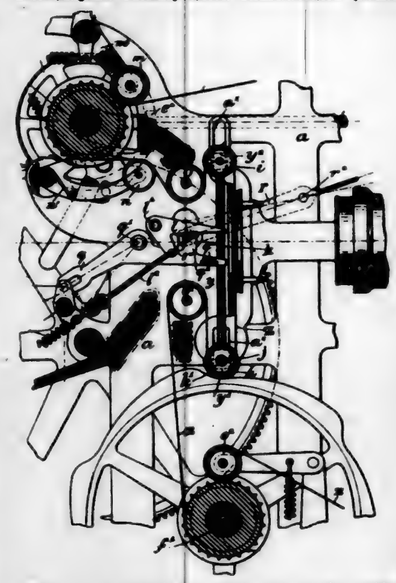
4. In a rheostat, the combination of metal plates having their surfaces coated with a material of relatively low electrical conductivity, bodies of metal between said plates of relatively large mass, said bodies having portions thinner than the remainder thereof extended beyond said plates, thereby providing heat-radiating surfaces, the plates and said bodies of metal being electrically connected through the said coatings, substantially as described.

5. A rheostat consisting of a series of metallic plates, said plates having upon their surfaces a coating of a material of relatively low conductivity, and being electrically connected through said coatings, said plates having a relatively large body portion adjacent to their contact-surfaces and having portions extending beyond said surfaces of less thickness than said body portions, with plates of uniform thickness alternating with said other plates, substantially as described.

6. A rheostat consisting of a series of plates having openings through them, a supporting member extending through said openings, certain of said plates extending beyond the edges of others and certain of the openings through the plates being of a size different from those through the others, substantially as described.

7. The combination in a rheostat of a series of metal plates of relatively great thickness at certain points, plates of substantially uniform thickness alternating with said other plates, said plates of uniform thickness having a coating of relatively low electrical conductivity upon their surfaces, with means for retaining said plates in contact with one another, substantially as described.

704,449. PROJECTING APPARATUS. ROLAND H. EDWARDS, London, England. Filed May 16, 1898. Serial No. 680,851. (No model.)



Claim.—1. In animated-photograph apparatus, the combination with the film-advancing rollers, and fixed guide-rollers over which a looped portion of the film passes across the axis of a lens; of a vibrating frame, and an idle roller mounted on each end of said frame, said frame and rollers being situated within the looped portion of the film, means for continuously winding and unwinding the film, means for vibrating said frame alternately in a direction with, and in a direction the reverse of the movement of the film, the movement of the said frame with the film carrying said film at an accelerated speed, and the reverse movement of said frame being at a speed equal to the speed of the advance of the film, a shutter, and means for operating said shutter synchronously with the vibration of said frame; substantially as described.

2. In an animated-photographic apparatus, the combination with the film-advancing rollers, and fixed guide-rollers over which a looped portion of the film is guided across the axis of a lens; of a vibrating frame and an idle roller mounted on each end of said frame, said frame and rollers being situated in said looped portion of the film, means for continuously unwinding the film, means for vibrating said frame alternately in a direction with and in a direction the reverse of the movement of the film, the reverse movement of said frame being at a speed equal to the speed of the advance of the film, and the movement with the film being accelerated and carrying the film with it, substantially as described.

3. In an animated-photograph apparatus, the combination with the film-advancing rollers, and film unwinding and winding rolls; a vibratory frame; a roller journaled in each end of said frame; means to reciprocate said frame and said rollers therein in such manner that the part of the film between said rollers is held stationary with respect to the lens-axis during the movement in one direction of said vibratory frame, while the speed of travel of said portion of the film is accelerated on the return movement of the said frame; and a shutter adapted to operate synchronously with such return movement, substantially in the manner and for the purpose herein set forth.

4. In animated-photograph apparatus, the combination with the film-advancing rollers, and the film unwinding and winding rolls, of a pair of movable rollers adapted to be reciprocated simultaneously, a roller on each end of one of said rollers, cam-wheels operating in conjunction with said rollers to reciprocate the movable rollers; two pairs of stationary rollers arranged and acting in conjunction with said movable rollers whereby that part of the film between said pair of movable rollers is held stretched across the axis of a lens and intermittently held stationary with respect thereto, and intermittently caused to advance at an accelerated speed; and a shutter adapted to act simultaneously with such accelerated movement, substantially as and for the purposes herein set forth.

5. In animated-photograph apparatus, the combination with film-advancing rollers; of a vibrating frame; a pair of idle rollers mounted in said frame, and fixed guide-rollers, over which a looped portion of the film is guided across the axis of a lens; means for continuously unwinding and winding the film, a cam-wheel operating in conjunction with one of the film-advancing rollers engaging a portion of said vibrating frame and operating the same alternately in a direction with, and in a direction the reverse of the movement of the film, the reverse movement of said frame being at a speed equal to the speed of the advance of the film, and the return movement being accelerated; a shutter, and means for operating said shutter synchronously with the operation of said frame, substantially as described.

6. In animated photographic apparatus, the combination with the film-advancing rollers; of a vibrating frame; an idle roller mounted on each end of said frame; over which a looped portion of the film is guided across the axis of a lens; means for continuously unwinding the film; a roller on each end of one of said idle rollers, cam-wheels operating in conjunction with said rollers for vibrating said frame alternately in a direction with and in a direction the reverse of the movement of the film; said reverse movement being at a speed equal to the speed of the advance of the film, and the return movement being accelerated, substantially as described.

7. In animated photographic apparatus, the combination with the film-advancing rollers; of a vibrating frame; an idle roller mounted on each end of said frame over which a looped portion of the film is guided across the axis of a lens; means for vibrating said frame alternately in a direction with and in a direction the reverse of the movement of said film, the reverse movement of said frame being at a speed equal to the speed of the advance of the film, and the return movement being accelerated, substantially as described.

8. In an animated photograph apparatus, the combination, with film-reels, and film-feeding mechanism, of a film-support, carrying the portion of the film which is in the field of the apparatus, which support is independent of the reels, is movable in the direction of motion of the film through said field, and imparts motion to the film passing over it independent of the motion imparted thereto by the feeding mechanism, and means for vibrating the support laterally in the direction of motion of the film and in the opposite direction, substantially as described.

9. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip and mechanism for feeding the film through the field of the apparatus, of a movable film-support, independent of said reels or equivalent means, and over which the film passes when passing through the field of the apparatus, said support being mounted to move in a direction opposite to that of the film passing over it, and means for so moving said support at a speed substantially equal to that of the film passing over it, whereby the portion of the film passing over said support may be held

stationary, at intervals, in the field of the apparatus, substantially as described.

10. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip, and mechanism for feeding the film through the field of the apparatus, of a movable film-support independent of said reel or equivalent means and of said feeding mechanism, and over which the film passes when passing through the field of the apparatus, said support being mounted to move at intervals in a direction opposite to that of the film passing over it, and means for so moving said support at a speed substantially equal to that of the film passing over it, whereby the portion of the film passing over said support may be held stationary at intervals in the field of the apparatus, substantially as described.

11. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip, and mechanism for feeding the film through the field of the apparatus, of a movable film-support, independent of said reels or equivalent means and over which the film passes when passing through the field of the apparatus, said support being mounted to move at intervals in a direction opposite to that of the film passing over it, and having stationary axes near which the film passes when passing to and from said support, and means for moving said support in a direction opposite, but at a speed substantially equal to that of the film passing over it, whereby the portion of the film passing over said support may be held stationary, at intervals, in the field of the apparatus, substantially as described.

12. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip, and mechanism for feeding the film through the field of the apparatus, of a vibrating film-support independent of said reels or equivalent means, and over which the film passes when passing through the field of the apparatus, said film-support being arranged to move alternately in the direction of motion of the film passing over it and in the direction opposite thereto, and a cam for vibrating said support, arranged to move in the direction opposite to that of the film with a velocity substantially equal to that of the film, whereby the portion of the film passing over said support may be held stationary, at intervals, in the field of the apparatus, substantially as described.

13. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip, and mechanism for feeding the film through the field of the apparatus, of a vibrating film-support, independent of said reels or equivalent means, and over which the film passes when passing through the field of the apparatus, said film-support being arranged to move alternately in the direction of motion of the film passing over it and in the direction opposite thereto, and a cam for vibrating said support arranged to move it in the direction opposite to that of the film with a velocity substantially equal to that of the film, and so proportioned that the period during which the support is moved in opposition to the motion of the film, is longer than the period during which said support is moved with the film, whereby the portion of the film passing over said support may be held stationary, at intervals, in the field of the apparatus, and for longer periods than the periods of motion of the film through the field of the apparatus, substantially as described.

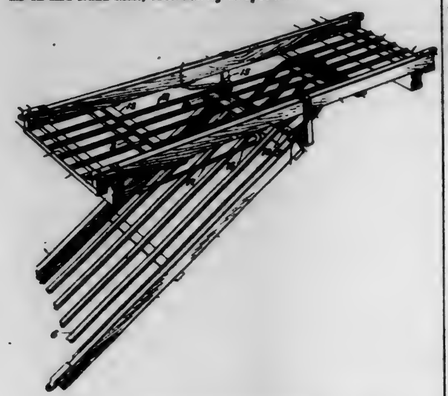
14. In a consecutive-view apparatus, the combination with reels or equivalent means for supplying and taking up a flexible film or picture-strip, a main driving-shaft, and film-feeding rolls driven thereby, of a movable film-support having film-guides located upon opposite sides of the field of the apparatus, and over which the film may pass, said support imparting motion to the portion of the film passing over it independent of the motion imparted thereto by the feeding-rolls, and a cam on said driving-shaft arranged to move said film-support alternately in the direction of motion of the film and in the direction opposite thereto, substantially as described.

704,450. ICE-RUNWAY. FREDERICK H. REMMERS, CHARLES H. REMMERS, and FREDERICK P. DESSELL, Athens, N. Y. Filed Feb. 19, 1902. Serial No. 94,769. (No model.)

Claim.—1. An ice-runway comprising a main runway, a shunt-runway having swinging connection with the main runway, slat connections for directing ice from the inlet end of the main runway to the shunt-runway, a trap mounted to swing in the main runway and normally forming a portion of the bottom thereof, and means for elevating said trap to permit the passage of ice from the main runway to the shunt-runway, substantially as specified.

2. An ice-runway comprising a main runway, consisting of side rails and bottom slats, a hanger on said main runway, a shunt-runway having swinging connection with said hanger, slat connections for directing ice from the inlet end of the main runway to the shunt-runway, a trap mounted to swing in the main runway and normally forming a portion of the bottom thereof, a crank-shaft having swinging connection with the

main runway and engaging against the under side of the trap, and a handle on said crank-shaft, substantially as specified.



704,451. FASTENER FOR SHOE-UPPERS. WARREN E. ELLIS, Haverhill, Mass. Filed Feb. 26, 1901. Serial No. 48,943. (No model.)

Claim.—1. A detachable fastener for shoe-uppers comprising two members, each provided with eyelet engaging and retaining means, said members being hinged together midway between the free ends of the fastener, for the purpose set forth.

2. A detachable fastener for shoe-uppers comprising two members each of which consists of a central portion 2 and end portions 3 and 4 each of said end portions being provided with eyelet engaging and retaining means, and said central portions 2 being hinged together, for the purpose set forth.

3. A detachable fastener for shoe-uppers composed of two members each of which comprises a central portion 2 and end portions 3 and 4, each of said end portions being provided with eyelet engaging and retaining means, and a clip wrapped around said central portions 2, whereby said members are hinged together, substantially as described.

4. A detachable fastener for shoe-uppers comprising two members, the ends of which are each provided with an eyelet-engaging hook extended to form a short free end united thereto by an abrupt bend, said members being hinged together midway between said ends, for the purpose set forth.

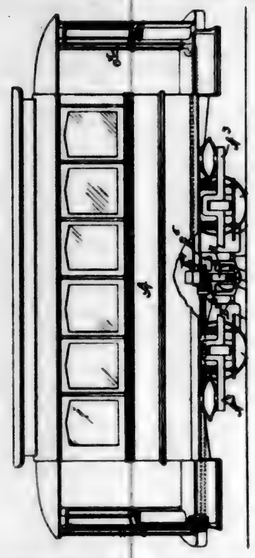
5. A detachable fastener for shoe-uppers comprising two members, each of which consists of a central portion 2 and end portions 3 and 4, said central portions 2 being hinged together and each of said end portions being provided with an eyelet-engaging hook and extended beyond the same to form a short free end which is united to the corresponding hook by an abrupt bend, substantially as and for the purpose set forth.

704,452. VEHICLE-BRAKE. CHARLES B. FAIRCHILD, New York, N. Y. Filed Sept. 16, 1901. Serial No. 75,467. (No model.)

Claim.—1. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement, means to impart movement to said brush-carrying head or frame toward and from the road-bed or pavement and stops to limit the rotation of said brake-brush, substantially as described.

2. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, stops thereon to limit the rotation of said brake-brush, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said frame abuts adapted to receive the end thrust due to the application of the brake, guides or ways in said rigid frame to which the brush-carrying frame is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the pavement, substantially as described.

3. In a vehicle-brake of the type described, the combination of a brake-brush, a head or frame in which said brake-brush is revolubly mounted, stops to limit the rotation of said brake-brush, a frame rigidly supported beneath the car-body, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed, said means comprising a screw revolubly connected to said brush-carrying head and to the car-body, the connection to one thereof comprising a nut to which said screw is threaded, and means to impart rotary movement to said screw, substantially as described.



4. In a vehicle-brake of the type described, the combination with the brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops which limit the rotation of said brake-brush, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said frame abuts adapted to receive the end thrust due to the application of the brake, guides or ways in said rigid frame to which the brush-carrying head or frame is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising a screw revolubly connected to said brush-carrying head or frame and to the car-body, the connection to one thereof comprising a nut secured thereto to which said screw is threaded, and means to rotate said screw, substantially as described.

5. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops to limit the rotation of said brake-brush, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising nuts of different lead secured to said brush-carrying head and to the car-body, a screw the opposite ends of which are threaded to said nuts and means to rotate said screw, substantially as described.

6. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops which limit the rotation of said brake-brush, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said rigid frame abuts adapted to receive the end thrust due to applying the brake, guides or ways in said rigid frame to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head or frame toward and from the road-bed or pavement, said means comprising nuts of different lead secured to said brush-carrying head and to the car-body, a screw the opposite ends of which are threaded to said nuts and means to rotate said screw, substantially as described.

7. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops to limit the rotation of said brake-brush, a rigid frame, guides or ways therein to which said brush-carrying head or frame is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising a screw revolubly connected to said brush-carrying head and to the car-body, the connection to one thereof comprising a nut pivoted thereto, and means to rotate said screw, substantially as described.

8. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, stops to limit the rotation of said brake-brush, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising nuts of different lead pivotally connected to said brush-carrying head and to the car-body, a screw the opposite ends of which are threaded to said nuts and means to rotate said screw, substantially as described.

9. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops which limit the rotation of said brake-brush, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said rigid frame abuts adapted to receive the end thrust due to applying the brake, guides or ways in said rigid frame to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising nuts of different lead pivoted to the brush-carrying head and to the car-body, a screw the opposite ends of which are threaded to said nuts and means to rotate said screw, substantially as described.

10. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops to limit the rotation of said brake-brush, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement, means to impart movement to said brush-carrying head toward and from said pavement, said means comprising a screw revolubly connected to said brush-carrying head and to the car-body, the connection to one thereof comprising a nut pivoted thereto to which said screw is threaded and means to rotate said screw and stops adapted to limit the pivotal movement of said brush-carrying head or frame, substantially as described.

11. In a vehicle-brake of the type described, the combination with a brake-brush of a head or frame in which said brake-brush is revolubly mounted, stops which limit the rotation of said brake-brush, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said rigid frame abuts adapted to receive the end thrust due to applying the brake, guides or ways in said rigid frame to which said brush-carrying head or frame is fitted and is movable toward and from the road-bed or pavement, rigid surfaces on said brush-carrying head or frame which are opposite rigid surfaces on said rigid frame and diverge gradually therefrom and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, said means comprising nuts of different lead pivoted to the brush-carrying head and to the car-body, a screw the opposite ends of which are threaded to said nuts and means to rotate said screw, substantially as described.

12. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement, means to impart movement to said brush-carrying head or frame toward and from the road-bed or pavement and counterbalance-springs applied to said brush-carrying head or frame, substantially as described.

13. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, a rigid frame secured to and depending from the car-body, rigid supports against which the lower end of said rigid frame abuts adapted to receive the end thrust due to applying the brake, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement, means to impart movement to said brush-carrying head toward and from the road-bed or pavement and counterbalance-springs which connect said brush-carrying head with the car-body, substantially as described.

14. In a vehicle-brake of the type described, the combination with a brake-brush, of a head or frame in which said brake-brush is revolubly mounted, said head or frame consisting of right and left hand sections comprising overlying members rigidly secured together, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, substantially as described.

15. In a vehicle-brake of the type described, the combination with a brake-brush comprising a back or support, heads or disks and trunnions on said heads or disks, all formed integral with each other, of a head or frame to suitable bearings in which the trunnions on said brake-brush are fitted, said head or frame consisting of right and left hand sections comprising overlying members rigidly secured together, a rigid frame, guides or ways therein to which said brush-carrying head is fitted and is movable toward and from the road-bed or pavement and means to impart movement to said brush-carrying head toward and from the road-bed or pavement, substantially as described.

16. A brake-brush for a brake of the type described, comprising a back or support to which the brushes are secured, disks secured to the ends thereof and trunnions on said disks located eccentrically thereof on the side of said brush back or support, substantially as described.

17. A brake-brush for a brake of the type described comprising a back or support, a flange thereon to which the brushes are attached, heads or disks secured to the ends of said brush back or support and trunnions on said heads or disks located eccentrically thereof on the side of said brush back or support, substantially as described.

18. A brake-brush for a brake of the type described, comprising a back or support to which the brushes are secured, heads or disks secured to the ends thereof and trunnions on said heads or disks located eccentrically thereof on the side of said brush back or support, the outer curved surfaces of said brush back or support and of said heads or disks being grooved or corrugated forming teeth therein, substantially as described.

19. A brake-brush for a brake of the type described, comprising a back or support, heads or disks secured to the ends thereof and shoes removably secured in said heads or disks which extend on both sides of the free ends of the brush-teeth when in normal unflexed position, substantially as described.

20. A brake-brush for a brake of the type described, comprising a support to which the brushes are secured and rigid cam-surfaces adapted to rotate said brake-brush in the manner described, said cam-surfaces being provided with teeth or projections, substantially as described.

21. A brake-brush for a brake of the type described, comprising a back or support to which the brushes are secured, heads or disks secured to the ends thereof, trunnions on said heads or disks located eccentrically thereof on the side of said back or support and removable shoes secured in the edges of said heads or disks which extend on both sides of the free ends of the brushes when in normal unflexed position, substantially as described.

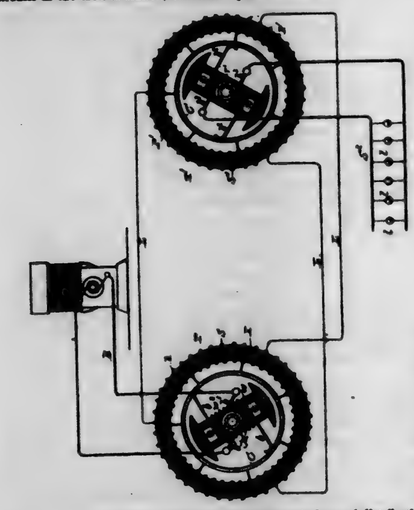
22. In a vehicle-brake of the type described, the combination with a frame supported upon the vehicle so as to be movable toward and from the road-bed or pavement and means to impart movement to said frame toward and from the road-bed or pavement, a brake-brush revolubly mounted in said frame and stops adapted to limit the rotation of said brake-brush, of a spring or springs applied to said brake-brush and adapted to give it an impulse toward its normal position when said brake is released, substantially as described.

23. In a vehicle-brake of the type described, the combination with a frame supported upon the vehicle so as to be movable toward and from the road-bed or pavement and means to impart movement to said frame toward and from said road-bed or pavement and a brake-brush revolubly mounted in said frame, of stops adapted to limit the rotation of said brake-brush, said stops comprising a rigid projection or projections on said brake-brush and a dog or dogs pivoted upon said frame in the path of travel of said projection or projections, stops on said frame which limit the pivotal movement of said dog or dogs and springs applied to said dog or dogs adapted to maintain them normally in central position, substantially as described.

704,453. MEANS FOR CHANGING THE TENSION OF CURRENTS. WILLIAM M. FAIRFAX, Brooklyn, N. Y. Filed Oct. 11, 1898. Serial No. 443,612. (No model.)

Claim.—1. In a system of electrical generation, transmission and distribution, the combination of a generator of continuous currents, a local circuit or circuits connected thereto, a transformer having a stationary core and stationary primary and secondary coils, the primary coils being connected to a local circuit, and the secondary coils being normally permanently connected to interconnected three-phase transmission-leads, a rotary commutating device electrically connected to the primary coils for producing successively-acting magnetomotive forces in the stationary core of the transformer, thereby producing successively-acting electromotive forces in the secondary coils of the transformer which result as three-phase currents in the interconnected transmission-leads, a transformer with stationary core and primary and secondary coils located at a distant station, the primary coils thereof being permanently connected to the interconnected three-phase transmission-leads, and a rotary commutating device which changes the successively-produced electromotive forces in the secondary coils into direct currents in the secondary circuits at the distant station, substantially as described.

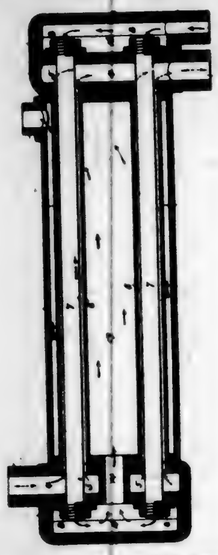
2. In a system of electrical generation, transmission and distribution, the combination of a generator of low-tension continuous currents, a local circuit or circuits connected thereto, a transformer having a stationary core and stationary low-tension primary and high-tension secondary coils, the primary coils being connected to a local circuit, and the secondary coils being normally permanently connected to interconnected three-phase transmission-leads, a rotary commutating device electrically connected to the primary coils for producing successively-acting magnetomotive forces in the stationary core of the transformer, thereby producing successively-acting electromotive forces in the secondary coils of the transformer which result as three-phase currents in the interconnected transmission-leads, a transformer with stationary core and primary and secondary coils located at a distant station, the primary coils thereof being permanently connected to the interconnected three-phase transmission-leads, and a rotary commutating device which changes the successively-produced electromotive forces in the secondary coils into direct currents in the secondary circuits at the distant station, substantially as described.



3. In a system of electrical generation, transmission and distribution, the combination of a generator of continuous currents, a local circuit or circuits connected thereto, a transformer having a stationary core and stationary low-tension primary and high-tension secondary coils, the primary coils being connected to a local circuit, and the secondary coils being normally permanently connected to interconnected three-phase transmission-leads, a rotary commutating device electrically connected to the primary coils for producing successively-acting magnetomotive forces in the stationary core of the transformer, thereby producing successively-acting electromotive forces in the secondary coils of the transformer which result as three-phase currents in the interconnected transmission-leads, a transformer with stationary core and high-tension primary and low-tension secondary coils located at a distant station, the primary coils thereof being permanently connected to the interconnected three-phase transmission-leads, and a rotary commutating device which changes the successively-produced electromotive forces in the secondary coils into direct currents in the low-tension secondary circuits at the distant station, substantially as described.

4. In a system of electrical generation, transmission and distribution, the combination of a generator of continuous currents, a local circuit or circuits connected thereto, a transformer having a stationary core and stationary primary and closed-circuited secondary coils, the primary coils being connected to a local circuit, and the secondary coils being normally permanently connected to interconnected three-phase transmission-leads, a rotary commutating device electrically connected to the primary coils for producing successively-acting magnetomotive forces in the stationary core of the transformer, thereby producing successively-acting electromotive forces in the secondary coils of the transformer which result as three-phase currents in the interconnected transmission-leads, a transformer with stationary core and closed-circuited primary and secondary coils located at a distant station, the primary coils thereof being permanently connected to the interconnected three-phase transmission-leads, and a rotary commutating device which changes the successively-produced electromotive forces in the secondary coils into direct currents in the secondary circuits at the distant station, substantially as described.

704,454. FEED-WATER HEATER AND CONDENSER. HENRY A. PETERSON, Williamsport, Pa. Filed June 18, 1900. Serial No. 20,697. (No model.)



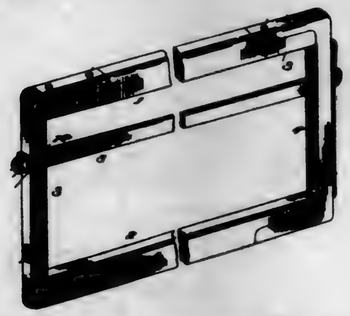
Claim.—1. A heater or condenser comprising opposite hollow headers, one having an inlet for fluid and the other an outlet for the same, a tubular casing seated upon and confined between said headers, a series of tubes contained within said casing and likewise seated upon and confined between the headers, said tubes communicating with the chambers within the headers, an inlet for another volume of fluid, an outlet for the same, and a second set of tubes passing through the headers and through the tubes which communicate with the chambers in said headers, said internal tubes having end fastening devices bearing upon the outer faces of the headers and serving as tubular stay-bolts to confine the headers to the said casing, substantially as specified.

2. A heater or condenser consisting of opposite hollow headers one having a fluid-inlet and the other an outlet for the said fluid, a tubular casing seated upon and confined between said headers and having an outlet for another volume of fluid, a series of tubes contained within said casing and likewise seated upon and confined between the headers and communicating with the chambers within said headers, other tubes passing through the headers and through the tubes which connect the chambers of said headers, fastening devices secured to the ends of said inner tubes, and bearing upon the outer faces of the headers, and caps secured to the headers and inclosing chambers with which said internal tubes communicate, one of said caps having an inlet branch for the second volume of fluid and the opposite header having a passage leading from the chamber of its cap to the chamber within the central tubular casing, substantially as specified.

3. A heater or condenser consisting of opposite hollow headers, one having an inlet for fluid and the other having an outlet for the same, a tubular casing seated upon and confined between said headers and having an outlet for another volume of fluid, a series of tubes contained within said casing and likewise seated upon and confined between the opposite headers, said tubes communicating with the chambers within the headers, other tubes passing through the headers and through said connecting-tubes and having fastening devices bearing upon the outer faces of the headers and serving to secure the latter to the central structure, threaded flanges projecting outwardly from each header, and caps screwed upon said flanges, one of said caps having an inlet for the second volume of fluid, and the opposite header having a passage providing a communication between the chamber within its cap and the chamber within the central tubular casing, substantially as specified.

704,455. HEDDLE-FRAME. TOUSSAINT J. PUTAT, Hudson, Mass. Filed Nov. 2, 1901. Serial No. 80,980. (No model.)

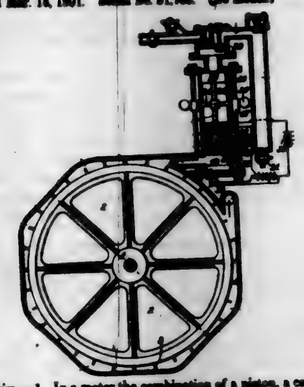
Claim.—1. A heddle-frame comprising wooden upper and lower bars, and metal channel-irons connecting said bars, the ends of said bars fitting between the sides of the channel-irons substantially as described.



2. A heddle-frame comprising wooden upper and lower bars, and metal channel-irons connecting said bars, said channel-irons being bent at the ends and recessed to the upper and lower bars, the ends of said wooden bars being partially inclosed by the bent ends of the channel-irons substantially as described.

3. A heddle-frame comprising upper and lower wooden bars having their outer ends and part of their sides adjacent said ends recessed, metal angle-bars formed of channel-irons, the ends of said irons being bent, the outer portion thereof fitting the recess in the outer ends of the wooden bars while the side portions of the metal bars fit the recesses in the sides of the wooden bars, and forming means for securing the two sets of bars together.

704,456. ROTARY MOTOR. THOMAS U. GRAY, London, England. Filed Mar. 18, 1901. Serial No. 51,703. (No model.)

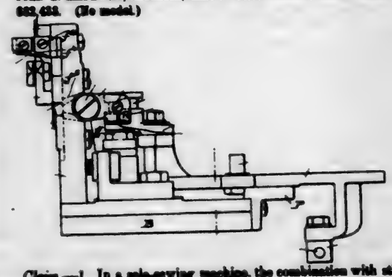


Claim.—1. In a motor the combination of a piston, a casing for said piston provided with inlet and exhaust ports, a combustion-chamber communicating with the inlet-port, a valve provided with a passage and adapted to reciprocate in the combustion-chamber, a compression-chamber which communicates with the combustion-chamber and coöperates with the valve-passage, a valve-stem carried by said valve, a piston carried by the valve-stem, a cylinder within which the said piston is adapted to reciprocate and which communicates by means of valves with the combustion-fluid source and with the compression-chamber, and sparking apparatus adapted to be operated after the valve has been moved by the working charge so as to close the communication between the combustion-chamber and the compression-chamber, substantially as described and for the purpose specified.

2. In a motor the combination of a piston and its casing, a combustion-chamber, a valve reciprocative in said combustion-chamber and having a passage, a compression-chamber coöperative with said passage, a cylinder adapted to communicate with a source of fluid-supply and also with said compression-chamber, a piston in said cylinder, a stem connecting the cylinder and valve, the latter being arranged to be acted upon by the working charge to close the communication between the combustion and compression chambers, cross-arms connected to said stem, guides for said cross-arms, and sparking means operable with one of said parts.

3. In a rotary motor the combination of a rotary drum, pistons or vanes carried by said drum, a casing provided with a fluid-pressure passage through which the pistons or vanes travel and having inlet and exhaust ports, a combustion-chamber communicating with the inlet-port, a valve provided with a passage and adapted to reciprocate in the combustion-chamber, a compression-chamber which communicates with the combustion-chamber and coöperates with the valve-passage, a valve-stem carried by said valve, a piston carried by the valve-stem, a cylinder within which the said piston is adapted to reciprocate and which communicates by means of valves with the combustible-fluid source and with the compression-chamber, electric sparking apparatus, and a contact carried by the valve-stem and adapted to close the circuit of said sparking apparatus after the valve has been moved by the working charge so as to close the communication between the combustion-chamber and the compression-chamber, substantially as described and for the purpose specified.

704,457. SHOE-SEWING AND WELT-BEVELING MACHINE. JOHN B. HADAWAY, Brockton, Mass. Filed June 3, 1898. Serial No. 682,433. (No model.)



Claim.—1. In a sole-sewing machine, the combination with stitch-forming mechanism, of welt-beveling mechanism and means for throwing the welt-beveling mechanism into and out of operation during the continued operation of the machine, substantially as described.

2. In a sole-sewing machine, the combination with stitch-forming mechanism, of welt-beveling mechanism, a movable gage, means for throwing the welt-beveling mechanism into and out of operation during the continued operation of the machine, and means for throwing the movable gage into and out of operation, substantially as described.

3. In a sole-sewing machine, the combination with stitch-forming mechanism, of welt-beveling mechanism, a movable gage and connected means for throwing the welt-beveling mechanism and the movable gage into and out of operation, substantially as described.

4. In a sole-sewing machine, the combination with stitch-forming mechanism, feeding means and feed-regulating means, of welt-beveling mechanism and connected means for throwing the welt-beveling mechanism into and out of operation and operating the feed-regulating means, substantially as described.

5. In a sole-sewing machine, the combination with stitch-forming mechanism, feeding means and feed-regulating means, welt-beveling mechanism, a movable gage, and connected means for throwing the welt-beveling mechanism into and out of operation and operating the movable gage and the feed-regulating means, substantially as described.

6. In a sole-sewing machine, the combination with stitch-forming mechanism, of welt-beveling mechanism, a movable crease-gage, means for throwing the welt-beveling mechanism into and out of operation, and means for throwing the movable crease-gage into and out of operation, substantially as described.

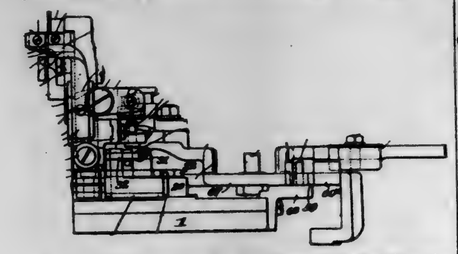
7. In a sole-sewing machine, the combination with stitch-forming mechanism, of welt-beveling mechanism, a movable crease-gage and connected means for throwing the welt-beveling mechanism and the movable crease-gage into and out of operation, substantially as described.

8. In a sole-sewing machine, the combination with stitch-forming mechanism, feeding means, and a feed-regulating means, of welt-beveling mechanism, a movable crease-gage and connected means for throwing the welt-beveling mechanism into and out of operation and operating the movable crease-gage and the feed-regulating means, substantially as described.

704,458. SHOE-SEWING AND WELT-BEVELING MACHINE. JOHN B. HADAWAY, Brockton, Mass. Filed July 5, 1899. Serial No. 722,216. (No model.)

Claim.—1. In a sole-sewing machine, the combination with stitch-forming mechanism, feeding means and feed-regulating means, of a welt-beveling cutter, a movable edge-gage, and means for throwing the welt-beveling cutter into and out of operation and operating the movable edge-gage and the feed-regulating means, substantially as described.

2. In a sole-sewing machine, the combination with stitch-forming mechanism, of a welt-beveling cutter, a movable gage, and means for throwing the welt-beveling cutter and the movable gage into and out of operation comprising a cam and a lever, substantially as described.



3. In a sole-sewing machine, the combination with stitch-forming mechanism, of a welt-beveling cutter, a movable gage, and means for throwing the welt-beveling cutter and the movable gage into and out of operation comprising a cam and a lever, said cam having two cam-faces for operating the cutter and gage respectively, substantially as described.

4. In a sole-sewing machine, the combination with stitch-forming mechanism, of a welt-beveling cutter, a movable gage, and means for throwing the welt-beveling cutter and movable gage into and out of operation comprising a cam and a lever, feed mechanism including a feed-adjusting lever and coöperating stops and projections on the two levers, substantially as described.

5. In a sole-sewing machine, the combination with stitch-forming mechanism, of a welt-beveling cutter and a lever for throwing it into and out of operation, feed mechanism including a feed-adjusting lever, the two levers having coöperating stops and projections, substantially as described.

6. In a sole-sewing machine, the combination with stitch-forming mechanism, of a movable gage, welt-beveling mechanism arranged to be thrown into and out of operation, work-feeding mechanism, a lever for adjusting the stroke of the work-feeding mechanism, a lever for simultaneously advancing or retracting the movable gage and throwing the welt-beveling mechanism into and out of operation, and an adjustable block carried by said lever arranged to engage the lever of the feed-adjusting mechanism, substantially as described.

7. In a sole-sewing machine, the combination with stitch-forming mechanism, of a movable gage, a lever for actuating said gage, work-feeding mechanism and a lever for adjusting the stroke of said work-feeding mechanism, diverging stops carried by said lever and an adjustable block carried by the gage-actuating lever, arranged to engage the said stops, substantially as described.

8. In a sole-sewing machine, the combination with stitch-forming mechanism, of a welt-beveling cutter, a gage, and means for moving the gage forward and back in the direction of the feed simultaneously with the forward and back feed movements, substantially as described.

9. In a sole-sewing machine, the combination, with stitch-forming mechanism, and feed mechanism, of a welt-beveling cutter, a gage, said welt-beveling cutter and gage being mounted upon a part of the feed mechanism and partaking of its movements, substantially as described.

10. In a sole-sewing machine, the combination with stitch-forming mechanism and feed mechanism, of a gage, said gage being mounted upon a part of the feed mechanism and partaking of its movements, substantially as described.

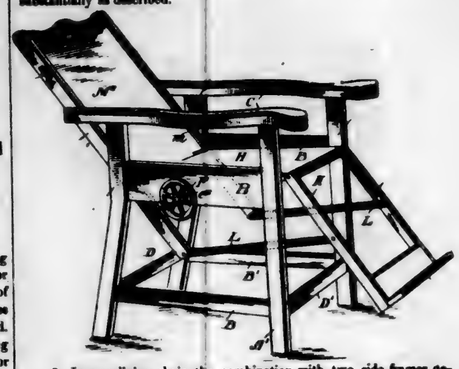
11. In a sole-sewing machine, the combination with stitch-forming mechanism, and a feed-slide, of a welt-beveling cutter and a gage mounted upon said slide, substantially as described.

12. In a sole-sewing machine, the combination with stitch-forming mechanism and a feed-slide, of a welt-beveling cutter, a movable gage, and means for throwing the welt-beveling cutter and movable gage into and out of operation, said cutter, gage and throwing means being mounted upon said feed-slide, substantially as described.

704,459. ADJUSTABLE RECLINING-CHAIR. JAMES R. HARGER, Washington, D. C. Filed Oct. 18, 1901. Serial No. 79,152. (No model.)

Claim.—1. In a reclining-chair, the combination of two side frames capable of adjustment toward and from each other at the top, the back and seat pivoted between said frames and a combined tie-bolt and clamp-screw extending through said frames beneath the seat whereby the back and seat may be clamped in any desired position by means of said clamp-screw.

2. In a reclining-chair, the combination with two side frames detachably connected together, a combined tie-bolt and clamp-screw connecting said side frames, lugs projecting forwardly near the front end of said side frames, a back pivoted between said side frames and projecting downward beneath the seat, a seat pivoted to said back and resting at its forward end on said lugs, a foot-rest pivoted at the forward end of said seat, and links connecting the lower end of said back and said foot-rest, substantially as described.

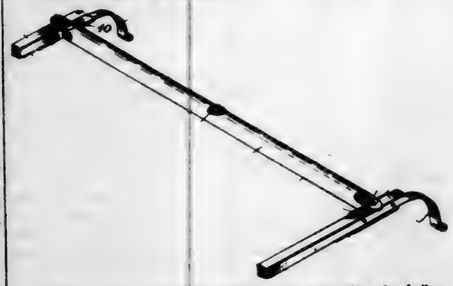


3. In a reclining-chair, the combination with two side frames detachably connected together, a back comprising side pieces pivoted between said side frames and a sliding piece adjustably mounted between said side pieces, a seat pivoted to said back at some distance from the lower end thereof, a foot-rest pivoted to the front end of said seat, and links connecting the lower ends of the side pieces of said back to the foot-rest, and means for clamping said side frames against said seat, substantially as and for the purposes described.

4. In a reclining-chair, the combination with two side frames provided with lugs for supporting the front end of the seat, the back and seat pivoted between said frames, a foot-rest pivoted to the front end of said seat, links connecting said foot-rest and the lower end of said back, a clamp-screw spanning said frames beneath said seat with a hand-wheel on said clamp-screw, substantially as described.

5. In a reclining-chair, the combination with two side frames detachably connected together, a combined tie-bolt and clamp-screw connecting said side frames, a hand-wheel on said clamp-screw, lugs projecting forwardly near the front end of said side frames, a back provided with side pieces pivoted between said side frames and projecting downward beneath the seat, and an adjustable sliding piece mounted between said side pieces, a seat pivoted to said back and resting at its forward end on said lugs, a foot-rest pivoted at the forward end of said seat, and links connecting the lower end of said back and said foot-rest, substantially as described.

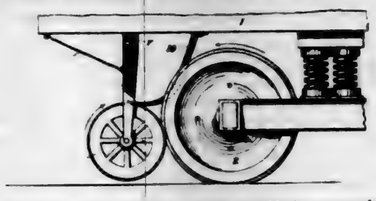
704,460. CROSS-BAR FOR VEHICLE-SHAFTS. SAMUEL H. HAYDEN and HARLOW D. HATHAWAY, Flint, Mich. Filed Dec. 26, 1901. Serial No. 87,208. (No model.)



Claim.—In a cross-bar for vehicles, the combination of a hollow body U-shaped in cross-section, a whiffletree-plate mounted centrally said bar, apertured ears and a strap mounted on the ends of said body to serve in securing said bar to shafts.

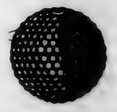
704,461. CAR-FENDER. JOHN T. HOGGINS, St. Louis, Mo. Filed Nov. 4, 1901. Serial No. 81,056. (No model.)

Claim.—1. A car-fender comprising a suitable drum or disk located in advance of the car-truck, and adapted to be forced into engagement with the car-wheels upon impact with a body on the track, and to have rotation imparted thereto in a direction contrary to that of the wheels with which it is in engagement, substantially as set forth.



2. A car-fender comprising a suitable rotatable drum suspended on arms pivotally depending from the car-body, springs for normally retaining said drum out of engagement with the car-wheels, the heads of the drum being adapted to be forced into engagement with the tread of the wheels upon impact with an object on the track, whereby rotation is imparted to said drum in a direction contrary to the wheels and the object struck effectively swept off the track, substantially as set forth.

704,462. MANUFACTURE OF GOLF-BALLS. ELEAZER KEMPSHALL, Boston, Mass. Filed Mar. 15, 1902. Serial No. 98,321. (No model.)

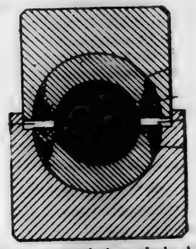


Claim.—1. The process in producing a playing-ball, consisting in repeatedly heating a mass of gutta-percha to an extent to soften the same, and each time compressing it to the shape of a ball while heated and soft, and also maintaining the compression at each operation until the ball cools sufficiently to become hard.

2. The process in producing a playing-ball, consisting in heating gutta-percha to an extent to soften it; molding it under pressure, while heated and soft, to approximate its final form; maintaining the pressure until the ball cools sufficiently to become hard; reheating the ball by heating it; recompressing it while warm and soft; and maintaining the compression until the ball cools sufficiently to become hard.

3. The process in producing a playing-ball, consisting in heating gutta-percha, molding it under compression while heated into an approximate form, reheating the ball so as to soften it, recompressing the ball while hot, and maintaining the compression until the ball is cooled and hardened.

704,463. PROCESS OF MAKING PLAYING-BALLS. ELEAZER KEMPSHALL, Boston, Mass. Filed Apr. 5, 1902. Serial No. 101,462. (No model.)

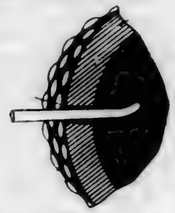


Claim.—1. A process in producing a playing-ball, consisting in applying undersized soft-rubber segments to a spherical core, drawing said segments together upon said core so as to stretch the rubber and also to cause the edges of the segments to meet, and applying means for holding said segments together so as to form a tensioned sphere upon the core.

2. A process in producing a playing-ball consisting in applying undersized soft-rubber segments to a spherical core, drawing said segments together upon said core so as to stretch the rubber and also to cause the edges of the segments to meet, and connecting said edges together.

3. A process in producing a playing-ball consisting in applying undersized soft-rubber segments to a spherical core, drawing said segments together upon said core so as to stretch the rubber and also to cause the edges of the segments to meet, connecting said edges together, and compressing a hard cover upon the soft-rubber sphere.

704,464. PROCESS OF MANUFACTURING PLAYING-BALLS. ELEAZER KEMPSHALL, Boston, Mass. Filed Apr. 14, 1902. Serial No. 102,804. (No model.)



Claim.—1. A process of making a playing-ball, consisting in forming a body of tensioned rubber, applying an external structure or shell thereto, and piercing or cutting such body of rubber so as to relieve the tension and permit the rubber to expand in radial directions.

2. A process of making a playing-ball, consisting in forming a body or center of overwound thread, applying an external structure or shell thereto, and cutting or severing such thread.

3. A process of making a playing-ball, consisting in forming a body or center of overwound thread, applying an external structure or shell thereto under heat and compression, and cutting or severing such thread.

4. A process of making a playing-ball, consisting in forming a body or center of overwound rubber, applying an external structure or shell thereto under heat and compression, maintaining the compression until the shell hardens, and finally cutting or severing such rubber.

5. A process of making a playing-ball, consisting in forming a body or center of overwound tensioned thread, applying an external structure or shell thereto, and cutting or severing such thread.

6. A process of making a playing-ball, consisting in forming a body or center of overwound thread, applying an outer structure or shell thereto, and cutting or severing such thread.

7. A process of making a playing-ball, consisting in forming a spherical body or center of overwound rubber thread, applying an external structure or shell thereto, and cutting or severing such winds.

8. A process of making a playing-ball, consisting in forming a body or center under tension, applying an outer structure or shell to the body, and then releasing such tension to cause the body to spring outwardly at all points under restraint of the shell.

9. A process of making a playing-ball, consisting in forming a body or center of overwound thread under tension, applying an outer structure or shell to the body, and then releasing such tension to cause the body to spring outwardly at all points under restraint of the shell.

10. A process of making a playing-ball, consisting in forming a body or center of overwound elastic thread under tension, applying an outer structure or shell of hard springy material, and then releasing such tension to impart to the body a bursting tendency at all points under restraint of the shell.

11. A process of making a playing-ball, consisting in forming a spherical body or center of thread overwound upon itself, applying an external structure or shell thereto, and then severing the winds of the thread to impart to the body a bursting tendency at all points under restraint of the shell.

12. A process of making a playing-ball, consisting in forming a body or center under tension, applying an external structure or shell thereto, forming an opening in the shell, and then introducing a suitable implement into the opening and releasing such tension to impart to the body a bursting tendency at all points under restraint of the shell.

13. A process of making a playing-ball, consisting in forming a body or center under tension, applying an external structure or shell thereto, forming an opening in the shell, introducing a suitable implement into the opening and releasing such tension, and finally withdrawing the implement and filling up the opening.

14. A process of making a playing-ball, consisting in forming a body or center under tension, applying an external structure or shell thereto by compression, forming openings in the shell and introducing an implement therein and releasing such tension to impart to the body a bursting tendency at all points, then filling up the openings, and again subjecting the ball to compression under heat.

704,465. BLASTING-CARTRIDGE. WASSILY KIBALNOV, Moscow, Russia. Filed Oct. 23, 1901. Serial No. 79,360. (No model.)

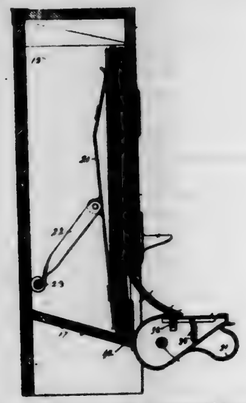
Claim.—1. A blasting-cartridge closed by a cylinder with hemispherical bottom formed by a number of tongues the adjacent edges of which cover each other reciprocally forming at the center a star-shaped opening which is automatically closed as soon as the pressure is applied.

2. A blasting-cartridge closed by a cylinder with hemispherical bottom formed by a number of tongues, the adjacent edges of which cover each other successively, forming at the center a star-shaped opening adapted to be closed by the pressure in the cartridge, and means for retaining said cylinder in said cartridge, substantially as described.

3. A blasting-cartridge consisting of a tube closed at one end, explosive compound in said tube, a cylinder with a hemispherical bottom formed by a number of tongues, inserted in said tube upon the explosive compound, the said tongues being adapted to close the bottom of the cylinder when the explosion takes place, substantially as described.

4. A blasting-cartridge closed by a cylinder with a hemispherical bottom formed by a number of tongues adapted to be closed by the pressure in the cartridge, and a fuse in said cylinder, substantially as described.

704,466. **VENDING APPARATUS FOR NEWSPAPERS.** LOUIS C. OVERPECK, Hamilton, Ohio, assignor to the National Newspaper Distributing Company, Cincinnati, Ohio. Filed Sept. 14, 1900. Serial No. 30,064. (No model.)



Claim.—1. The combination with a receptacle formed with a discharge-opening, and a slanting bottom terminating at the bottom of said opening, of a hinged apron to close the opening and terminating in a projecting lip contiguous to the bottom adapted to engage with the edge of a newspaper within the receptacle and carry it through the opening with the movement of the apron.

2. The combination with a receptacle formed with a discharge-opening, a slanting bottom terminating at the bottom of said opening, and clamping mechanism adapted to maintain a newspaper in the receptacle with its edge on the bottom contiguous to the opening, of a delivery-apron adapted to close the opening and arranged to engage with the edge of the paper and carry it through the opening, and means to lock the apron in the closed position.

3. The combination with a receptacle formed with a discharge-opening, a hinged apron adapted to close the opening, and having an adjustable gap, means for rendering said gap adjustable, and means adapted to lock the apron in the closed position, of a clamp within the receptacle adapted to engage the edge of a newspaper thereunder within the gap, whereby it may be carried through the opening by the opening movement of the apron.

4. The combination with a closed receptacle formed with a discharge-opening, a hinged delivery-apron to close the opening and formed with a lip to register with the bottom of the opening, and a gage-plate adjustable on the apron in relation to the lip, of a spring-actuated clamp within the receptacle and arranged to feed newspapers thereunder successively against the plate and with their folded edges in engagement with the lip, whereby they may be discharged through the opening by the apron.

5. The combination with a receptacle formed with a discharge-opening, a delivery-apron hinged thereon and actuated by a spring to close the opening, and a lug on the apron, of a vertical tube mounted within the receptacle, a slide thereunder and formed with an opening therethrough, a spring arranged to move the slide with the opening therein in registration with the tube, and a fulcrumed lever engaging with the slide and actuated by the lug in closing the apron to move the slide with the opening therein out of registration with the tube.

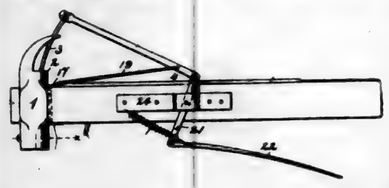
6. The combination with a newspaper-receptacle containing a discharge-opening, and a hinged delivery-apron adapted to close the opening, of a sliding gate actuated by the opening movement of the apron to partially close the opening while the apron remains open.

7. A newspaper-receptacle with discharge-opening, an apron for closing said opening, and having a gap, means for making said gap adjustable, and a device actuated by the opening movement of said means to partially close the opening while said apron remains open, as set forth.

8. A newspaper-receptacle having a discharge-opening, means to close said opening having a gap, means for making said gap adjustable, a locking device for said adjusting means, and a sliding plate to partially close said opening and movable by the movement of said closing means, as set forth.

9. In a device for the purpose described, an apron having a gap at its edge, a receiving-plate yieldingly mounted on said apron, a movable notched wedge and a contiguous partition engaging said wedge for adjusting said plate, as and for the purpose specified.

704,467. **MAGAZINE NAILING-HAMMER.** GEORGE I. SMITH, Mayview, Kans. Filed Aug. 9, 1900. Renewed Mar. 8, 1902. Serial No. 96,972. (No model.)

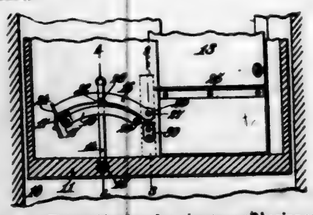


Claim.—1. A self-feeding nailing-hammer comprising in combination a handle provided with a nail-magazine, a hammer-head provided with a tubular bore extending to the striking-face of the hammer, an oscillatory notched disk to deliver the nails individually from the magazine into the bore of the hammer-head, a plunger to advance the nails through said bore, a lever, and connections therewith to oscillate said disk to deliver a nail on the movement of the lever in one direction and to advance the plunger to force the nail along the bore on the movement of said lever in the other direction, as set forth.

2. A self-feeding nailing-hammer, comprising in combination, a handle provided with a nail-magazine, a spring-actuated follower in said magazine, a hammer-head having a tubular bore extending to the striking-face thereof, an oscillatory notched disk to feed the nails individually from the magazine to said bore, a yielding detent extending across said bore to support the nail therein, means to force the nail through said bore past the detent and project the point of the nail beyond the striking-face of the hammer-head, a lever and connections therewith to operate said disk and said last-mentioned means to feed the nail from the magazine and to advance the same into position to be driven, as set forth.

3. A self-feeding nailing-hammer comprising a hammer-head provided with a tubular bore extending to the striking-face thereof, a handle provided with a nail-magazine, a spring-actuated follower adapted to force the nails toward the hammer-head, an oscillatory disk having a peripheral recess and adapted to deliver the nails individually from the magazine to said bore, a spring-actuated detent extending across the bore and means to advance the nails through said bore and past the detent to deliver them in position to be driven, as set forth.

704,468. **SAFETY DEVICE FOR ELEVATORS.** WILLIAM H. WILSEY, Sioux City, Iowa. Filed Apr. 12, 1902. Serial No. 102,636. (No model.)



Claim.—1. The combination of an elevator-well having an opening, a door for said opening, a latch for holding the door shut, a car, a controller on the car, a detent operative independently of said controller and

effective for holding the controller in a central position, and means upon the latch for holding the detent in its effective position when the door is opened, and the detent, when in its ineffective position serving to prevent retroactive movement of the latch.

2. The combination of an elevator-well having an opening, a door for said opening, a latch for holding the door shut, a car, a controller on the car, a detent operative independently of said controller and effective for holding the controller in a central position and having a perforation, and a pin upon the latch adapted to enter said perforation when the detent is in its effective position.

3. The combination of an elevator-well having an opening, a door for said opening, a latch for holding the door shut, a car, a controller on the car, having a projection, a notched detent, the notch of which is adapted to engage over the projection on the controller, and said detent having a perforation, and a pin upon the latch adapted to enter said perforation.

4. The combination of an elevator-well having an opening, a door for said opening, a spring-latch for holding the door shut, a car, a controller on the car, a detent operative independently of said controller and effective for holding the controller in a central position, and means upon the latch for holding the detent in its effective position when the door is open, and the detent when in its ineffective position serving to prevent retroactive movement of the latch.

5. The combination of an elevator-well having an opening, a door for said opening, a latch for holding the door shut, a car, a controller on the car, a detent operative independently of said controller and effective for holding the controller in a central position, means upon the latch for holding the detent in its effective position when the door is opened, and the detent when in its ineffective position serving to prevent retroactive movement of the latch, and means upon the door for holding said latch in its retracted position while the door is open.

6. The combination of an elevator-well having an opening, a door for said opening, a ledge extending entirely across the door, a latch disposed in the path of the ledge, a car, a controller on the car, a detent operative independently of said controller and effective for holding the controller in a central position, and means upon the latch for holding the detent in its effective position when the door is open and the detent, when in its ineffective position, serving to prevent retroactive movement of the latch, and said ledge, when the door is open, being adapted to hold the latch in its retracted position.

7. The combination of an elevator-well having an opening, a door for said opening, a detent for holding the door shut, a car, a controller on the car, a pivoted latch operative independently of said controller and effective for holding the controller in a central position, and means upon the latch for holding the detent in its effective position when the door is open, and the detent, when in its ineffective position, serving to prevent retroactive movement of the latch.

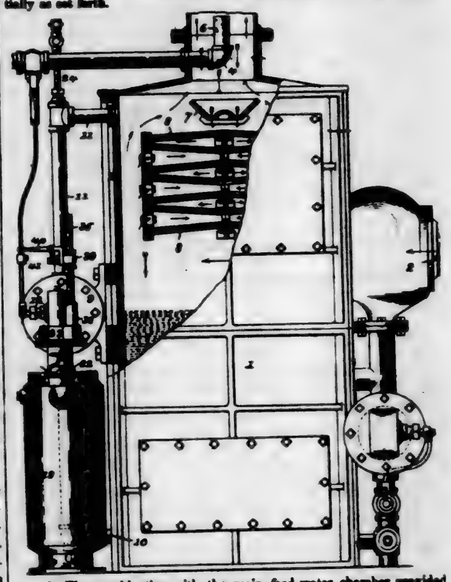
8. The combination of an elevator-well having an opening, a door for said opening, a detent for holding the door shut, a car, a controller on the car, a pivoted latch operative independently of said controller and effective for holding the controller in a central position, means upon the latch for holding the detent in its effective position when the door is open, and the detent, when in its ineffective position, serving to prevent retroactive movement of the latch, and a bracket upon the car contiguous to the free end of the detent.

9. The combination of an elevator-well having an opening, a door for said opening, a latch for holding the door shut, a car, a controller on the car, having a projection, a detent having a notch to engage over said projection and a perforation, a pin upon the latch adapted to enter said perforation, and a ledge extending across the door, the latch being disposed in the path of the ledge.

704,469. **PURGE-FEEDING APPARATUS FOR STEAM PLANTS.** JOHN ANGELL, St. Louis, Mo. Original application filed Apr. 27, 1901, Serial No. 57,625. Divided and this application filed July 27, 1901. Serial No. 69,562. (No model.)

Claim.—1. The combination with the main feed-water chamber provided with a steam-inlet neck and a steam-outlet neck, of a feed-water-inlet pipe provided with a regulating-valve, a float-chamber secured to the side of the main heater-casing and having equalizing connections therewith by a water pipe or passage extending to the lower portion of the heater-casing and a steam pipe or passage extending to the upper portion of the heater-casing, a float arranged in said float-chamber, operative connections between the float and the regulating-valve in the feed-water-inlet pipe, a purge-tank, and a purge-outlet pipe connecting with the feed-water-inlet pipe and arranged in the equalizing-pipe connections of the float-chamber, substantially as set forth.

2. The combination with the main feed-water chamber provided with a steam-inlet neck, a steam-outlet neck, and a feed-water-inlet pipe, of a purge-tank, an outlet-pipe from the purge-tank connected to the feed-water-inlet pipe, and a tubular casing surrounding the purge-outlet pipe, said casing having communication with the main heater-casing, substantially as set forth.



3. The combination with the main feed-water chamber provided with a steam-inlet neck, a steam-outlet neck and a feed-water-inlet pipe, of a purge-tank, an outlet-pipe from the purge-tank connected to the feed-water-inlet pipe, and a vertical pipe or passage connecting with the top and bottom of the main heater-chamber and inclosing the purge-outlet pipe, substantially as set forth.

4. The combination with the main feed-water chamber provided with a steam-inlet neck, a steam-outlet neck, and a feed-water-inlet pipe, of a purge-tank, an outlet-pipe from the purge-tank connected to the feed-water-inlet pipe, means for forcing the purge composed from said tank, and means for agitating the contents of the purge-tank, the same comprising a rotary agitator arranged in said purge-tank, and a motor-engine connected to said agitator and secured to the upper end of said tank, substantially as set forth.

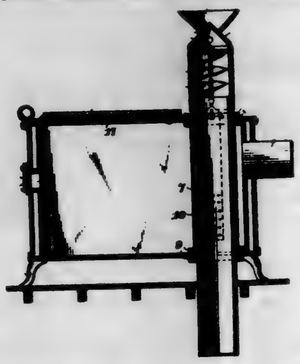
5. The combination with the main feed-water chamber provided with a steam-inlet neck, a steam-outlet neck and a feed-water-inlet pipe, of a purge-tank, an outlet-pipe from the purge-tank connected to the feed-water inlet, means for forcing the purge composed from said tank, and means for agitating the contents of the purge-tank, the same comprising, a rotary agitator arranged within the tank, a motor-engine having operative connection with said agitator and provided with motive-fluid inlet and outlet passages, and a pipe connecting the outlet-passage with the interior of the feed-water chamber, substantially as set forth.

6. The combination with the main feed-water chamber provided with a steam-inlet neck, a steam-outlet neck and a feed-water-inlet pipe, of a purge-tank, an outlet-pipe from the purge-tank connected to the feed-water inlet, means for forcing the purge composed from said tank, means for agitating the contents of the purge-tank, the same comprising, a rotary agitator arranged within the purge-tank, a motor-engine having operative connection with said agitator and provided with motive-fluid inlet and outlet passages, and means for automatically controlling the operation of said motor-engine, the same comprising a valve in the motive-fluid-supply passage, a float-chamber connected with the main heater-chamber, a float in said chamber, and operative connections between said float and said valve, substantially as set forth.

704,470. **HEATING-STOVE.** JAMES L. RAMSAY, Suffolk, Va., assignor of one-half to Thomas J. Hoy and Henry W. Campbell, Suffolk, Va. Filed Oct. 3, 1901. Serial No. 77,468. (No model.)

Claim.—1. In a heating-stove, the combination with the body thereof, of a heating-pipe piercing the stove and having a tapered discharge end projected exteriorly thereof and provided with discharge-perforations, an inverted conical deflector carried by the tapered end of the pipe and

having its sides flared across the perforations therein to deflect the air escaping therefrom, and means located in the projected portion of the pipe for producing a centrifugal discharge of air through the perforations.



2. In a heating-stove, the combination with the body thereof, of a heating-pipe piercing the stove and having a tapered discharge end projected exteriorly thereof and provided with discharge-perforations, an inverted conical deflector carried by the tapered end of the pipe and having its sides flared across the perforations therein to deflect the air escaping therefrom, and a spiral deflector located within the projected end of the pipe to produce a centrifugal discharge through the perforations thereof.

3. In a heating-stove, the combination with the body thereof, of a heating-pipe piercing the stove and having a tapered discharge end projected exteriorly thereof and provided with discharge-perforations, an inverted conical deflector carried by the tapered end of the pipe and having its sides flared across the perforations therein to deflect the air escaping therefrom, and a rotatable spiral deflector located within the projected end of the pipe to produce a centrifugal discharge of air through the perforations thereof.

4. In a stove, the combination with the stove-body, of a heating-pipe piercing the same and having its discharge end tapered and projected exteriorly of the stove and also provided in its tapered portion with discharge-perforations, a combined deflector and water-receptacle comprising a hollow inverted conical imperforate deflector rising from the top of the pipe at a point between the perforations and overhanging the latter, and a rotatable spiral deflector carried within the projected end of the pipe to produce a centrifugal discharge of air through the perforations.

5. In a heating-stove, the combination with the body thereof, of a heating-pipe piercing the stove and having a tapered discharge end projected exteriorly of the stove and provided with discharge-perforations, and an inverted conical deflector carried by the tapered end of the pipe and having its sides flared across the perforations in the pipe to deflect the air escaping therethrough.

6. In a heating-stove, the combination with the stove-body, of an open-ended heating-pipe piercing the same and in communication with the external air, a removable conical cap at the discharge end of the pipe and provided with perforations in the conical portion thereof, and an inverted conical deflector projected from the outer end of the conical cap and overhanging the perforations thereof.

7. In a heating-stove, the combination with the body thereof, of an open-ended heating-drum piercing the same and in communication with the external air, a tubular casing removably applied to the discharge end of the drum and having an outer conical perforate end, and an inverted hollow conical deflector projected from the outer end of the cap, and overhanging the perforations in the outer end of the casing.

8. In a stove, the combination with the stove-body having a fire-box for burning fuel, of a gas-relief passage communicating between the fire-box and the external air, a perforate movable closure for the outer end of the passage, a stem forming a handle projected therefrom, and an imperforate damper-plate slidably mounted upon the stem exteriorly of the closure to normally close the perforations thereof and capable of yielding under excess gas-pressure to open said perforations.

9. In a stove, the combination with the stove-body having a fire-box for burning fuel, of a gas-relief passage communicating between the fire-box and the external air, a pivotal perforate closure for the outer end of the passage, whereby the latter may be opened, and a yieldable damper-plate carried exteriorly by the closure to normally close the perforations thereof and capable of yielding outward under excess gas-pressure to uncover the perforations.

10. In a stove, the combination with the stove-body having a fire-box for burning fuel, of a gas-relief passage communicating between the fire-box and the external air, a pivotal conical perforate closure for opening and closing the same for the outer end of the passage, a handle projected from the apex of the closure, and a yieldable conical damper-plate slidably mounted upon the handle.

11. In a stove, the combination with the stove-body having a fire-box for burning fuel, of a gas-relief passage piercing the top of the stove and communicating with the fire-box, a perforate closure-cap movably mounted upon the top of the stove to cover and uncover the top of the gas-relief passage to give access to the interior thereof, and a damper-plate fitted upon the top of the perforate closure-cap and capable of yielding under excess gas-pressure to uncover the perforations of the cap and permit escape of the gas.

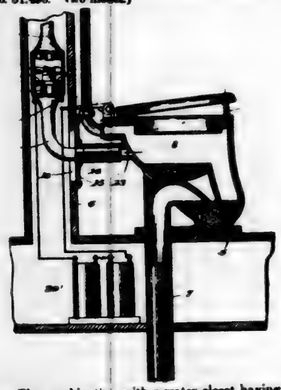
12. In a stove, the combination with the stove-body, of a gas-relief tube piercing the stove-body and having its inner end portion provided with perforations and its outer end in communication with the external air, and a gas-pressure-actuated controlling device carried by the outer end of the tube.

13. In a stove, the combination with the stove-body having inner and outer shells, of a gas-relief tube piercing the top of the stove and lying between the inner and outer shells, the adjacent portions of the tube and inner shell having registered perforations, and a gas-actuated controlling device for the upper open end of the tube.

14. In a stove, the combination with the body thereof having inner and outer shells, of a vertical gas-escape tube piercing the top of the stove and located between the inner and outer shells, the adjacent portions of the tube and inner shell being provided with registered perforations, a conical perforate closure-cap for the upper open end of the tube and also pivotally connected to the top of the stove, a shank rising from the apex of the cap and terminating in an enlarged handle, and a conical gravity damper-plate normally closing the perforations of the cap and slidably mounted upon the shank.

15. In a stove, the combination with the stove-body, of a heating-pipe piercing the same and having its discharge end projected exteriorly of the stove and provided in its top with discharge-perforations, and a combined deflector and water-receptacle comprising a hollow inverted conical imperforate deflector rising from the top of the pipe at a point between the perforations and overhanging the latter.

704,471. VENTILATOR ATTACHMENT FOR WATER-CLOSETS. SCHUYLER C. BROWN, Saratoga Springs, N. Y. Filed Mar. 16, 1901. Serial No. 51,496. (No model.)

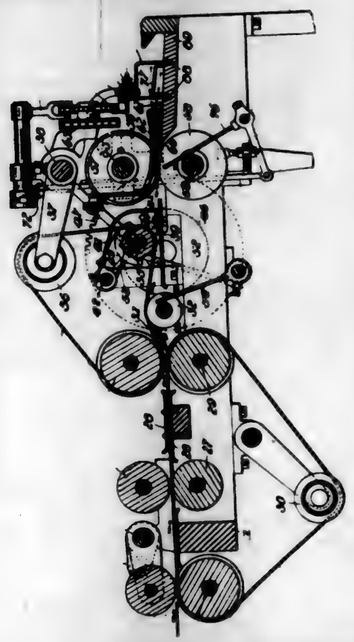


Claim.—The combination with a water-closet having a ventilating-nipple, and an adjacent hollow wall having an opening therein, of a covering-plate for the opening, a sleeve passed through the covering-plate and engaged over the nipple, a ventilating-pipe within the wall and connected with the sleeve, said pipe having an enlarged portion forming a chamber, a fan in the chamber and having a motor, and means operable by a person using the closet, for energizing the motor.

704,472. MACHINE FOR CUTTING AND COLLATING PAPER. WILLIAM Y. DEAR, Jersey City, N. J. Filed Dec. 31, 1900. Serial No. 41,668. (No model.)

Claim.—1. In a device of the character described, means for perforating paper in lines, in combination with a device for tearing the paper in strips along said perforated lines, and an apparatus for piling said strips and cutting them into blocks of sheets, substantially as described.

2. In a device of the character described, in combination with a device for tearing a sheet of paper along perforated lines into strips, apparatus for piling the said strips and cutting them into a number of blocks of sheets, and means for collecting the said blocks of sheets in their regular order, substantially as described.



3. In a device of the character described, a pair of rollers adapted to tightly press against a sheet of perforated paper passed therebetween, shield-plates, or guides, receiving the paper from the pair of rollers, and a second pair of rollers operated at a greater surface speed than the said first pair of rollers, for receiving the paper from the shield-plates and tearing it along the perforations while said perforations lie between the shield-plates, substantially as described.

4. In a device of the character described, a pair of rollers adapted to tightly press against a sheet of perforated paper passed therebetween, a second pair of rollers also tightly pressing said sheet between them and operated at a greater surface speed than the said first pair of rollers, and them adapted to tear the paper in strips along the lines of perforations, a plate adapted to receive the strips from the said roller and tapes, and a roller around which the tapes travel provided with projecting fins for adjusting the pile of strips on the said plate, substantially as described.

5. In a device of the character described, a pair of rollers adapted to tightly press against a sheet of perforated paper passed therebetween, a second pair of rollers also tightly pressing said sheet between them, and operated at a greater surface speed than the said first pair of rollers, to tear the paper in strips along the lines of perforation, a slotted plate adapted to receive the strips from the said roller and tape, a stop against which the strips are piled, and a number of fingers operating within the slots of the plate for ejecting the pile of strips when the stop is removed, substantially as described.

6. In a device of the character described, a suitably-driven roller, tapes bearing thereon, and adapted to act with the roller to advance and pile on each other strips of paper fed therebetween, a plate upon which the strips of paper are piled on leaving the roller and tapes, a stop against which the strips are piled, a second roller with projecting helical fins thereon for evening the pile of strips, a number of fingers for discharging the pile of strips from the plate, and means for removing the stop and operating the fingers, substantially as described.

7. In a device of the character described, a suitably-driven roller, tapes bearing thereon and adapted to act with the roller to advance strips of paper fed therebetween, a slotted plate upon which the strips of paper are piled on leaving the roller and tapes, stops against which the strips are piled, a guide beneath which the front edges of the strips are led, a second roller around which the tapes travel having projecting helical fins thereon for evening the pile of strips therebeneath, a number of fingers operating within the slots of the plate to discharge the pile of strips thereon, and a cam for removing the stop and operating the fingers simultaneously, substantially as described.

8. In a device of the character described, a pair of rollers adapted to tightly press against a sheet of perforated paper passed therebetween, shield-plates receiving the paper from the pair of rollers, a second pair of rollers also tightly pressing said sheet between them and operated at a greater surface speed than the said first pair of rollers and adapted to tear the paper in strips along the lines of perforation, a slotted plate to receive the strips of paper from the said roller and tapes, stops against which the strips are piled, a roller around which the tapes pass with projecting helical fins thereon for evening the pile of strips, a number of fingers operating within the slots of the plate to discharge the pile of strips therefrom, and means for removing the stop and operating the fingers simultaneously, substantially as described.

9. In a device of the character described, a shaft, a number of cutter-rolls mounted thereon, annular projecting cutting-blades located in the center of the peripheries, a pair of disks journaled beneath each cutter-roll and adapted to receive the cutter-blade therebetween, a number of pivoted arms operating between the pairs of disks, and means for operating the arms, substantially as described.

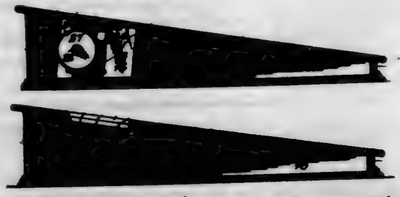
10. In a device of the character described, a shaft, a number of cutter-rolls mounted thereon, a pair of disks journaled beneath each cutter-roll and adapted to support a pile of paper strips while being cut in blocks by the cutter-rolls, a number of pivoted arms located between the pairs of disks and adapted to remove the blocks from the cutter-rolls when cut, and an inclined guide in one side of the path of each block, substantially as described.

11. In a device of the character described, a shaft, a number of cutter-rolls mounted thereon, a pair of disks journaled beneath each cutter-roll and adapted to support a pile of paper strips while being cut into blocks by the cutter-rolls, a number of pivoted arms located between the pairs of disks and adapted to remove the blocks from the cutter-rolls when cut, an inclined guide at one side of the path of each block, a number of inclined plates for receiving the blocks from the guides, and means for collecting the blocks from the inclined plates, substantially as described.

12. In a device of the character described, a shaft, a number of cutter-rolls mounted thereon, a pair of disks journaled beneath each cutter-roll and adapted to support a pile of paper strips while being cut into blocks by the cutter-rolls, a number of pivoted arms located between the pairs of disks and adapted to remove the blocks from the cutter-rolls when cut, an inclined guide in one side of the path of each block, a slotted guide located above each pivoted arm and adapted to retain the blocks in position previous to their discharge by said arms, a number of inclined plates for receiving the blocks from the guides, a suitably-operated endless chain, a lug carried thereby, a guide-rod, a sleeve slidable thereon, means on the sleeve to be engaged by the lug, and arms on the sleeve to collect the blocks from the inclined plates in regular order, substantially as described.

13. In a device of the character described, a number of inclined plates adapted to support blocks of paper sheets, a guide-rod, a sleeve slidable thereon, arms on the sleeve clearing the inclined plates, a suitably-driven endless chain, a lug thereon, an arm on the sleeve for engaging the lug to carry the sleeve along the inclined plates and collect the blocks therefrom, and a weight connected to the sleeve to retract it to its normal position on being disengaged from the lug, substantially as described.

704,478. DESK. CHARLES F. DEPLANTY, Coffeyville, Kans., assignor to Emil W. Rooney, Coffeyville, Kans. Filed Aug. 20, 1901. Serial No. 73,712. (No model.)



Claim.—1. The combination with a desk having an opening in its top, of a receptacle located beneath the opening, a follower slidably mounted in the receptacle beneath the opening, a shaft journaled across the desk, a hand secured to the shaft and having an engagement with the follower to move the same within the receptacle and toward the desk-top, and a

retracting-spring located beneath the follower and within the receptacle, said spring being fastened to the follower to move it away from the desk-top.

2. A desk having an opening in the platform thereof, a follower located beneath the opening and movable toward and from the same, manually-operated means for positively moving the follower toward the opening, and a look engaging the manually-operated means to hold the follower against movement.

3. A desk having an opening in its platform, a follower located beneath the opening and movable toward and from the same, a shaft journaled upon the desk, connections between the shaft and the follower, and means for holding the shaft against movement.

4. The combination with a desk having an opening in its top, of a receptacle located beneath the opening, a follower slidably mounted in the receptacle and having portions projecting beyond the opposite ends of the same, a shaft journaled across the desk, and connections between the shaft and the projecting ends of the follower.

5. The combination with a desk having an opening in its top, of a receptacle located beneath the opening, a follower slidably mounted in the receptacle and having portions projecting through the opposite ends of the same, a shaft journaled across the desk beneath its top and projecting from one side thereof, said projecting end being provided with a handle-knob, disks secured to the shafts at the opposite ends of the receptacle, bands secured to the disks and passing about the projecting portions of the follower, a friction-wheel attached to the shaft, a holding-spring bearing against the wheel, and a coiled spring secured to the under side of the follower for retracting the same.

704,474. CAR-WHEEL-HOLDING DEVICE. ERROM C. DEMUTH, Moberly, Mo. Filed May 5, 1902. Serial No. 106,045. (No model.)

Claim.—1. In a car-wheel-holding device of the class described, a body arranged to be inserted between the car body and wheel, said body having a wedge.

2. In a car-wheel-holding device of the class described, a body-bar, and a wedge movably mounted upon the body-bar.

3. In a car-wheel-holding device of the class described, a body-bar, and a wedge mounted upon the body-bar and slidable longitudinally thereon.

4. In a car-wheel-holding device of the class described, a body-bar, and a wedge mounted upon the body-bar and slidable longitudinally thereon, said wedge having its outer inclined face roughened.

5. In a car-wheel-holding device of the class described, a body-bar, and a wedge slidably mounted on the body-bar, said wedge having a shoe on its outer inclined face, the outer face of said shoe being roughened.

6. In a car-wheel-holding device of the class described, a body-bar having a longitudinal guideway, and a wedge-block slidably mounted upon the body-bar and having a guide element located in the guideway.

7. In a car-wheel-holding device of the class described, a body-bar having a longitudinal guideway, a guide-rod arranged in the guideway, and a wedge-block slidably mounted upon the body-bar and having opened guide elements located in the guideway and engaging the rod.

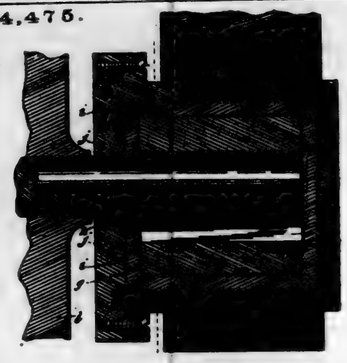
8. In a car-wheel-holding device of the class described, a body having a longitudinal guideway, a guide-rod arranged within the guideway and spaced from the side walls thereof, and a wedge-block slidably mounted upon the body-bar and having eyes located in the guideway, said eyes having openings through which the rod is passed.

9. In a car-wheel-holding device of the class described, the body-bar arranged to be inserted between the car body and wheel, said body-bar having a block slidably mounted thereon.

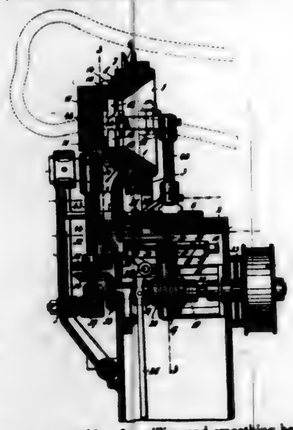
704,475. COMBINED JOURNAL-BEARING AND AIR-COMPRESSOR. CHARLES F. DU BOIS, Denver, Colo. Filed June 1, 1899. Serial No. 14,739. (No model.)

Claim.—In a combined journal-bearing and air-compressor for vehicles, the combination of the journal-box, a spindle eccentrically located within the journal-box and of smaller diameter than the latter; with slides or pistons attached to the spindle for compressing the air as the vehicle is moved forward, pipes for collecting the compressed air, and means for admitting air into the lower part of the journal-box, for the purpose and substantially as described.

704,475.



704,476. WOODWORKING-MACHINE. FRANZ DUDEK, Bielitz, and RUDOLF DEMBOWSKI, Bielitz, Austria-Hungary, assignors of one-half to Firm of G. Josephy's Erben, Bielitz, Austria-Hungary. Filed Dec. 30, 1901. Serial No. 87,202. (No model.)



Claim.—1. A machine for milling and smoothing bent or straight round wood rods or sticks for bent-wood chairs and the like comprising cutters disposed in a rotating cutter-head for milling and smoothing the blank, guide-bar in front of the cutter-head, and guiding-arms at the rear of the same for guiding the blank, an exchangeable disk with cams for controlling the movements of the cutters toward or away from the blank and for controlling the movements of the guiding organs of the blank and means actuated by the cam-disk for displacing the cutters and the guiding organs of the blank, essentially as and for the purpose stated.

2. In a machine for milling and smoothing bent or straight round wood rods or sticks for bent-wood chairs and the like comprising a rotating cutter-head, guide-bar, guiding-arms, an exchangeable cam-disk for controlling the movements of the cutters and the guiding organs, the combination of the cam-groove 35 with a rotary bell-crank lever one end of which engages in the said cam-groove and the other end a bolt rigidly connected to a standard whereby a to-and-fro movement is imparted to the said standard, essentially as and for the purpose stated.

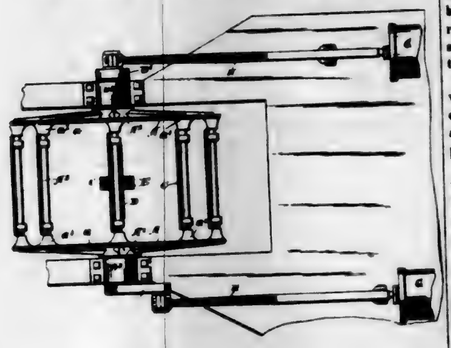
3. In a machine for milling and smoothing bent or straight round wood rods or sticks for bent-wood chairs and the like, comprising a rotating cutter-head, guide-bar, guiding-arms and exchangeable cam-disk, the combination of the cam-groove with rotary bell-crank lever, a standard to which a to-and-fro movement is imparted by the said bell-crank lever, guide-cheeks fixed in the standard and being provided with inclined slots, cutter-holders rotatable on bolts in the cutter-head and projections of the cutter-holders engaging in the said slots of the guide-cheeks, essentially as and for the purpose stated.

4. In a machine for milling and smoothing bent or straight round wood rods or sticks for bent-wood chairs and the like, comprising a rotating cutter-head, guide-bar, guiding-arms and exchangeable cam-disk, the combination of the cam-groove with a rotary bell-crank lever, standard,

guide-cheeks fixed in the standard, rotary cutter-holders, projections of the cutter-holders engaging in slots provided in the guide-cheeks, studs arranged on said standard, vertical rotary shafts with angle-piece fixed thereon and provided with slots in which the said studs engage and guiding-arms carried by the said rotary shafts which guiding-arms hold the work-piece, essentially as and for the purpose stated.

5. In a machine for milling and smoothing bent or straight round wood rods or sticks for bent-wood chairs and the like, comprising a rotating cutter-head, guide-bar, guiding-arms, exchangeable cam-disk, means for imparting to the cutters a displacement toward and away from the blank, means for displacing the guiding-arms, the combination with the flange of the cam-disk provided with a cam, of a guide-bar disposed in the front of the cutter-head and sliding on said cam the guide-bar being provided with a recess in which the blank is held, essentially as and for the purpose stated.

704,477. PADDLE-WHEEL. FRANK EHLER, Geddes, S. D., assignor, by direct and mesne assignments, to Vertical Propeller Company, Geddes, S. D. Filed Nov. 18, 1901. Serial No. 82,494. (No model.)



Claim.—1. A wheel comprising two rotative members arranged eccentrically with respect to each other, blades or paddles interposed between and pivoted to said rotative members, shafts to which said rotative members are attached, said shafts overlapping each other between the rotative members, and a rigid frame embracing laterally-separated side members with which said shafts have rotative engagement and by which said shafts are positively held in parallel relation.

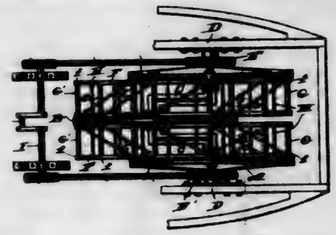
2. A wheel comprising two rotative members arranged eccentrically with respect to each other, blades or paddles interposed between and pivoted to said rotative members, shafts to which said rotative members are attached, said shafts overlapping each other between the rotative members, a rigid frame embracing laterally-separated side members with which said shafts have rotative engagement, gear-wheels attached to said shafts within said frame, and an intermediate gear-pinion mounted in said frame and intermeshing with both of said gear-wheels.

3. A wheel comprising two rotative side members arranged eccentrically with respect to each other, blades or paddles interposed between said members, and pivot-rods on the side members which extend inwardly therefrom along the upper and lower edges of said blades or paddles and which have pivotal engagement with the latter at both lateral edges thereof.

4. A wheel comprising two rotative side members arranged eccentrically with respect to each other, blades or paddles interposed between said members, and pivot-rods on the side members which extend inwardly therefrom along the top and bottom edges of the said blades or paddles and have pivotal engagement with the latter at both lateral edges thereof, said blades or paddles being considerably narrower than the space between the side members to afford wide spaces between the side edges of the blades or paddles and said side members.

5. A wheel comprising two rotative side members arranged eccentrically with respect to each other, shafts to which said side members are attached, said shafts overlapping each other between said side members and being provided with crank-arms arranged in angular relation to each other, blades or paddles interposed between and pivoted to said rotative members, a rigid frame having laterally-separated side members with which said shafts have rotative engagement, gear-wheels on the said shafts, an intermediate gear-pinion mounted in said frame and intermeshing with said gear-wheels, and two cylinders the pistons of which are severally connected with and give motion to the crank-arms on said shafts.

704,478. PADDLE-WHEEL. FRANK EHLER, Geddes, S. D., assignor, by direct and mesne assignments, to Vertical Propeller Company, Geddes, S. D. Filed Jan. 15, 1902. Serial No. 89,866. (No model.)



Claim.—1. A wheel comprising two rotative members arranged eccentrically with respect to each other, a stationary supporting-bar having parallel, offset, rigidly-connected portions on which said rotative members are mounted, means for driving one of said rotative members, pivot-rods rigidly attached to said rotative members, and connections between said pivot-rods, whereby motion given to one member is transmitted to the other.

2. A wheel comprising two rotative members arranged eccentrically with respect to each other, a stationary supporting-bar having rigidly-connected, parallel, offset portions on which the said rotative members are mounted, pivot-rods rigidly secured to the said rotative members, and paddle-frames pivotally engaging and connecting said pivot-rods.

3. A wheel comprising two rotative members arranged eccentrically with respect to each other, a rigid, stationary bar having rigidly-connected, parallel, offset portions on which the said rotative members are mounted, pivot-rods on said members, paddle-frames having pivotal engagement with said pivot-rods, and paddle-blades attached to said paddle-frames.

4. A wheel comprising two rotative members arranged eccentrically with respect to each other, a stationary supporting-bar having rigidly-connected, offset portions on which said rotative members are mounted, and one end of which is rigidly attached to a support, a hollow driving-shaft which engages one of the offset parts of the supporting-bar and to which one of said rotative members is attached, driving means applied to said hollow shaft for turning said member attached thereto, pivot-rods on the wheel members, and means connecting said pivot-rods whereby motion is transmitted from the driven to the non-driven member.

5. A wheel comprising two rotative members arranged eccentrically with respect to each other, a stationary supporting-bar having rigidly-connected, parallel offset parts on which said rotative members are mounted, said offset parts being arranged in the same horizontal plane, means applied to one of said members for driving the same, pivot-rods rigidly attached to said members, horizontally-arranged paddle-frames mounted on said pivot-rods and connecting the same, and blades rigidly attached to and extending downwardly from said paddle-frames.

6. The combination with eccentric, rotative wheel members, and paddle-frames pivotally connected therewith, said blades attached to said paddle-frames, said frames being provided with vertically-arranged side plates depending from the frames and attached to the ends of said blades.

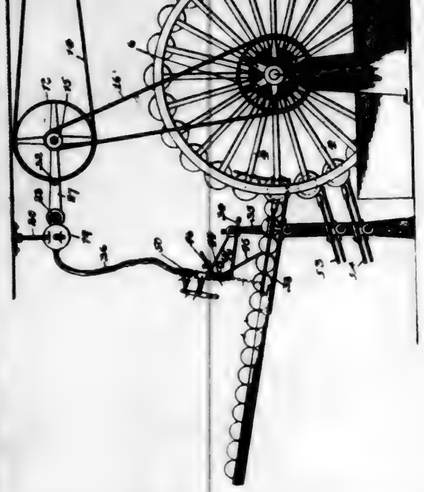
7. A wheel comprising two exterior rotative members, an intermediate, eccentric, rotative member, a stationary supporting-bar on which said exterior rotative members are mounted, said supporting-bar having a central offset part on which the intermediate member is mounted, said bar being attached at its ends rigidly to stationary supports, pivot-rods on the exterior and intermediate members and connections between said pivot-rods.

704,479. FOLLOWER-PLATE FOR TYPE-WRITING-MACHINES. CHARLES F. LAGARDE, Cleveland, Ohio, assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed June 21, 1901. Serial No. 65,499. (No model.)

Claim.—1. In a type-writing machine, the combination with a flat platen for the support of a work-sheet, of a work-engaging member shiftable over the platen, and means for effecting the return of said member to its initial position.

2. In a type-writing machine, the combination with a flat platen to support the work-sheet, of a work-engaging member shiftable over the platen in the direction of line-spacing, and means for effecting the return of said member to its initial position at the rear end of the platen.

3. In a type-writing machine, the combination with a flat platen to support the work-sheet, and designed to support traveling printing mechanism, of a work-engaging member shiftable over the platen, and means, independent of the printing mechanism, for effecting the automatic movement of said member.



5. In a type-writing machine, the combination with a flat platen to support the work-sheet, and traveling printing mechanism movable over the platen, of a follower-plate disposed over the platen for advance with the printing mechanism, and means independent of the printing mechanism for effecting the return of the follower-plate to its initial position.

6. In a type-writing machine, the combination with a flat platen, and the tracks or guides for the traveling printing mechanism, of a follower-plate slidably engaging said tracks or guides, and having means disposed for engagement with the traveling printing mechanism to effect the movement of the follower-plate through the movement of said printing mechanism.

7. In a type-writing machine, the combination with a flat platen, and the swinging tracks or guides for the traveling machine-frame, of a follower-plate having loose sliding engagement with said tracks or guides, whereby said plate will gravitate to its initial position when the tracks or guides are raised, and machine-engaging means carried by said follower-plate and disposed in the path of movement of the traveling machine-frame.

8. In a type-writing machine, the combination with the flat platen, and the swinging tracks or guides for the traveling printing mechanism, of a follower-plate having loose sliding engagement with said tracks or guides, whereby said plate will gravitate to its initial position when the tracks or guides are raised, and machine-engaging projections located above the top surface of the follower-plate.

9. In a type-writing machine, the combination with a flat platen, and the swinging tracks or guides for the traveling machine-frame, of a follower-plate having loose sliding engagement with said tracks or guides, whereby said plate will gravitate to its initial position when the tracks or guides are raised.

10. In a type-writing machine, the combination with a flat platen, and the tracks or guides for the traveling printing mechanism, of a follower-plate slidably engaging said tracks or guides and movable away from the writing-surface when said tracks or guides are elevated, and means for effecting an engagement of the follower-plate with the traveling printing mechanism to insure the advance of the follower-plate in the direction of line-spacing.

704,480. CAR-TESTING MACHINE. GEORGE F. LESSER, Chicago, Ill., assignor of three-fourths to Louis Standtke, Chicago, Ill. Filed Oct. 4, 1901. Serial No. 77,980. (No model.)

Claim.—1. The combination with a carrier, a chute adapted to direct cans to said carrier, a driving-shaft connected with said carrier, and

2. The combination with a carrier, a chute adapted to direct cans to said carrier, a driving-shaft connected with said carrier, and clutch mechanism on said shaft, of pneumatically-operated mechanism for moving said clutch mechanism into engagement to drive said shaft and said carrier, a valve controlling said pneumatically-operated mechanism, and mechanism adapted by the contact of cans in said chute to open said valve and close the same automatically when not contacted by a can, substantially as described.

3. The combination with a carrier, a chute adapted to direct cans to said carrier, a driving-shaft connected with said carrier, and clutch mechanism on said shaft, of mechanism adapted to be operated by compressed air to throw said clutch mechanism into engagement to drive said shaft and said carrier, means controlled by cans in said chute to admit air under pressure to the mechanism which operates said clutch mechanism to throw said clutch mechanism into engagement, and means to automatically release said clutch mechanism when said can-controlled means is not contacted by a can in the chute, substantially as described.

4. The combination with a carrier, a chute adapted to direct cans to said carrier, a driving-shaft connected with said carrier, and clutch mechanism on said shaft, of mechanism operated by air-pressure to throw said clutch mechanism into engagement to drive said shaft and said carrier, a valve controlling the passage of compressed air to said clutch-moving mechanism, and mechanism adapted by the contact of cans in said chute to open said valve and close the same automatically when not contacted by a can, substantially as described.

5. The combination with a carrier, a chute adapted to direct cans to said carrier, a driving-shaft connected with said carrier, a driven pulley rotatably mounted on said shaft and having upon it one member of a clutch mechanism, and a second clutch member slidingly mounted on said shaft and adapted to engage with the clutch member on said pulley, of a cylinder, a piston mounted in said cylinder and connected with said second clutch member, a tube adapted to lead compressed air to said cylinder, a valve in said tube controlling the passage of compressed air therethrough, a valve-stem adapted to be contacted by cans in said chute and open said valve to permit of the passage of compressed air to said cylinder and to automatically close said valve when not contacted by a can in said chute, and springs adapted to normally hold said clutch members out of engagement, substantially as described.

Claim.—As a new article, a bucket, having its upper part made tapering and provided with internal horizontal rubbing-surfaces, its lower part being smooth and curved outward toward the base, to deflect the splashing water toward the center of the bucket, substantially as shown and for the purposes described.

704,482. BOTTLE OR JAR. EDWARD L. LIVINGSTON, New York, N. Y., assignor to Ralph W. Hare, trustee, Brooklyn, N. Y. Filed July 5, 1901. Serial No. 67,102. (No model.)

Claim.—1. The combination of two screw-threaded bodies having threads with substantially flat bearing-surfaces and intervening grooves materially greater in size than the said threads, as and for the purpose set forth.

2. The combination of two screw-threaded bodies having threads with substantially flat bearing-surfaces in cross-section and intervening grooves materially greater in size than the said threads, and an elastic body mounted between said bodies, as and for the purpose set forth.

3. A bottle or jar provided with an exteriorly-screw-threaded neck having an outwardly-beveled upper end, a screw-threaded cap or cover therefor having a corresponding beveled surface interiorly thereof the grooves intervening between the threads of said neck and of said cover being greater in size than the threads in cross-section, and an elastic body mounted between said beveled surfaces, as and for the purpose set forth.

4. A bottle or jar provided with a screw-threaded neck the thread of which is substantially flat on the lower surface thereof in cross-section, in combination with a screw cap or cover therefor the thread of which is substantially flat on the upper surface thereof in cross-section, said threads being so proportioned and disposed that when in engagement a space will intervene between the spirals forming the thread of the cap and the next lower spiral forming the thread of the bottle.

5. A bottle or jar provided with a screw-threaded neck the thread of which is substantially flat on the lower surface thereof in cross-section, and rounded on the upper surface thereof, in combination with a screw cap or cover the thread of which is substantially flat on the upper surface thereof in cross-section, and rounded on the lower surface thereof, the thread of both the bottle and cover being materially less in size than the groove intervening between the spirals, as and for the purpose set forth.

6. A bottle or jar provided with a neck having an outwardly-beveled upper end, a cap or cover therefor, in combination with a cup mounted in the mouth of the bottle or jar and adapted to yield under the pressure of the contents thereof, said cup having a flange adapted to engage said beveled end, and an elastic body mounted between said flange and said cover, as and for the purpose set forth.

9. A bottle or jar provided with a neck having an outwardly-beveled upper end, a cap or cover therefor having a corresponding beveled surface, in combination with a yielding cup having a flange adapted to engage the beveled surface of said neck, and an elastic body secured between said flange and said cover, as and for the purpose set forth.

704,483. BROOM-HEAD. WILLIAM HAMFIELD, Scranton, Miss., assignor of one-half to Charles S. Hartwother, Scranton, Miss. Filed Oct. 15, 1901. Serial No. 78,709. (No model.)

Claim.—1. A coupling for handles, comprising a tubular stem or shank member, a socket member to receive the shank member, both of the members being provided with corresponding openings, and a spring-catch carried by the interior of the stem and having its free end provided with a head to snap into the corresponding openings and detachably interlock the members.

2. A coupling, comprising a tubular shank or stem having a slot, a spring-catch carried by the interior of the stem and having its free end provided with a head which is projected outwardly through the slot, one end of the head being beveled and the opposite end presenting an abrupt shoulder, and a socket to receive the shank and provided with an opening for the detachable reception of the head, whereby the parts are held against independent rotation and endwise separation.

3. A coupling for handles, comprising a tubular shank or stem member having diametrically opposite openings, spring-catches secured to the interior of the shank and having their heads projected outwardly through the respective openings, and a socket to snugly receive the shank or stem and provided with diametrically opposite openings to register with the openings of the shank or stem and detachably receive the heads of the respective spring-catches.

704,484. SYSTEM OF ELECTRIC DISTRIBUTION. CARL J. A. MICHALKE, Charlottenburg, Germany, assignor to Siemens & Halske Electric Company of America, Chicago, Ill., a Corporation of Illinois. Original application filed Dec. 31, 1897, Serial No. 665,185. Divided and this application filed Mar. 10, 1900. Serial No. 8,201. (No model.)

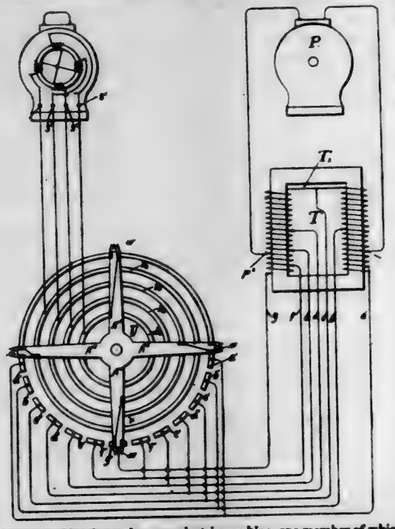
Claim.—1. In combination, a dynamo-electric machine, one member of which is provided with a plurality of angularly-displaced windings, and means for inversely varying the supply of effective current from a single-phase source to said angularly-displaced windings.

2. In combination, a dynamo-electric machine, one member of which is provided with a plurality of angularly-displaced windings, the winding on the other member being adapted to be traversed by single-phase alternating currents, a subdivided source of single-phase alternating current, and a switching device interposed between said source and said angularly-displaced windings, the switching device being constructed and arranged to inversely vary the potentials at the terminals of the said windings.

3. In combination, a dynamo-electric machine, one member of which is provided with a plurality of angularly-displaced windings, the winding on the other member being short-circuited, a subdivided source of single-phase alternating current, and a switching device constructed and arranged to supply current from said source to said windings in such a manner as to produce a progressive shifting of the field produced by said windings.

4. In combination, a dynamo-electric machine, one member of which

is provided with a plurality of angularly-displaced windings, the winding on the other member being adapted to be traversed by single-phase alternating currents, a single-phase transforming device provided with a plurality of secondary terminals, and a switching device arranged to successively vary the connection between the terminals of the transforming device and the angularly-displaced windings of the receiving device in such a manner as to produce a progressive shifting of the field generated in the member on which the angularly-displaced windings are mounted.



5. In combination, a dynamo-electric machine, one member of which is provided with a plurality of angularly-displaced windings, the winding on the other member being adapted to be traversed by single-phase alternating currents, a subdivided source of single-phase alternating current provided with a plurality of terminal leads, and a switching device arranged to successively vary the connection between the said leads and the angularly-displaced windings of the receiving device in such a manner as to produce a successive shifting of the field generated in the member upon which the angularly-displaced windings are mounted.

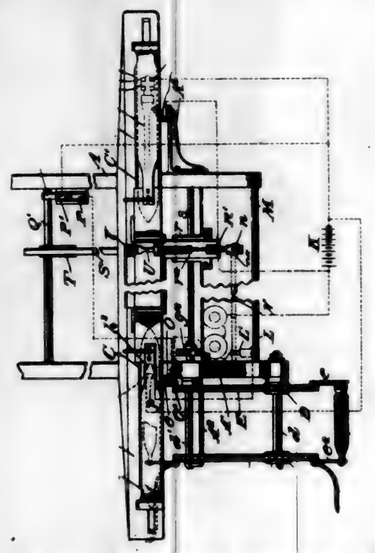
6. In combination, a dynamo-electric machine, one member of which is provided with a plurality of angularly-displaced windings, the winding on the other member being adapted to be traversed by single-phase alternating currents, a subdivided source of single-phase alternating electromotive force, and a switching device comprising two relatively movable sets of contacts, the contacts of one set being connected to said subdivided source, and the contacts of the other set to the angularly-displaced windings of the receiving device.

7. In an alternating-current system of distribution, the combination with a source of current, of a single-phase transformer provided with a winding adapted to be connected to said source, a switching means provided with contact-terminals, said contact-terminals being in electrical engagement with points of different potential upon the winding of the said transformer, a dynamo-electric machine, one of the members of which is provided with a plurality of angularly-displaced windings, and means for interconnecting the said windings with different contact-terminals of the said switching means, substantially as described.

8. In a system of distribution, the combination with a source of alternating current, of a single-phase transformer-winding, said winding being adapted for inclusion in circuit with the said source, contact-terminals, said contact-terminals being in electrical engagement with points of different potential upon the said winding, a dynamo-electric machine, one of the members of which is provided with a plurality of angularly-displaced windings, the other member being provided with a short-circuited winding, and means for interconnecting the said angularly-displaced windings with the said contact-terminals, substantially as described.

704,485. WEFT-REPLENISHING LOOM. WILLIAM H. HOOPER and FRANK R. CLARK, Augusta, Ga. Original application filed Apr. 3, 1900, Serial No. 11,518. Divided and this application filed July 27, 1902. Serial No. 29,020. (No model.)

Claim.—1. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and an auxiliary circuit partially completed by change in the electric condition of the first-named circuit.



2. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, an auxiliary circuit partially completed by change in the electric condition of the first-named circuit, and subsequently operating means for wholly completing said auxiliary circuit.

3. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and a second circuit completed by the said shuttle.

4. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and a second circuit completed by the said shuttle when in the changing position.

5. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, an auxiliary circuit partially completed by change in the electric condition of the first-named circuit and wholly completed by the shuttle.

6. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, an auxiliary circuit partially completed by change in the electric condition of the first-named circuit and wholly completed by the shuttle when the said shuttle is in the changing position.

7. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, an auxiliary circuit partially completed by change in the electric condition of the first-named circuit, and means for completing said auxiliary circuit when the shuttle is in the changing position.

8. In a loom, the combination with the lay, shuttle-boxes, shuttle and filling-changing mechanism, of means for controlling the operation of said filling-changing mechanism including electric contacts carried by said shuttle-boxes, an electric circuit including a set of said contacts and having its electric condition changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, a second circuit, and means for completing the same through another set of said contacts when the shuttle is in the feeding position.

9. In a loom, the combination with the lay, shuttle-boxes, shuttle and filling-changing mechanism, of means for controlling the operation of said filling-changing mechanism, including electric contacts carried by said shuttle-boxes, an electric circuit including a set of said contacts and having its electric condition changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and a second circuit completed by the closure of another set of contacts by the shuttle when it is in its changing position.

10. In a loom, the combination with an electromagnetically-operated changing mechanism, of means for controlling the operation thereof including an electric circuit, the electric condition of which is changed on the exhaustion of the filling to a predetermined amount, and an electromagnetic circuit making and breaking device in said circuit.

11. In a loom, the combination with an electromagnetically-operated filling-changing mechanism, of means for controlling the operation thereof including an electric circuit the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and an auxiliary circuit governed by the change in the electric condition of the first-named circuit.

12. In a loom, the combination with an electromagnetically-operated filling-changing mechanism, of means for controlling the operation thereof including an electric circuit the electric condition of which is changed upon the exhaustion of the filling in an active shuttle to a predetermined amount, and a second circuit completed by the said shuttle.

13. In a loom, a bobbin-magazine for automatically supplying bobbins to the shuttle, bobbins carried by said magazine, electromagnets operating to bring the bobbins of said magazine successively into the feeding position, an electric circuit passing through the coils of said magnets, an electric circuit governing the operation of said magnet-circuit, and means for changing the electric condition of said governing-circuit upon the exhaustion of the filling in an active shuttle to a predetermined amount.

14. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, and means operated upon the breaking of the active filling for initiating the completion of said circuit.

15. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof including an electric circuit, and means operated upon the breaking of the active filling for partially completing the said circuit.

16. In a loom, the combination with a filling-changing mechanism, of means controlling the operation thereof including an electric circuit, means operated upon the breaking of the active filling for initiating the completion of said circuit, a shuttle, and means operated by the shuttle when in the changing position for completing said circuit.

17. In a loom, the combination with a filling-changing mechanism, of means controlling the operation thereof, including an electric circuit, a filling-fork, and means operated by the filling-fork upon the breaking of the active filling for initiating the completion of said circuit.

18. In a loom, the combination with a filling-changing mechanism, of means for controlling the operation thereof, including an electric circuit, a filling-fork, means operated by the filling-fork upon the breaking of the active filling, and partially completing said circuit, a shuttle, and means operated by the shuttle for completing said circuit.

704,486. STEAM-ENGINE GOVERNOR. RALPH J. PATTERSON, Waterville, Me. Original application filed Apr. 13, 1901, Serial No. 55,603. Divided and this application filed Sept. 27, 1901. Serial No. 76,756. (No model.)

Claim.—1. In a steam-engine governor, a governor-spindle having centrifugal arms pivoted thereto, and an inertia device secured to each centrifugal arm at the pivotal point of the latter.

2. In a steam-engine governor, a governor-spindle having centrifugal arms pivoted thereto and an inertia device secured to each centrifugal arm at the pivotal point of the latter, the said inertia devices being independent from each other.

3. In a steam-engine governor, a governor-spindle having centrifugal arms pivoted thereto, and an inertia attachment for each centrifugal arm comprising an L-shaped arm having one end adapted to be detachably secured to the centrifugal arm and a weight at the other end.

4. In a steam-engine governor, a governor-spindle, arms pivoted thereto, a centrifugal weight attached to one end of said arms and an inertia device attached to the other end thereof.

5. In a steam-engine governor, a governor-spindle, centrifugal arms pivoted thereto, inertia-arms detachably secured to each centrifugal arm at the pivotal point of the latter, said inertia-arms each being bent to extend at right angles to the governor-spindle and carrying inertia-weights at their ends.

6. In a steam-engine governor, a governor-spindle, centrifugal arms pivoted thereto, an inertia-weight for each centrifugal arm, and means whereby each inertia-weight is carried entirely by its centrifugal arm.

7. In a steam-engine governor, a governor-spindle, centrifugal arms pivoted thereto, and L-shaped arms detachably secured to each of said centrifugal arms, one branch of said L-shaped arms extending in the direction of the centrifugal arms, and the other branch extending at right angles to the governor-spindle, and an inertia-weight secured to the end of each of said L-shaped arms.

8. In a steam-engine governor, a governor-spindle having centrifugal arms pivoted thereto, and an inertia device secured to each centrifugal arm, said inertia devices being independent from each other.

704,487. SPRING BUTT-HINGE. THOMAS H. PENTY and WILLIAM L. BELLARD, Cleveland, Ohio; said Penty assignor of one-half of his right to Albert B. Lynch and Charles H. Dorer, Cleveland, Ohio. Filed Oct. 9, 1901. Serial No. 78,066. (No model.)

Claim.—1. A spring butt-hinge having its leaves normally swung together and provided, at their inner side edges, with ears arranged in line longitudinally of the said edges; a torsional coiled spring interposed lengthwise between two of the said ears and having two arms projecting laterally of the same side of the spring and arranged with the leaves of the hinge between them and acting to hold the leaves swung together, and the axial pin arranged within the aforesaid ears and spring and withdrawable endwise, substantially as and for the purpose set forth.

2. A spring butt-hinge having its leaves normally swung together and provided, at their inner side edges, with ears arranged in line longitudinally of the said edges; a torsional coiled spring interposed lengthwise between two of the said ears and having two parallel or approximately parallel arms projecting laterally of the same side of the spring and arranged with the leaves of the hinge between them and acting to hold the leaves swung together, and the axial pin arranged within the aforesaid ears and spring and withdrawable endwise, substantially as and for the purpose set forth.

3. A spring butt-hinge having its leaves normally swung together and provided at their inner side edges, with ears arranged in line longitudinally of the said edges; a torsional coiled spring interposed lengthwise between and in line with two of the said ears and having two arms slid into the inner side of the different leaves, respectively, and acting to hold the leaves swung together, and the endwise-withdrawable axial pin extending through the coils of the spring and engaging the aforesaid ears interiorly, and the leaves having their inner sides grooved to accommodate the reception of the aforesaid arms of the spring.

4. A spring butt-hinge having its leaves normally swung together and provided at their inner side edges, with ears arranged in line longitudinally of the said edges, a torsional coiled spring interposed lengthwise between two of the said ears and normally under tension, which spring has its two end coils terminating in two arms projecting laterally of the same side of the spring and engaging the inner side of the different leaves, respectively, and converging from the said end coils when the spring is detached, and the endwise-withdrawable axial pin extending through the coils of the spring and engaging the aforesaid ears internally.

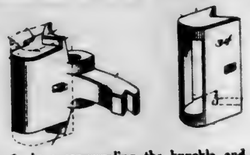
704,488. APPARATUS FOR THE MANUFACTURE OF MOLDED HOLLOW GLASS ARTICLES. PAUL T. SIEVERT, Dresden, Germany. Filed Jan. 28, 1902. Serial No. 91,544. (No model.)

Claim.—1. In an apparatus for the manufacture of molded hollow glass articles, the combination of an open mold and an undivided frame for holding a layer of plastic glass independently of the mold itself and

supporting the so-held layer on the margin of the mold while a portion of said layer within said frame sinks through said frame into the mold and molds itself therein by its own weight, substantially as herein described.

2. In an apparatus for the manufacture of molded hollow glass articles, the combination with an open mold, of an undivided and invertible frame for receiving and turning over a layer of plastic glass and supporting the so received and turned-over layer on a margin of the mold while a portion of said layer within said frame sinks through said frame into the mold and molds itself therein by its own weight, substantially as herein described.

704,489. CAR-COUPLING. JAMES R. THOMAS, St. Louis, Mo. Original application filed Mar. 5, 1901, Serial No. 50,384. Divided and this application filed Oct. 22, 1901. Serial No. 79,613. (No model.)



Claim.—1. In a car-coupling, the knuckle, and a protective cap-like wear-hood of an approximate U shape, and removably fitted over and housing therein the coupling-nose of the knuckle.

2. In a car-coupling, the knuckle, and a protective cap-like wear-hood, removably fitted over the nose of the knuckle, said hood having separate cheek portions, respectively facing the inner and outer sides of the knuckle-nose.

3. In a car-coupling, the knuckle, and a protective cap-like wear-hood removably fitted over and housing therein the coupling-nose of the knuckle, said hood being of an approximate U shape in cross-section and having inner and outer cheek members, and the coupling-nose and hood having flush-fitting and interlocking elements at the upper and lower sides of the knuckle.

4. In a car-coupling, the knuckle having its coupling-arm formed with flat side faces, a transverse shoulder on the outer side thereof, and offset angular abutments or lugs at the top and bottom edges, and a protective wear-hood of an approximate U shape, the same comprising opposite inner and outer cheek-plates, and upper and lower end pieces connecting said cheek-plates, and provided with angular engaging notches having a registering interlocking fit with said abutments or lugs, and fastening means for detachably holding the hood on the knuckle.

704,490. COMPOSITION FOR THE PRODUCTION OF VAPORS OF FORMALDEHYDE. JEAN J. A. TRILLAT, Paris, France, assignor, by mesne assignments, to Harold H. Fries and Albert Fries, constituting firm of Fries Bros., New York, N. Y. Original application filed Nov. 24, 1898, Serial No. 713,270. Divided and application filed Dec. 29, 1897, Serial No. 664,394. Again divided and this application filed June 27, 1900. Serial No. 21,756. (No specimens.)

Claim.—1. The improved composition of matter for producing formic-aldehyde vapors, comprising a substance containing formic aldehyde and a substance neutral to formic aldehyde and soluble in a solvent thereof, so that said composition in solution has a higher boiling-point than a simple formic-aldehyde solution, to the effect set forth.

2. The improved composition of matter for producing formic-aldehyde vapors, consisting of an aqueous solution containing formic aldehyde and a mineral substance neutral to formic aldehyde and soluble in a solvent thereof, so that the solution has a higher boiling-point than a simple aqueous formic-aldehyde solution, to the effect set forth.

3. The improved composition of matter for producing formic-aldehyde vapors, comprising a substance containing formic aldehyde and a neutral soluble salt of an alkali or alkaline earth, so that said composition in solution has a higher boiling-point than a simple formic-aldehyde solution, to the effect set forth.

4. The improved composition of matter for producing formic-aldehyde vapors comprising a neutral substance containing formic aldehyde and a soluble chlorid.

5. The improved composition of matter for producing formic-aldehyde vapors comprising a neutral mixture of a substance containing formic aldehyde and sodium chlorid.

6. The improved composition of matter for producing formic-aldehyde vapors consisting of a neutral solution of formic aldehyde, and a substance neutral to formic aldehyde, so that said solution has a higher boiling-point than a simple formic-aldehyde solution, to the effect set forth.

704,491. BRAKE-SHOE. GEORGE A. WOODMAN, Chicago, Ill., assignor of three-fourths to Thomas R. Kirby, Frederick W. Renshaw, and H. V. Kuhlman, Chicago, Ill. Filed Apr. 5, 1902. Serial No. 101,552. (No model.)

Claim.—1. A brake-shoe, having a back plate provided at its ends with guides for the brake-head.

2. A brake-shoe, having a back plate and guides for the brake-head formed out of the back plate.

3. A brake-shoe, having a back plate and guides for the brake-head formed out of the back plate inside of the end edges thereof.

4. A brake-shoe, having a back plate and outwardly-extending projections cut and stamped up from the plate to form guides for the brake-head, said projections leaving openings to receive the metal of which the body of the shoe is formed.

5. A brake-shoe, having an attaching-lug and a back plate, said plate being struck up beneath the lug to form the inner wall of the opening in the lug.

6. A brake-shoe, having an attaching-lug and a back plate, said plate being provided with a protuberance forming the inner wall of the opening in the lug.

7. A brake-shoe, having an attaching-lug and a back plate, said plate being provided beneath the lug with continuous side edges and inward projections within said side edges.

8. A brake-shoe, having an attaching-lug and a back plate, said plate being provided between its side edges beneath the lug with inward projections and an outward protuberance.

9. A brake-shoe, having an attaching-lug and a back plate, and projections cut and stamped up from the plate beneath the lug, said projections leaving openings inclosed by the side edges of the plate to receive the metal of which the body of the shoe is formed.

10. A brake-shoe, having an attaching-lug and a back plate, said plate being provided with a protuberance to form the inner wall of the opening in the lug and having inward projections at or about its center and outward projections at its ends stamped up therefrom and leaving openings to permit the metal of which the body of the shoe is formed to flow thereinto and form locking connection with the projections.

11. A brake-shoe having a back plate provided with oppositely-disposed inwardly-directed angular projections between its center and its ends.

12. A brake-shoe, having a back plate provided with inwardly-directed angular projections stamped out of the plate and permitting the metal of which the body of the shoe is formed to form locking engagement therewith.

REISSUES.

12,008. EYELET. JOHN C. RHODES, New Bedford, Mass., assignor, by mesne assignments, to J. C. Rhodes & Co., Incorporated, a Corporation of Maine. Filed Jan. 11, 1902. Serial No. 89,386. Original No. 565,091, dated Aug. 4, 1896.

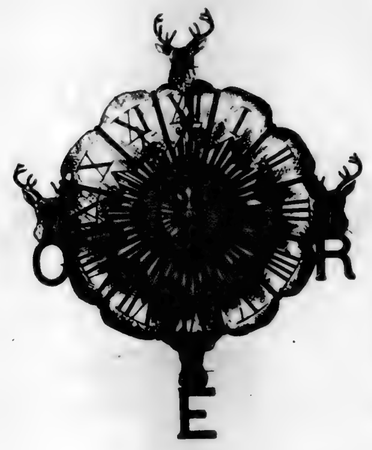
Claim.—1. A coated eyelet, as described, consisting of a tubular body rolled outwardly and over at one end to form a flange, presenting within the same a smooth flaring entrance, the peripheral edge of the said flange being turned or bent abruptly at an angle to form a ring-like seat-lip outside the body, and adapted to rest upon the material in which the eyelet is set, to thereby receive the setting pressure and stiffen the eyelet-flange to prevent cracking of its surface or finishing coating, said eyelet also having a plurality of lines of weakness at its clenching end, substantially as described.

2. A coated eyelet as described, consisting of a tubular body, open at both ends and provided at one end with an outwardly-flaring face-flange having its outer or peripheral portion turned downwardly outside the body, said downwardly-turned portion resting upon the face of the material and provided with a laterally bent or turned strengthening-lip outside the body to hold the eyelet-face in proper form against the setting thrust and thereby prevent cracking of a hard surface-coating, substantially as described.

3. A coated eyelet as described consisting of an open tubular body, thinned at one end, and provided at the other with an outwardly-flaring face-flange having its outer or peripheral portion abruptly turned downwardly outside the body, said downwardly-turned portion seated upon the face of the material and provided with a laterally bent or turned strengthening-lip outside the body to hold the eyelet-face in proper form against the setting thrust and thereby prevent cracking of its hard surface-coating, substantially as described.

DESIGNS.

35,973. BADGE. AUGUSTUS R. LYON, Salt Lake City, Utah. Filed May 16, 1902. Serial No. 107,692. Term of patent 7 years.



Claim.—The ornamental design for a badge, substantially as shown and described.

35,974. HANDLE FOR SPOONS, FORKS, OR SIMILAR ARTICLES. HENRIK HILLSON, Wallingford, Conn., assignor to R. Wallace & Sons Mfg. Co., Wallingford, Conn., a Corporation. Filed May 12, 1902. Serial No. 107,643. Term of patent 7 years.

Claim.—The ornamental design for a handle for a spoon, fork or similar article as herein shown and described.

35,975. HANDLE FOR SPOONS, FORKS, OR SIMILAR ARTICLES. HENRIK HILLSON, Wallingford, Conn., assignor to R. Wallace & Sons Mfg. Co., Wallingford, Conn., a Corporation. Filed May 12, 1902. Serial No. 107,644. Term of patent 7 years.

Claim.—The ornamental design for a handle for a spoon, fork or similar article as herein shown and described.

35,976. BOTTLE. WILLOUGHBY M. MCCORMICK, Baltimore, Md. Filed June 5, 1902. Serial No. 110,392. Term of patent 7 years.

Claim.—The ornamental design for a bottle herein shown and described.

35,977. PAPER BOX. PHINEAS B. MYERS, Morristown, N. J. Filed June 10, 1902. Serial No. 111,078. Term of patent 7 years.

Claim.—The ornamental design for a paper box, substantially as herein shown and described.

TRADE-MARKS

REGISTERED JULY 8, 1902.

38,564. CLOTHS AND STUFFS OF WOOL, WORSTED, OR HAIR. WM. FULTON & SONS, LTD., Paisley, Scotland. Filed May 22, 1902.

KEYMO

The word "KEYMO." Used since November, 1901.

38,565. SHEETINGS. SELTON MILLS, Belton, S. C. Filed May 27, 1902.

A representation of a Chinese school-master and two pupils, the school-master being seated in a chair before a table, while the pupils occupy seats upon the opposite side of the table. Used since January, 1902.

38,566. BOOTS AND SHOES. PERKINS, HARDY & CO., West Derry, N. H., and Boston, Mass. Filed Dec. 13, 1901.

The words "BIG RED APPLE" and the pictorial representation of an apple. Used since December 1, 1900.

38,567. BOOTS AND SHOES. UNITED WORKINGMEN'S BOOT AND SHOE COMPANY, San Francisco, Cal. Filed May 31, 1902.

ORO

The word "ORO." Used since December, 1901.

38,568. RUBBER HEELS FOR BOOTS AND SHOES. PLYMOUTH RUBBER CO., Stoughton, Mass. Filed June 4, 1902.

NERV-EZE

The hyphenated word "NERV-EZE." Used since May 12, 1902.

38,569. CERTAIN NAMED WALL HANGINGS AND COVERINGS. FREDK. WALTON & CO., LIMITED, Sunbury Common, England. Filed Feb. 26, 1902.

LINOID

The word "LINOID." Used since December, 1901.

38,570. HAIR, NAIL, TOOTH, AND FLESH BRUSHES. FLORENCE MANUFACTURING COMPANY, Northampton, Mass.; New York, N.Y., and Chicago, Ill. Filed Apr. 28, 1902.

The representation of a red Greek cross. Used since April 21, 1902.

38,571. HAIR, NAIL, TOOTH, AND FLESH BRUSHES. FLORENCE MANUFACTURING COMPANY, Northampton, Mass.; New York, N.Y., and Chicago, Ill. Filed Apr. 28, 1902.

PROPHYLACTIC

The word "PROPHYLACTIC." Used since 1885.

38,572. RUBBER TIRES. THE GOODYEAR TIRE AND RUBBER COMPANY, Akron, Ohio. Filed May 26, 1902.

THE BROADWAY

The words "THE BROADWAY." Used since September 24, 1901.

38,573. GLASS LAMP-CHIMNEYS, GLASS LANTERN-GLOBES, AND GLASS REFLECTORS. GILL BROTHERS COMPANY, Steubenville, Ohio. Filed June 9, 1902.

The representation of a coronet. Used since November, 1900.

38,574. GLASS LAMP-CHIMNEYS, GLASS LANTERN-GLOBES, AND GLASS REFLECTORS. GILL BROTHERS COMPANY, Steubenville, Ohio. Filed June 9, 1902.

CORONET

The word "CORONET." Used since November 1, 1900.

38,575. POULTRY. CLARINDA POULTRY, BUTTER & EGG CO., Clarinda, Iowa. Filed May 28, 1902.

GOLDEN

The word "GOLDEN." Used since October 1, 1900.

38,576. SOAP. SWIFT AND COMPANY, Chicago, Ill. Filed Oct. 4, 1901.

BANNER

The word "BANNER." Used since 1891.

38,577. GINGER-SNAPS. FRANK GOSS, Manchester, Conn. Filed Mar. 15, 1901.

The representation of a landscape with a house, a well-curb and sweep, and a tree in the background, a fence in the foreground, and a fence in the middle foreground. These pictorial representations are arranged within a circumscribing circle. Used since January 1, 1901.

38,578. PEPSIN CHEWING-GUM. FREEPORT NOVELTY COMPANY, Freeport, Ill. Filed June 9, 1902.

Goo-Goo

The hyphenated word "Goo-Goo." Used since February 3, 1902.

38,579. CHOCOLATE-COVERED MOLASSES CHIPS. WILLIAM SHERMAN TROWBRIDGE, Mendville, Pa. Filed Apr. 28, 1902.

38,579.

The words "THE TWENTIETH CENTURY," printed in red ink between the representation of two cocoa-trees. Used since October 20, 1901.

38,580. SMOKING-TOBACCO, CHEWING-TOBACCO, CIGARS, CHEROOTS, CIGARETTES, AND SNUFF. FRANCES ELIZABETH VAN RAALTE, London, England. Filed Dec. 31, 1901.

CAPITAN GENERAL

The words "CAPITAN GENERAL." Used since January, 1883.

38,581. COMPLEXION COMPOUNDS IN TABLET, SOAP, AND POWDER FORM. ROBERT HENRY SMITH, Los Angeles, Cal. Filed Mar. 17, 1902.

Klear Skin

The hyphenated word "KLEAR-SKIN." Used since October 1, 1901.

38,582. CERTAIN NAMED MEDICINES AND MEDICINAL PLASTERS. ALEX. SEIDLER, Newark, N. J. Filed Feb. 24, 1902.

Smith Sisters.

The portraits of the two Smith sisters, who are named, respectively, Alice E. Smith and Ethel F. Smith, standing at opposite sides of a table on which is placed a filtering apparatus. The Smith sister at the right of the table has in her hand a pestle, which is being operated in a mortar. The Smith sister to the left of the table is shown in the act of pouring a liquid from a graduate into a vessel which is standing on a gas-stove, and the term "SMITH SISTERS" is arranged above the picture. Used since January 1, 1902.

38,583. REMEDIES FOR NERVOUS DISEASES AND DISEASES OF THE STOMACH, LIVER, AND BOWELS. THE MURNA MEDICAL COMPANY, Winchester, Va. Filed May 3, 1902.

MURNA

The word "MURNA." Used since April 22, 1902.

38,584. INTERNAL REMEDIES FOR CERTAIN NAMED DISEASES. JOHN B. FLINT, Cleveland, Ohio. Filed Apr. 7, 1902.

M. M. Co.

The representation of St. Benedict and the letters "M. M. Co.," St. Benedict being shown as holding a crook or staff and also holding a chalice in one hand, from which a snake is emerging, and a book in the other hand. Used since July 15, 1901.

38,585. CERTAIN NAMED MEDICAL COMPOUNDS. AUSTIN V. H. SPRAGUE, New York, N. Y. Filed Apr. 16, 1902.

ST. LUKE

The abbreviation and word "ST. LUKE." Used since January 1 1902.

38,586. CARBONED PAPER. THE GENERAL MANIFOLD COMPANY, Franklin, Pa. Filed May 24, 1902.

A circular figure having superimposed thereon a triangular figure consisting of an interior solid triangle and an outer triangle, with the representation of quilled pens arranged within and adjacent to the inner periphery of the circle and the representation of an ink-bottle in the apex of the inner triangle. Used since May 10, 1902.

38,587. CERTAIN NAMED SPORTING GOODS. P. GOLDSMITH'S SONS, Cincinnati, Ohio. Filed Jan. 20, 1902.

Two concentric circles, between which is arranged a wreath, and within the inner circle is arranged a Maltese cross, from which lines radiate, giving somewhat of a sunburst effect, some of the radiating lines extending beyond the inner circle. Used since September 23, 1901.

38,588. LUBRICANT. WILLIAM F. DOWNS, Jersey City, N. J. Filed May 27, 1902.

LUBRIPHITE

The word "LUBRIPHITE." Used since May 8, 1902.

38,589. LUBRICATING-OILS. GALENA-SIGNAL OIL COMPANY, Franklin, Pa. Filed May 26, 1902.

The pictorial representation of a steam-railway locomotive. Used since 1873.

38,590. LUBRICATING-OILS. GALENA-SIGNAL OIL COMPANY, Franklin, Pa. Filed May 26, 1902.

GALENA G

The word "GALENA," together with the representation of a star inclosing the letter "G." Used since December, 1870.

38,591. SMALT. WEBSTER C. BEERS, New York, N. Y. Filed June 7, 1902.

OSMALTO

The word "OSMALTO." Used since May 21, 1902.

38,592. SMALT. WEBSTER C. BEERS, New York, N. Y. Filed June 7, 1902.

EXTROID

The word "EXTROID." Used since May 21, 1902.

38,593. MINERAL PAINTS. MOHAWK PAINT AND CHEMICAL CO., New York, N. Y. Filed May 27, 1902.

FEROX

The word "FEROX" inclosed within a diamond-shaped figure. Used since May 12, 1902.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

READ v. SCOTT.

Decided June 20, 1902.

1. INTERFERENCE—PATENT AND APPLICATION—REISSUE APPLICATION—CLAIMS REJECTED AND CANCELED.

Where one interference is declared between a pending application of S. and a patent to R. and another interference is declared between the said pending application of S. and an application for a reissue of the patent to R., *Held* that on a consolidation of the two interferences the same will continue as to counts corresponding to claims in the patent, even though these claims were originally presented in the reissue application and subsequently canceled therefrom on reference to an English patent to S.

2. REISSUE APPLICATION—REJECTION OF CLAIMS CORRESPONDING TO THOSE IN ORIGINAL PATENT—EFFECT ON VALIDITY OF ORIGINAL PATENT.

The cancellation of claims in a reissue application which correspond to the claims of the patent which it is sought to reissue has no effect upon the claims in the patent while the reissue application is still pending in the Patent Office. (*The McCormick Harvesting Machine Co.* v. *Aultman & Co.*, 82 O. G., 1988.)

APPEAL on motion.

PRINTING AND FOLDING MACHINE.

Patent granted George F. Read December 26, 1899, No. 639,770. Application for reissue filed December 24, 1901, No. 87,137. Application of Walter Scott filed February 19, 1897, No. 624,266.

Messrs. Philipp, Sawyer, Rice & Kennedy for Read.

Mr. Richard W. Barkley for Scott.

ALLEN, *Commissioner:*

This is an appeal by Scott from the decision of the Examiner of Interferences denying his motion for judgment of priority of invention defined in counts 2 and 4 of the above-entitled interference.

The records show that this interference, No. 20,844, was originally declared between a patent, No. 639,770, to Read and an application of Scott, Serial No. 624,266, and that the issue included six counts. Subsequently Read filed an application for a reissue of his Patent No. 639,770, and another interference, No. 21,689, was declared between said reissue application of Read and the application of Scott already involved in the said prior interference. The issue in this second interference included two counts. The reissue application as originally filed contained a series of new claims, as well as the claims corresponding to the six counts of the interference in which his patent was involved. Before the second interference was declared Read canceled two of the claims from his reissue application, which corresponded to two of the counts of the prior interference, on a rejection of them by the Primary Examiner on an English patent to Scott, No. 7,860 of 1896.

It is upon these two counts that Scott now moves for an award to him of judgment of priority of invention. Scott contends that Read has conceded priority of invention to him as to these two counts by canceling the claims corresponding thereto from his reissue application after they had been rejected by the Primary Examiner on the English patent to Scott above referred to. Counsel for Read contends that no such assumption is warranted, which contention is a sound one.

The rules nowhere provide for a determination of an interference after it has been once declared on a mere cancellation of the claims. (Rules 107 and 125.) Moreover, a claim cannot be canceled from an application involved in an interference by the mere filing of an amendment to that effect. (Rule 130.) The two claims in question were canceled from the reissue application before said application was declared to be involved in an interference. This act of itself can have no effect upon the two claims which remain in the patent.

The two interferences have been consolidated under No. 20,844 on motion by Scott, which motion was concurred in by Read. The counts of the issue in the consolidated interference therefore correspond to two claims in Read's patent and six claims in his application for the reissue of said patent and the eight claims in Scott's application, which correspond, respectively, to the two claims in the patent to Read and the six claims in Read's reissue application.

That this must be so necessarily follows from what was said by the Supreme Court of the United States in *The McCormick Harvesting Machine Co.* v. *Aultman & Co.*, (82 O. G., 1988.) In this case the Court answered the following question, certified to it by the circuit court of appeals, in the negative:

If the owner of a patent applies to the Patent Office for a reissue of it, and includes among the claims in the application the same claims as those which were included in the old patent, and the Primary Examiner rejects some of such claims for want of patentable novelty, by reference to prior patents, and allows others, both old and new, does the owner of the patent, by taking no appeal and by abandoning his application for reissue, hold the original patent, the return of which he procures from the Patent Office, invalidated as to those of its claims which were disallowed for want of patentable novelty by the Primary Examiner in the proceeding for reissue?

In answering this question the Court said:

* * * Until the amended patent shall have been issued the original stands precisely as if a reissue had never been applied for, (*Allen* v. *Kulp*, C. D., 1897, 472; 79 O. G., 1523; 166 U. S., 501, 503,) and must be returned to the owner upon demand. * * * It is true that it was within his (the Examiner's) power to reject any claims contained in the application for a reissue which he judged to be invalid, whether contained in the original patent or not. It is also true that the reasons given for the rejection of such claims might apply equally to the same claims contained in the original patent; but with respect to such claims he was *functus officio*. * * *

Our conclusion upon the whole case is that, upon the issue of the original patent, the Patent Office had no power to revoke, cancel or annul it. It had lost jurisdiction over it, and did not regain such jurisdiction by the application for a reissue. Upon application being made for such reissue the Patent Office was authorized to deal with all its claims, the originals as well as those inserted first in the application, and might declare them to be invalid, but such action would not affect the claims of the original patent, which remained in full force, if the application for a reissue were rejected or abandoned.

It is held, therefore, that inasmuch as counts 2 and 4 correspond to claims in Read's patent they still constitute counts of this consolidated interference, notwithstanding the fact that they were again presented in Read's application for a reissue of his patent and canceled therefrom because they were rejected by the Examiner on reference to Scott's English patent.

The decision of the Examiner of Interferences is affirmed.

EX PARTE HOLOPHANE GLASS COMPANY.

Decided June 20, 1902.

1. TRADE-MARK—PATENTED ARTICLE—"HOLOPHANE"—NOT REGISTRABLE.

The word "Holophane" alone is not registrable as a trade-mark for prismatic glass, for the reason that it is the name of the patented article in connection with which the mark is used and for the further reason that the word is shown to have been used as the name of the article long prior to any date of use which is set up by the present applicant.

2. SAME—NAME AND ARBITRARY SYMBOL—NOT REGISTRABLE.

Where it appears that the word "Holophane" alone is not registrable, it cannot be made registrable by association with an arbitrary symbol. (*Ex parte Farnum and Company*, 18 O. G., 412.)

ON appeal.

TRADE-MARK FOR PRISMATIC GLASS.

Application filed December 21, 1901, No. 64,726.

Mr. Wallace A. Bartlett for the applicant.

ALLEN, *Commissioner:*

This is an appeal from an action of the Examiner of Trade-Marks refusing to register the word "Holophane" borne on the face of a seal or notched edged disk as a trade-mark for pressed glassware for illuminating purposes.

It appears that the word "Holophane" is the name of the patented article in connection with which the mark now under consideration is used. This word was used as the name of the article long prior to any date of use which is set up by the present applicant, as is shown by the French patent to Psaroudaki, No. 233,140, September 30, 1893. This word alone is not registrable to this applicant. See the decisions of the Supreme Court of the United States in *Singer Manufacturing Company* v. *June*, (75 O. G., 1703,) *The Holzapfel's Composition Company, Ltd.*, v. *Rahtjens American Composition Company*, (97 O. G., 958,) and the Commissioner's decision in *ex parte Velvril Company, Ltd.*, (84 O. G., 807.) Since, therefore, this word alone is not registrable, it cannot be made registrable by association with an arbitrary symbol. (*Ex parte Farnum and Company*, 18 O. G., 412.)

The mark as shown is not registrable. The action of the Examiner, therefore, refusing registration was right, and it is affirmed.

EX PARTE THE ALADDIN GAS LIGHT COMPANY.

Decided June 25, 1902.

TRADE-MARK—GOODS OF THE SAME CLASS—LAMPS AND BICYCLE-LAMPS.

A trade-mark for gas or vaporizing lamps, except bicycle-lamps, refused registration in view of substantially the same mark registered for bicycle-lamps, since the goods are of the same class and the use of the same mark by different owners will mislead the purchasing public.

ON appeal.

TRADE-MARK FOR LAMPS, ETC.

Application filed February 17, 1902, No. 65,126.

Mr. E. G. Siggers for the applicant.

ALLEN, *Commissioner:*

This is an appeal from an action of the Examiner of Trade-Marks refusing to register the word "Aladdin" as a trade-mark for gas or vaporizing lamps that generate gas or vapor from gasolene and similar hydrocarbons and burn the same; also, lighting systems in which the gas is generated from gasolene and similar hydrocarbons and having a plurality of burners at which said gas or vapor is burned to produce artificial light.

Registration has been refused in view of the prior registration to Eno, No. 27,581, December 31, 1895, of the words "Aladdin's Lamp" and a pictorial representation for bicycle-lamps.

Applicant expressly excludes bicycle-lamps from the goods to which his mark is applied.

The use of the word "Aladdin" alone in place of the registered mark above described on goods of the same class would tend to mislead and deceive the purchasing public, since the marks are so similar that it would be supposed that they designate goods of common origin. It is to be determined, therefore, whether or not bicycle-lamps are included in the same class of goods with lamps generally.

The word *class* as it is used in the statute relating to trade-marks means that—

genus which includes as species such goods as if exposed to the purchasing public side by side with the "particular" goods to which the trade-mark has been applied will result in the "deception" mentioned in section 8 of the statute, whereby the purchasing public, misled by the application of a single title to the various "particular" goods comprised within the class, will conclude that they have originated from the same source and will purchase one under the impression that it was made by the maker of the other. (*Ex parte Crown Distilleries Co.*, 98 O. G., 2590.)

Undoubtedly bicycle-lamps and lamps are goods of the same class as above defined. Bicycle-lamps are commonly made by makers of lamps generally, and the purchasing public seeing the same mark applied to each would naturally suppose them to be products of the same maker. A registration which will lead to this result should not be granted.

The action of the Examiner of Trade-Marks was right, and it is affirmed.

EX PARTE THE LAXAKOLA COMPANY.

Decided June 25, 1902.

TRADE-MARKS — ANTICIPATION — "DERMAKOLA" AND "DERMACURA."

The word "Dermakola" should not be refused registration upon the registered word "Dermacura" in view of the difference in the sound of the words and in view of the difference in appearance due to the style in which they are printed.

ON appeal.

TRADE-MARK FOR PROPRIETARY MEDICINES.

Application filed November 27, 1901, No. 64,578.

Mr. E. G. Siggers for the applicant.

ALLEN, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing to register the word "Dermakola" as a trade-mark for an ointment for the skin. The word is shown in the facsimile and is described as printed in script type on a red band extending diagonally across a circular field, the upper and lower zones of the field being also red, leaving tapering white sections on opposite sides of the band.

Registration has been refused in view of the prior registration to Blackstone, No. 18,936, February 3, 1891, of the word "Dermacura," applied to an ointment.

The question presented in this case is: Does the mark for which registration is sought so nearly resemble the prior registered mark as to cause confusion or mistake in the mind of the public? In considering this question, as was stated in *ex parte Vogel and Son*, (99 O. G., 2321)—

* * * the appearance of the marks is as important as the sound of the words used therein when these words are spoken. Both senses are to be used in determining the question whether or not one mark so nearly resembles the other as to have the tendency to mislead and to cause confusion in the minds of the purchasing public.

In the case now under consideration the mark for which registration is sought has to the eye an appearance so decidedly different that no person of ordinary intelligence would mistake one for the other. The word "Dermakola" is believed to be so distinct in sound as well as in meaning from "Dermacura" that no one would mistake one for the other. This conclusion is strengthened by the fact that numerous registrations have been granted for compound words of this class in which the elements "cu'a," "kola," and "derma" appear. This class of words is therefore well known to the purchasing public, and the distinctions between them are recognized.

It is believed that there are differences between the registered mark and that presented in this case which are sufficient to warrant the grant of registration.

The action of the Examiner of Trade-Marks is reversed.

EX PARTE MAGNUS METAL COMPANY.

Decided June 25, 1902.

TRADE-MARK—"GALENA"—REGISTRABLE.

The word "Galena" as a trade-mark for manufactured metals *Held* to be registrable on the ground that while it has a limited geographical significance and is also descriptive of lead sulfid its arbitrary significance when used in connection with antifriction metals is so far predominating that it will be so understood by the public.

ON appeal.

TRADE-MARK FOR MANUFACTURED METALS.

Application filed January 17, 1902, No. 64,880.

Messrs. Peirce & Fisher for the applicant.

ALLEN, *Commissioner:*

This is an appeal from an action of the Examiner of Trade-Marks refusing to register as a trade-mark for an antifriction metal a mark described as consisting of—

the word "Galena" inclosed within a diamond-shaped border, this word being formed of letters of different heights so that the space covered by said letters shall be of a general diamond-shaped outline.

The Examiner has objected to the registration of the word "Galena" because, in his opinion, it is either descriptive of the goods to which it is applied or deceptive, and, further, because it is geographical.

It is true that the word "Galena" is the name of one of the principal lead ores—viz., lead sulfid. It is also true that some antifriction metals contain lead in their composition; but it is not believed that the purchasing public would ever take the word "Galena" as applied to antifriction metals as indicating that galena or lead sulfid forms a part thereof, because, as is well known, such lead sulfid is not suitable for such a use. The word, therefore, is not descriptive and necessarily not deceptive.

This word has also a geographical meaning. It is the name of a small town in the United States. It is not, however, one of those words which are used merely as designating locality. As used in connection with antifriction metals its arbitrary significance is predominating. The purchasing public would not understand it as indicating the place of origin, especially in view of the fact that applicants do not carry on their business at any place called "Galena," but at Buffalo, N. Y.

The decision of the Examiner of Trade-Marks is reversed.

BECK *v.* LONG.

Decided June 26, 1902.

1. APPEAL TO EXAMINERS-IN-CHIEF—MISTAKE—REQUEST TO TRANSFER THE APPEAL TO COMMISSIONER AFTER EXPIRATION OF LIMIT OF APPEAL REFUSED.

Where an appeal has been taken to the Examiners-in-Chief from the decision of the Examiner refusing to dissolve an interference and it appears that the appeal was taken by mistake, *Held* that said appeal cannot be transferred to the Commissioner's docket after the limit of appeal has expired, for such a proceeding would have the effect of permitting an appeal to the Commissioner after the limit of appeal has expired.

2. SAME—SAME—PRACTICE.

In the event that an appeal in an interference proceeding is taken by mistake to the Examiners-in-Chief and the mistake is not discovered until after the limit of appeal has expired, *Held* that the proper practice to pursue is to withdraw the appeal to the Examiners-in-Chief and to file an appeal to the Commissioner, at the same time requesting an extension of the limit of appeal to include the date of filing. The reasons should be set forth why the appeal was not taken to the Commissioner sooner, and a copy of the paper should be served upon the opponent.

ON request.

ACETYLENE-GENERATOR.

Application of Charles W. Beck filed September

21, 1896, No. 606,492. Application of David N. Long filed August 25, 1900, No. 28,068.

Messrs. Davis & Davis for Beck.

Mr. Ernest W. Bradford for Long.

ALLEN, *Commissioner:*

This is a request by Long that an appeal taken by him to the Examiners-in-Chief from a decision of the Primary Examiner denying his motion for a dissolution of the interference be transferred to the Commissioner's docket and considered as an appeal to the Commissioner.

No precedent for the action requested is cited and it would be wholly irregular at this time after the limit of appeal from the Examiner's decision has expired. Long seems to think now that he made a mistake in taking the appeal to the Examiners-in-Chief instead of to the Commissioner, and from an indorsement by the Examiners-in-Chief upon the present request it seems that they are of the same opinion, although the appeal has not been heard and disposed of by them. To now transfer the appeal to the Commissioner's docket would have the effect of permitting an appeal to the Commissioner after the limit of appeal has expired. Beck is entitled to a hearing upon the question whether this shall be done, and aside from other considerations the present request is irregular in that no notice of it was served upon him.

Long's proper course in order to make the proceedings regular would be to withdraw his appeal to the Examiners-in-Chief and to file an appeal to the Commissioner, at the same time requesting an extension of the limit of appeal to include the date of filing. He should set forth the reasons why the appeal was not taken to the Commissioner sooner and should serve a copy of the papers upon his opponent.

The request is denied.

EX PARTE BURROWES.

Decided June 27, 1902.

DIVISION—STAND FOR BILLIARD-TABLES—ADJUSTING DEVICE FOR LEVELING THE TOP OF THE TABLE.

Division should not be required between a claim for a stand for a billiard-table and a claim covering the stand in combination with the table-adjusting device.

ON petition.

GAME-BOARD STAND.

Application of Edward T. Burrowes filed February 7, 1902, No. 92,953.

Mr. L. S. Bacon for the applicant.

ALLEN, *Commissioner:*

This is a petition from a decision of the Examiner requiring division between the claims of the above-entitled application.

The invention covered by the claims is a folding stand for pool or billiard tables. The stand is provided with adjusting devices for leveling the top of the table upon which games are played.

Claims 1 to 5, inclusive, include the adjusting means as an element, in combination with the side bars, while claims 6 to 10, inclusive, cover the stand without the adjusting devices.

It is true that leveling devices alone for billiard-tables are classified separately from the table structure; but when the levelers are made a part of the combination, as in the case now under consideration, this combination is classified with the table structure and not with levelers.

In the present case there are no separate claims for the leveler which can be separated from the claims for the table structure. Hence division should not be required.

The petition is granted.

EX PARTE DAVIN.

Decided June 27, 1902.

1. DRAWING—RULE 50 DEFINED.

Where the specification describes the grain of wood as running lengthwise and this feature is included in the claims, the drawing should show the same, since the rules require that the drawing must show every feature of the invention covered by the claims. (Rule 50.)

2. DRAWING—RULE 50 DISTINGUISHED FROM RULE 51.

Where the grain of wood is an essential feature of the invention, the requirement that the drawing should show the same is not inconsistent with the requirement of the fourth section of Rule 51, which states that imitations of wood in surface-graining should not be attempted.

3. COMBINATION CLAIM—INTANGIBLE ELEMENT SHOULD NOT BE INCLUDED.

An "opening" should not be made a positive or direct element in combination claims, for the reason that an opening is not a tangible thing. It can exist only in connection with some other element. If it is desired to describe this element as provided with an opening, there is no objection to such a course.

ON petition.

BUSHINGS FOR WHEELS AND PULLEYS.

Application of Walter W. Davin filed March 25, 1902, No. 99,943.

Mr. Wallace A. Bartlett for the applicant.

ALLEN, *Commissioner:*

This is a petition from an action of the Examiner objecting to the drawing and claims of the above-entitled application.

The Examiner has required that the drawing be amended to show the grain of the wood running lengthwise. The specification so describes the grain, and this feature is included in the claims. It is therefore an essential feature of the invention that the grain shall run lengthwise.

The Examiner's requirement was right, since the rules require that—

> the drawing must show every feature of the invention covered by the claims. (Rule 50.)

The statement in the fourth section of Rule 51 that—

> imitations of wood or surface graining should not be attempted—

is in no way inconsistent with the requirement of Rule 50 that every feature covered by the claims be illustrated. Rule 51 does not absolutely prohibit the imitation of wood or surface graining where such imitation is necessary or desirable. The language of the rule is that these imitations *should* not be attempted, and the reason for this is found in the difficulty experienced by ordinary draftsmen in making such imitations in a satisfactory manner.

The Examiner has also required that the "opening" should not be made a positive or direct element in the claims. This requirement also is a proper one. An opening is not a tangible thing. It can exist only in connection with some other element. If it is desired to describe this element as provided with an opening, there is no objection to such a course. An opening, however, should not be included as an element by itself.

The petition is denied.

EX PARTE ADAMS.

Decided June 27, 1902.

DIVISION—LAWN-MOWER—CLUTCH.

Division was properly required between claims for a lawn-mower mechanism one of the elements of which is a clutch and the claims for the specific clutch construction. A clutch is a distinct and independent invention from the mechanism in which it is used as an element.

ON petition.

LAWN-MOWERS.

Application of Fred L. Adams filed January 22, 1902, No. 90,836.

Messrs. R. S. & A. B. Lacey for the applicant.

ALLEN, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring division between claims 1 to 5, inclusive, and claims 6 to 14, inclusive, in the above-entitled application.

Claims 1 to 5, inclusive, cover a lawn-mower mechanism one of the elements of which is a clutch. Claims 6 to 14, inclusive, cover the specific clutch construction. A clutch is a distinct and independent invention from the mechanism in which it is used as an element. It is so recognized by inventors and manufacturers and by this Office in its scheme of classification.

Though claims 6 to 14, inclusive, begin with the phrase "In a rotary cutter," the particular clutch construction which is claimed therein is a separate subject-matter of invention from a cutter and is capable of separate use. It is immaterial as far as the clutch mechanism is concerned whether the shaft on which it is mounted carries a cutter or some other element.

Division was properly required, and the petition is denied.

LOCKWOOD v. SCHMIDT.

Decided June 28, 1902.

PRELIMINARY STATEMENT—AMENDMENT OF.

Where testimony has been taken by both parties, a motion for leave to amend a preliminary statement by changing the date of reduction to practice will not be granted where there is no showing that the utmost diligence in preparing the original statement had been used and when it does not appear that a mistake has been made in alleging the date of reduction to practice. (*McDermott* v. *Hildreth*, 98 O. G., 1282.)

APPEAL on motion.

DROVER'S WHIP.

Application of Charles R. Lockwood filed August 21, 1901, No. 72,813. Application of August J. Schmidt filed May 26, 1900, No. 18,035.

Messrs. Chamberlin & Wilkinson for Lockwood.

Messrs. Parker & Carter for Schmidt.

ALLEN, *Commissioner:*

This is an appeal by Schmidt from a decision of the Examiner of Interferences denying his motion to amend his preliminary statement by changing the date of his reduction to practice from March 1 to February 13, 1900.

Testimony has been taken by both parties and the case came before the Examiner of Interferences for final hearing May 27, 1900. At the hearing the motion now under consideration was filed by Schmidt.

The only showing in support of the motion is contained in a statement by Schmidt to the effect that—

> * * * the physical acts constituting the reduction to practice were performed in part by the said Charles R. Lockwood, as is shown by the record herein; that August J. Schmidt, at the time when he made his preliminary statement, was not able to fix the exact date of these acts and other associated acts which constituted such reduction to practice, but believed them to be about March 1st, 1900; that the testimony given by said Lockwood disclosed the fact that he, the said Lockwood, believed such acts to have been performed about the 13th of February, 1900.

In the statement quoted there is no showing that Schmidt used the utmost diligence in preparing his original statement; nor is it apparent that any mistake has been made in the date of the alleged reduction to practice. The Examiner of Interferences, therefore, properly denied the motion. As was said in *McDermott* v. *Hildreth*, (98 O. G., 1282:)

> If, however, the case has so far advanced that testimony has been taken, each party relying on the other's statement for the dates which must be overcome, an amendment to set back these dates is open to suspicion and will be received only upon a clear showing of mistake, and, further than this, the moving party must be free from negligence and must show the utmost diligence in seeking to correct this mistake. (*Henderson* v. *Noakes*, 99 O. G., 1431.)

The decision of the Examiner of Interferences is affirmed.

EX PARTE HOEGH.

Decided June 28, 1902.

1. AMENDMENT—NEW MATTER—NEW SPECIES OF INVENTION.

Where an application as filed discloses several specific forms of the same generic invention, *Held* that an amendment can not properly be made disclosing another specific form although it embodies the generic invention.

2. SAME—SAME—DISCLOSURE OF BEST FORM OF INVENTION.

The requirement of the statute that an applicant disclose the best mode of applying his invention does not warrant an amendment to an application disclosing a different form of the invention from that contained in the application as originally filed.

3. CLAIMS—MULTIPLICATION OF.

While all reasonable latitude should be allowed an applicant in presenting claims in order that the patent when issued may afford him full protection, an unreasonable and unnecessary multiplication of the claims will not be permitted.

ON petition.

TOOL-SUPPORT.

Application of Hans J. Hoegh filed July 31, 1901, No. 70,335.

Mr. Sidney I. Prescott for the applicant.

ALLEN, *Commissioner:*

This is a petition that the Examiner in charge of the above-entitled application—

* * * be advised that the claims involved do not involve new matter, that they are not meaningless, not indefinite, not unfounded in the disclosure, not substantially alike, not functional, that they do not obscure the invention, that they are not needlessly multiplied, that the new drawing does not show new matter, that it should be allowed to remain in the application; and directed to proceed accordingly.

This application as amended contains fifty-three claims. Of this number claims 46, 47, 48, 52, and 53 stand rejected on references and claims 49, 50, and 51 stand rejected on the ground that they include matter not disclosed in the original application when filed.

These matters relate to the merits, and appeal lies in the first instance to the Examiners-in-Chief. (Rule 133.)

So much of the petition as relates to the request that the Examiner "be advised that the claims involved do not involve new matter" and that they are "not unfounded in the disclosure" is therefore dismissed.

The remaining questions raised by the petition relate to objections made to claims 1 to 45, inclusive, and to the substitute drawing and description relating thereto.

The objections made to the substitute drawing and the description relating thereto will first be considered. It is held by the Examiner that the drawing discloses matter not supported by the original disclosure. The records show that the application as originally filed contained two sheets of drawings. It is apparent from a mere comparison of the substitute drawing with those originally filed that the objections to the substitute drawings are well taken.

The original drawings disclosed three specific forms of the same generic invention. The substitute sheet discloses one specific form of the invention totally different from two of the forms originally shown and described, and though similar in some respects to the third form originally disclosed it differs from the said original disclosure in many specific details of construction.

The applicant states in his brief—

that the original specification in this case would support a patent as contended by the Examiner is conceded, but it is believed that a patent issued on such a disclosure would be defective and void, the disclosure not being of the character contemplated by the statutes. * * *

It is believed that it is not sufficient for an applicant to show any means for applying the principle of his invention in order to comply with the requirements of the statutes, but he must disclose the best mode known to him. If for any reason he does not do so in the specification as filed, he must do so by amendment.

In this belief the applicant is in error. It is true that the statute (section 4888) requires that—

in case of a machine, he (the inventor) shall explain the principle thereof, and the best mode in which he has contemplated applying that principle—

but this must be done when the application is filed. It is not permissible for an inventor to file an application and then at some future date file an amendment disclosing what he then considers to be the best mode of applying the general principle of the invention when the same differs in construction from that which he originally described and claimed. There is no warrant in the original application for the specific disclosures in the substitute sheet of drawings and the description relating thereto. The Examiner has properly objected to the new disclosure on the ground that it contains new matter, for the reason that the new disclosure would support specific claims not warranted by the original disclosure.

In cases like the present one, where an applicant is dissatisfied with the original disclosure and desires to take out the patent based upon another disclosure which he considers to be a better mode of applying the principle of the invention, the proper course to pursue is to file a new application. The discrepancy in the original application cannot be cured by an amendment.

The objections to claims 1 to 45, inclusive, will now be considered.

Claims 1, 2, 3, 4, 5, and 6 are vague and indefinite by reason of the phrase "by the action thereof" which occurs in each of these claims. This phrase renders the claims vague and indefinite, because it is not clear as to what element the word "thereof" refers. The objection will be obviated by the cancellation of this phrase from these claims. All the remaining claims are sufficiently definite to comply with the requirements of the statute.

The objection to the claims as to multiplicity is well taken. This invention is a very simple one. It is impossible to draw fifty-three claims on the simple structure which is disclosed without making many duplicates. All reasonable latitude should be allowed an applicant in presenting claims in order that the patent when issued may afford him full protection. In this case, however, the large number of claims presented by the applicant is not only unnecessary, but unreasonable.

Claim 1 covers the combination, with the tool-support, of means for clamping a tool in said support. Claim 2 covers the same combination expressed in different words, in that the "means" for clamping the tool in claim 1 is defined in claim 2 as means for releasing the tool. If a tool is clamped to a support, it follows that if it is to be released from said support it must be unclamped.

Claims 1 and 2 therefore cover by means of different words the same construction, and but one of these claims should be presented. The same holding is made as to each of the groups composed of claims numbered 4, 5, 7, 8, 10, and 11; 3, 6, 9, and 12; 13 to 18, inclusive; 19 to 24, inclusive; 25 to 33, inclusive; 34 to 36, inclusive; 37 to 39, inclusive, and 40 to 45, inclusive.

The petition from the action of the Examiner that the claims are meaningless, indefinite, functional, and obscure is granted to the extent indicated.

The petition from his action that the claims are "needlessly multiplied" is denied.

Changes in Classification.

(ORDER No. 1,488.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 7, 1902.

The following changes in classification are directed:

In Division IX, class 137, Water Distribution, the subclasses in the group of Filters are abolished.

In Division VI, class 23, Chemicals, subclass 26, Purifying water, is abolished.

In Division XXXI, class 210, Water Purification, is established, with the following subclasses:

Filters—
2. Beer.
3. Cistern-cleaners.
4. Cistern-supply.
5. Decanters.
6. Faucet.
7. Filtering-faucets.
8. Granular-bed.
9. Materials.
10. Oil.

Filters—
11. Porous-wall.
12. Portable.
13. Pressure.
14. Rotary-bed.
15. Service-pipe.
16. Strainers.
17. Submerged.
18. Systems.
1. Miscellaneous.

F. I. ALLEN,
Commissioner.

Inks.

(ORDER No. 37.)

All applications, communications, and other instruments in writing or print, which should properly constitute a permanent record in this Office, must be prepared with a substantially permanent ink. Aniline and other perishable inks will not be accepted.

APPLICATIONS UNDER EXAMINATION.

Photographic Copies of Drawings.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

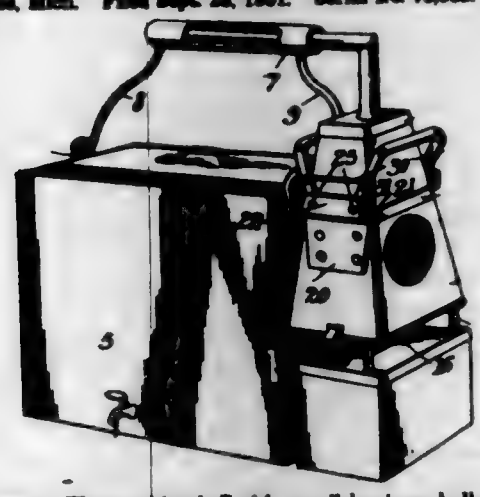
As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

F. I. ALLEN,
Commissioner.

PATENTS

GRANTED JULY 15, 1902.

704,492. **DINNER PAIL AND HEATER.** Joseph H. Ahlet, Glennie, Mich. Filed Sept. 28, 1901. Serial No. 76,205. (No model.)



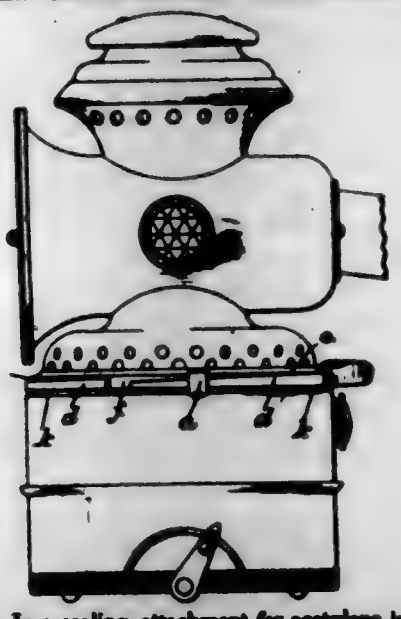
Claim.—1. The combination with a pail having a hollow handle, of an exteriorly-connected heater provided with a heat-pipe extending into said pail-handle and constructed and arranged to conduct heat from the heater thereto.

2. The combination with a pail having a hollow handle, of a heater removably connected to the pail and having a chimney and a removably-attached pipe leading through the handle to conduct heat thereto, said heater having a supporting-frame to support the pail when the heater is detached from the pail.

3. The combination with a pail having a pivoted bail including a hollow handle, of a heater removably connected to the exterior of the pail and including a chimney having a removable pipe extension leading to the handle to conduct heat thereto, and means connected with the pail for holding the bail against movement when the pipe is engaged with the handle.

4. The combination with a pail of a heater having a chimney provided with angular supporting-plates, a frame mounted in said plates and adapted to swing into open horizontal supporting position for receiving said pail, and means for detachably connecting said pail and heater.

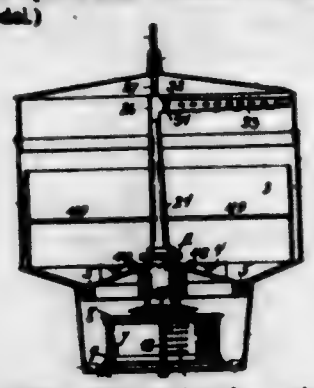
704,498. **SEALING ATTACHMENT.** Charles C. Armstrong, Columbus, Ohio. Filed Mar. 5, 1901. Serial No. 49,813. (No model.)



Claim.—1. In a sealing attachment for acetylene lamps, the combination with the gas-generator, of the gasket composed of suitable material; a cover or lid the flange or rim of which rests firmly but detachably on said gasket; a chimney-base, the head of which fits on the rim of said cover; a locking-ring provided with flanges; said flanges being adapted to operate in conjunction with suitably-arranged hooked arms attached to said gas-generator, so as to tighten or loosen the parts, thereby opening or hermetically closing said joint, substantially as described.

2. The combination in an acetylene-gas lamp with the generator, said generator being provided with means for securely connecting the parts, and formed with an annular beading; of a suitable gasket or packing; a cover or lid provided with a rim; a chimney the base of which is provided with a head adapted to rest on said rim; a locking-ring adapted to rest over and on the head of said chimney, said locking-ring being provided with flanges, and recesses, so that said ring is adapted in conjunction with the securing-arms of said generator, to operate in opening or hermetically closing or opening the joint of the gas-generator, substantially as described.

704,494. **DISH-WASHING MACHINE.** Cephas W. Arnot, Ypsilanti, Mich. Filed Apr. 20, 1901. Renewed May 23, 1902. Serial No. 108,681. (No model.)



Claim.—1. In a dish-washing device, the combination of a water-receptacle, a dish-containing tray, a traveling pipe, or nozzle, adapted to eject water upon the dishes in the tray and means connected with and operated by a movement of said pipe, or nozzle, for forcing water therethrough upon the dishes.

2. In a dish-washing apparatus, the combination of a water-receptacle, a tray for containing dishes, a rotary stand-pipe having a horizontal nozzle-arm and means for forcing the water through said stand-pipe and nozzle-arm operated by a rotation of said stand-pipe, whereby the water is distributed over the dishes as the stand-pipe is rotated.

3. In a dish-washing machine, the combination of a water-receptacle, a dish-containing tray located therein above the water-line, a pump within the water-receptacle, a traveling perforated nozzle, adapted to distribute the water over the dishes in said tray and means connected with and actuated by a movement of said nozzle for operating said pump to force the water through said nozzle onto the dishes.

4. In a dish-washing machine, the combination of a water-receptacle, a pump in the bottom thereof, a stand-pipe extending from said pump and passing vertically through the center of said receptacle, a removable tray surrounding said stand-pipe within said receptacle, said stand-pipe being rotary and connected with said pump for the operation thereof, a crank for rotating said stand-pipe to force the water from the pump therethrough and a perforated nozzle-arm projecting from said stand-pipe adapted to distribute the water upon the dishes in the tray.

5. In a dish-washing machine, the combination of a suitable receptacle having a water-chamber in the bottom thereof and adapted to contain dishes above said water-chamber, a rotary stand-pipe having a horizontal nozzle-arm adapted to sweep the interior of the receptacle above the dishes, a pump connected with said stand-pipe whereby, by a rotation of said pipe the water is forced through the stand-pipe and nozzle-arm.

6. In a dish-washing machine, the combination of a dish-receptacle a water-chamber, a suitable nozzle for spraying the dishes within said receptacle, a pump adapted to force water through said nozzle, said pump comprising a cylinder, an annular casing located eccentrically therein, int-

eral blades projecting from said casing and held yieldingly in terminal contact with the wall of the cylinder and means for rotating said casing within the pump-cylinder to drive the water therefrom into said nozzle.

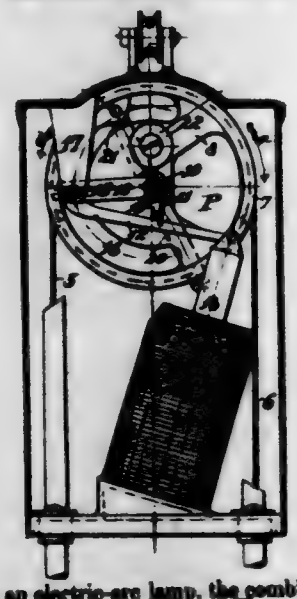
7. In a dish-washing machine, the combination of a dish-receptacle, a water-chamber, a pump located in said water-chamber, a hollow shaft, or stand-pipe connected with the pump-cylinder and adapted to receive the water therefrom as said shaft, or stand-pipe, is rotated to drive the pump, said pump comprising a cylinder with a detachable top and bottom, a circular rotary casing located eccentrically within the cylinder and adapted to be attached to said stand-pipe, said casing having laterally-projecting blades adapted to sweep the pump-chamber and hold in terminal contact with the wall of the cylinder and a water-chamber in the top of the cylinder communicating with said stand-pipe and the cylinder of the pump.

8. In a device for the purpose set forth, the combination of a suitable receptacle adapted to contain dishes, a pump, a rotary stand-pipe and nozzle-arm connected with said pump, said stand-pipe being removably attached to the pump and having a detachable coupling at its upper end, the nozzle-arm being detachably attached to said coupling and having a removable plug in the outer end thereof.

9. In a device for the purpose set forth, the combination with a water-pipe or spraying apparatus, of a pump connected therewith, said pump comprising a cylinder having a removable top and bottom and provided with means for detachably clamping said parts together, a rotary case within the pump-cylinder having blades, or paddles, adapted to work laterally therethrough and held by spring-pressure in terminal contact with the wall of the cylinder.

10. In a device for the purpose set forth, the combination with a water-pipe, or sprayer, a pump communicating with said pipe, said pump comprising a cylinder having a closed top and bottom, a rotary case within the pump-cylinder, laterally-projecting blades within said case whose inner ends overlap, a spring interposed between the overlapping ends of said blades whose ends engage the opposed blade ends so as to lock said blades together to cause them to move in unison and hold their outer ends in terminal contact with the wall of the cylinder.

704,495. ELECTRIC-ARC LAMP. ARTHUR M. ARTER, Hammersmith, England. Filed Jan. 12, 1899. Serial No. 702,009. (No model.)



Claim.—1. In an electric-arc lamp, the combination of two carbon-holders, a wheel, a horizontal axle on which the said wheel is mounted, means for supporting the said axle elastically, a fixed support on the same side of the said axle as the said two carbon-holders, a link connecting the said axle to the said fixed support, means for connecting the said carbon-holders to the said wheel so that the rotation of the latter will move the said carbon-holders in opposite directions, a mechanical device adapted to decrease the distance between the said carbon-holders, and an electromagnetic device constructed and arranged to counterbalance, to overcome, and to fall short of the action of the said mechanical device in accordance respectively with the passage through the carbons of normal, more than normal, and less than normal current.

2. In an electric-arc lamp, the combination of two carbon-holders, a wheel having a horizontal axle carried by a yielding support, flexible connections passing from the said carbon-holders to opposite sides of and secured to the said wheel, a solenoid whose core is connected by a flexible connector to the same side of the said wheel as that to which the lower carbon holder is connected, and means for automatically moving the said carbon-holders toward each other on decrease of current passing through the carbons carried by the said carbon-holders.

3. In an electric-arc lamp, the combination of two carbon-holders, a fixed support, an arm pivoted to the said support, an axle secured to the outer end of the said arm and supported by spring force or gravity, a wheel mounted on the said axle, means for connecting the said carbon-holders to the said wheel so that the rotation of the latter will move them in opposite directions, a boss or portion of smaller diameter secured to the said wheel, a lever having a fixed pivot, a solenoid whose core is connected to the outer end of the said lever, a flexible connector secured to an intermediate point of the said lever and coiled around and attached to the said boss so that a pull thereon will tend to lower the said axle and to rotate the said wheel in the direction to move the said carbon-holders away from each other, and means for automatically moving the said carbon-holders toward each other on decrease of the current passing through the carbons carried by the said carbon-holders.

4. In an electric-arc lamp, the combination of two carbon-holders, a wheel having a horizontal axle, means for connecting the said carbon-holders to the said wheel so that rotation of the latter will move the said carbon-holders in opposite directions, a boss or portion of smaller diameter fixed to the said wheel, a solenoid whose core is connected to the said boss or portion of smaller diameter and is adapted to rotate the said wheel so as to move the carbon-holders away from each other on an increase of the current passing through the carbons carried by the said holders, and means for automatically moving the said carbon-holders toward each other on a decrease of the said current.

5. In an electric-arc lamp, the combination of two carbon-holders, a fixed support, an arm pivoted to said support, an axle secured to the outer end of the said arm, a wheel mounted on the said axle, means for connecting the said carbon-holders to the said wheel so that the rotation of the latter will move them in opposite directions, means for automatically and electrically lowering the said wheel and rotating it so as to cause the said carbon-holders to move away from each other on increase of the current passing through the carbons carried by the said holders, means for automatically moving the said carbon-holders toward each other on decrease of the current passing through the carbons carried by the said carbon-holders, and a spring supporting the said axle and arranged in an inclined position so as to give a more nearly uniform turning moment about the axis of the pivot of the said arm than would be the case with a vertical spring.

6. Apparatus for moving two bodies in opposite directions in accordance with divergences of an electrical current from the normal, comprising a wheel, a horizontal axle on which the said wheel is mounted, means for supporting the said axle elastically, a fixed support on the same side of the said axle as the said two bodies, a link connecting the said axle to the said fixed support, means for connecting the said two bodies to the said wheel so that rotation of the latter will move the bodies in opposite directions, a mechanical device adapted to move the said bodies in certain directions, and an electromagnetic device adapted to counterbalance, to overcome, and to fall short of the action of the said mechanical device in accordance respectively with the passage through the said electromagnetic device of normal current, more than normal current, and less than normal current.

7. Apparatus for moving two bodies in opposite directions in accordance with divergences of an electrical current from the normal, comprising a wheel, a horizontal axle on which the said wheel is mounted, means for supporting the said axle elastically, a fixed support on the same side of the said axle as the said two bodies, a link connecting the said axle to the said fixed support, means for connecting the said two bodies to the said wheel so that rotation of the latter will move the said bodies in opposite directions, a mechanical device adapted to move the said bodies in certain directions, and an electromagnetic device adapted to counterbalance, to overcome, and to fall short of the action of the said mechanical device in accordance respectively with the passage through the said electromagnetic device of normal current, more than normal current, and less than normal current, the said electromagnetic device including a lever having a fixed fulcrum, a connection from an intermediate point of the said lever to the said wheel, and a solenoid having a core connected to the outer end of the said lever.

8. An electric-arc lamp, comprising a rotatable body, carbons operatively connected with the said rotatable body to move in opposite directions when the said body is rotated, an electrically-controlled actuating means operatively connected with and adapted to rotate the said body in one direction, and mechanical means operatively connected with and adapted to rotate the said body in the opposite direction.

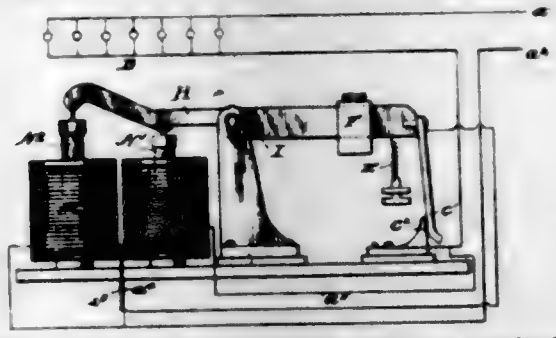
9. An electric-arc lamp comprising an elastically-supported rotatable body, carbons operatively connected with the said body and adapted to be moved thereby in opposite directions when the body is rotated, an electrically-controlled actuating means acting against the elastic support of the said body and operatively connected with the body to rotate it in one direction, and a mechanical means operatively connected with the said body and adapted to rotate it in the opposite direction, said mechanical means also acting against the said elastic support of the rotatable body.

10. An electric-arc lamp comprising an elastically-supported frame, a rotatable body journaled therein, an electrically-controlled actuating means operatively connected with the said rotatable body and adapted to rotate the same in one direction for separating the carbons, and a mechanically-controlled means operatively connected with the carbons and with the rotatable body and adapted to move the carbons and the rotatable body in opposition to the said electrically-controlled actuating means.

11. An electric-arc lamp comprising a rotatable body, two carbons, separate connections between the carbons at opposite sides of the axis of the said rotatable body, mechanical means for rotating the body in one direction for causing the carbons to approach, electrical means operatively connected with the rotatable body and adapted to rotate it in opposition to the said mechanical means, the rotatable body having a weight so disposed thereon as to act in opposition to the said mechanical means during the first portion of the consumption of the carbons, and acting in unison therewith during the consumption of the remaining portion of the carbons.

12. An electric-arc lamp comprising a rotatable body, carbons operatively connected with the said body at opposite sides of its axis, the connections extending thereabout in opposite directions, mechanical means operatively connected with the rotatable body for causing the said carbons to approach each other, electrical means operatively connected with the rotatable body to cause it to rotate in opposition to the mechanically-operating means, the said rotatable-body-carrying means compensating for the consumption of the said carbons.

704,496. AUTOMATIC CIRCUIT-BREAKER. BRIGHAM BALLANTYNE, Sumpter, Oreg. Filed Aug. 8, 1900. Serial No. 26,271. (No model.)



Claim.—1. In an automatic circuit-breaker, the combination with the conductors a' and a^2, of a stationary contact c^2, connected with said conductor a', a pivoted switch-lever having a contact c' normally in engagement with said stationary contact, a solenoid of low resistance electrically connected with said movable contact and with the conductor a^2, a core for said solenoid connected directly to said lever for positively operating the same to separate the contacts on the presence of an excess of current in the solenoid-coils, an independent solenoid of high resistance, a core therefor connected directly to said lever, said high-resistance solenoid-coil being in closed circuit with said conductors a' and a^2, substantially as described.

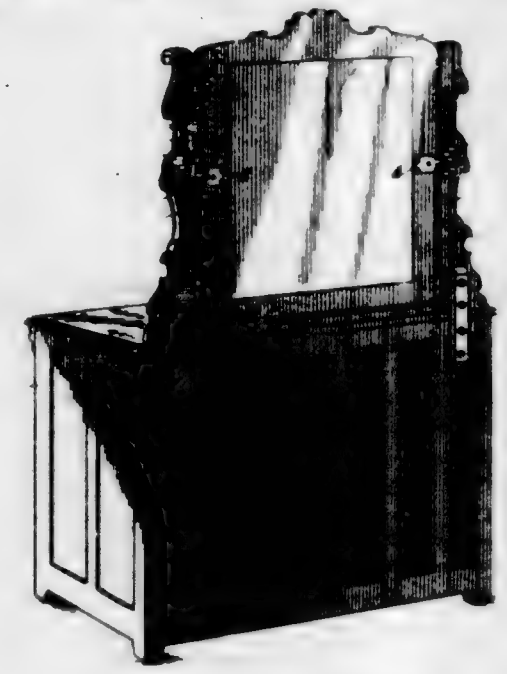
2. In combination with the main conductors a' and a^2, a stationary contact c^2 connected to said conductor a', a centrally-pivoted switch-lever carrying a contact c' on its front end, means whereby said lever is held with the front end normally depressed, a pair of solenoids arranged beneath the rear end of the lever, one of said solenoids being of low resistance and the other of high resistance, electrical connections from said low-resistance coil to the movable contact and to conductor a^2, electrical connections from the high-resistance solenoid to the conductors a' and a^2, and a core in each solenoid directly connected with the rear portion of the switch-lever, substantially as described.

704,497. MIRROR-ADJUSTER. ADAM J. BAKER, Norfolk, Va. Filed Mar. 6, 1902. Serial No. 96,912. (No model.)

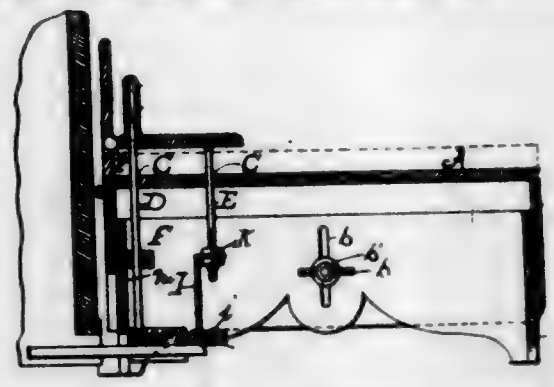
Claim.—1. The combination of a pair of uprights, a mirror-frame pivotally mounted between the same, trunnion-plates secured to the mirror-frame, trunnion-brackets on the uprights, one of which brackets is slotted, a ratchet-wheel on one of the trunnions arranged in the slotted portion above the bracket, a pawl on one of the uprights engaging the ratchet-wheel, and a pawl-operating device operable from the front of the upright, substantially as described.

2. The combination of a pair of supporting-uprights, a mirror-frame pivotally mounted between the same, trunnions secured to the mirror-frame, trunnion-brackets on the uprights, a ratchet-wheel adjustable on one of the trunnions, means for fixing the adjustment of the ratchet-wheel, a pawl on one of the uprights engaging the ratchet-wheel, and a pawl-operating device on the same upright, substantially as described.

3. The combination of a supporting-frame comprising a pair of uprights, a mirror-frame pivotally mounted between the same, trunnions on the mirror-frame, trunnion-brackets on the uprights, one of said brackets being slotted, a ratchet-wheel laterally adjustable on one trunnion and received in the slotted portion of the bracket, means for setting the ratchet-wheel, a pawl engaging the ratchet-wheel, and a pawl-shifting device operable from the front of the supporting-frame, substantially as described.



704,498. FOOT-REST AND PEDAL EXTENSION FOR PIANOS. ALONZA M. BATES, Chicago, Ill., assignor of one-half to E. A. Bates, Chicago, Ill. Filed Mar. 28, 1901. Serial No. 52,899. (No model.)



Claim.—1. In combination with a piano and the pedals thereof, a foot rest or stool, means for adjusting the upper portion thereof to varying heights, extension-pedals, pedal-engaging feet, rods supported by said stool to connect each of said feet to the extension-pedals, and means for adjusting the length of said rods, substantially as shown and described.

2. In a foot stool or rest for pianos having a base and top relatively adjustable to each other and adjustable pedal-moving mechanism mounted thereon, an opening in the rear of the stool-base and adjustable stops mounted on the base adapted to secure the same against side movement by contact with the piano-pedals, substantially as set forth.

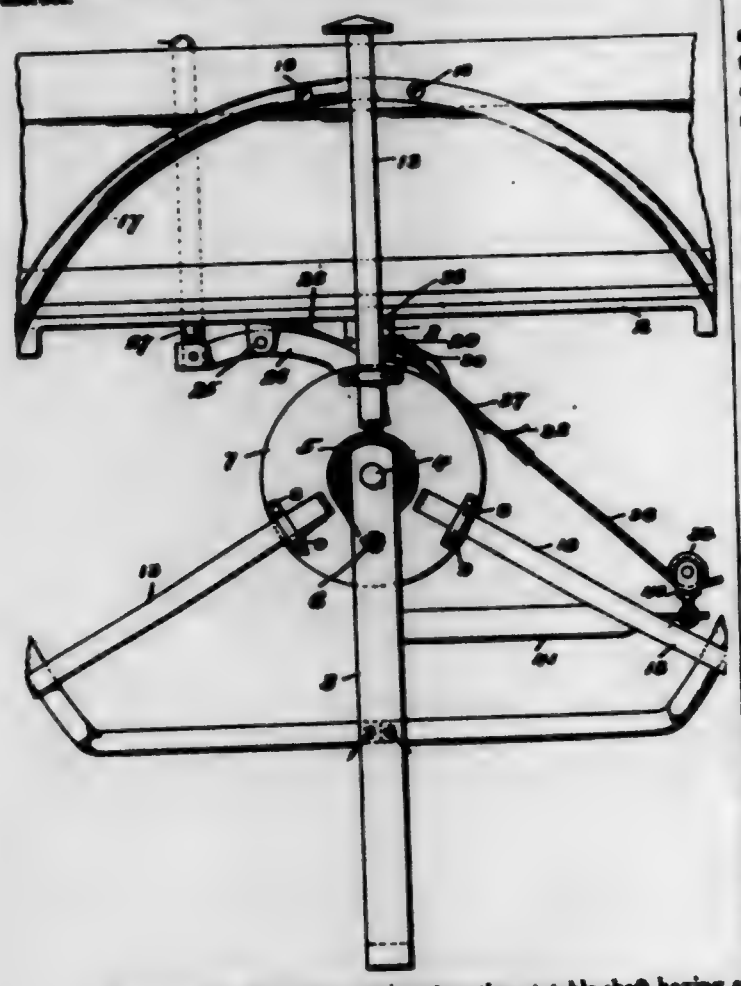
3. In an adjustable foot rest or stool for pianos having pedal-engaging feet, and adjustable rods connected thereto and mounted on the foot-stool, an extension-pedal having a hollow toe-guard adapted to receive the upward extension of one of the said rods, substantially as shown and described.

4. A foot rest or stool for pianos comprising a top and base and means for giving relative vertical adjustment thereto, a pedal-engaging block, an extension-pedal with a hollow toe-guard above the stool and rods mounted on the stool to connect the said block to the said pedal, one of said rods being provided with an adjustable connection to the said block, and the other of said rods socketed at its upper end within the said hollow toe-guard, substantially as shown and described.

5. An adjustable foot-stool for pianos having a pedal-engaging block and an extension-pedal, means for connecting said block and pedal comprising a clip attached to the block, a rod attached to the extension-pedal, an internally-threaded nut having an externally-threaded nipple screwed on said rod, and a nut screwed on said nipple adapted to clamp the clip when the nipple is passed therethrough, substantially as shown and described.

704,499. TORPEDO-SETTING DEVICE. PETER BEATTIE, Lente Island, Conn. Filed Feb. 8, 1902. Serial No. 93,207. (No model.)

CLAIMS.—1. The combination with a torpedo-carrier; of one or more torpedoes connected therewith; means for intermittently rotating said carrier, said means being controlled by the movement of a car-wheel over the rail; and means whereby the said torpedoes will move in a path at substantially a right angle to said torpedo-carrier during the rotation thereof.



2. The combination with an intermittently-rotatable shaft having a plurality of stop-shoulders connected therewith; a pawl member arranged to engage said stop-shoulders; means for disengaging said pawl member from said stop-shoulders, said means being arranged so as to be actuated by the car-wheel; and a torpedo-carrier connected with said shaft.

3. The combination with a torpedo-carrier having torpedoes secured thereto; of a shaft having stop-shoulders connected therewith; a pawl member adapted to engage the said stop-shoulders and hold the said shaft against movement, the stop-shoulders being so arranged relatively to said torpedoes that when engaged by said pawl member a torpedo will be upon the car-rail; and a pawl-releasing member connected at one end with said pawl member, the other end of which projects into the path of the car-wheel and is actuated thereby.

4. The combination with a torpedo-carrier having torpedoes secured thereto; of a shaft having stop-shoulders connected therewith; a pawl member adapted to engage said stop-shoulders and hold the said shaft against movement, said stop-shoulders being so arranged relatively to said torpedoes that when engaged by said pawl member a torpedo will be upon the car-rail; mechanism for disengaging said pawl member from said stop-shoulders, said mechanism comprising a part connected with said pawl member and projecting into the path of movement of the car-wheel; and means for rotating said shaft when said pawl member is disengaged.

5. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders for limiting the movement of said shaft in one direction; a dog adapted to engage said stop-shoulders; a connection between said dog and the semaphore whereby the movement of said semaphore will impart movement to said torpedo-carrier.

6. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; spring mechanism for rotating said shaft, a pawl member movable in and out of the path of said stop-shoulders, and adapted to hold said shaft against movement in one direction; a dog adapted to engage said stop-shoulders and having connection with the semaphore whereby the shaft will be rotated against the action of said spring mechanism and the stop-shoulder with which said pawl member is engaged will be moved away from said pawl member by the movement of said semaphore in one direction.

7. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulders and having connection with the semaphore whereby the stop-shoulder with which said pawl member is engaged will be moved away from said pawl member by the movement of said semaphore in one direction; and means for rotating said shaft whereby the said stop-shoulder will again engage said pawl member when the semaphore is moved in the opposite direction.

8. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulder, said pawl member and dog being so arranged that both engage the same stop-shoulder at one and the same time.

9. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulders, said pawl member and dog being so arranged that both engage the same stop-shoulder at one and the same time; and means for disengaging said pawl member and dog from said stop-shoulders.

10. The combination with a torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member having a projecting lip thereon, movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulder and while so engaged to rest upon said projecting lip; and means for disengaging said pawl member and dog from said stop-shoulders.

11. The combination with the torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog-carrier movable about said shaft; a dog pivotally mounted on said dog-carrier and adapted to engage the said stop-shoulders; and a connection between said dog-carrier and the semaphore for moving said dog-carrier and dog in one direction.

12. The combination with a torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulder; means for disengaging said pawl member and dog from said stop-shoulders; and means for rigidly holding said dog out of engagement with said stop-shoulders.

13. The combination with a torpedo-carrier; of a shaft having stop-shoulders connected therewith; a pawl member movable in and out of the path of said stop-shoulders; a dog adapted to engage said stop-shoulders; means for disengaging said pawl member and dog from said stop-shoulders; and a spring-clip for engaging and retaining said dog after the same has been disengaged from said stop-shoulder.

14. The combination with the shaft; of a ratchet-disk fixed thereto; a pawl member; a trip-rod for actuating said pawl member; a dog-carrier rotatably mounted upon said shaft; a dog pivotally secured to said dog-carrier and normally bearing against said ratchet-disk; a torpedo-carrier fixed to said shaft; and means for intermittently rotating said shaft.

15. The combination with the shaft; of a ratchet-disk fixed thereto; a pawl member; a trip-rod for actuating said pawl member; a dog-carrier rotatably mounted upon said shaft; a dog pivotally secured to said dog-carrier and normally bearing against said ratchet-disk; a torpedo-carrier fixed to said shaft; a spring connected with said shaft for rotating the same; and a spring-clip to retain and hold said dog when disengaged from said ratchet-disk.

16. The combination with a spring-rotated shaft; of a torpedo-carrier having a plurality of torpedoes flexibly connected therewith; and a guide-bar for imparting a movement to said torpedoes during their rotation at a right angle to the path of movement of said carrier.

17. The combination with the shaft; of a ratchet-disk fixed thereto; a pawl member; a trip-rod for actuating said pawl member; a dog-carrier rotatably mounted upon said shaft; a dog pivotally secured to said dog-carrier and normally bearing against said ratchet-disk; a torpedo-carrier fixed to said shaft; means for intermittently rotating said shaft; and a guide-bar concentric with said shaft for moving said torpedoes laterally during their rotation.

18. The combination with the torpedo-disk having a recess in the face thereof; of a torpedo spring-bar, one end of which is angularly bent and inserted within said recess; and means for yieldingly securing said spring-bar laterally, said means comprising a plate, a rod passing therethrough and a spring for drawing said rod in one direction.

19. The combination with the shaft; of a ratchet-disk fixed thereon and having fixed stops upon the side thereof; a yielding stop-arm normally in the path of said stops; and movable wedge means for disengaging said stop-arms from said stops.

20. The combination with the shaft; of the ratchet-disk having fixed stops upon the side thereof; rigid spring-arms in the path of said stops; a rotatable member which engages said spring-arms and disengages the same from said stops; and means for rotating said rotatable member.

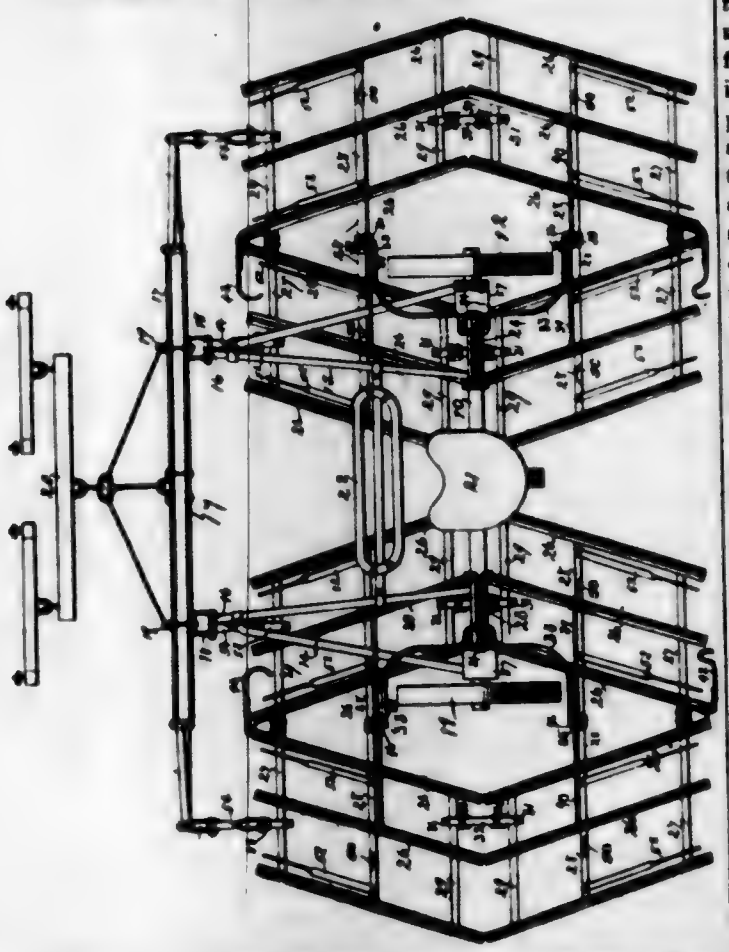
21. The combination with the shaft; of the ratchet-disk having fixed stops upon the side thereof; a rigid spring-arm in the path of said stops; a dog-carrier having a dog connected therewith which engages the teeth

of said ratchet-disk, said carrier having a beveled part thereon which engages said spring-arm and moves the same away from said stops.

22. The combination with the shaft; of a ratchet-disk fixed thereon and having a circular recess in either side thereof with fixed stops therein: rigid spring-arms having spring-fingers which enter said recesses and engage said stops; and a rotatable member having a beveled face thereon which engages said spring-fingers during its rotation and forces the same out of said recesses and out of the path of said stops.

23. The combination with a car-rail; of a bracket secured to the under side thereof; a shaft journaled in said bracket and at substantially a right angle to said car-rail; a spring for actuating said shaft; a ratchet-disk and coöperating pawl for limiting the movement of said shaft; a torpedo-carrier fixed to said shaft having flexible torpedo-bars connected therewith; and a guide-bar for determining the lateral movement of said torpedo-bars.

704,500. RIDING-HARROW. LEWIS P. BLOOD, Runnells, Iowa. Filed Sept. 28, 1901. Serial No. 76,691. (No model.)



Claim.—1. In a riding-harrow, a carriage-axle, traction-wheels on the ends of the axle, frames extended forward from the end portions of the axle inside of the traction-wheels, a foot-rest fixed to the said frames, a seat fixed to the center of the axle, a drag-bar hinged to the front ends of said frames and hinged extensions at the ends of the drag-bar, arranged and combined to operate in the manner set forth for the purpose stated.

2. In a riding-harrow, a carriage-axle, traction-wheels on the ends of the axle, frames extended forward from the end portions of the axle inside of the traction-wheels, a foot-rest fixed to the said frames, a seat fixed to the center of the axle, a drag-bar hinged to the front ends of said frames, extensions hinged to the ends of the drag-bar and harrow-sections hinged to the drag-bar and to the ends of said extensions, arranged and combined to operate in the manner set forth for the purpose stated.

3. In a riding-harrow, a carriage-axle, a drag-bar connected with the axle, hinged extensions on the ends of the drag-bar, traction-wheels on the ends of the axle, frames fixed to the end portions of the axle inside of the traction-wheels to project upward, curved rock-shafts in bearings fixed to said frames, arms at the centers of said rock-shafts and harrow-sections connected with the ends of the rock-shafts and the ends of the drag-bar, arranged and combined to operate in the manner set forth for the purposes stated.

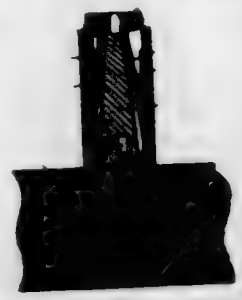
4. In a riding-harrow, a carriage-axle, traction-wheels on the ends of the axle, frames fixed to the axle to project forward, a drag-bar connected with the free ends of said frame, hinged extensions on the ends of the drag-bar, frames fixed to the end portions of the axle inside of the traction-wheels to project upward, curved rock-shafts in bearings fixed to said frames, arms at the centers of said rock-shafts, harrow-sections connected with the ends of the rock-shafts and the drag-bar, hand-levers fulcrumed to said frames and connected with the arms of the rock-shafts, arranged and combined to operate in the manner set forth for the purposes stated.

5. In a riding-harrow, a carriage-axle, traction-wheels on the ends of the axle, frames fixed to the axle to support a drag-bar, a drag-bar connected with said frame, hinged extensions at the ends of the drag-bar, frames fixed to the end portions of the axle inside of the traction-wheels to project upward, curved rock-shafts in bearings fixed to said frames, arms at the centers of said rock-shafts and harrow-sections connected with the ends of the rock-shafts, hand-levers fulcrumed to said frames and connected with the arms of the rock-shafts and means for locking the levers to the axle, arranged and combined to operate in the manner set forth for the purposes stated.

6. In a riding-harrow, a carriage-axle, traction-wheels on the ends of the axle, frames fixed to the axle to project forward, a drag-bar attached to the ends of said frame, extensions hinged to the end of the drag-bar, frames fixed to the end portions of the axle inside of the traction-wheels to project upward, curved rock-shafts in bearings fixed to said frames, arms at the centers of said rock-shafts and harrow-sections connected with the ends of the rock-shafts, hand-levers fulcrumed to said frames and connected with the arms of the rock-shafts, means for locking the levers to the axle, four harrow-sections hinged together in inclined positions relative to each other and the traction-wheels, two of them inside and two of them outside of said wheels, runners on the rear ends of the outside rear sections and runners on the front ends of the outside front sections, hangers on the ends of the arched rock-shafts hinged to extensions of cross-bars at the central portions of the harrow-sections and curved arms pivotally connected with the journals on the ends of the rock-shafts and the central portions of the center bars of the harrow-sections, arranged and combined to operate in the manner set forth for the purposes stated.

7. A riding-harrow comprising a carriage-axle, wheels on the ends of the axle, frames fixed to the end portions to extend forward, a seat on the center of the axle, a drag-bar connected with the front ends of said frames, extensions hinged to the ends of the drag-bar, frames fixed to the end portions of the axle to project upward, curved rock-shafts in bearings fixed to the said fixed frames that project upward, arms at the centers of the rock-shafts, hand-levers fulcrumed to the frames that project upward from the axle, links connecting the arms of the rock-shafts with the levers, means for locking the levers, four harrow-sections hinged together in inclined positions relative to each other and the traction-wheels of the carriage, two on the inside and two on the outside of each wheel, hangers on the ends of the arched rock-shafts hinged at their lower ends to harrow-sections, curved arms pivotally connected with the ends of the rock-shafts and cross-bars of the harrow-sections that are hinged together, means for retaining the harrow-sections on the outsides of the carriage-wheels in vertical planes, means for hinging the front ends of the front and inner harrow-sections to the drag-bar, means for connecting the front and outer harrow-sections to the hinged extensions at the ends of the drag-bar, and a driver's seat at the center of the carriage-axle midway between the said levers, all arranged and combined to operate in the manner set forth for the purposes stated.

704,501. BUTTON-HOLDER FOR UPHOLSTERING-MACHINES. PETER BOLLER, Chicago, Ill. Filed Oct. 29, 1901. Serial No. 80,404. (No model.)



Claim.—1. In a button-holder for upholstering-machines, a button-clamp having a seat in its outer end for button-heads, and composed of a pair of oppositely-disposed yielding jaws, means to fasten the clamp in place, and an anvil between the jaws.

2. In a button-holder for upholstering-machines, a clamping-member having a seat in its outer end for button-heads, and comprising a pair of spring-jaws tapered upwardly, and a conical anvil between the jaws.

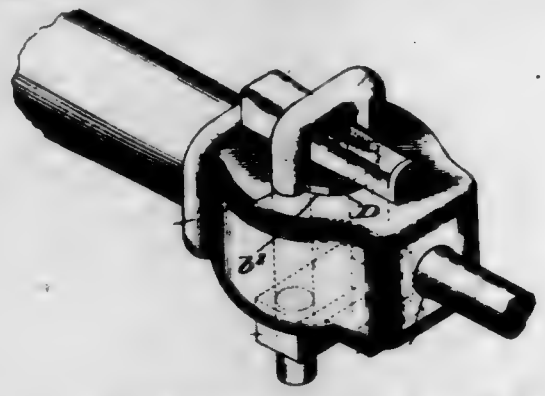
3. In a button-holder for upholstering-machines, a button-clamp having a seat in its outer end for button-heads, and composed of a pair of oppositely-disposed integral spring-arms, means to secure the clamp on the mold, and a conical anvil between the arms.

4. In an upholstering-machine, the combination with a mold having hollow tufters, of button-holders in the tufters, each holder comprising a

pair of opposite spring-arms fastened to the mold at one end and having lateral movement at their free ends to detachably seat a clench-button.

5. In an upholstering-machine, the combination with a mold having tubular tufters, of button-holders located in the tufters comprising a clamping member composed of opposite spring-arms providing a seat for button-heads, and a central plug or anvil.

704,502. DRILL-HOLDING CHUCK-BOLT FOR ROCK-DRILLS. OTTO H. BOSSERT, Denver, Colo. Filed Feb. 11, 1902. Serial No. 93,560. (No model.)

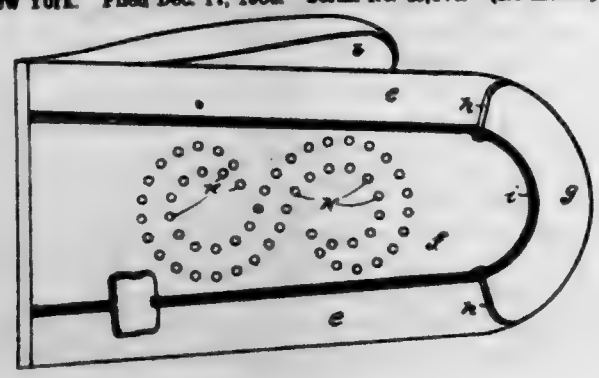


Claim.—1. In a drill-holder for rock-drills, the combination with a drill and drill-chuck, of a U-shaped bolt, the members of which pass through holes in the said chuck and are each provided with a notch or recess near their lower end; a yoke having holes through which the depending ends of the bolt are passed, and a keyway at right angles to the said holes, which intersects the same; a key which is passed through the keyway in said yoke and through the notch or recesses in the depending members of the bolt, so as to lock the said yoke upon the said bolt, and a wedge which lies between the connecting members of said U-shaped bolt and the top of the aforesaid clamp-block the said wedge being designed, when driven in one direction, to clamp the said block upon the aforesaid drill, so as to hold the same within the chuck, substantially as shown.

2. In a drill-holder, for rock-drills, the combination with a drill and drill-chuck, of a clamp-block which fits in a recess, in the said chuck, the said block being provided on its under side with a semicircular recess which overlies the end of the drill; a U-shaped bolt, which straddles the said block, the members thereof passing through the said chuck and each of said members being provided with a groove or recess near its lower end; a yoke having vertical holes and holes at right angles to the said vertical holes, which intersect the same, the said yoke being adapted to fit on the depending ends of the U-shaped bolt; pins which pass through the last-mentioned holes in the said yoke, and through the grooves or recesses in the ends of the said U-shaped bolt so as to lock the said yoke upon the said bolt, and a wedge which is driven between the connecting member of the U-shaped bolt and the top of the aforesaid clamping-block, so as to clamp the said block upon the end of the aforesaid drill, to retain the same within the said chuck, substantially as shown.

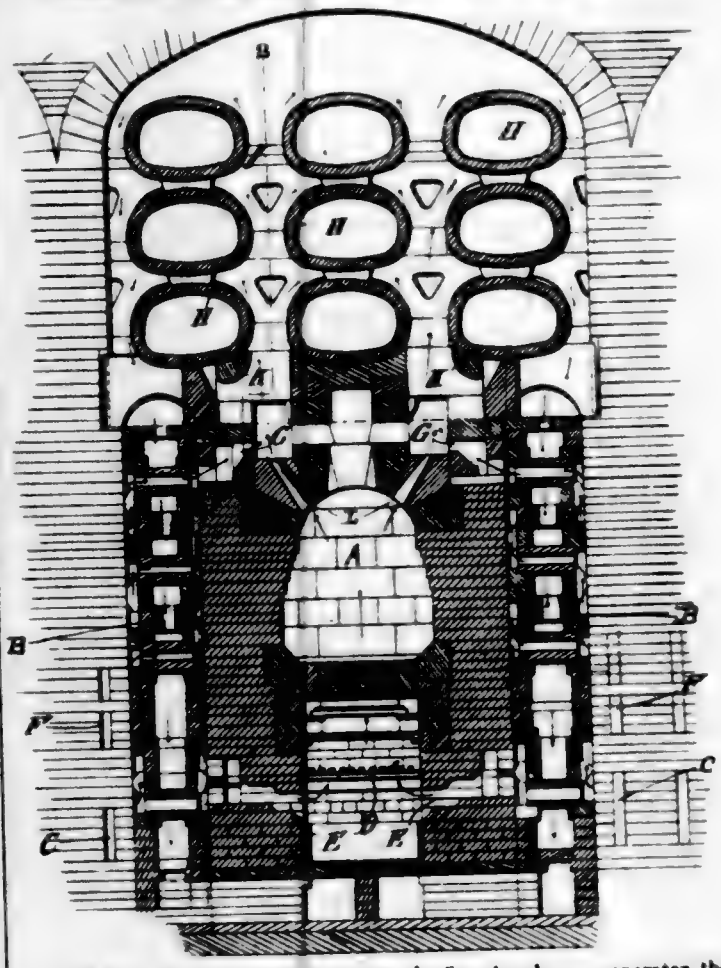
3. A clamping device for drills and the like, consisting of a U-shaped bolt, the members of which are each provided with a groove or recess near their lower end; a yoke, having holes through which the members of the bolt pass, and a keyway at right angles to said holes, which intersect the same; a key which is passed through the said keyway, and through the grooves or recesses in the members of the bolt, so as to lock the said yoke upon the said bolt a clamping-block, which lies upon the drill or a like object, and a wedge which is driven between the said block and the connecting member of the bolt, in combination with any suitable chuck or casing, substantially as shown.

704,503. MITTEN. ANDREW J BREDA, Chicago, Ill., assignor to the Standard Varnish Works, New York, N. Y., a Corporation of New York. Filed Dec. 17, 1900. Serial No. 40,171. (No model.)



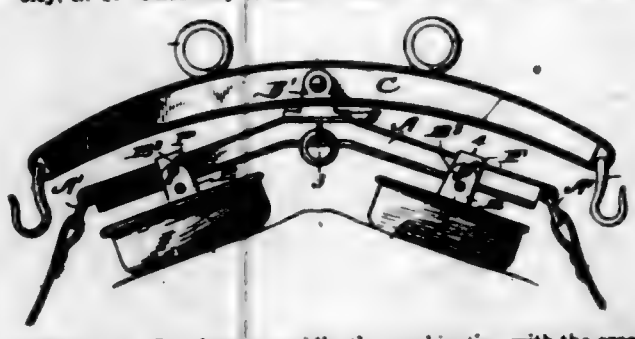
Claim.—As a new article of manufacture, a filler-mitt having its palm portion and a portion of its back along both longitudinal edges of the mitt formed in one integral piece, whereby the seams are removed from the longitudinal edges of the mitt to the back thereof, being thereby relieved of frictional contact, an insert *f* that completes the back portion of the mitt being united with the said integral piece by seams located upon the back of the mitt, a tip portion *g* united with the insert *f*, and a thumb-sheath for the mitt, a portion of the thumb-sheath being an outward continuation of the section of material that forms the bottom of the mitt, substantially as described.

704,504. RETORT GAS-FURNACE. FREDERICK BREDEL, Milwaukee, Wis. Filed Mar. 20, 1901. Serial No. 52,004. (No model.)



Claim.—In a recuperator-furnace, the fire-chamber or generator, the recuperator and the retort-chamber and retorts mounted therein, protecting-blocks for the retorts nearest the fire-chamber, a primary supply of air-ducts leading into the space below the grate of the furnace, a secondary air-supply through ducts G to form combustion and an auxiliary air-supply through ducts G' situated below and close to supporting-blocks R for the purpose of keeping said blocks R cool, as set forth.

704,505. HARNESS-SADDLE. JOHN BRONSBERG, Long Island City, N. Y. Filed July 8, 1901. Serial No. 67,305. (No model.)



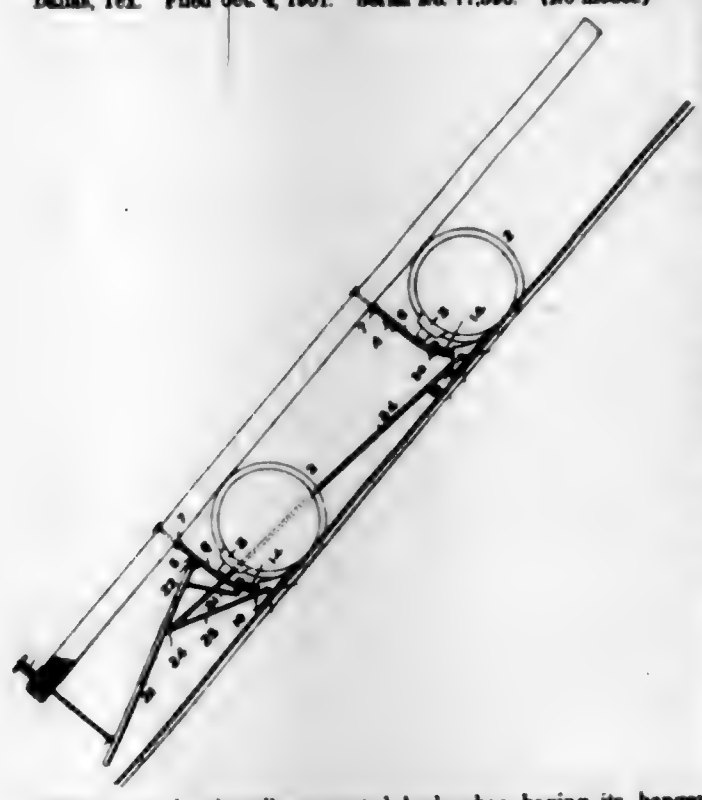
Claim.—1. In a harness-saddle, the combination with the cross-bar, having a pivot-bolt arranged centrally thereon and having ears extending therefrom, a bridge-piece pivotally held to the said bolt, a shield carried by the bridge, a rectangular-shaped member slidably positioned upon each end of the cross-bar, pads each carrying a coupling member that is designed to engage each of the said members on the cross-bar, and means for locking the said members together, substantially as shown and described.

2. In a harness-saddle, the combination with a cross-bar having loops arranged at the ends thereof, a pivot arranged centrally upon the

said bar, a bridge carrying hooks at its ends pivotally connected to the said pivot, rectangular-shaped members carried by the bars and having lugs projecting therefrom, couplings pivotally connected to the rectangular members, pads carried by the coupling members and means carried by the said coupling members for engaging the rectangular member and locking the said pad to its adjusted position, substantially as specified.

3. In a harness-saddle, the combination of a cross-bar having a pivot-bolt arranged thereon, a bridge carrying a shield, pivotally connected to the said pivot-bolt and having hooks arranged upon the ends thereof and rings positioned on the top rectangular-shaped members slidably held upon the cross-bar, a screw passing through said member and adapted for engagement with the cross-bar, said members having lugs projecting therefrom, coupling members pivotally connected to the said lugs, one side of each member projecting beyond the opposite side and having a threaded aperture arranged therein, a set-screw passing through said aperture and engaging the rectangular member, and loops arranged upon the ends of the cross-bar, substantially as and for the purpose set forth.

704,506. CAR-BRAKE. FRANK O. BROWN and EDWARD T. MOORE, Dallas, Tex. Filed Oct. 4, 1901. Serial No. 77,590. (No model.)



Claim.—1. A pivotally-supported brake-shoe having its hanger passed through a passage therein, rods connected thereto, a pivoted hanger having sliding connection with said hanger, and means for depressing the rods and forcing the shoe into engagement with the track, as set forth.

2. A pivotally-suspended brake-shoe having its hanger passed through a passage therein, means for forcing the same into contact with a track, a pivoted hanger having sliding connection with said hanger, and means for automatically applying sand from said shoe as the same is forced against the track, as set forth.

3. In a car-brake, a brake-shoe, formed with a sand-receiving chamber, and an automatically-actuated valve controlling the discharge therefrom, a pivoted hanger and a shoe-hanger having sliding connection with said hanger and detachably engaged in the shoe.

4. The combination with a brake-shoe having a passage therethrough for the passage of its hanger and a sand-receiving chamber with outlet at the bottom, and a two-part hanger carrying said shoe with a sliding connection between said two parts, of an automatic closure for said opening, adapted to be opened by contact with the rail as the shoe is forced into contact therewith.

5. A brake-shoe having curved front face with groove and a passage extending therethrough for the reception of its hanger, with its lower end enlarged and provided with an interior shoulder, as set forth.

6. A brake-shoe having an inclined front face, a passage for the reception of its hanger, and a sand-receiving chamber, as set forth.

7. A brake-shoe having a passage therethrough with offset near its lower end, as and for the purpose specified.

8. A brake-shoe having a passage therethrough with offset and shoulder near its lower end, combined with a hanger inserted in said passage and having a shoulder for engagement with the shoulder of said passage, as set forth.

9. A brake-shoe formed with an inclined front upper face with groove, a passage for its hanger, with offset and shoulder and a sand-receiving chamber with bottom outlet and a filling-aperture with removable closure, as set forth.

10. The combination with a hanger having a slot, of a shoe-hanger, means connecting the two and permitting of sliding movement of the one relatively to the other, and a shoe carried by the shoe-hanger and having a passage therethrough through which said hanger passes, as set forth.

11. The combination with a pivotally-supported hanger having a slot, of a shoe-hanger having sliding connection therewith, and a passage therethrough through which the hanger passes, a shoe carried by the shoe-hanger and a spring adapted to return the parts to their normal position, as set forth.

12. The combination with a pivotally-supported hanger, and a shoe-hanger connected therewith for sliding movement, and a shoe carried by the shoe-hanger, of a pivotally-supported rod connected with the said shoe, and means for operating said rod, as set forth.

13. The combination with a pivotally-supported brake-shoe and a hanger passed through a passage in said shoe, of a pivotally-mounted hanger having sliding connection with said hanger, a pivotally-supported fender, means connecting the fender and shoe and means for returning the parts to normal position, as set forth.

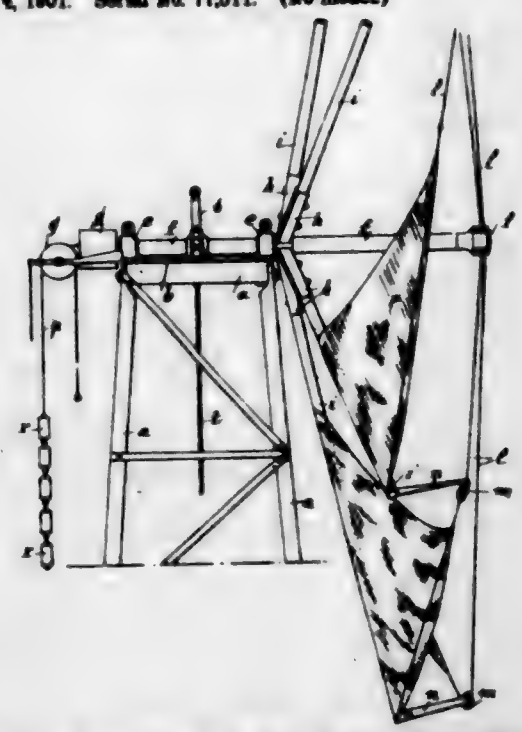
14. The combination with a pivotally-supported fender, and a pivotally-supported brake-shoe, of a pivotally-supported hanger slidingly connected with the shoe-hanger, pivotal connections between the fender and shoe, and a spring connecting the shoe-hanger with the fender, as set forth.

15. A pivotally-suspended brake-shoe, a pivotally-supported fender, a pivotally-supported hanger slidingly connected with the shoe-hanger, pivotal connections between the fender and shoe, means for returning the parts to normal position, and means whereby the shoe will be actuated by depression of the fender either by foot-power or by the meeting with an obstruction by the fender, as set forth.

16. The combination with front and rear brake-shoes having passages therethrough through which their hangers pass, and a pivotally-supported fender, of connections between the fender and all of the brake-shoes whereby the front and rear shoes are actuated simultaneously, as set forth.

17. A brake-shoe having an inclined passage therethrough and having a shoulder to receive and engage its hanger, said shoe being so shaped with its radius of movement so arranged that when depressed to its lowest point in the arc of a circle it will engage the top of the rail and the bottom of the wheel at the contact-point.

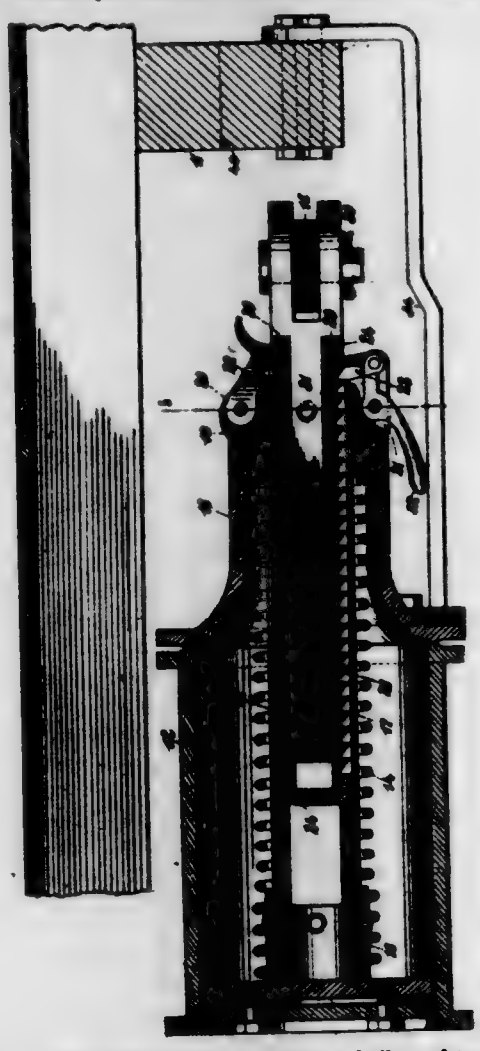
704,507. WINDMILL. RAPHAËL BRUNEAU, Oran, France. Filed Oct. 4, 1901. Serial No. 77,511. (No model.)



Claim.—The combination with a standard of a revolving platform supported upon antifriction-balls carried by the standard, a hollow shaft turning freely in two bearings fixed upon the platform, a hollow counterweight secured at one end of the hollow shaft, a center secured to the other end of the hollow shaft, sail-arms secured to the center, sails of flexible material secured to the arms at the base, stays and cords secured at one end to the points of the triangular sails passing thence over pulleys secured at the ends of rigid arms secured to the ends of the arms and extending outward therefrom at an angle and thence over other pulleys in the end of the hollow shaft, a swivel secured to the ends of the

stays or cords, a cord *p* secured to the swivel and passing thence out through the hollow shaft and counterweight and over a pulley carried by the hollow shaft, and a plurality of removable weights secured to the end of the cord *p*, substantially as shown and described.

704,508. CAR-BRAKE MECHANISM. GEORGE E. BURGESS, Buffalo, N. Y. Filed Apr. 18, 1902. Serial No. 103,484. (No model.)



Claim.—1. The brake-cylinder having a hollow piston-rod, combined with the take-up bar therein, the push-rod supported within said take-up bar and connected at its outer end with a lever of the brake connections, a take-up pawl connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, a locking-pawl connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod, and means for freeing said locking-pawl when it is carried beyond a definite point during the outward stroke of the piston-rod and restoring it into engagement with the take-up bar upon said pawl being moved back along said point during the return stroke of said piston-rod, said take-up bar engaging said push-rod during its outward movement to apply the brakes and leaving said push-rod during its return movement; substantially as set forth.

2. The brake-cylinder having a hollow piston-rod, combined with the take-up bar therein, the push-rod supported within said take-up bar and connected at its outer end with a lever of the brake connections, a take-up pawl connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, a locking-pawl connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod, a lever-arm connected with said locking-pawl for actuating the same, and a projecting surface for acting upon said lever-arm to free said locking-pawl when it is carried beyond a definite point during the outward stroke of the piston-rod and restoring it into engagement with the take-up bar upon said pawl being moved back along said point during the return stroke of said piston-rod, said take-up bar engaging said push-rod during its outward movement to apply the brakes and leaving said push-rod during its return movement; substantially as set forth.

3. The brake-cylinder having a hollow piston-rod, combined with the take-up bar having the two series of oppositely-inclined and oppositely-arranged teeth and supported within said piston-rod, the push-rod supported within said take-up bar and connected at its outer end with a lever of the brake connections, a take-up pawl connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, a locking-pawl connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod, means for automatically freeing said locking-pawl when it is carried beyond a definite point during the outward stroke of the piston-rod and restoring it into engagement with said take-up bar at a definite point during the return stroke of the piston-rod, said take-up bar engaging said push-rod during its outward movement to apply the brakes and leaving said push-rod during its return movement; substantially as set forth.

4. The brake-cylinder having a hollow piston-rod, combined with the take-up bar therein, the push-rod supported within said take-up bar and connected at its outer end with a lever of the brake connections, a take-up pawl connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, and a locking-pawl connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod; substantially as set forth.

5. The brake-cylinder having a hollow piston-rod, combined with the take-up bar therein, the push-rod freely supported within said take-up bar and pivotally connected at its outer end with a lever of the brake connections, a take-up pawl connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, and a locking-pawl connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod, said take-up bar engaging said push-rod during its outward movement to apply the brakes and leaving said push-rod during its return movement; substantially as set forth.

6. The brake-cylinder having a hollow piston-rod, combined with the take-up bar therein, the push-rod freely supported within said take-up bar and pivotally connected at its outer end with a lever of the brake connections, a take-up means connected with the piston-rod for engaging said take-up bar and driving the same forward during the application of the brakes, a locking means connected with said piston-rod for engaging said take-up bar and moving the same inward with said piston-rod, and means for automatically freeing said locking means when the latter is carried beyond a definite point during the outward stroke of the piston-rod and then restoring the same into engagement with said take-up bar at a definite point during the return stroke of the piston-rod, said take-up bar being adapted to engage said push-rod during its outward movement and to leave said push-rod substantially free during its inward movement; substantially as set forth.

704,509. AUTOMATICALLY-INFLATED POLISHING-WHEEL. ISAAC P. GADBAR, Beloit, Wis. Filed Nov. 11, 1901. Serial No. 81,875. (No model.)

Claim.—1. A pneumatic polishing-wheel having an air-cushioned polishing-surface, a funnel for catching air as the wheel is rotated, an opening communicating between said funnel and the air-cushion, and an air-valve in said opening.

2. A pneumatic polishing-wheel having an air-cushioned peripheral polishing-surface, a funnel on the body of said wheel for catching air as the wheel is rotated, and an opening communicating between said funnel and the air-cushion.

3. A pneumatic polishing-wheel having an air-cushioned peripheral polishing-surface, a funnel for catching air as the wheel is rotated, an opening in the wheel for permitting a portion of the air caught by the funnel to escape, and an opening communicating between said funnel and said air-cushion.

4. A pneumatic polishing-wheel having an air-cushioned peripheral polishing-surface, a funnel on the side of the wheel for catching air as the wheel is rotated, a rib near the mouth of said funnel, an opening through the wheel near said rib, an opening communicating between said funnel and the air-cushion, and an air-valve in said last-mentioned opening.

5. A pneumatic polishing-wheel having an air-cushioned peripheral polishing-surface, a funnel on the side of the wheel for catching air as the wheel is rotated, a rib near the mouth of said funnel, an opening through the wheel near said rib, an air-pocket in said wheel, an air-port between the funnel and the air-pocket, an air-duct communicating between said pocket and the air-cushion, and an air-valve for said air-duct.

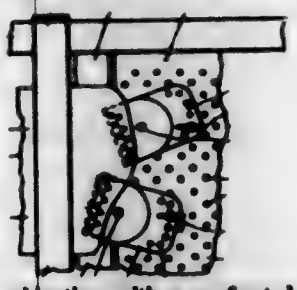
6. A pneumatic polishing-wheel having an air-cushioned peripheral polishing-surface, a funnel on the side of the wheel for catching air as the wheel is rotated, a rib near the mouth of said funnel, an opening through the wheel near said rib, an air-pocket in said wheel, an air-port communicating between the funnel and the air-pocket, a valve for said air-port in said air-pocket, an air-duct communicating between the air-pocket and the air-cushion, and an air-valve in said air-duct.

7. A pneumatic polishing-wheel having a hub, a rim and a web, said web having a circumferential groove, a cover for said groove, adapted to form an air-cushion, means for securing said cover in position, a funnel on the web of the wheel for catching air as the wheel is rotated, a rib near the mouth of said funnel, for dividing the current of air, an opening through the web of the wheel near said rib, an air-pocket on the web of the wheel substantially opposite the funnel, an air-port communicating between the funnel and the air-pocket, an air-valve in said pocket for said port, an air-duct communicating between said pocket and the groove in the periphery of said wheel, and an air-valve for said air-duct in said groove.

8. In a pneumatic polishing-wheel, in combination, a wheel having a peripheral rim; a peripheral rib at each side of said rim; a cover adapted to be secured over said ribs, to form an air-space between said cover and said rim; a funnel for catching air as the wheel is rotated; and an air-duct communicating between said funnel and said air-space.

9. In a pneumatic polishing-wheel, in combination, a wheel having a peripheral rim; a peripheral rib at each side of said rim; a cover adapted to be secured over said ribs, to form an air-space between said cover and said rim; a funnel on the body of said wheel, for catching air as the wheel is rotated; an air-duct communicating between said funnel and said air-space; and an air-valve for said air-duct.

704,510. LEATHER-STRETCHING DEVICE. JOHN CALDWELL, Minneapolis, Minn., assignor to W. S. Nott Company, Minneapolis, Minn., a Corporation. Original application filed Mar. 26, 1900, Serial No. 10,128. Renewed Dec. 17, 1900. Serial No. 40,215. Divided and this application filed Aug. 6, 1901. Serial No. 71,083. (No model.)



Claim.—The combination with a perforated stretcher-head, of a leather-holder consisting of a base-plate having in its rear portion a series of holes, and a second plate pivotally connected thereon and having a free swinging lateral movement with respect thereto under tension and provided with means for engaging the leather, and a pin or key inserted in selected holes in the base-plate and stretcher-head, for pivotally connecting the leather-holder to the stretcher-head, substantially as set forth.

704,511. SPLINT-BOXING MACHINERY. ALBERT B. CALKINS, Franklin, N. J., assignor to American Match Machine Company, New York, N. Y., a Corporation of New Jersey. Filed May 31, 1901. Serial No. 62,488. (No model.)

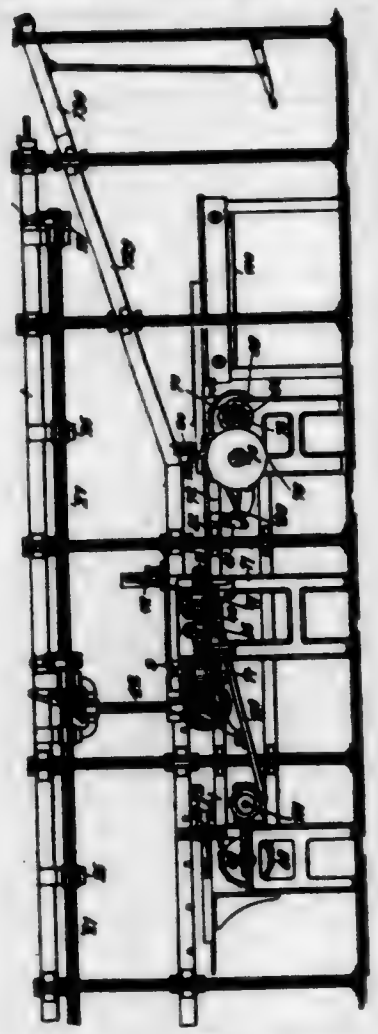
Claim.—1. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a reciprocating conveyor adapted to receive splints from the carriers, and in its movement to convey them to the box, and an expelling-plunger adapted to move within and across the space occupied by the splints when at rest within the conveyor, to forcibly expel the splints therefrom.

2. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a reciprocating conveyor adapted to receive splints from the carriers, and in its movement to convey them to the box, and an expelling-plunger, operated by the movement of the conveyor, adapted to move within and across the space occupied by the splints when at rest within the conveyor, to forcibly expel the splints therefrom.

3. In splint-boxing machinery, the combination with means for feeding forward splint-carriers and ejecting mechanism for ejecting splints therefrom, of an oscillatory conveyor and operating mechanism therefor arranged to move said conveyor from a receiving position adjacent to the path of said carriers to a discharging position during intervals between the ejection of said splints, and an expelling-plunger adapted to move within and across the space occupied by the splints when at rest within the conveyor, to forcibly expel the splints therefrom.

4. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower adapted to be moved across the said opening, to expel the splints therefrom, and means for causing the movement of the conveyor to so operate said follower.

5. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower adapted to be moved across the said opening, to expel the splints therefrom, and means for simultaneously moving the conveyer, and for so moving the follower relatively thereof.



6. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey them to the box, a follower adapted to be moved across the said opening, to expel the splints therefrom, and means, operated by the movement of the conveyer, for so moving the follower.

7. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer, having a plurality of openings therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, and a follower adapted to be moved across the said openings, to expel the splints therefrom.

8. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower adapted to be moved across the said opening, to expel the splints therefrom, and a stationary cam arranged to move said follower outward to eject the splints during motion of the conveyer toward the box.

9. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower adapted to be moved across the said opening to expel the splints therefrom, a stationary cam, a lever in engagement with said stationary cam, and a link connection between said follower and said lever, said cam being arranged to be engaged by said lever during motion of the conveyer toward the box.

10. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower normally seated in a recess in the rear wall of said opening, and adapted to be moved across the said openings, to expel the splints therefrom, and a cam arranged to operate

said follower to expel the splints during motion of the conveyer to the discharging position.

11. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, of a conveyer movable in a curved path adapted to convey splints from the carriers to a discharging-point, means carried by the conveyer for preventing escape of splints from said conveyer, during the motion thereof, by reason of centrifugal action, and means, independent of the conveyer, for bringing boxes into position to be filled from said conveyer.

12. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, of a movable conveyer adapted to convey splints from the carriers to a discharging-point and having separate splint receiving and discharging openings, means carried by the conveyer for closing said receiving-opening during motion of the conveyer, and means, independent of the conveyer, for bringing boxes into position to be filled from said conveyer.

13. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, of a rotary conveyer adapted to convey splints from the carriers to a discharging-point and having separate splint receiving and discharging openings, means carried by the conveyer for closing said discharging-openings during motion of the conveyer, and means, independent of the conveyer, for bringing boxes into position to be filled from said conveyer.

14. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, of a movable conveyer adapted to convey splints from the carriers to a discharging-point and having separate splint receiving and discharging openings, means carried by said conveyer for closing said receiving and discharging openings independently during motion of the conveyer, and means, independent of the conveyer, for bringing boxes into position to be filled from said conveyer.

15. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, and means carried by the conveyer for closing the said opening during a movement of the conveyer.

16. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, and means, carried by the conveyer and operated thereby in its movement, for closing the said opening, during a portion of its said movement.

17. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the said opening, and means for closing said door during a movement of the conveyer.

18. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for said opening, and means operated by the conveyer, upon its movement for closing the said door.

19. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyer, and means for closing the said door during a movement of the conveyer.

20. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyer, and means, operated by the conveyer in its movement, for closing and opening the said door.

21. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, an ejecting device for said conveyer, a door for the discharge end of the opening in said conveyer, and means for closing the said door during a movement of the conveyer.

22. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a hinged door for the discharge end of the opening in the said conveyer, and means, operated by the conveyor in its movement, for closing and opening the said door.

23. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyer, another door for the discharge end thereof, and means for closing the said doors during a movement of the conveyer.

24. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyer, another door for the discharge end thereof, and means, operated by the conveyer in its movement, for closing and opening the said doors.

25. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyer, another door for the discharge end thereof, and means for opening the admission-door at one end of a stroke of the conveyer, and the discharge-door at the other end of such stroke, and for closing both doors in intermediate positions of the conveyer.

26. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a hinged door for the said opening, a pinion secured to said door, a gear-sector in gear with said pinion, and means whereby said sector may move with said conveyer, but is adapted to have a limited relative movement thereof.

27. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer, having a plurality of openings therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, of a plurality of hinged doors for the said openings, pinions secured to the said doors, a rack-bar in engagement with the said pinions, and means for operating the said rack-bar.

28. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having a plurality of openings therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, of a plurality of hinged doors for the said openings, pinions secured to the said doors, a rack-bar in engagement with the said pinions, and a cam for operating the said rack-bar.

29. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having a plurality of openings therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, of a plurality of hinged doors for the said openings, pinions secured to the said doors, a rack-bar in engagement with the said pinions, and two stationary cams, one at each end of the said rack-bar, and adapted to operate same.

30. In splint-boxing machinery, the combination with means for feeding forward splint-carriers, and means for supporting a box to receive splints therefrom, of a pivoted conveyer adapted to receive splints from said carriers and convey the same to boxes, and arranged tangentially with respect to its path of movement.

31. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of means for raising and lowering the level of said plates with respect to the conveyer.

32. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of means for inserting splints into boxes supported thereon, and means for raising the said plates with respect to the conveyer, after the said plates have traveled past the splint-inserting means.

33. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a delivery-table, and means for raising the said plates when in proximity with the said delivery-table.

34. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a cam for raising the said plates with respect to the conveyer.

35. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising the said plates to the level of the said delivery-table.

36. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising the said plates to the level of the said table.

37. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table, and means for raising the said plates when in proximity with the said delivery-table, and for delivering the boxes so raised to the delivery-table.

38. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising the said plates to the level of the said delivery-table and for delivering the boxes so raised to the delivery-table.

39. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising the said plates to the level of the said delivery-table, when in proximity thereto, and for lowering the said plates to permit them to pass beneath the said table.

40. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising the said plates to the level of the said delivery-table, when in proximity thereto, the front edges of the said plates, and the rear edge of the said table, being beveled.

41. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and a cam for raising the said plates to the level of the said delivery-table, the front edges of the said plates, and the rear edge of the said table, being beveled.

42. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a delivery-table, means for raising the said plates when in proximity with the said delivery-table, and a pusher for delivering the boxes so raised to the delivery-table.

43. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising the said plates to the level of the said delivery-table, a pusher for delivering the boxes so raised to the delivery-table, and means for lowering the plates, after the boxes have been removed therefrom, to permit the said plates to pass beneath the said table.

44. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates, carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising the said plates to the level of the said delivery-table, and a pusher for delivering the boxes so raised to the delivery-table, the front edges of the said plates, and the rear edge of the said table, being beveled.

45. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table, means for raising the said plates when in proximity with the said delivery-table, and a presser-plate, arranged above the said supporting-plates when they are so raised.

46. In splint-boxing machinery, the combination with a traveling box-conveyer, having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table, means for raising the said plates when in proximity with the said delivery-table, and a spring-actuated presser-plate, arranged above the said supporting-plates when they are so raised.

47. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a delivery-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising the said plates to the level of the said delivery-table, a spring-actuated presser-plate thereabove, and means for delivering the boxes so raised to the delivery-table.

48. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising said plates with respect to the conveyer, when in proximity to the end of the said table.

49. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, and means for raising said plates to the level of the said feed-table.

50. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising the said plates when in proximity to the end of the said table, and a reciprocating plunger arranged above the said plates, at the point at which they are raised.

51. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising the said plates to the level of the said feed-table, and a reciprocating plunger arranged above the said plates, at the point at which they are raised.

52. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising said plates when in proximity to the end of said table, means whereby a box may be introduced upon a plate when so raised, and means for depressing the said plate carrying the said box.

53. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising said plates to the level of the said feed-table, means whereby a box may be introduced upon a plate when so raised, and a reciprocating plunger arranged above said plates, at the point at which they are raised, and adapted in its movement to lower the said plates.

54. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of relatively movable box-supporting plates carried thereby, of a feed-table arranged above the level of the said plates when in their lowered position with respect to the conveyer, a cam for raising the said plates, when in proximity to one end of said table, a reciprocating plunger arranged above said plates, at the point at which they are raised, and adapted in its movement to lower the said plates, and a cam for causing the reciprocation of the said plunger.

55. In splint-boxing machinery, the combination with a traveling box-conveyer having a plurality of box-supporting plates carried thereby, of a feed-table, and a delivery-table therefor, each arranged above the level of the said plates when in their lowered position with respect to the conveyer, means for raising said plates with respect to the conveyer, when in proximity with the said delivery-table and for lowering the said plates with respect to the conveyer when in proximity with the said feed-table.

56. In splint-boxing machinery, the combination with means for imparting a step-by-step movement to splint-carriers, a box-conveyer, and means for imparting a step-by-step movement thereto, of a splint-conveyer, movable in a curved path, adapted to receive splints from the carriers and in its movement to deliver same to the box, and means carried by the conveyer for preventing escape of splints from the conveyer during motion thereof toward the box, by reason of centrifugal action.

57. In splint-boxing machinery, the combination with means for imparting a step-by-step movement to splint-carriers, said splint-carriers provided with splint-locking plates, of a rock-shaft, a finger thereon adapted to engage said locking-plates, and a cam for operating said rock-shaft, said cam adapted to operate the said rock-shaft, intermediate of the step-by-step movements of the carriers.

58. In splint-boxing machinery, the combination with means for imparting a step-by-step movement to splint-carriers, said splint-carriers provided with splint-locking plates, of two rock-shafts, fingers thereon adapted to engage said locking-plates, and means for operating said rock-shafts intermediate of the step-by-step movements of the carriers.

59. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyer having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a follower adapted to be moved across the said opening, to expel the splints

therefrom, and means for causing the movement of the conveyor to so operate said follower.

60. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, and means carried by the conveyor for closing the said opening during a movement of the conveyor.

61. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, and means, carried by the conveyor and operated thereby in its movement, for closing the said opening, during a portion of its said movement.

62. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the said opening, and means for closing said door during a movement of the conveyor.

63. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for said opening, and means operated by the conveyor, upon its movement, for closing the said door.

64. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyor, and means for closing the said door during a movement of the conveyor.

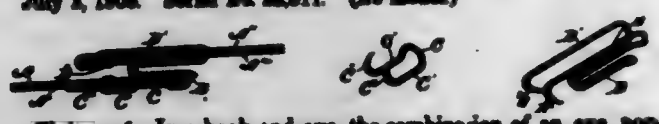
65. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyor, another door for the discharge end thereof, and means for closing the said doors during a movement of the conveyor.

66. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a door for the admission end of the opening in said conveyor, another door for the discharge end thereof, and means for opening the admission-door at one end of a stroke of the conveyor, and the discharge-door at the other end of such stroke, and for closing both doors in intermediate positions of the conveyor.

67. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having an opening therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, a hinged door for the said opening, a pinion secured to said door, a gear-sector in gear with said pinion, and means whereby said sector may move with said conveyor, but is adapted to have a limited relative movement thereof.

68. In splint-boxing machinery, the combination with splint-carriers, and means for supporting a box to receive splints therefrom, of a movable conveyor having a plurality of openings therein for receiving splints from the carriers, and adapted in its movement to convey the said splints to the box, of a plurality of hinged doors for the said openings, pinions secured to the said doors, a rack-bar in engagement with the said pinions, and means for operating the said rack-bar.

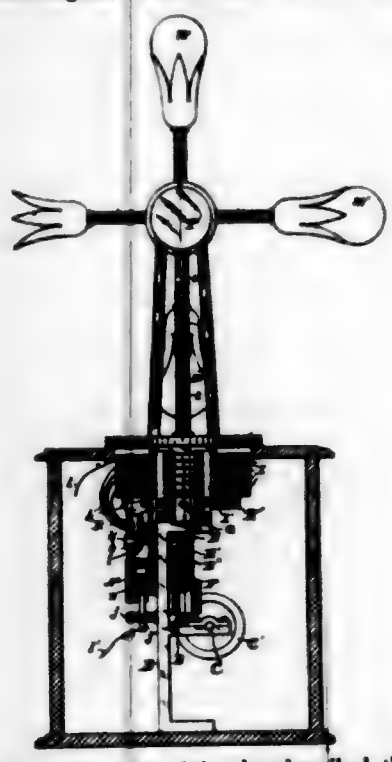
704,512. HOOK AND EYE. MILTON R. CARPANY, Hamilton, Mich., assignor of one-half to Horace R. Peck, Kalamazoo, Mich. Filed July 2, 1902. Serial No. 113,211. (No model.)



Claim.—1. In a hook and eye, the combination of an eye portion with an engaging portion O; parallel portions O', O' extending therefrom and terminating in attaching-hooks at the ends flattened to clench tightly; and a hook portion, the wires of which are extended and turned backwardly parallel with the shank of the hook at B', B', extending beyond the hook and terminating in flattened attaching-hooks turned toward the hook portion, the said hook and eye being inserted through the garment and hooked back into the fabric and clenched to engage the same as specified.

2. In a hook and eye, the combination of a hook portion, the wires of which are extended and turned backwardly parallel with the shank of the hook at B', B' extending beyond the hook and terminating in attaching-hooks turned toward the hook portion, the parts being inserted through the garment and hooked back and clenched into the fabric to engage the same as specified.

704,513. DISPLAY DEVICE. STEWART L. CAMPBELL, Kalamazoo, Mich. Filed Aug. 22, 1901. Serial No. 72,906. (No model.)



Claim.—1. In an apparatus of the class described, the combination of a suitable base; a vertical shaft therein; a turn-table on the top of said shaft; standards upward from said shaft; a hub with one or more radial arms transverse to said standard and supported in suitable bearing therein; a sleeve surrounding said shaft beneath the turn-table; a pulley on the said hub; a movable pulley on said sleeve; guide-pulleys for guiding the belt from the pulley on said sleeve to the pulley on said hub; a brake for controlling the motion of said sleeve; a lever connected to said brake; a cam connected to the moving part of said apparatus for acting on the said lever, whereby the brake is applied and removed automatically to induce a variable complex motion; electric lights carried by the radial arms on said hubs; independent connections to each of said lights; contact-rings carried by said hub; brushes adapted to bear on said contact-rings; wires extending from said brushes down the standards through the turn-table; fixed contact-rings with the said brushes; contact independent connections from each of said contact-rings to brushes; and the revolving contact device made up of insulated segments revolving in contact with said brushes to connect and disconnect the same successively and alternately, all coacting for the purpose specified.

2. In an apparatus of the class described, the combination of a suitable base; a vertical shaft therein; a turn-table on the top of said shaft; standards upward from said shaft; a hub with one or more radial arms transverse to said standard and supported in suitable bearings therein; a sleeve surrounding said shaft beneath the turn-table; a pulley on the said hub; a movable pulley on said sleeve; guide-pulleys for guiding the belt from the pulley on said sleeve to the pulley on said hub; a brake for controlling the motion of said sleeve; a lever connected to said brake; a cam connected to the moving part of said apparatus for acting on the said lever, whereby the brake is applied and removed automatically to induce a variable complex motion; electric lights on the ends of said radial arm or arms; suitable connections through the turn-table and hub for delivering the current to said radial arms, for the purpose specified.

3. In an apparatus of the class described, the combination of a suitable base; a vertical shaft therein; a turn-table on the top of said shaft; standards upward from said shaft; a hub with one or more radial arms transverse to said standard and supported in suitable bearings therein; a sleeve surrounding said shaft beneath the turn-table; a pulley on the said hub; and a movable pulley on said sleeve; guide-pulleys for guiding the belt from the pulley on said sleeve to the pulley on said hub; a brake for controlling the motion of said sleeve; a lever connected to said brake; a cam connected with a moving part of said apparatus for acting on the said lever whereby the brake is applied and removed automatically to induce a complex motion, coacting as specified.

4. In an apparatus of the class described, the combination of a suitable base; a vertical shaft therein; a turn-table on the top of said shaft;

standards upward from said shaft; a hub with one or more radial arms transverse to said standard and supported in suitable bearings therein; a sleeve surrounding said shaft beneath the turn-table; a pulley on the said hub; a movable pulley on said sleeve; guide-pulleys for guiding the belt from the pulley on said sleeve to the pulley on said hub; a brake for controlling the motion of said sleeve; electric lights on the ends of said radial arm or arms; suitable connections through the turn-table and hub for delivering the current to said radial arms, for the purpose specified.

5. In an apparatus of the class described, the combination of a suitable base; a vertical shaft therein; a turn-table on the top of said shaft; standards upward from said shaft; a hub with one or more radial arms transverse to said standard and supported in suitable bearings therein; a sleeve surrounding said shaft beneath the turn-table; pulley on the said hub; and a movable pulley on said sleeve; guide-pulleys for guiding the belt from the pulley on said sleeve to the pulley on said hub; a brake for controlling the motion of said sleeve, coacting as specified.

6. In an apparatus of the class described, the combination of a turn-table having a standard projecting therefrom; a hub with radial arms supported in the axial line of said turn-table on suitable bearings carried by said standard and transversely thereto; means of rotating said turn-table and revolving the hub with the radial arms at the same time to produce a complex movement.

7. In an apparatus of the class described, the combination of a turn-table having a standard projecting therefrom; a hub with radial arms supported on suitable bearings carried by said standard and transversely thereto; means of rotating said turn-table and revolving the hub with the radial arms at the same time to produce a complex movement and means of varying the relative speed of said turn-table and hub.

8. In an apparatus of the class described, the combination of a turn-table having a standard projecting therefrom; a hub with radial arms supported on suitable bearings carried by said standard transversely thereto; incandescent electric lights on the ends of said arms; and means of rotating said turn-table and revolving the hub with the radial arms at the same time, to produce a complex movement.

9. In an apparatus of the class described, the combination of a turn-table having a standard projecting therefrom; a hub with radial arms supported on suitable bearings carried on said standard transversely thereto; incandescent electric lights on the ends of said arms; means of rotating said turn-table and revolving the hub with the radial arms at the same time, to produce a complex movement; and means of varying the relative speeds of said turn-table and hub.

704,514. WEEDER. BENJAMIN F. CLARK and WILSON SMITH, Cambridge City, Ind., assignors to The National Drill Company, Cambridge City, Ind. Filed Sept. 27, 1901. Serial No. 76,734. (No model.)

Claim.—1. In a weeder, the frame composed of horizontal bars, teeth, clips adapted to take over said bars and the ends of said teeth, and means whereby the clips and the ends of the teeth are held in place, substantially in the manner and for the purpose described.

2. In a weeder, the frame composed of a pair of bars extending horizontally, one above the other, teeth, clips adapted to take about said bars and the teeth, and means for securing said clips to the bars, to retain the teeth in place, substantially as and for the purpose described.

3. In a weeder, the combination of horizontal bars, two of which are arranged in the same vertical plane, teeth whose upper ends are bent in a horizontal direction, with clips adapted to take about said bars and teeth, and means for securing said clips in place, substantially as shown and for the purpose described.

4. In a weeder, the frame comprising horizontal bars, teeth whose upper ends are bent to form hooks lying in a horizontal plane, and of a size to correspond with the width of the bars, clips composed of channel-iron and of a depth sufficient to take over said bars and the upper ends of the teeth, and means for securing said clips to the bars to retain the teeth in place, substantially as shown and for the purpose specified.

5. In a weeder, the frame comprising horizontal bars, teeth whose upper ends are adapted to fit against said horizontal portions, clips composed of channel-iron of a depth sufficient to take over said bars and the ends of said teeth, one flange of said clip provided with a slot for the passage of the teeth, and means for securing said clips to the bars to retain the teeth in place, substantially as shown and for the purpose specified.

6. In a weeder, the frame comprising horizontal bars, two of which are arranged in the same vertical plane, teeth whose upper ends are arranged and adapted to lie between said horizontal bars and clips arranged to take over said bars and provided with slots for the passage of the teeth, said bars, clips and ends of the teeth adapted to receive bolts, whereby the parts are held in place, substantially as shown and for the purpose described.

7. In a weeder or the like comprising a pair of horizontal bars arranged one above the other, teeth whose upper ends are bent laterally and adapted to lie between said bars, clips adapted to embrace said bars at the point where the teeth come between said bars, one flange of the clips provided with a slot for the passage of the teeth, said bars and clip provided with openings adapted to register, and bolts to be passed through said openings and the bent ends of the teeth, whereby the parts are clamped together, substantially as shown and for the purpose described.

704,515. SEAT FOR CULTIVATORS. BENJAMIN F. CLARK and WILSON SMITH, Cambridge City, Ind., assignors to The National Drill Company, Cambridge City, Ind. Filed Mar. 7, 1902. Serial No. 97,146. (No model.)

Claim.—1. As a means for supporting a seat, vertical arms rigidly connected to the frame of the machine and provided with notches, swinging arms pivoted to said vertical arms, a Y-shaped arm supporting the seat at the rear and having its forward ends engaging said swinging arms and provided with a horizontally-projecting plate adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

2. As a means for supporting a seat, a vertical arm rigidly connected to the frame of the machine and provided with notches, a swinging arm pivoted to said vertical arm, a second arm supporting the seat at its rear end, and having its forward end engaging said swinging arm, and provided with a horizontally-projecting plate adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

3. In combination, a vertical arm rigidly connected to a frame and provided with notches, a swinging arm pivoted to said vertical arm, a second arm supporting the seat at its rear end and having its forward end bent into hook form and engaging said swinging arm, and a horizontal projection on said second arm adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

4. In combination, a vertical arm provided with notches and rigidly attached to the frame of the machine, a swinging arm pivoted to said vertical arm, a second arm provided with a seat at its rear end and with a vertical slot at its forward end through which passes the said swinging arm, and a horizontal projection on said second arm adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

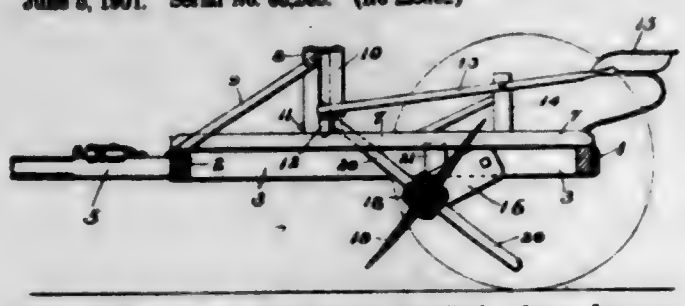
5. In a cultivator, vertical arms provided with notches and rigidly attached to the frame, swinging arms pivoted to said vertical arms, a Y-shaped arm carrying a seat at its rear end and having grooves at its forward ends in which are located the said swinging arms, and horizontal projections on the forward ends of said Y-shaped arm adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

6. In a cultivator, vertical arms provided with notches and rigidly connected to the frame, swinging arms pivoted to said vertical arms, a Y-shaped arm having its forward ends located between said vertical arms and said swinging arms, and provided with angular extensions adapted to engage said swinging arms, angle-plates secured at the forward ends of said Y-shaped arm, with their horizontal legs in a position to engage notches on said vertical arms, plates forming a groove to receive said swinging arms and an adjustable seat mounted at the rear of said Y-shaped arm, substantially as and for the purpose described.

7. In a cultivator, vertical arms provided with notches, swinging arms pivoted to said vertical arms, a bifurcated arm carrying a seat at its rear end and provided with hooks at its forward ends which engage said swinging arms, and horizontal projections at the forward ends of the bifurcations which are adapted to engage the notches of said vertical arms, substantially as and for the purpose described.

8. In combination, a vertical arm provided with notches, a swinging arm pivoted to said vertical arm, a bar supporting a seat at its rear end and provided at its forward end with a slot by means of which it may slide on said swinging arms, and also provided with a horizontal projection adapted to engage the notches in said vertical arm, substantially as and for the purpose described.

704,516. STALK-RAKE. JOSEPH L. CLARK, Lebanon, Tex. Filed June 5, 1901. Serial No. 63,205. (No model.)



Claim.—In a rake of the character described, a frame, frame-sections 6 and 7 thereon, a bracket 8 on said frame-sections, a post 10 on one of said sections parallel with said bracket, a controlling-bar pivoted at one end to said bracket with its free end extended between the bracket and post, an operating-lever pivoted to the free end of said bar and to a support in proximity to the seat, brackets 16 and 17 pivotally mounted on opposite sides of the frame, a rake-shaft journaled in the lower ends of said brackets, teeth on said shaft, a locking member passed through the shaft at right angles to its length and extended upon both sides of said shaft, with one end adapted to engage said controlling-bar, and flexible members 21 depending from opposite sides of the frame with their upper ends embracing three sides of the side pieces of the frame and their lower ends connected to the lower ends of said brackets to limit the downward movement of the brackets 16 and 17, as set forth.

704,517. BUTCHER'S SAW-FRAME. DWIGHT S. COLE, Brooklyn, N. Y., assignor to the New York State Saw Filers Association, Brooklyn, N. Y., a Corporation of New York. Filed Oct. 8, 1901. Serial No. 77,957. (No model.)

Claim.—1. In a saw-frame a socket at the heel end of the frame having a cavity adapted to receive the end of the saw, a bolt adapted to work in the socket, a cross-pin on the bolt engaging with the socket to prevent rotation, a wing-nut to give tension to the bolt, a pin on the bolt, and a beveled surface at one side of the forward end of the bolt, for the purposes set forth.

2. In a saw-frame a slot at the front end of the toe of the frame, the plane whereof is at an angle relative to the general plane of the frame, and means to hold the front end of the saw within the slot, for the purposes set forth.

3. In a saw-frame a socket at the heel end of the frame having a substantially cylindrical opening, a slot above and below said opening adapted to receive the end of the saw-blade, a bolt having a beveled surface at one side of its front end and means for holding the saw, and a wing-nut threaded to the bolt.

4. In a saw-frame a socket at the heel end of the frame having a substantially cylindrical opening, a slot above and below said opening adapted to receive the end of the saw-blade, a bolt provided with a beveled surface at one side of its front end, means to hold the saw, and means to prevent rotation of the bolt, and a wing-nut threaded to the bolt.

5. In a saw-frame a socket for the heel of the saw made of a piece of strip-steel formed half and half substantially as shown in Fig. 8, then bent upon itself, whereby a central cylindrical recess with a slot above and below is produced without machine-work.

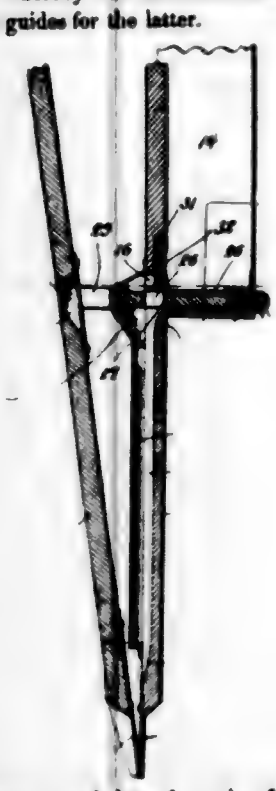
6. The combination of a saw-frame, devices at or near its ends for holding the saw in proper vertical alinement with the frame and for applying tension thereto, whereby when the tension is applied the saw automatically moves into rigid engagement with the sides of the saw-frame.

7. In a saw-frame a tension device embodying a threaded bolt, the bolt having a beveled surface at one side adapted to engage with one side of the socket in which it works, and a cavity in the socket adapted to receive the end of the saw whereby the saw-blade when under tension is crowded against the opposite side of said socket.

704,518. HAND CORN-PLANTER. FRED A. COLLYER, Victoria, Canada. Filed July 17, 1901. Serial No. 68,561. (No model.)

Claim.—1. A seed-planter comprising the handle-bars, a hopper, an imperforate hood secured to one handle-bar opposite to an opening therein, a conduit leading from the hood, a dropping-slide adapted to project into and to terminate within said hood, links pivoted to one handle-bar and embracing opposite sides of the two handle-bars, and a pivotal bolt connecting the other ends of said links and the dropping-slide together, substantially as described.

2. A seed-planter consisting of a pair of handle-bars pivoted together at their lower portion, a seed-hopper carried by one of said handle-bars and having a feed-opening in the lower side thereof, a closed imperforate channel or conduit leading from the feed-opening to the lower end of the planter, a slide with a feed-slot therein reciprocating in said feed-opening and projecting from the rear side of the hopper, and a pair of connecting link-rods pivotally connected to each side of the opposite handle-bar and to the outer rearwardly-extending end of said slide to reciprocate the latter, whereby said link-rods embrace the hopper and both handle-bars to form guides for the latter.



3. A seed-planter consisting of a pair of handle-bars pivoted together at their lower portion, a seed-hopper carried by one of said handle-bars and having a feed-opening in the lower side thereof, a closed imperforate channel or conduit leading from the feed-opening to the lower end of the planter, and means for feeding grain through said slot and channel, said means being operated by the opening and closing of the handle-bars.

4. A seed-planter consisting of a pair of handle-bars pivoted together at their lower portion, a seed-hopper carried by one of said handle-bars and having a feed-opening in the lower side thereof, a closed imperforate channel or conduit leading from the feed-opening to the lower end of the planter, a reciprocating slide operating in the feed-opening to measure grain, and means connected to said slide and to the opposite handle-bar to reciprocate the same by the opening and closing of the handle-bars to feed grain from the hopper, whereby no opening is left for the escape of grain between the hopper and the lower end of the conduit.

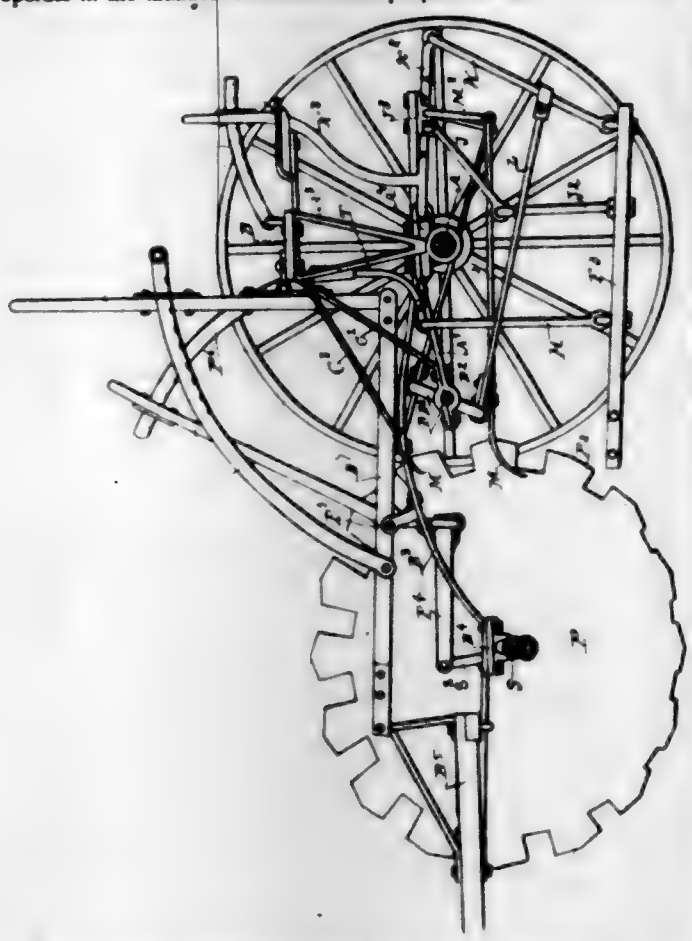
5. A seed-planter consisting of a pair of handle-bars pivoted together at their lower portion, a seed-hopper carried by one of said handle-bars and having a feed-opening in the lower portion thereof, a feed device operating in said feed-opening to measure out grain and extending rearwardly through an opening at the outer side of the hopper, and a pair of link-rods pivotally connected to said feed device at each side of the hopper and also pivotally connected to the opposite handle-bar, whereby to form at once a means for operating the feed device and to form guides for the handle-bars.

6. A seed-planter consisting of a pair of handle-bars pivoted together at their lower portion, a seed-hopper carried by one of said handle-bars and having a feed-opening in the lower side thereof, a closed imperforate channel or conduit leading from the feed-opening to the lower end of the planter, a slide with a feed-slot therein reciprocating in said feed-opening, means for operating said slide by the opening and closing of the handle-bars, an adjustable sliding plate projecting across the rear portion of said feed-slot and extending rearwardly flush with the reciprocating slide and having a longitudinal adjusting-slot therein projecting outside of the hopper when the handles are closed together, and a screw passing through said longitudinal slot and secured in the slide and also projecting outside the hopper when the handles are closed together, whereby the width of the feed-slot may be adjusted externally of the handle-bars.

704,519. POTATO-HARVESTER. DAYTON T. COLBERTSON, Milo, Iowa. Filed Apr. 30, 1901. Serial No. 58,177. (No model.)

Claim.—1. In a potato-harvester, a rotatable axle, a carriage-frame, traction-wheels fixed to the ends of the axle, arched hangers pivotally con-

nected with the carriage-frame, shakers and carriers composed of curved rods fixed at their front ends to straight bars and pivotally connected with the arched hangers, a crank-shaft at the front of the carriage-frame, rake-bars connected with the crank-shaft for moving vines in a plane above the shakers and carriers and means for simultaneously reciprocating the rake-bars and the suspended shakers and carriers, arranged and combined to operate in the manner set forth for the purposes stated.



2. In a potato-harvester, shakers and carriers composed of a plurality of rods curved at their front ends and the front ends fixed to straight bars, arched hangers pivotally connected with the carriage-frame and also pivotally connected with the straight bars of the shakers and carriers, as shown and described for the purposes stated.

3. In a potato-harvester, shakers and carriers composed of a plurality of rods curved at their front ends and the front ends fixed to straight bars, arched hangers pivotally connected with the carriage-frame and also pivotally connected with the straight bars of the shakers and carriers, and means for imparting reciprocating motion to the shakers and carriers, as shown and described for the purposes stated.

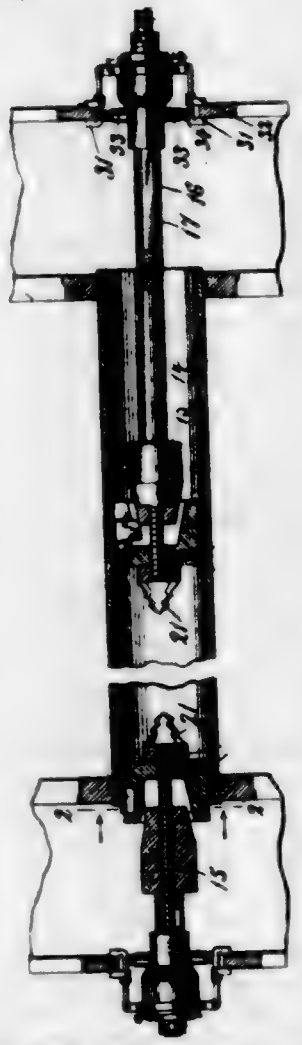
4. In a potato-harvester, a carriage-frame on a rotatable axle, traction-wheels fixed to the ends of the axle, two arched hangers pivotally connected with the carriage-frame, reciprocating shakers and carriers pivotally connected with the said hangers, reciprocating rakes pivotally connected with the carriage, a third arched hanger pivotally connected with a central rear extension of the carriage-frame and also pivotally connected with the rear ends of the reciprocating shakers and carriers, a rotatable crank-shaft at the front end of the carriage-frame and rods connected with cranks on the end portions of said shafts and with said hangers and means for raising and lowering the suspended shakers and carriers, arranged and combined to operate in the manner set forth for the purposes stated.

5. In a potato-harvester, a carriage-frame on a rotatable axle having fixed traction-wheels on its ends, an auxiliary frame extended forward from the main frame and rigidly fixed thereto, a rotatable axle in bearings on the front end of the auxiliary frame, disk-shaped diggers fixed to the ends of said axle, a pole pivotally connected with the front end of the auxiliary frame, a lever fulcrumed to the main frame, a bar pivotally connected with the rear end of the pole and means for retaining the lever stationary, arranged and combined to operate in the manner set forth for the purposes stated.

6. In a potato-harvester, a carriage-frame on a rotatable axle having fixed traction-wheels on its ends, an auxiliary frame extended forward from the main frame and rigidly fixed thereto, a pole pivotally connected with the front end of the auxiliary frame, a lever fulcrumed to the main frame, a bar pivotally connected with the lever and also pivotally connected with the rear end of the pole and means for retaining the lever and pole stationary, an axle in bearings at the front end of the auxiliary frame and rotatable diggers in the form of disks having cutters extending radially from their circumferences on the ends of the axle, arranged and combined to operate in the manner set forth for the purposes stated.

7. A potato-harvester comprising a carriage-frame on a rotatable axle having fixed traction-wheels, reciprocating shakers and carriers suspended under the carriage-frame, reciprocating rakes in a plane above the said shakers and carriers, a crank-shaft at the front of the carriage-frame and connected with the rotatable axle by means of sprocket-wheels and a chain, means for reciprocating the rakes, means for adjusting the shakers and carriers, an auxiliary frame rigidly connected with the carriage-frame to extend forward therefrom, an axle having its ends inclined downward, diggers rotatably mounted on the inclined ends of said axle, a pole pivotally connected with the front end of the auxiliary frame, a lever fulcrumed to the carriage-frame and connected with the pole by means of a bar, all arranged and combined to operate in the manner set forth for the purposes stated.

704,520. TUBE CLAMPING, CUTTING, AND EXPANDING MACHINE. HARRY DEL MAR, New York, N. Y., assignor of one-half to Eugene Del Mar, New York, N. Y. Filed July 15, 1901. Serial No. 68,291. (No model.)



Claim.—1. In a device of the character described, a supporting-bracket, means for securing said bracket positively to the boiler head or plate, said securing means consisting of collapsible and expansible clamping devices, substantially as specified.

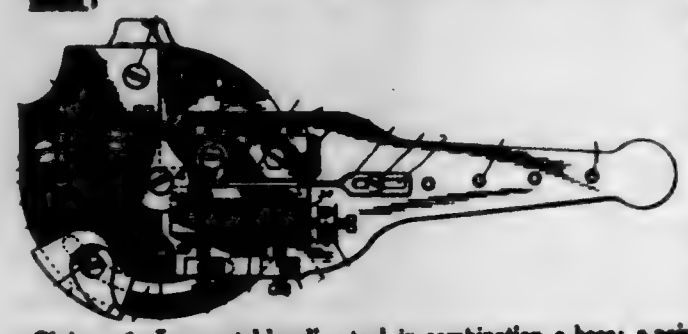
2. In a device of the character described, a supporting-bracket, means for positively securing said bracket to the boiler head or plate, said means consisting of collapsible and expansible clamping devices, and means for adjusting the operating devices relatively of the bracket, substantially as specified.

3. In a device of the character described, a supporting-bracket, means for securing said bracket positively to the boiler head or plate, means for adjusting the operating devices relatively of the bracket, and means for turning the operating devices in fixed position relatively to the supporting-bracket, substantially as specified.

4. In a device of the character described, a central rod, a tool at one end of said rod, a mandrel, a supporting-bracket, means for securing said bracket positively to the boiler head or plate, a connection between the supporting-bracket and the mandrel, and means for turning the tool and mandrel independently or in unison, substantially as specified.

5. In a device of the character described, a central rod, a tool located at one end of said rod and provided with expansible devices, a tapered mandrel projecting under said expansible devices, a supporting-bracket provided with adjustable clamping devices, a tube passing through said bracket and carrying at its opposite end a mandrel, and means for turning the central rod with the tool carried thereon and the tube carrying the mandrel independently or in unison, substantially as specified.

704,521. METAL-BENDING TOOL. JAMES J. DOLAN AND SERA HOYT, Sandwich, Ill. Filed June 6, 1902. Serial No. 110,473. (No model.)



Claim.—1. In a metal-bending tool, in combination, a base; a pair of gripping-jaws and an abutment, one of such elements being pivoted and the other being fixed to the base; and connection between the top of the abutment and the compressing member of the pair of jaws.

2. In a metal-bending tool, in combination, a base-plate, an abutment fixed thereto and having a pair of angularly-disposed faces; a lever pivoted upon the base-plate, its center of oscillation being aligned with the angle of the abutment; a pair of clamping-jaws mounted upon the lever, the mouth between them being opposite the angle of the abutment; a hinge connection between the top of one of the jaws and the abutment; and a link connection between the two jaws.

3. In a metal-bending tool, in combination, a base, an abutment fixed thereto, a lever pivoted to the base, a clamping-jaw secured on the lever, a hinge connection between the abutment and the jaw, a second jaw laterally and longitudinally adjustable on the lever, and an adjustable tie for securing the upper ends of the jaw together.

4. In a metal-bending tool, in combination, a base, an abutment fixed thereto, a lever hinged to the base, a jaw secured thereon, a second jaw laterally and longitudinally adjustable on the lever and between which and the first-mentioned jaw the work is designed to be placed, and an adjustable tie for securing the upper ends of the jaws together.

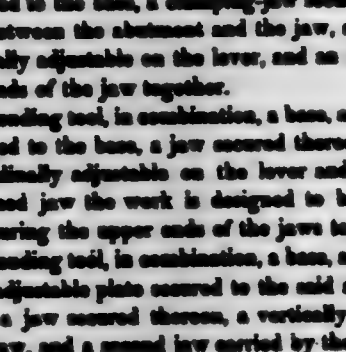
5. In a metal-bending tool, in combination, a base, an abutment fixed thereto, a vertically-adjustable plate secured to the said abutment, a lever hinged to the base, a jaw secured thereon, a vertically-adjustable plate secured to the said jaw, and a second jaw carried by the lever and being adjustable relatively to the first-mentioned jaw.

6. In a metal-bending tool, in combination, a base, an abutment fixed thereto and having a transverse recess, a plate located in the recess and having an outstanding flange at its lower edge and vertical slots, bolts passing through said slots for securing the plate, a lever pivoted to the base, a jaw secured thereon, a plate having vertical slots, bolts passing through said slots for securing the plate to the said jaw, and a second jaw secured to the lever and adjustable relatively to the first-mentioned jaw.

7. In a metal-bending tool, in combination, a base, an abutment fixed thereon, a lever hinged to the base, a jaw secured thereon, a hinge connection between the said abutment and jaw at the top thereof, a second jaw carried by the lever and being laterally and longitudinally adjustable thereon, adjustable positive stops for securing the latter jaw against movement, and an adjustable stop for limiting the movement of the lever.

8. In a metal-bending tool, in combination, a base, an abutment fixed thereto, a lever hinged to the base, a jaw secured thereon, a hinge connection between the said abutment and jaw at the top thereof, a second jaw on the lever parallel with the first-mentioned jaw and having longitudinal slots therein, slots in the lever transverse to the longitudinal slots, bolts passing through said longitudinal and transverse slots for securing the said jaw, set-screws forming positive stops for the jaws, an adjustable gage on the lever, a stop adjustable on the base for limiting the movement of the lever, a link secured at one end to one of the lever-jaws and having its other end threaded and passing through an aperture in the other lever-jaw, and a nut upon the said threaded end.

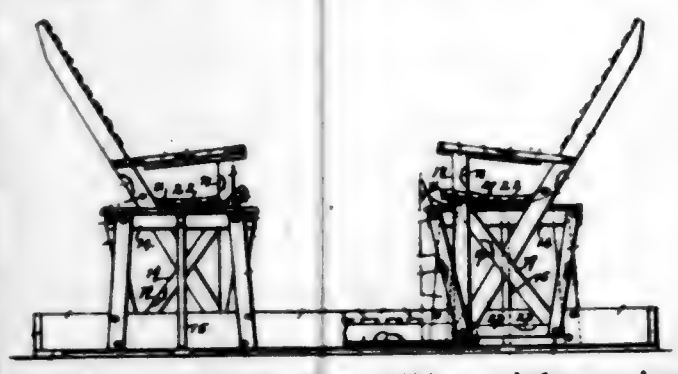
704,522. COCK OR FAUCET. WILLIAM H. DOUGLAS, Washington, D. C. Filed Oct. 17, 1901. Serial No. 78,991. (No model.)



Claim.—1. A cock or faucet comprising a valve-chamber the bottom of which constitutes a valve-seat, said seat having an inlet-port at the edge thereof adjacent the faucet-inlet, and the wall of said chamber within the faucet having an outlet-port opposite said inlet-port; and a hollow rotatable valve completely filling said valve-chamber and formed in the bottom and side thereof respectively with ports corresponding to the ports first named, said valve constructed at its upper edge to overlap the upper edge of the wall of the chamber, and the meeting faces of such edges being beveled, as shown and for the purpose described.

2. A cock or faucet comprising a valve-chamber of equal diameter throughout its height, the bottom of said chamber constituting a valve-seat, said seat and the wall of the chamber being formed respectively, with inlet and outlet ports for a liquid or fluid; and a rotatable valve also of equal diameter throughout its height and snugly fitting said chamber, said valve having ports corresponding to those first named, and also having a bearing upon the upper edge of the wall of the chamber constructed to permit descent of the valve on occurrence of wear between the valve and its seat.

704,528. PORTABLE CHAIR-SWING. ASHFORD T. DOWDEN, Prairie City, Iowa, assignor to the Dowden Manufacturing Company, Prairie City, Iowa. Filed May 20, 1901. Serial No. 61,004. (No model.)



Claim.—1. In a chair-swing, a rigid base, a platform, two benches fixed to the base at each side and each end portion of the base, two hangers, two upright chair-legs, a chair-seat, two links and two side pieces of a chair-back jointly pivoted to each end portion of the platform arranged and combined to operate in the manner set forth for the purposes stated.

2. In a chair-swing, a rigid base, a platform, two benches fixed to the base at each side and each end portion of the base, two hangers, two upright chair-legs, two links and two side pieces of a chair-back jointly pivoted to each end portion of the platform, a chair-seat, two inclined chair-legs pivoted at their top ends to the upper portions of the upright front legs, two hangers pivoted to the benches at their top ends and jointly pivoted at their lower ends to the lower ends of the inclined legs and the ends of the two links, arranged and combined to operate in the manner set forth for the purposes stated.

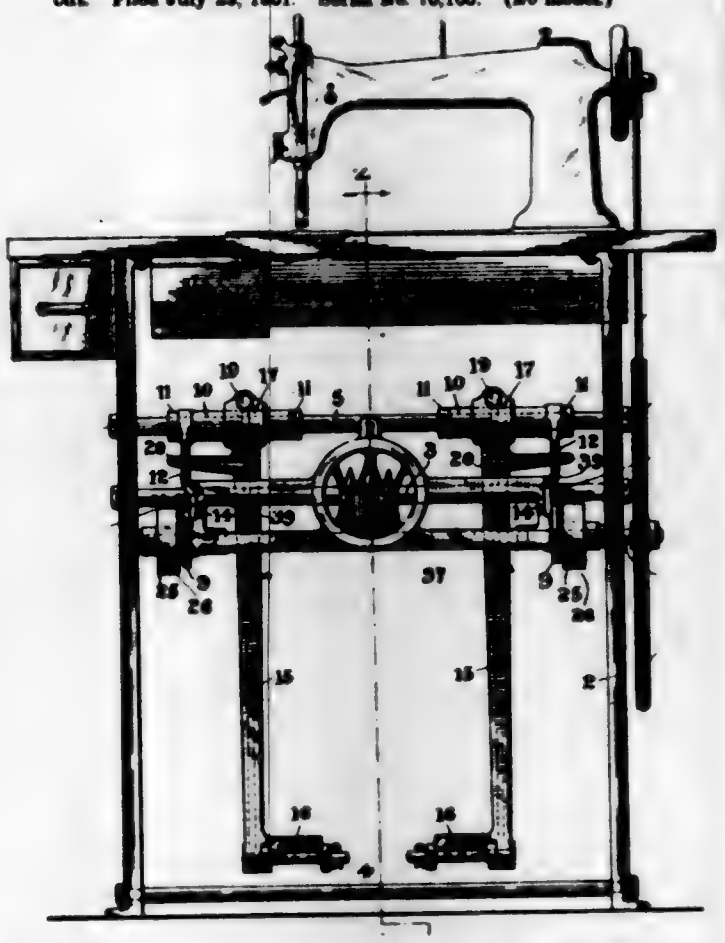
3. In a chair-swing, a rigid base, a platform, two benches fixed to the base at each side and each end portion of the base, two hangers, two upright chair-legs, two links and two side pieces of a chair-back jointly pivoted to each end portion of the platform, two inclined chair-legs, pivoted at their top ends to the upper portions of the upright front legs, two hangers pivoted to the benches at their top ends and jointly pivoted at their lower ends to the lower ends of the inclined legs and the ends of the two links, a seat pivoted to the side pieces of the chair-backs and adjustably connected with the front upright chair-legs, arranged and combined to operate in the manner set forth for the purposes stated.

4. In a chair-swing, a chair composed of a seat and two mating upright front legs, two mating inclined rear legs pivoted at their top ends to the upper portions of the said upright front legs, links pivoted to the lower ends of the upright legs and the inclined legs, sides for a chair-back pivoted to the lower ends of the upright front legs, a rod extended through the upper end portions of the upright legs and through the upper ends of the inclined legs, a seat pivoted to the sides of the chair-back, means for adjustably fastening the seat to said rod, arms pivoted to the sides of the chair-back and means for adjustably connecting the front ends of the arms to the tops of the upright front chair-legs, and means for suspending the chair, arranged and combined to operate in the manner set forth for the purposes stated.

5. In a swing, a chair composed of two mating upright front legs, two mating inclined rear legs pivoted at their upper ends to the upper portions of the said upright front legs, links pivoted to the lower ends of the upright legs and the inclined legs, a chair-back pivoted to the lower ends of the upright legs, a seat pivoted to the sides of the chair-back, a rod extended through the upper end portions of the upright legs and also through the upper ends of the inclined legs, arms pivoted to the sides of the chair-back and means for adjustably fastening the front ends of the arms to the tops of the upright front chair-legs, arranged and combined to operate in the manner set forth for the purposes stated.

6. A portable swing comprising a rigid base composed of parallel side pieces and cross-pieces fixed thereto, benches fixed to the side pieces for supporting a platform and two chairs, a platform suspended between the side pieces of the base, hangers pivotally connected with the benches and the ends of the platform, chairs, each comprising mating side pieces of a chair-back, pivotally connected with the hangers and platform, chair-legs pivotally connected with the hangers and the platform, chair-seats pivotally connected with the side pieces of the chair-backs and chair-arms pivotally connected with the chair-backs and adjustably connected with the front chair-legs, arranged and combined to operate in the manner set forth for the purposes stated.

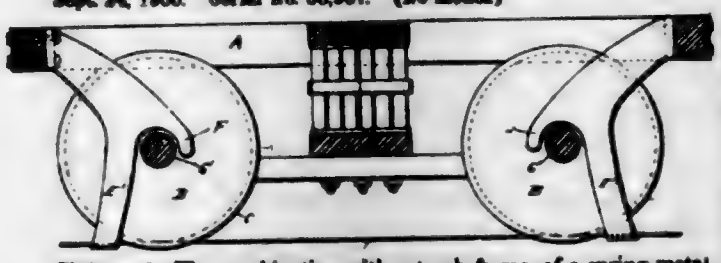
704,524. TREADLE-POWER STAND FOR SEWING-MACHINES. GEORGE M. RAMEY, Bridgeport, Conn., assignor to Wheeler & Wilson Manufacturing Company, Bridgeport, Conn., a Corporation of Connecticut. Filed July 29, 1901. Serial No. 70,105. (No model.)



Claim.—1. In a foot-power stand for sewing-machines and the like, the combination of the driving-shaft suitably journaled and carrying a loose pinion, suitable clutch mechanism intermediate of said pinion and driving-shaft, a segment-gear provided with an elongated hub and pivoted around a spindle secured to the supporting-legs and a pendent treadle-lever secured upon the elongated hub of said segment-gear and provided with a lateral extension or finger 20 adapted to bear against one of the spokes of said segment-gear, substantially as and for the purpose set forth.

2. In a foot-power stand for sewing-machines and the like, the combination of the driving-shaft suitably journaled and carrying a loose pinion, suitable clutch mechanism intermediate of said pinion and driving-shaft, a segment-gear provided with an elongated hub and pivoted around a spindle secured to the supporting-legs and a pendent treadle-lever adjustably secured around the elongated hub of said segment-gear, whereby said treadle-lever is capable of lateral adjustment upon said hub, substantially as and for the purpose set forth.

704,525. FLANGER. MATTHIAS B. EATON, Boston, Mass. Filed Sept. 24, 1900. Serial No. 30,907. (No model.)

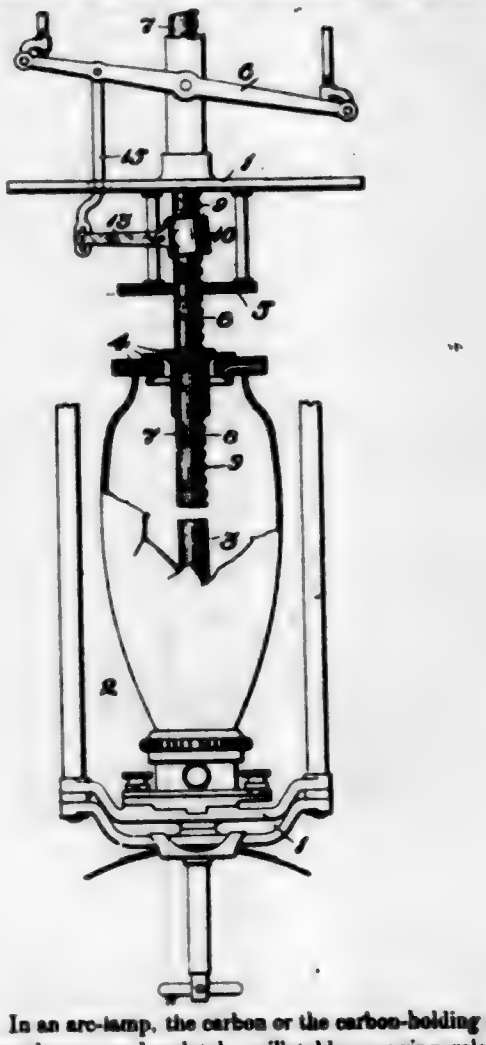


Claim.—1. The combination with a truck-frame, of a spring-metal flanger secured to said frame and extending down at the side of the wheel and terminating near the tread but slightly in front thereof, the lower end being free and inclined slightly into the path of the flange of the wheel, and adapted to yield transversely to the truck-frame.

2. The combination with a truck-frame, of a spring-metal flanger secured thereto extending downwardly by the side of the wheel, the lower extremity terminating below the horizontal plane of the track near but in front of the tread of the wheel, said lower end being inclined slightly toward or into the path of the flange of the wheel.

3. The combination with a truck-frame, of a flanger secured thereto and extending downwardly normally out of contact with the axle of the wheel, but when under tension adapted to engage the axle which then serves as a brace, the lower extremity of said flanger terminating in front of the tread of the wheel and inclined more or less into the path of the flange of the wheel.

704,526. ELECTRIC-ARC LAMP. HARRY BYRKBECK, McKeesport, Pa. Filed Dec. 30, 1901. Serial No. 87,708. (No model.)



Claim.—1. In an arc-lamp, the carbon or the carbon-holding rod or tube having spaces thereon, and a clutch oscillatably engaging, releasing, and reëngaging therewith in and between said spaces.

2. In an arc-lamp, the carbon or the carbon-holding rod, or tube having spaces thereon, and a clutch oscillitably engaging, releasing, and reëngaging therewith and at points in and between said spaces.

3. In an arc-lamp, the carbon or the carbon-holding rod, or tube having equidistant spaces thereon, and an oscillating clutch having jaws engaging, releasing, and reëngaging therewith in and between said spaces.

4. In an arc-lamp, the carbon or the carbon-holding rod, or tube having equidistant spaces thereon, and an oscillating clutch having jaws engaging, releasing, and reëngaging therewith and alternately in and between said spaces.

5. In an arc-lamp, the carbon or the carbon-holding rod, or tube having spaces thereon, and an oscillating double-jawed clutch engaging, releasing and reëngaging therewith and with said jaws alternately at points in and between said spaces.

6. In an arc-lamp, the carbon or the carbon-holding rod, or tube having spaces thereon, an oscillating clutch engaging therewith in and between said spaces, a movable member to retain the same in its engaged position, and a trip to release said clutch and member.

7. In an arc-lamp, the carbon or carbon-holding rod, or tube having spaces thereon, an oscillatable double-jawed clutch engaging therewith in and between said spaces in alternate manner, a movable member to retain the same in its engaged position, and a trip to release said clutch and member.

8. In an arc-lamp the carbon, or carbon-holding rod, or tube having spaces thereon, an oscillatable double-jawed clutch engaging therewith in and between said spaces in alternate manner, a member pivoted to said

clutch to engage said spaced member and retain the clutch-jaws in their operative position, and a trip to release said clutch and member.

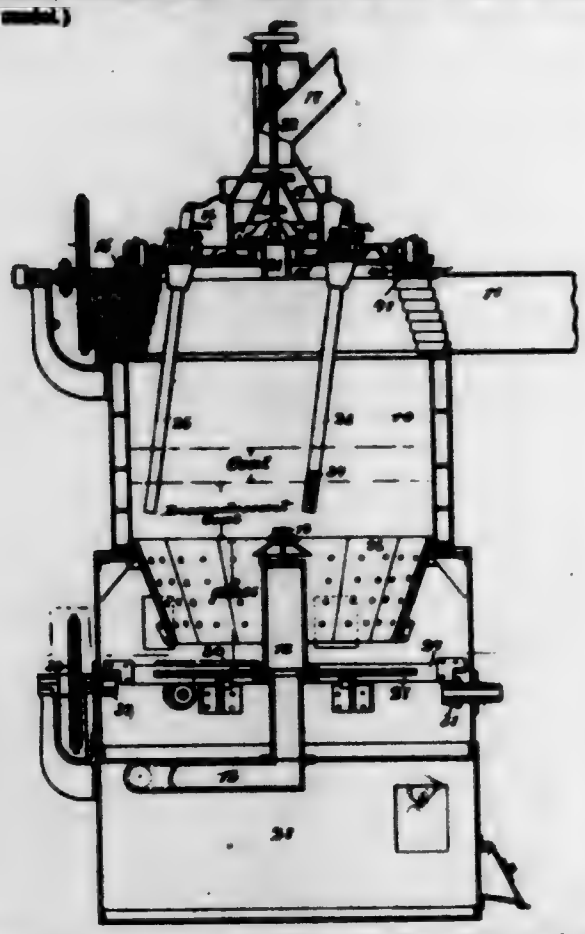
9. In an arc-lamp, the carbon or carbon-holding rod, or tube having spaces thereon, an oscillatable double-jawed clutch engaging therewith in and between said spaces in alternate manner, a member pivoted to said clutch at a point midway between said jaws to engage said spaced members and retain the clutch-jaws in their operative position, and a trip to release said clutch and member.

10. In an arc-lamp, the carbon or carbon-holding rod, or tube having spaces thereon, an oscillatable double-jawed clutch engaging therewith in and between said spaces in alternate manner, a jawed member pivoted to said clutch engaging the spaced member at a point opposite one of said clutch-jaws, retaining said clutch-jaws in operative position, and a trip to release said clutch and member.

11. In an arc-lamp, the carbon or carbon-holding rod, or tube having spaces thereon, an oscillatable clutch having fixed double jaws non-registerable with said spaces engaging said member each time in and between said spaces in alternate manner, a jawed member pivoted to said clutch engaging said spaced member at a point opposite one of said clutch-jaws, retaining said clutch-jaws in operative position, and a trip to release said clutch and member.

12. In an arc-lamp, the carbon or carbon-holding rod, or tube having spaces thereon, an oscillatable clutch having fixed double jaws non-registerable with said spaces engaging said member each time in and between said spaces in alternate manner, a jawed member pivoted to said clutch opposite the jaws and engaging said spaced member opposite one of said clutch-jaws, retaining said clutch-jaws in their operative position, and a trip to engage said clutch and release the same and said member.

704,527. GAS-PRODUCER. WILLIAM J. EVANS and FRANK KLEPETKA, Great Falls, Mont. Filed Nov. 13, 1897. Serial No. 658,330. (No model.)



Claim.—1. In a gas-producer, the combination of the gas-chamber walls and top relatively rotary, a water seal between said walls and top, means for confining a body of water upon the said top, an overflow from the said top to the said seal, and an overflow device for the said seal, substantially as set forth.

2. In a gas-producer, the combination of the gas-chamber walls and top relatively rotary, a water seal between said walls and top, means for confining a body of water upon the said top, an overflow from the said top to the said seal, a mechanical stirrer or poker carried by the said top and provided with cooling-passages, and fluid connections supplying water thereto and discharging onto the said top, substantially as set forth.

3. In a gas-producer, the combination of the gas-chamber walls and top relatively rotary, a water seal between said walls and top, means for confining a body of water upon the said top, a mechanical stirrer or poker carried by the said top and provided with cooling-passages, fluid connections leading to said passages and delivering from said passages onto the said top, and an overflow from the said top to the said seal, substantially as set forth.

4. In combination in a gas-producer, the top thereof provided with stirrers or pokers having cooling-passages, coal-feeding mechanism carried by said top, a water-holding receptacle for cooling the said coal-feeding mechanism, and fluid connections leading therefrom to the cooling-passages of the said stirrers or pokers, substantially as set forth.

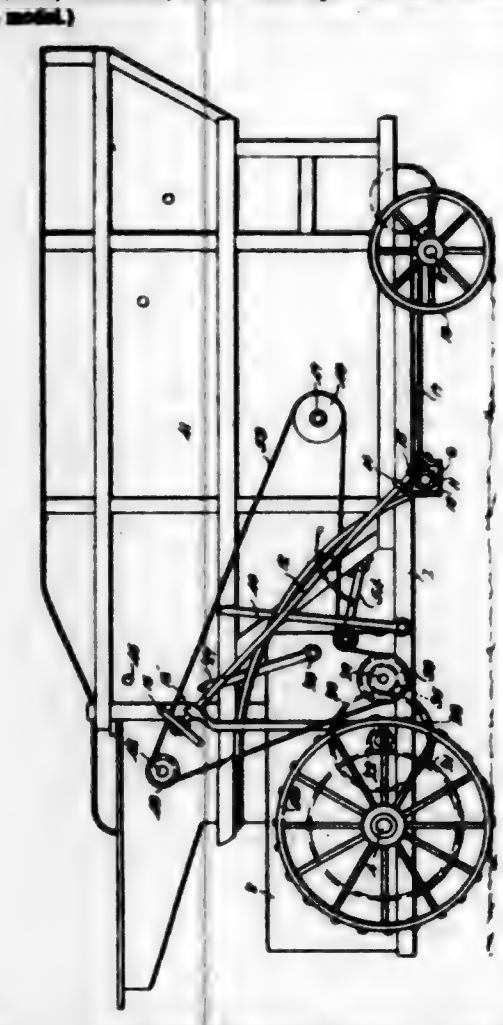
5. In combination in a gas-producer, a coal-feeding opening in the top thereof, means for delivering the coal around but not into the said opening, and coal-feeding arms feeding the coal in a centripetal direction to the said opening, substantially as set forth.

6. In combination in a gas-producer, a coal-feeding opening in the top thereof, means for delivering the coal around but not into the said opening, including a spreading cone which overhangs the said opening, and coal-feeding arms extending beneath the said cone feeding the coal in a centripetal direction to the said opening, substantially as set forth.

7. In combination in a gas-producer, a coal-feeding opening in the top thereof, means for delivering the coal around but not into the said opening, including a spreading device which overhangs the said opening, coal-feeding arms above said opening, and jet-producing mechanism directed downward from above the said opening, substantially as set forth.

8. In combination in apparatus for feeding coal to a gas-producer, an opening through which the coal is fed, means for producing dynamic counter-pressure in such opening in opposition to the static pressure without the producer, a spreading deflector above the said opening, means for delivering coal by gravity onto the said deflector, and mechanical means for feeding the coal from around the said deflector to said opening, substantially as described.

704,528. SELF-PROPELLING TRUCK AND MOTOR FOR THRESHING-MACHINES AND GRAIN-SEPARATORS. FRANK A. PENCOYAR, Blanchard, Iowa. Filed Apr. 24, 1901. Serial No. 57,288. (No model.)



Claim.—1. A self-propelling truck having a power-shaft, in combination with the casing of a threshing-machine or the like, having a drive-shaft one or more, the said casing of said machine being detachably mounted on said truck and means to transmit power from said power-shaft to said drive-shaft, substantially as described.

2. In a self-propelling truck having an engine for propelling the same and also for furnishing power to a threshing-machine or the like carried on said truck, the combination of a traction-shaft, a counter-shaft geared thereto, a brake for said counter-shaft, an engine-shaft, a clutch thereon and gearing connecting said engine-shaft with said counter-shaft, the said gearing including a pinion on said engine-shaft adapted by the clutch to be locked to or released from said engine-shaft and means to

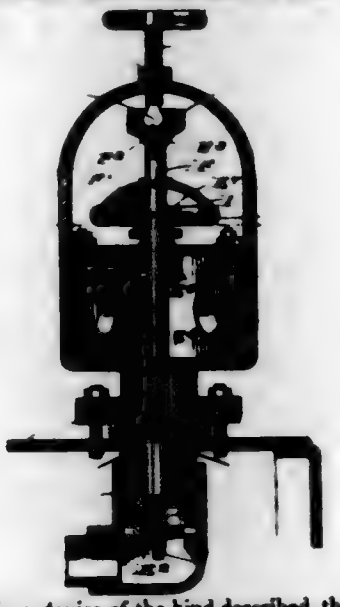
convey power from the engine-shaft to the said machine-driving element, substantially as described.

3. A self-propelling truck having a power-shaft with pulleys at both ends thereof, in combination with a machine of the class described detachably mounted on said truck and having counter-shafts provided with pulleys, slack belts connecting the pulleys of said counter-shafts to the pulleys of said power-shaft and means for tightening said slack belts, substantially as described.

4. A self-steering supporting-truck for a threshing-machine or the like, having a motor to propel the same, a pivoted axle, means to turn the same, and an inclined, upwardly-extending shaft geared to said axle-turning means and having means whereby it may be manually rotated, substantially as described.

5. In combination with a threshing-machine and grain-separator, having a cylinder, driving-shaft and a driving-shaft for the separating mechanism, each of said shafts having a pulley on the same side of the machine, an engine having a power-shaft provided with a pulley, and an endless belt connecting said pulleys of said power-shaft and cylinder and separating-machine drive-shafts, whereby the separator-machine drive-shaft is driven uniformly and is not affected by the variations in the speed of the cylinder, substantially as described.

704,529. **SAFETY DEVICE FOR STEAM-BOILERS.** FREDERICK FORKETT, San Antonio, Tex. Filed Nov. 23, 1901. Serial No. 83,406. (No model.)



Claim.—1. In a device of the kind described, the combination with a valve, and its stem, of a presser-rod adapted to bear upon the valve-stem, said presser-rod being pivotally supported, whereby it can be swung by gravity away from the end of the valve-stem, substantially as described.

2. In a device of the kind described, the combination with a valve and its stem, of a presser-rod adapted to contact with the end of the valve-stem, said presser-rod having a screw-shaft movably connected thereto, whereby the presser-rod can be swung by gravity away from the valve-stem, substantially as described.

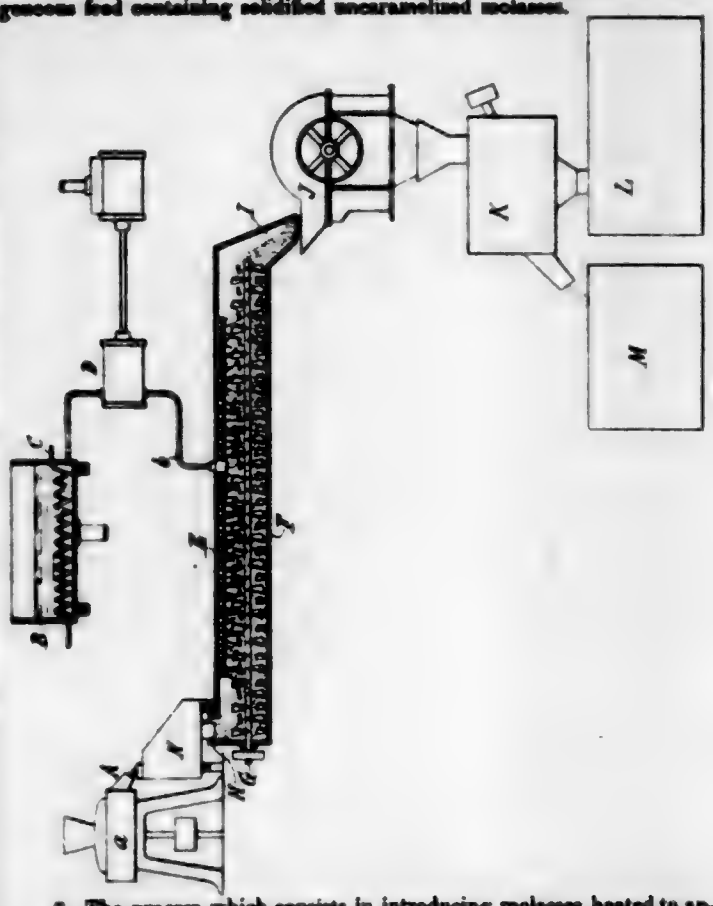
3. In a device of the kind described, the combination with a valve and its stem, of a presser-rod adapted to bear upon the said stem, said presser-rod having a disk attached thereto, said disk having a weighted periphery, said presser-rod being pivotally suspended or supported whereby it can be swung by gravity away from the end of the valve-stem, substantially as described.

4. In a device of the kind described, the combination with a valve and its stem, of a presser-rod adapted to bear upon the said stem, a disk attached to said presser-rod and having a weighted periphery, and a screw-shaft connected to the presser-rod, by means of a universal joint, whereby said presser-rod can be swung by gravity away from the valve-stem, substantially as described.

5. In a device of the kind described, the combination with a valve and its stem, of a presser-rod adapted to bear upon the end of the valve-stem, said presser-rod having a disk attached thereto, the periphery of said disk being weighted, a threaded shaft connected to the presser-rod by means of a universal joint, a yoke through which the screw-shaft works, and a jam-nut surrounding the screw-shaft and adapted to bear upon the top of the yoke, substantially as and for the purpose described.

704,580. **STOCK-FOOD AND PROCESS OF MAKING SAME.** SPENCER L. FRASER, Chicago, Ill., assignor of one-tenth to Sophronia Demarest Fraser, Chicago, Ill. Filed Apr. 26, 1899. Serial No. 714,515. (Specimens.)

Claim.—1. The process which consists in introducing molasses heated to approximately 180° to 230° Fahrenheit into finely-divided dry base material, stirring the mixture to thoroughly incorporate the molasses, and drying it at a low temperature, to produce a dry, pulverulent homogeneous feed containing solidified uncaramelized molasses.



2. The process which consists in introducing molasses heated to approximately 180° to 230° Fahrenheit into finely-divided uncooked dry base material, stirring the mixture to thoroughly incorporate the molasses, and drying it at a low temperature, to produce a dry, pulverulent homogeneous feed containing solidified uncaramelized molasses.

3. The process which consists in introducing molasses heated to approximately 180° to 230° Fahrenheit into finely-divided dry base material, stirring the mixture to thoroughly incorporate the molasses, and then drying at a low temperature leaving the mass to cure for a sufficient time to cause the moisture to be absorbed and the molasses to solidify, whereby to produce a dry, pulverulent, homogeneous feed of wholesome and appetizing flavor.

4. A feed comprising a finely-divided fibrous or absorbent base material, and solidified cooked and uncaramelized molasses, the latter distributed homogeneously throughout the base, and the feed being dry, pulverulent, and of wholesome and appetizing flavor.

5. A feed comprising a finely-divided fibrous or absorbent uncooked alimentary base, and solidified uncaramelized molasses, the latter distributed homogeneously throughout the base and coated on or attached to the particles of the base, the feed being dry, pulverulent, and of wholesome and appetizing flavor.

6. A feed comprising a finely-divided fibrous or absorbent uncooked alimentary base, and ten per cent. or more solidified cooked molasses, the latter distributed homogeneously throughout the base, and the feed being dry, pulverulent, and of wholesome and appetizing flavor.

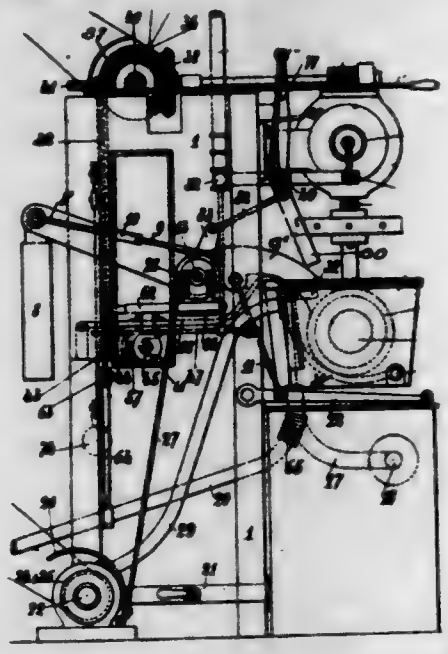
704,581. **MERCERIZING-MACHINE.** MAURICE PRINCE, Paris, France. Filed Dec. 11, 1900. Serial No. 39,541. (No model.)

Claim.—1. In a mercerizing-machine, an upper roller and driving means for the same, a lower stretching-roller over which the hanks pass from the driving-roller, a vat for containing mercerizing liquid, an operating-lever for lowering the stretching-roller into and elevating it from the vat, and counterbalancing means for the stretching-roller

2. In a mercerizing-machine, rollers over which the hanks are strung, a vat for containing mercerizing liquid, driving means for rotating the rollers and moving the hanks to carry them through the mercerizing liquid in the vat, an automatically-controlled mercerizing-liquid supply for the vat, an automatically-controlled mercerizing-liquid outlet for the vat, and an automatically-controlled rinsing-liquid inlet and outlet for discharging said liquid into and withdrawing it from the vat.

3. In a mercerizing-machine, a vat, a rinsing-liquid inlet for discharging said liquid into the vat, two vessels or a chamber for the rinsing liquid, and an automatically-controlled outlet for drawing part of the rinsing liquid from the vat into one of said vessels and part into the other.

4. In a mercerizing-machine, two rollers over which the hanks are strung, a vat, means for rotating the rollers to move the hanks through the vat, a tank for mercerizing liquid, automatically-controlled supply and return means for drawing mercerizing liquid from said tank into the vat and for returning it from the vat to the tank, automatically-operating rinsing means for subjecting the hanks to the action of a rinsing liquid after they have been subjected to the mercerizing liquid, two tanks or vessels for receiving the rinsing liquid, and an automatically-controlled outlet for withdrawing rinsing-liquid rich in mercerizing liquid into one tank and rinsing liquid free from mercerizing liquid into another tank.



5. In a mercerizing-machine, a vat, feed mechanism for moving the hanks through a mercerizing solution in the vat, an automatically-controlled outlet for withdrawing the mercerizing solution from the vat, automatically-operating stopping means for arresting the hanks-feed mechanism to permit the hanks to drain, automatically-operated starting means for throwing the hanks-feed mechanism into operation after the mercerizing solution has been withdrawn from the vat, and rinsing means for the hanks.

6. In a mercerizing-machine, a vat, two rollers over which the hanks are adapted to be stretched, driving means for rotating one of the rollers to move the hanks, lowering and raising means for lowering one of the rollers into and elevating it from the vat, mercerizing-liquid-supply means, automatically-operated controlling means for said mercerizing-liquid-supply means whereby said liquid is supplied to the vat upon elevation of said roller and said supply stopped upon lowering of the roller, starting means for throwing the roller-driving means into operation, and automatically-operating stopping means for throwing the roller-driving means out of operation after a predetermined time.

7. In a mercerizing-machine, a vat, two rollers over which the hanks are adapted to be stretched, driving means for rotating one of the rollers to move the hanks, lowering and raising means for lowering one of the rollers into and elevating it from the vat, mercerizing-liquid-supply means automatically operating to supply said liquid to the vat upon the elevation of said roller, automatically-operating means for arresting the mercerizing-liquid-supply means to stop the supply of said liquid upon lowering of the roller, starting means for throwing the roller-driving means into operation, an automatically-controlled mercerizing-liquid outlet for the vat, stopping means for throwing the roller-driving means out of operation after a predetermined time, and rinsing means adapted to automatically rinse the hanks.

8. In a mercerizing-machine, a vat, two rollers over which the hanks are adapted to be stretched, driving means for rotating one of the rollers to move the hanks, lowering and raising means for lowering one of the rollers into and elevating it from the vat, mercerizing-liquid-supply means automatically operating to supply said liquid to the vat upon the elevation of said roller, automatically-operating means for arresting the mercerizing-liquid-supply means to stop the supply of said liquid upon the lowering of the roller, starting means for throwing the roller-driving means into operation, and automatically-controlled mercerizing-liquid outlet for the vat, automatically-operating spraying means for spraying the hanks with the rinsing liquid, and an automatically-controlled rinsing-liquid outlet for drawing said liquid from the vat.

9. In a mercerizing-machine, a vat, two rollers over which the hanks are adapted to be stretched, driving means for rotating one of the rollers to move the hanks, lowering and raising means for lowering one of the rollers into and for elevating it from the vat, mercerizing-liquid-supply means automatically operating to supply said liquid to the vat upon the elevation of said roller, automatically-operating means for arresting the mercerizing-liquid-supply means to stop the supply of said liquid upon the lowering of the roller, starting means for throwing the roller-rotating mechanism into operation, and automatically-controlled mercerizing-liquid outlet for the vat, stopping means for throwing the roller-driving means out of operation for a predetermined time, automatically-operating spraying means for spraying the hanks with a rinsing liquid, starting means for again throwing the roller-driving means into operation, and stopping means for arresting the operation of the entire machine.

704,532. WINDOW CURTAIN AND SHADE SUPPORT. JAMES GALE, San Francisco, Cal. Filed Jan. 22, 1901. Serial No. 44,326. (No model.)

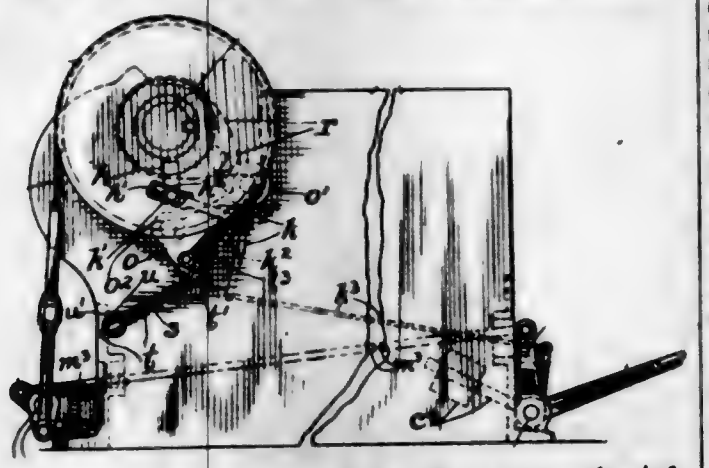
Claim.—In a curtain and shade support, the combination of metallic arms provided with pivotal connections to be attached to the window-casing, sheet-metal brackets substantially triangular in form, fixedly secured in their upper ends to the upper ends of said arms, fasteners in the lower ends of the said brackets said fasteners comprising round central parts loosely surrounding said arms and prongs passed through and secured in rivet-holes in the lower ends of said brackets, and a curtain-pole carried by the upper sides of said brackets, substantially as described.

704,533. METHOD OF PREPARING SPARKLING WINES. PAUL GARRETT, Weldon, N. C. Filed Jan. 31, 1901. Serial No. 45,498. (No specimens.)

Claim.—A method of preparing sparkling wines in bulk, consisting in fermenting the material in a closed receptacle under pressure of the natural carbonic-acid gas given off during the fermentation stage, draw-

ing slowly the fermented wine from the said closed receptacle through a filter into a closed clarifying-tank where the wine is clarified, subjecting the fermented wine simultaneously with the drawing off thereof through the filter to pressure of natural carbonic-acid gas externally supplied to the closed receptacle, and then finally subjecting the wine in bulk during the clarification stage within the clarifying-tank to pressure of natural carbonic-acid gas externally supplied for retaining the carbonic-acid gas generated during the clarification stage within the wine thereby producing a finished product for bottling.

704,534. BRAKE MECHANISM. GEORGE W. GREENWOOD, Cleveland, Ohio. Filed Mar. 31, 1902. Serial No. 100,944. (No model.)



Claim.—1. The combination, with the stationary framework, a shaft, a brake-band-engaging wheel and a cam operatively connected with the said shaft, and a brake-band extending over and circumferentially of the said wheel, of lever mechanism operatively connected with one end portion of the band, a lever operatively connected with the other end portion of the band and arranged to be engaged and actuated by the cam during the rotation of the shaft, and means acting to retain the said lever in its normal position, and the arrangement of the parts and the trend of the cam being such that the brake-band is caused to powerfully engage the aforesaid wheel during the operation of the aforesaid lever by the cam, or is loosened to such an extent as to render it inoperative during the actuation of the cam-actuated lever, according as the aforesaid lever mechanism is actuated into the one or the other of its positions.

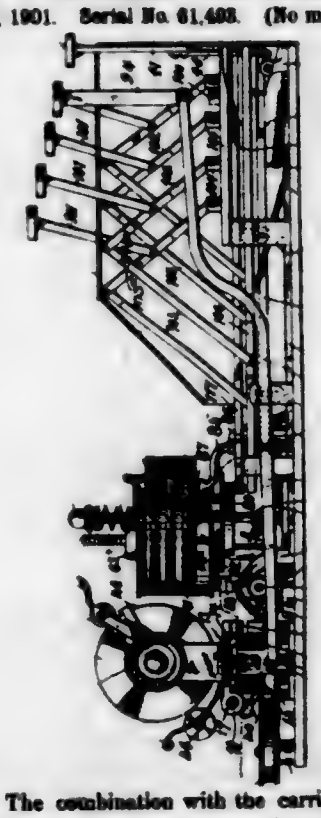
2. The combination, with the stationary framework, a shaft, a brake-band-engaging wheel and a cam operatively connected with the shaft, and a brake-band extending over and circumferentially of the said wheel, of lever mechanism operatively connected with one end portion of the band, a roller-bearing lever operatively connected with the other end portion of the band and arranged to be engaged and actuated by the cam during the rotation of the shaft, and a suitably-applied spring acting to retain the said lever in its normal position, and the arrangement of the parts and the trend of the cam being such that the brake-band, in the normal position of the aforesaid lever mechanism, is caused to powerfully engage the aforesaid wheel during the actuation of the aforesaid lever by the cam, and that the said band upon the operation of the said lever mechanism is loosened to such an extent as to render it inoperative during the actuation of the cam-actuated lever.

3. The combination, with the stationary framework, a shaft, a brake-band-engaging wheel and a cam operatively connected with the shaft, and a brake-band extending over and circumferentially of the said wheel, lever mechanism operatively connected with one end portion of the brake-band and operatively connected with the oscillating shaft, a lever operatively connected with the upper end portion of the brake-band, and normally arranged to be engaged and actuated by the said cam during the operation of the first-mentioned shaft, and means acting to retain the cam-actuated lever in its normal position, and the arrangement of the parts being such that the brake-band is caused to powerfully engage the brake-band-engaging wheel during the operation of the cam-actuated lever by the cam, or is loosened to such an extent as to render it inoperative during the said actuation of the cam-actuated lever, according as the aforesaid oscillating shaft is oscillated into the one or the other of its positions.

4. The combination, with the stationary framework; a shaft; a brake-band-engaging wheel and a cam operatively connected with the said shaft, and a brake-band extending over and circumferentially of the said wheel, of an oscillating shaft below the said wheel and having an arm or lever operatively connected with one end portion of the band, which shaft has another and normally depending arm or lever; another oscillating shaft having an arm or lever operatively connected with the aforesaid depending arm or lever of the first-mentioned oscillating shaft; means acting to retain the said oscillating shafts in their normal position; another lever arranged to be engaged by the aforesaid cam during the rotation of the first-mentioned shaft, and means acting to retain the said cam-actuated lever in its normal position, and the arrangement of the parts and the trend of the cam being such that the brake-band is caused to powerfully engage the aforesaid wheel during the operation of the cam-actuated lever by the cam, or is loosened to such an extent as to render it inoperative during the said actuation of the cam-actuated lever, according as the aforesaid oscillating shafts are actuated into the one or the other of their positions.

5. In combination, a stationary framework, a shaft, a brake-band-engaging wheel and a cam operatively connected with the shaft, a brake-band extending over and circumferentially of the said wheel, a power-transmitting wheel loosely mounted on the shaft, a clutch arranged to control operative connection between the last-mentioned wheel and the shaft, an oscillating shaft, lever mechanism adapted to render the clutch operative and operatively connected with the last-mentioned shaft, lever mechanism operatively connected with one end portion of the brake-band and operatively connected with the oscillating shaft, a lever operatively connected with the other end portion of the brake-band and normally arranged to be engaged and actuated by the said cam during the operation of the first-mentioned shaft, and means acting to retain the cam-actuated lever in its normal position, and the arrangement of the parts being such that the brake-band is caused to powerfully engage the brake-band-engaging wheel during the operation of the cam-actuated lever by the cam, or is loosened to such an extent as to render it inoperative during the said actuation of the cam-actuated lever, according as the aforesaid oscillating shaft is oscillated into the one or the other of its positions, and that the aforesaid clutch is rendered operative or inoperative according as the brake-band is rendered inoperative or operative.

704,535. TYPE-WRITER. JOHN D. GRIFFEN, New York, N. Y. Filed May 23, 1901. Serial No. 61,493. (No model.)



Claim.—1. The combination with the carriage having a rack-bar and escapement for releasing the carriage and rack-bar tooth by tooth, of the slide-block movable back and forth beneath the carriage and at right angles thereto, a direct connection between the slide-block and escapement, a key-operated printing device sliding bodily backward and forward in relation to the carriage, and means for moving the slide-block independently or by the advance of the printing device.

2. In a type-writer, the combination with the carriage having a suitable release or escapement, of a slide-block operating the escapement, independent means for operating the slide-block, a type-wheel movable back and forth in relation to the carriage, and means for moving the slide-block and operating the escapement by the advance of the type-wheel.

3. In a type-writer, the combination with the carriage having a suitable release or escapement, of a slide-block operating the release, a second slide-block abutting with and adapted to move the first slide-block, a type-wheel carried on the second slide-block, and means for moving the type-wheel back and forth.

4. In a type-writer, the combination with the carriage having a suitable release or escapement, of a slide or spacer block operating the escapement, key mechanism for moving the spacer-block, a second slide-block abutting with the spacer-block, a key mechanism for moving the second slide-block, and a type-wheel carried by the second slide-block.

5. The combination with the rotatable and horizontally and vertically movable type-wheel having its type arranged in a series of rows, of a vertically-sliding arm having its upper end abutting with the type-wheel so as to permit the type-wheel to slide horizontally in relation to the arm, tilting levers in engagement with the arm, the levers having a differential throw, and a key mechanism for operating the levers.

6. In a type-writer, the combination with the rotatable and vertically and horizontally movable type-wheel, of the laterally-arranged tilting levers, one having a greater throw than the other, a sliding arm supported on the levers and engaging the type-wheel so as to permit the type-wheel to slide horizontally in relation to the arm, and a key mechanism for tilting the levers.

7. In a type-writer, the combination with the rotatable and horizontally-reciprocating type-wheel, of key-operated slides arranged to move in succession and together, and an operative connection between the slides and the type-wheel whereby the movement of one slide turns the type-wheel, the movement of the second fixes its position, and the synchronous movement of the two advances the type-wheel for printing.

8. In a type-writer, the combination with the rotatable and horizontally-reciprocating type-wheel, of slides arranged one above the other adapted to move together or separately, the first slide being connected to the type-wheel so as to turn it, the second slide being arranged to fix the position of the type-wheel, and the movement of the two together being adapted to advance the type-wheel, and key-rods slidable parallel with the aforesaid slides and arranged to engage and move the slides.

9. In a type-writer, the combination with the rotatable and horizontally-reciprocating type-wheel and the reciprocating key-rods, of the sliding shifting rods pivotally connected to the type-wheel to turn it, means for moving the shifting rods by the movement of the key-rods, locking-rods connected to the type-wheel so as to fix its position, means for moving the locking-rods by the movement of the key-rods, and means for advancing the type-wheel by the further movement of the key-rods.

10. In a type-writer, the combination with the rotatable and horizontally-reciprocating type-wheel, of the shifting rods and locking-rods slidable in parallel relation, the shifting rods being pivoted to the type-wheel to turn it and the locking-rods having means for fixing the position of the type-wheel, and a key mechanism for moving the rods, said key mechanism being also arranged to advance the type-wheel bodily.

11. In a type-writer, the combination with the rotatable and horizontally-reciprocating type-wheel having pins or stops on the under side, of the shifting rods pivoted to the type-wheel so as to turn it, the sliding locking-rods to engage the aforesaid pins or stops to fix the position of the type-wheel, and a key mechanism for moving the shifting and locking rods.

12. In a type-writer, the combination with the rotatable and horizontally-movable type-wheel, of the slidable shifting rods pivotally connected to the type-wheel to turn it, the slidable locking-rods moving parallel with the shifting rods, stops on the type-wheel to engage the locking-rods, and freely-moving keys adapted in their movement to engage and operate the shifting and locking rods.

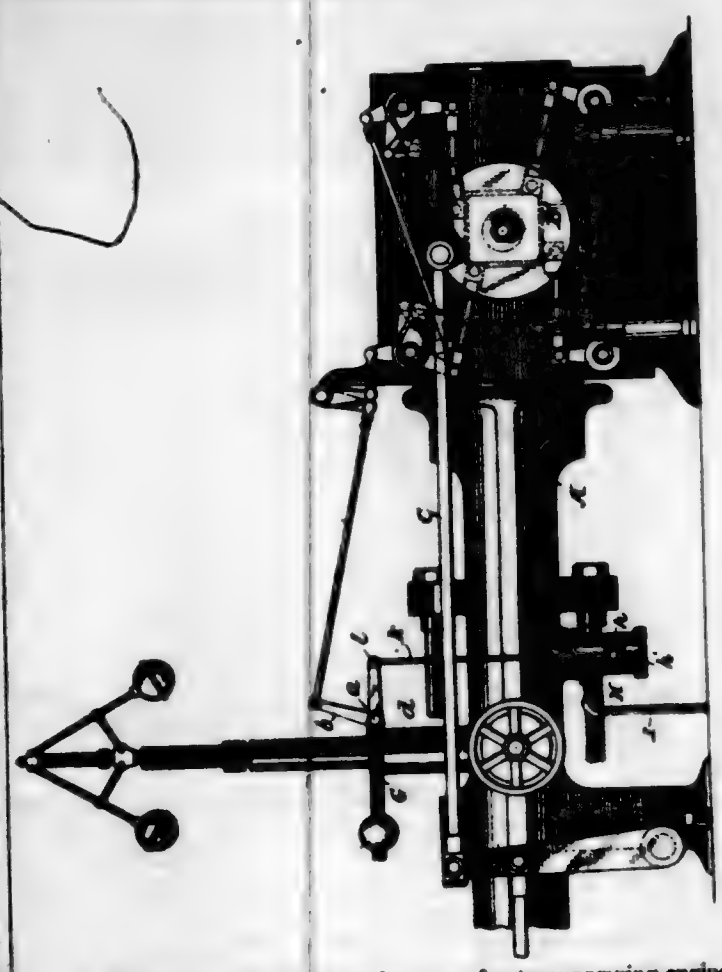
13. In a type-writer, the combination with the rotatable and horizontally-movable type-wheel, of the slides arranged one above the other, the shifting rods engaged and moved by the upper slides, said rods being pivotally connected to the type-wheel to turn it, the locking-rods moved by the lower slide, said rods being arranged to engage and lock the type-wheel from further rotation, the key-rods having means as the pins to cause them to engage the upper and lower slides, and means for operating the key-rods.

704,586. GOVERNOR-CONTROLLED VALVE-GEAR. JOHN A. GNOMMOS, New York, N. Y., assignor of one-half to Marshall T. Davidson, Brooklyn, N. Y. Filed Sept. 30, 1901. Serial No. 77,085. (No model.)

Claim.—1. The combination with the valve-gear of a steam pumping-engine, of a governor, a pivoted lever operatively connected with the valve-gear, connection between said governor and the lever, a pressure-governor and connection between it and the lever, and means for counterbalancing different pressures on the pressure-governor, substantially as described.

2. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pivoted lever operatively connected with the valve-gear, connection between the speed-governor and the lever, a pressure-governor and connection between it and the lever at one side of the pivot, and means on the lever at the other side of the pivot for compensating for pressure on the pressure-governor, substantially as described.

3. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pivoted lever operatively connected with the valve-gear, connection between the speed-governor and the lever at one side of the pivot, a pressure-governor and connection between it and the lever at the other side of the pivot, and means on the lever for compensating for pressure on the pressure-governor, substantially as described.



4. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pivoted lever operatively connected with the valve-gear, connection between the speed-governor and the lever at one side of the pivot, a pressure-governor and connection between it and the lever at the other side of the pivot, and variable means for counterbalancing different pressures on the pressure-governor, substantially as described.

5. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pivoted lever operatively connected with the valve-gear, connection between the speed-governor and the lever, a pressure-governor and connection between it and one end of the lever, and a weight on the other end of the lever compensating for pressure on the pressure-governor, substantially as described.

6. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pressure-governor, and operative connections between the two and the valve-gear so arranged that the operation of the speed-governor is independent of the pressure-governor on a decrease of pressure but said speed-governor is controlled by the pressure-governor upon an increase of pressure, substantially as described.

7. The combination with the valve-gear of a steam pumping-engine, of a speed-governor, a pressure-governor, and operative connections between the two and the valve-gear so arranged that said governors act in conjunction to control the valve-gear on a decrease of pressure but act in opposition on an increase of pressure, substantially as described.

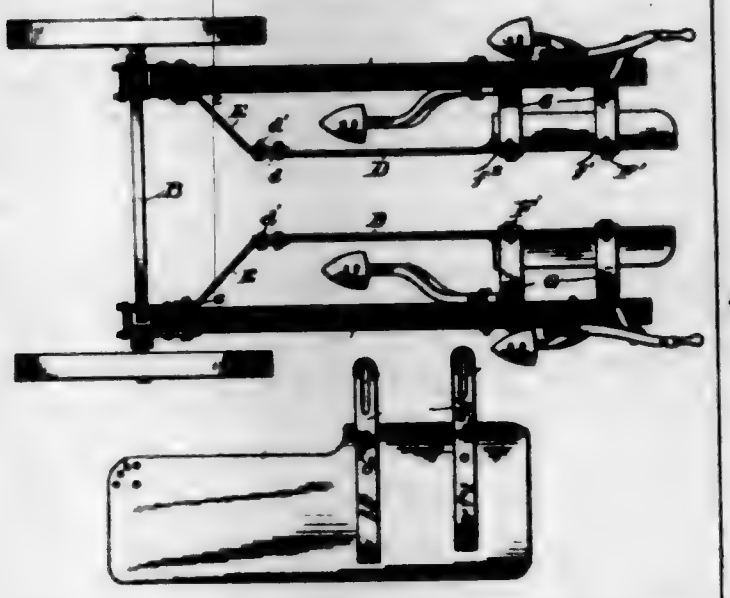
704,587. GARMENT-CLASP. MYRON B. HAMMOND, Bridgeport, Conn. Filed Mar. 26, 1902. Serial No. 100,087. (No model.)

Claim.—1. A garment-clasp comprising a button or stud, a metal loop having therein a pear-shaped opening, the upper ends of the side walls of said opening being notched, and a rubber element extending beyond the edges of said opening and with its ends lying within said notches, the edges of the loop being turned over and pinched firmly against the rubber throughout its length, substantially as set forth.

2. In a garment-clasp, the combination with the button or stud, of the loop having the upper ends of the side walls of its opening notched, and also having its side and bottom edges curled downwardly and thence brought into position in substantial coincidence with the side and bottom edges of said opening, and a section of rubber between said edges at the

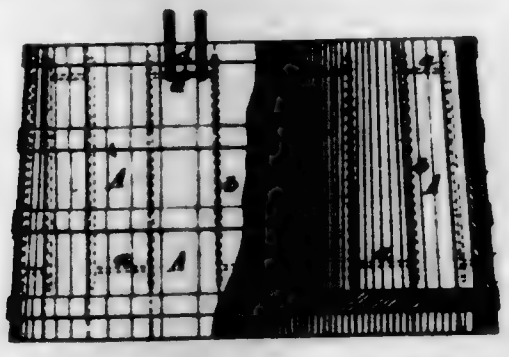
sides and bottom only of said opening, the upper extremities of the rubber section abutted against and fitting within said notched portions, while the rubber itself projects beyond the edges of the loop into said opening and is clamped firmly by said edges throughout the bottom and sides only of said opening, substantially as set forth.

704,538. CULTIVATOR. ALONZO HARMON, Tecumseh, Nebr. Filed July 9, 1900. Serial No. 22,942. (No model.)



Claim.—The combination with a cultivator of a fender extending along the side of the cultivator and adapted to be interposed in use between the cultivator and growing plants, the fender having in its front portion a series of openings in different vertical planes, and having at its rear end an upward extension provided with elongated openings, a rigid support extending rearward and outward from the front of the beam of the cultivator and having in its rear end an opening receiving a bolt which also passes through one of the openings in the front portion of the fender, and a bracket attached to the beam of the cultivator adjacent to the extension from the fender, the bracket having a vertical portion provided with openings adapted to register with those in the extension from the fender, substantially as described.

704,539. TANK. EDWARD H. HARMON, Belvedere, Cal. Filed Dec. 13, 1901. Serial No. 85,814. (No model.)



Claim.—1. A tank composed of staves, each having longitudinal edge grooves, and an intersecting passage connecting said grooves; said intersecting passages in adjoining staves being in different planes, and all the passages and grooves forming in series, a single continuous waterway.

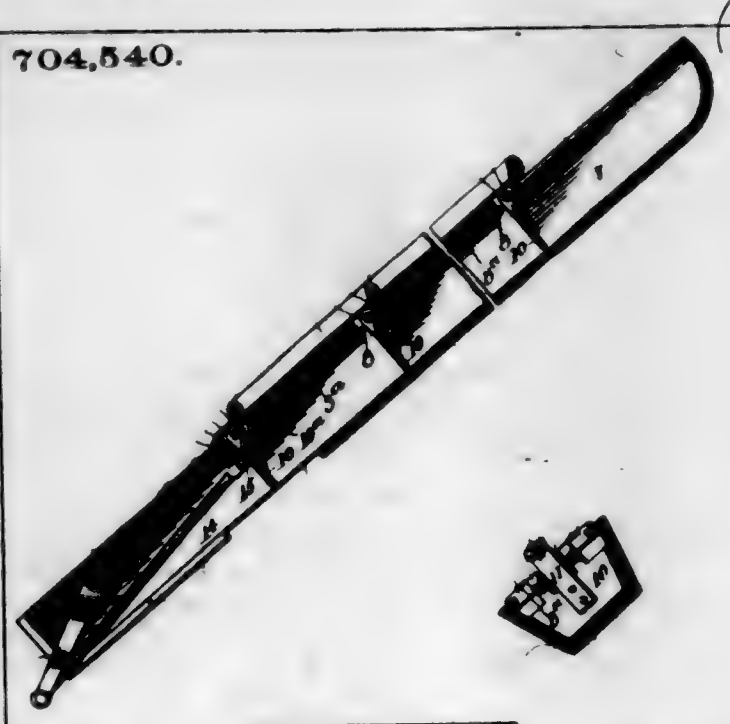
2. A tank composed of staves having vertical grooves in their edges, and communicating horizontal passages, arranged alternately near the top and the bottom of adjacent staves.

704,540. CONVEYER. ROBERT S. HILL, Detroit, Mich. Filed Mar. 24, 1902. Serial No. 99,711. (No model.)

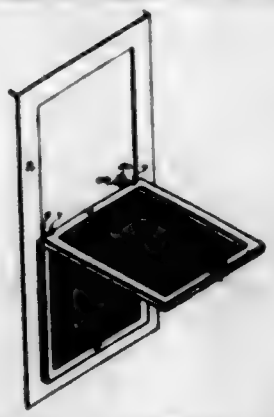
Claim.—1. In a conveyer in combination, a trough, guides thereon, sliding blocks embracing the guides, flights swingingly hung from the blocks, connecting-bars between the flights, and means to reciprocate the flights.

2. In a conveyer, in combination, a trough, guide-bars thereon, sliding blocks on the guide-bars, connected flights swingingly hung from the blocks, means to cause the flights to swing and slide, and a spring engaging a block and yieldingly holding the same against the sliding movement.

704,540.



704,541. WINDOW-SASH HINGE. JOHN HOLT, Canton, Ohio. Filed Apr. 16, 1902. Serial No. 103,083. (No model.)



Claim.—1. The combination of a window-frame, sash located against the face of said frame, hinges connecting the abutting edges of said sash, the hinge-pins being located on the outer side of said sash, and means for detachably connecting said hinge-pins with the window-frame.

2. The combination of a window-frame, pins projecting from the inner sides of said frame, sash located against the face of said frame, hinges connecting the abutting edges of said sash, the hinge-pins being located on the outer side of said sash, and hooked hinge-pin extensions directed inward and adapted to engage said frame-pins.

704,542. CLIP FOR UPHOLSTERING PURPOSES. HENRY J. JACOBS, Buffalo, N. Y. Filed Jan. 10, 1902. Serial No. 88,314. (No model.)

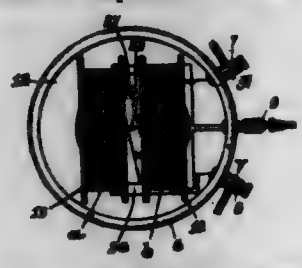
Claim.—1. The herein-described means for securing upholstering and similar materials to wire or other framework, comprising the foundation material and covering, a staple-batten, and a wire body, in combination with a clip engaging over said wire, a loop on said clip engaging the legs of the batten, and legs on said clip which lie at right angles to the legs of said batten and between said wire and the head of the batten, substantially as and for the purposes set forth.

2. A clip for securing upholstery and similar uses, in combination with a spring, an edge wire, and a staple-batten, comprising a clip having a loop portion engaging the legs of the batten, a portion to engage transversely the spring and the edge wire, and a portion to engage between the edge wire and the batten-head, whereby the upholstery, the edge wire, and the spring are secured together, substantially as and for the purposes set forth.

704,543. ELECTRICAL MEASURING INSTRUMENT. EDWARD B. JACKSON, Pittsfield, Mass., assignor to Thor H. Nelson, Boston, Mass. Filed Feb. 11, 1902. Serial No. 93,697. (No model.)

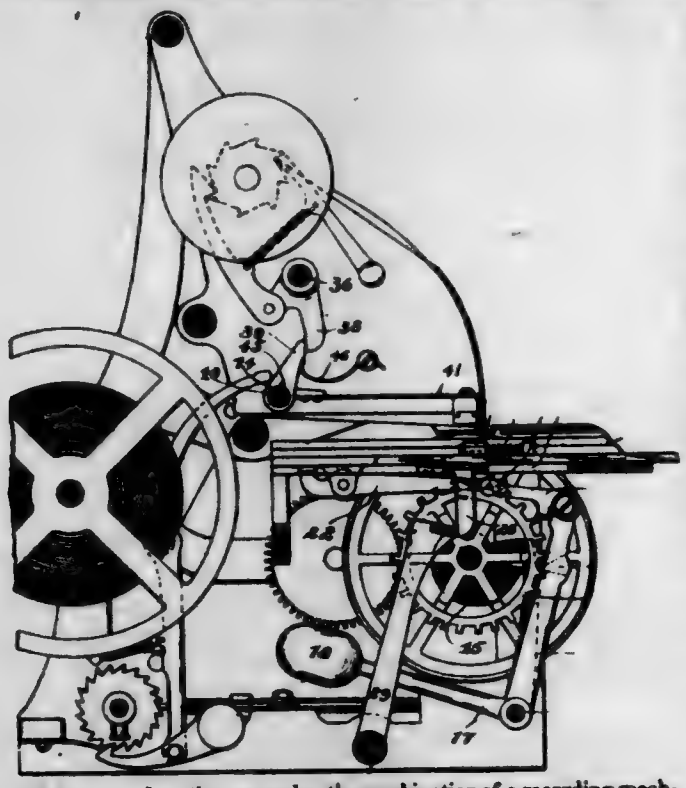
Claim.—1. An instrument for measuring the intensity and potential of electric circuits and comprising a pair of electromagnets, the re-

spective circuits of which are connected at one end to a single terminal, and at the other end with an independent terminal.



2. An instrument for measuring electrical current comprising the electromagnets *a* and *b*, constructed as described, and having the negative ends of their coils connected to a single terminal, and the positive ends of their coils connected to independent terminals.

704,544. WORKMAN'S TIME-RECORDER. GEORGE M. JAYNES, Detroit, Mich., and JOHN W. DEUBNER, Chicago, Ill., assignors, by mesne assignments, to International Time Recording Company, a Corporation of New Jersey. Filed May 24, 1901. Serial No. 17,794. (No model.)



Claim.—1. In a time-recorder, the combination of a recording mechanism, a shiftable carrier adapted to be shifted by directly-applied manual pressure, and an individual workman's type-check, removable from the carrier, provided with printing characters and adapted to be carried by the carrier into position to bring its type characters into register with a printing-form of the recording mechanism, said recording mechanism including an automatically-operating impression device which is tripped by the movement of the carrier.

2. In a time-recorder, the combination of a recording mechanism, a shiftable carrier adapted to be shifted by the directly-applied pressure of the workman's hand moving with the carrier, an individual workman's type-check, provided with printing characters adapted to be carried into printing position by said carrier, and a stop arranged to arrest the movement of the type-check and hold it in printing position independently of the movement of the carrier.

3. In a time-recorder provided with an outer casing, the combination of a recording mechanism, a shiftable carrier adapted to be shifted by the directly-applied pressure of a workman's hand moving with the carrier and arranged to normally protrude from the casing, an individual workman's type-check, removable from the carrier, provided with printing characters and adapted to be supported by the carrier and carried by the latter into position to bring its printing characters into register with a printing-form within the machine, said recording mechanism including an automatically-operating impression device which is tripped by the movement of the carrier, and a spring acting upon the carrier to automatically return the latter to its protruding position when pressure thereon is removed.

4. In a time-recorder, the combination with a clock-actuated printing-form and a printing mechanism adapted to be operated by power applied manually during the recording operation, of a reciprocatory carrier adapted to be shifted by the directly-applied pressure of the workman's hand moving with the carrier, operative connections between said carrier and said printing mechanism whereby the shifting of the former operates the latter, said printing mechanism including an automatically-operating impression device which is tripped when the carrier reaches a predetermined position, a workman's individual type-check, removable from the carrier, adapted to be carried by the carrier into printing position and means acting upon said carrier to automatically return it, together with the type-check carried thereby, to its initial position.

5. In a machine of the character described, the combination with a type-check carrier adapted to carry a check into recording position, of means acting to automatically partially discharge the check from the carrier, for the purpose described.

6. In a machine of the character described, the combination with a type-check carrier adapted to be operated by the directly-applied pressure of the workman's hand, of a type-check adapted to be supported by, and to move with, the carrier, with a part in bearing with the operator's hand which bears on the carrier and a spring arranged to act upon said check when in position upon the carrier in a direction opposed to the pressure which operates the carrier, for the purpose described.

7. In a machine of the character described, the combination with a type-check carrier adapted to be operated by the directly-applied pressure of the workman's hand, of a type-check adapted to be supported by, and to move with, the carrier, with a part in bearing with the operator's hand which bears on the carrier, a stop upon a rigid part of the machine adapted to arrest the check before the carrier reaches the limit of its movement in one direction, and a spring arranged to act upon said check when in position upon the carrier in a direction opposed to the pressure which operates the carrier, for the purpose described.

8. In a time-recorder having an outer casing, the combination with suitable guideways, of a carrier-bar mounted to reciprocate in said ways and arranged to normally project at its outer end beyond and free from the casing, a recess in the outer end of the carrier, a type-check adapted to rest upon said carrier-bar and provided with a nib portion adapted to enter said recess, a spring-pressed plunger upon the carrier adapted to engage the opposite end of the type-check and tending to discharge the latter partially from the carrier, a stop upon a fixed part of the machine adapted to engage the type-check and arrest its inward movement with the carrier, a spring acting to hold the carrier normally projected and operative connections between the carrier and the recording mechanism whereby the pushing in of the carrier effects the complete recording operation.

9. In a time-recorder having an outer casing, the combination with suitable guideways, of a carrier-bar mounted to reciprocate in said ways and arranged to normally project at its outer end beyond and free from the casing, a recess in the outer end of the carrier, a type-check adapted to rest upon said carrier-bar and provided with a nib portion adapted to enter said recess, a spring-pressed plunger upon the carrier adapted to engage the check and tending to partially discharge the latter from the carrier, guides adapted to confine the type-check from lateral movement relatively to the carrier during its travel with the latter, a stop upon a fixed part of the machine adapted to engage the type-check and arrest its inward movement with the carrier, a spring acting to hold the carrier normally projected and operative connections between the carrier and the recording mechanism whereby the pushing in of the carrier effects the complete recording operation.

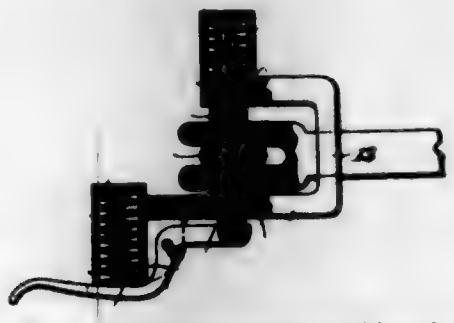
10. In a time-recorder, the combination with a clock-actuated printing-form and an impression mechanism adapted to be operated by power applied manually during the recording operation, of a workman's type-check carrying type adapted to be brought into printed alinement by direct inward movement of the check, and a thrust-operated reciprocatory operating member having operative engagement with the recording mechanism, located adjacent to the receiving-passage for the type-check and moving in lines parallel, or substantially parallel, with the movement of the type-check, whereby the operator may insert the type-check and simultaneously operate the thrust member by a substantially continuous inward thrust movement.

704,545. COUPLING DEVICE. JOHN G. KARGUES, Madison, Wis. Filed Aug. 20, 1901. Serial No. 73,718. (No model.)

Claim.—1. The combination with a pair of elements to be coupled, said elements being disposed in overlapping relation, of a coupler comprising a frame separate from the elements and a locking device movably mounted upon the frame and engaging the overlapping portions of both elements to secure them together, said device being movable out of engagement with one of the elements but remaining in engagement with the other and constituting means for securing the coupler upon said latter element.

2. The combination with a pair of elements to be coupled, said elements being disposed in overlapping relation, of a coupling comprising a yoke that embraces both elements, and a coupling-pin slidably mounted

upon the yoke and detachably engaging the overlapping portions of both elements to couple the same, said coupling-pin being movable out of engagement with one of the elements but remaining in engagement with the other and constituting means for securing the coupler upon said latter element.



3. An attachment of the class described, comprising a frame having spaced arms arranged to embrace a plurality of elements, a locking device movably mounted on one arm and arranged to engage one of the elements and a coupling-pin slidably mounted on the other arm and adapted to detachably engage all of the elements to secure them together.

4. An attachment of the class described, comprising a yoke arranged to embrace a plurality of elements, a coupling-pin slidably mounted upon one arm of the yoke and movable into the space between both arms, said pin being arranged to engage the elements to couple them and when in retracted position having its inner end projecting into the space between the arms of the yoke to engage the outer element, thereby constituting locking means for holding the attachment on said element.

5. An attachment of the class described, comprising a frame having spaced arms arranged to embrace a plurality of elements, and a locking device carried by each arm, said devices being arranged in substantial alinement and movable toward and from each other.

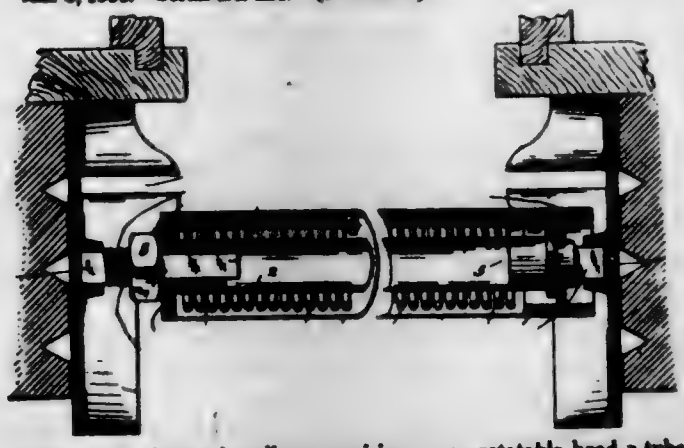
6. An attachable coupling device of the class described, comprising a yoke adapted to embrace a plurality of elements, a locking-bolt carried by one arm of the yoke and arranged to engage one of the elements, and a coupling-pin carried by the other arm of the yoke and arranged to engage all of said elements to couple them.

7. An attachable coupling device, comprising a yoke adapted to embrace a plurality of elements, a locking-bolt carried by one arm of the yoke and arranged to engage one of the elements, a coupling-pin carried by the other arm of the yoke and arranged to engage all of said elements to couple them, and means for operating said coupling-pin.

8. An attachable coupling device, comprising a yoke adapted to embrace a plurality of elements, a locking-bolt carried by one arm of the yoke and arranged to engage one of the elements, a coupling-pin carried by the yoke and arranged to engage all of said elements to couple them, and means for holding the coupling-pin in retracted position.

9. An attachable coupling device of the class described, comprising a yoke, a spring-pressed locking-bolt carried by one of the arms and adapted to engage one of the elements to be coupled, a spring-pressed coupling-pin carried by the other arm and adapted to engage all the elements to couple them, an operating-lever connected to the coupling-pin, and a dog arranged to engage the lever to hold the coupling-pin in retracted position but in engagement with the same element engaged by the locking-bolt.

704,546. SPRING-ROLLER FOR FIREPROOF BLINDS. WILLIAM R. KIMBAR, Columbus, Ohio, assignor to the Kimbar Manufacturing Company, Columbus, Ohio, a Corporation of West Virginia. Filed Jan. 3, 1900. Serial No. 292. (No model.)



Claim.—1. A curtain-roller comprising a non-rotatable head, a tube one end of which fits thereon, a plug in the opposite end of said tube, a head rotatable on said plug, a spring connected to and between said heads, and a drum or cylinder carried by the rotatable head.

2. A curtain-roller comprising a head, a tube one end of which fits thereon, a plug having a shoulder in the opposite end of said tube, a head rotatable on said plug beyond said shoulder, a spring secured to and between said heads, and a drum carried by said head.

3. A curtain-roller comprising an inner tube, a shouldered plug in one end of said tube adapted to engage a seat at one side of the window-opening, a head turning on said plug, a drum carried thereby, and a head secured to the opposite end of said tube having a prismatic socket, a threaded pin having prismatic ends to engage respectively said socket and a seat at the other side of the window-opening, a nut turning on the thread of said pin, and a spring secured to and between the aforesaid heads, substantially as described.

4. A curtain-roller comprising in combination an inner tube, a plug in one end thereof adapted to engage a seat at one side of a window or door opening, a head having a prismatic socket in the opposite end of said tube, a threaded pin having a prismatic end to engage said socket and an end to engage a seat at the opposite side of the window or door opening, a nut on said pin adapted to bind the tube between the aforesaid plug and head, a head turning on said plug and a drum carried by said head, substantially as described.

5. A curtain-roller cylinder or drum of sheet metal formed with securing tongues and slots, combined with a metallic slat or curtain secured to said cylinder or drum with said tongues, substantially as described.

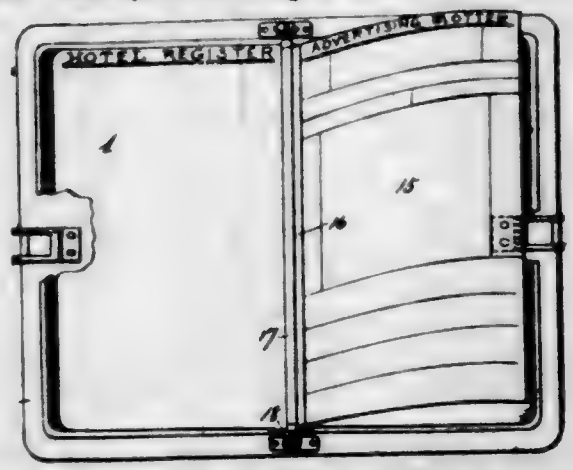
704,547. EXPANSIBLE BOLT. WILLIAM R. KIMBAR, Columbus, Ohio. Filed Jan. 10, 1902. Serial No. 89,155. (No model.)

Claim.—1. An expansible bolt device comprising a tube composed of semitubular shells, a wedging-nut longitudinally movable therein, one of said semitubular shells having a flexible tongue at one end to engage the other shell to hold the two together, and a transversely-extending flange at the other end of said tube to secure said nut within said tube, and a bolt to engage the said nut, substantially as described.

2. An expansible bolt device comprising a tube composed of semitubular parts, a portion of said parts being made thin and flexible and having outwardly-projecting spurs and an internally-threaded wedge-nut adapted to be engaged by a screw-bolt to operate said nut to expand said thin portion and spurs outwardly, substantially as described.

3. An expansible bolt device comprising a tube with a portion between its ends made thin and flexible and provided with outward projections, an internally-threaded wedge-nut within said tube, and a screw-bolt to engage said wedge-nut to expand said thin portion and spurs outwardly, substantially as described.

704,548. HOTEL-REGISTER. FREDERICK C. KLEE, Dubuque, Iowa, assignor to the National Hotel Register Company, Dubuque, Iowa. Filed Sept. 25, 1900. Serial No. 31,023. (No model.)



Claim.—1. The combination with a supporting plate or platform, of a rod having a pivotal connection at one end with the platform, a locking device carried by the platform and constructed to detachably lock the other end of the rod and means to permit the rod to have a yielding movement perpendicularly to the platform.

2. The combination with a supporting plate or platform, of a rod adapted to lie transversely across a book laid upon the platform, a short standard carried by the platform and to which one end of the rod is pivotally connected, a second short standard carried by the platform and constructed to detachably lock the other end of the rod, and a yielding connection between the said standards and the platform to permit the rod to have a yielding movement perpendicularly to the platform.

3. The combination with a supporting plate or platform, of a rod, a short standard carried by the platform and to which one end of the rod

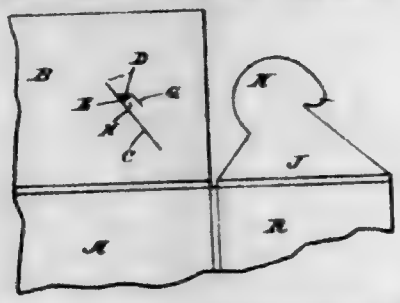
is pivotally connected, a rotatable short standard carried by the platform and having its upper end constructed to form hooks for detachably locking the other end of the rod.

4. The combination with a supporting plate or platform, of a short standard, a rod having one end pivotally connected with the said standard, a spring arranged to act upon said standard to normally retract the same, a second short standard constructed to detachably engage and lock the other end of the rod, and a spring arranged to act upon the latter standard to normally retract the same.

5. The combination with a supporting plate or platform for a book, of plates secured thereto at opposite sides, the one having a round and the other a squared aperture, a sleeve carried by each plate and inserted within the platform, short standards, the one having a round shank and the other a squared shank with respective round and squared portions extending through the apertures and within the sleeves, one of said standards being constructed at its upper end with hooks, coiled springs arranged to normally retract the standards, and a rod pivoted at one end to one of the standards, and its other end adapted to be engaged by the hooks of the other standard.

6. The combination with a supporting plate or platform, of a rod having a pivotal connection at one end with the platform, means for detachably locking the other end of the rod, means to permit the rod to have a yielding movement perpendicularly to the platform, and a sheet provided at one edge with a loop or sleeve through which latter the rod loosely passes, said sleeve being adapted to slip endwise off the rod when the latter has been detached from the locking means and swung upon its pivot in the manner set forth.

704,549. **SAFETY-BOX.** MOSES KLEIN, Chicago, Ill., assignor to American Folding Box Company, Chicago, Ill., a Corporation of Illinois. Filed June 20, 1901. Serial No. 65,248. (No model.)

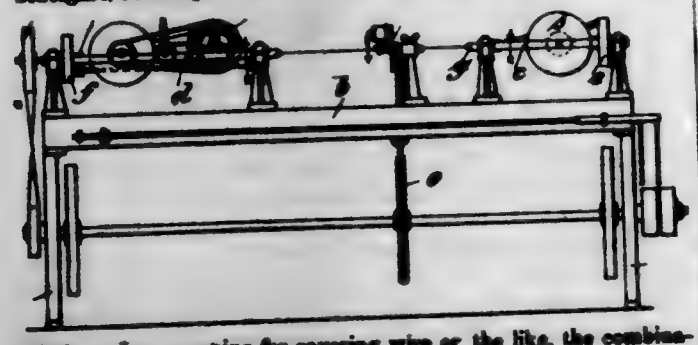


Claim.—1. In a safety-box, a corner-fastening consisting of a diagonally-arranged slot, having a lateral slit-like offset, on one part of the box, with a projecting part on the overlapping part of the box, adapted to enter such diagonal slot and provided with a lip shaped so as to enter and engage the slit-like offset, the lip underlying the fabric of the box between the lower end of the slot and the offset.

2. In a safety-box, a corner-fastening consisting of a diagonally-arranged slot, having a lateral slit-like offset, on one part of the box, with a projecting part on the overlapping part of the box, adapted to enter such diagonal slot and provided with a lip shaped so as to engage the slit-like offset, and a return incision to form a tongue, the lip underlying the fabric of the box between the lower end of the slot and the offset.

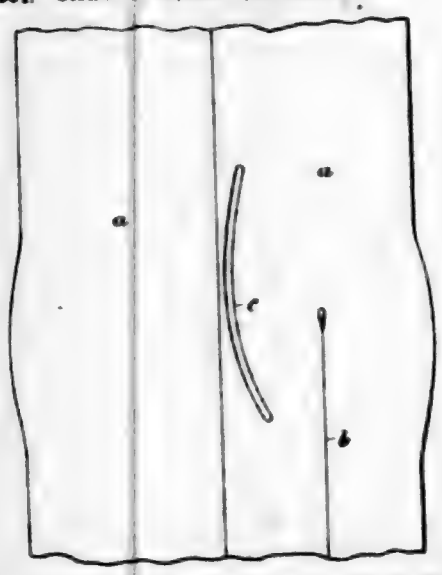
3. In a safety-box, a corner-fastening consisting of a slot, having a lateral slit-like offset, on one portion of the box, with a projecting part having a lip on the overlapping portion of the box and shaped so as to enter such slot and enter and engage the slit-like offset, and a return incision to form a tongue, the lip underlying the fabric of the box between the lower end of the slot and the slit-like offset.

704,550. **WIRE-COVERING MACHINE.** ANTON KREIDLER, Stuttgart, Germany. Filed Jan. 9, 1900. Serial No. 892. (No model.)



Claim.—In a machine for covering wire or the like, the combination of a feed device for the wire to be covered, a rotatable frame in which said feed device is mounted to turn, the axis of the feed device being transverse to that of the frame, another frame mounted to turn about an axis located in the continuation of the axis of the first-named frame, a take-up device mounted to turn in the second-named frame about an axis transverse to the axis of said frame, mechanism for rotating the two frames in the same direction and at the same rate of speed, guides located between the two frames and arranged to hold the wire in alinement with the axis about which said two frames rotate, means for covering the wire, said means being located between the two frames, and mechanism for rotating said means around the wire in the opposite direction to that in which the wire itself is rotated by the movement of said frames, whereby the wire will be fed longitudinally and at the same time rotated in one direction without being twisted, while the covering means will be rotated in the opposite direction.

704,551. **GLOVE.** EDOUARD LEBLANC, Grenoble, France. Filed Sept. 16, 1901. Serial No. 75,568. (No model.)



Claim.—1. A glove comprising a body-piece having in it a slit, substantially none of the material being cut away, whose edges form the entire thumb-opening and lie in the plane of the body-piece, and a thumb-piece the base edge of which is sewed to the edges of the slit.

2. A glove comprising a body-piece having in it a curved slit, substantially none of the material being cut away, whose edges form the entire separately-made completely-formed thumb-opening, and a thumb-piece the base edge of which is sewed to the edges of the slit.

3. A glove in which the thumb-opening in the body-piece is a slit, substantially none of the material being cut away, and in which there is a swelling at each side of the body-piece opposite the top of the button-slit.

4. A glove in which the thumb-opening in the body-piece is a curved slit whose edges form the entire thumb-opening and both the inside and outside edges of which are curved toward the palm of the hand.

5. A glove in which the thumb-opening in the body-piece is a curved slit both the inside and the outside edges of which are concave toward the palm of the hand and in which there is a swelling at each side of the body-piece opposite the top of the button-slit.

704,552. **EXTENSION-TABLE.** FRANK LIESER, Marquette, Mich. Filed Dec. 6, 1901. Serial No. 84,942. (No model.)

Claim.—1. An extension-table comprising stationary horizontal leaves, legs supporting the same, intermediate folding leaves hinged to the stationary leaves and adapted to swing inward wholly beneath the top of the table to permit the stationary leaves to be brought together, a connecting strip or section hinged to the adjacent edges of the folding leaves, and a locking device supported by the connecting strip or section and adapted to hold the folding leaves in a horizontal position, substantially as described.

2. An extension-table comprising fixed horizontal leaves, intermediate folding leaves hinged to the fixed leaves and adapted to swing downward wholly beneath the top of the table, a connecting strip or section hinged to the adjacent edges of the folding leaves, and a locking-bar mounted on and carried by the connecting strip or section and adapted to extend across the folding leaves to lock the same rigid with the fixed leaves, substantially as described.

3. An extension-table comprising fixed horizontal leaves or sections, legs supporting the same, the intermediate folding leaves hinged to the fixed leaves and arranged to swing downward, the connecting strip or section hinged to the adjacent edges of the folding leaves, a locking-bar pivoted to the connecting strip or section and arranged to extend across the folding leaves when the latter are arranged in a horizontal position, and means carried by the fixed leaves for engagement with the pivoted locking-bar, substantially as described.

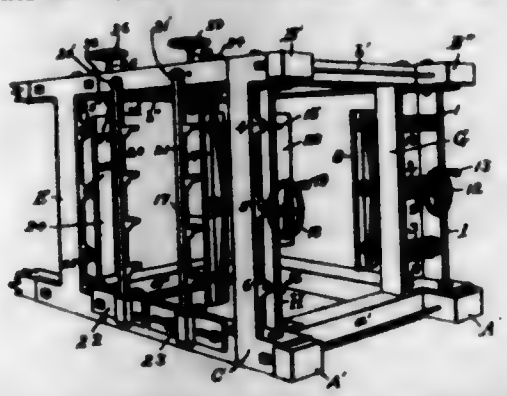
4. An extension-table comprising the fixed horizontal leaf 1, a pair

of end blades supporting the same, the intermediate fixed leaf 2, a central leg supporting the intermediate leaf and having opposite shoulders spaced from the same to form recesses, a cleat mounted on the fixed section 1, the folding intermediate leaves hinged to the fixed leaves, the connecting strip or section hinged to the adjacent edges of the folding leaves, and a locking-bar pivoted to the connecting strip or leaf and arranged to engage the cleat, and the central leg, substantially as described.

5. An extension-table comprising fixed horizontal leaves, legs supporting the same, folding intermediate leaves, and locking mechanism for connecting the legs composed of a horizontal loop mounted on one leg, a vertically-swinging catch pivotally mounted on the opposite leg and provided above its pivot with a recess, and a coiled spring located in the recess and interposed between the catch and the leg and holding the said catch in engagement with the horizontal loop, substantially as described.

6. An extension-table comprising fixed horizontal leaves, folding leaves, blocks mounted on the fixed leaves, one of the blocks being provided with a socket, and an approximately U-shaped locking device consisting of an elongated pintle journaled on one block and slidably connected to the same, whereby the locking device is capable of swinging longitudinally of the table and of sliding transversely of the same, a short engaging portion for engaging the socket of the other block to lock the table in its folded position, and a connecting portion, substantially as described.

704,558. PEDESTAL-CLAMP. JOHN A. LINDERMUR, Richmond, Ind. Filed Nov. 25, 1901. Serial No. 83,572. (No model.)



Claim.—1. In a pedestal-clamp, of a frame consisting of the parallel sills A′ and A″, the cross-sills *a′* and *a″*, the parallel beams B′ and B″, the cross-beams *b′* and *b″*, and the perpendicular posts C, D, E, and F; in combination with the clamping-plates 8, 14, 24 and 28 mounted therein and adapted to be operated laterally by means of threaded shafts and carried by suitable guides, all substantially as shown and described and for the purposes specified.

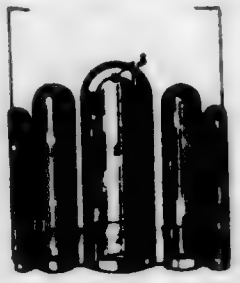
2. In a pedestal-clamping device, the combination of a frame, a plurality of clamping-plates slidably mounted therein and carried thereby; screw-shafts attached to each clamping-plate and crank-wheels adapted to revolve said shafts; guide-bars mounted on the back of each clamping-plate and passing through holes in the posts of the main frame; perpendicularly-mounted screw-shafts, mounted in the beam B′, each provided with hand-wheels on the upper ends and caps mounted on the lower ends thereof; spacing-bars 20 and 21 extending from the beam B′ and mounted in castings attached to the sill A′, all substantially as shown and described and for the purposes specified.

3. In a pedestal-clamp, the combination of a stationary framework, laterally-movable clamping-plates mounted therein and carried thereby; bars 20 and 21, perpendicularly secured to the framework, having brackets extending inwardly therefrom; the casting 32, secured on the under surface of B′, having threaded holes therein and threaded shafts 35 and 38 mounted therein, all substantially as shown and described and for the purposes set forth.

4. In a mechanism of the class described, the combination of a framework, substantially as shown; a pair of adjustably-mounted clamping-plates placed at right angles to the base and parallel with the perpendicular post of the framework; a pair of slidably-mounted clamping-plates, supported by guide-bars and carried laterally each by a single threaded shaft operated by hand-wheels; a pair of threaded shafts perpendicularly mounted in a suitable member 32 attached to the beam B′; bars, provided with inwardly-extending brackets, extending across the front of the framework, all substantially as shown and described and for the purposes set forth.

5. A pedestal-clamp, in combination with a framework, of two pairs of clamping-plates, adapted to approach and recede from each other by means of threaded shafts operated by crank-wheels; a pair of clamping-caps, 37 and 40, carried at right angles to said clamping-plates by the threaded shafts 35 and 38 respectively; and a pair of bars, 20 and 21, placed perpendicularly across the front of the framework carrying inwardly-projecting brackets, all substantially as shown and described and for the purposes set forth.

704,554. BACKING-PROTECTOR FOR BOOKS. STEFAN LEIWIK, Vienna, Austria-Hungary. Filed June 4, 1901. Serial No. 63,110. (No model.)



Claim.—1. In a device of the character described, the combination with the book-back, of a series of plates arranged longitudinally along a part of the exterior surface of the book-back and secured thereto parallel with each other, the exterior surface of said plates being rounded.

2. In a device of the character described, the combination with the book-back, of a series of plates arranged longitudinally along a part of the exterior surface of the book-back, each plate provided with an extension turned upward to straddle the edge of the back and secured to the inside of said back, and means traversing each plate and the book-back adapted to secure the plates to the exterior of said back.

704,555. LUBRICATING DEVICE. BRADFORD H. LOCKE, Denver, Colo. Filed Nov. 20, 1900. Serial No. 37,093. (No model.)

Claim.—1. In a motor, the combination of an outer sleeve or casing slotted or perforated circumferentially, an absorbent mass covering the circumferential series of slots or perforations, and a ring secured to the motor-shaft and adapted to throw outward against said absorbent mass any oil which may reach the same, substantially as shown and described.

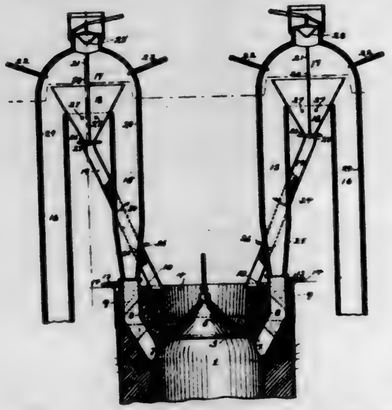
2. In a motor, the combination of an outer sleeve or casing slotted or perforated circumferentially, an absorbent mass covering the circumferential series of slots or perforations, a ring secured to the motor-shaft

within said circumferential series of slots or perforations, and a tapered sleeve or ring secured to the motor-shaft and adapted to lead toward the first-named ring any oil which may reach said tapered sleeve or ring substantially as shown and described.

2. In a motor, the combination of an outer sleeve or casing slotted or perforated circumferentially, an absorbent mass covering the circumferential series of slots or perforations, a ring secured to the motor-shaft within said circumferential series of slots or perforations, and a dished ring secured in said outer sleeve or casing and directed toward the first-named ring, substantially as shown and described.

704,556. FURNACE-TOP DOWN-COMER AND EXPLOSION-PIPE.

PATRICK MEEHAN, Lowellville, Ohio. Filed Nov. 13, 1901. Serial No. 82,131. (No model.)



Claim.—1. A blast-furnace having a shaft and top provided with a gas-port leading from the furnace-chamber, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly, and a dust-pipe connected to said down-comer above the furnace-top and leading back to the stack.

2. A blast-furnace having a shaft and top provided with a gas-port leading from the furnace-chamber, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly and being enlarged above the furnace-top to form an expansion-chamber, and a dust-pipe leading from the expansion-chamber back to the stack.

3. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly, a dust-catcher in said down-comer above the furnace-top, and a dust-pipe connected to the dust-catcher and leading back to the stack.

4. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then making a sharp bend and leading downwardly, a funnel formed in the bottom of said bend, and a dust-pipe leading from said funnel back to the stack.

5. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer being enlarged to form an expansion-chamber, a transverse baffle-plate in said expansion-chamber, and a conduit connected to said expansion-chamber at the lower end of said baffle-plate and leading back to the stack.

6. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and being enlarged above the furnace-top to form an expansion-chamber, a transverse baffle-plate in said expansion-chamber, and a dust-pipe connected to said expansion-chamber at the lower end of said baffle-plate and leading back to the stack.

7. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then making a sharp bend and leading downwardly, a funnel formed in the bottom of said bend, a transverse baffle-plate in said bend and projecting downwardly into the funnel, and a dust-pipe leading from said funnel back to the stack.

8. A blast-furnace having a shaft and top provided with a gas-port leading from the furnace-chamber, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly and being enlarged to provide an expansion-chamber, a dust-pipe leading from said expansion-chamber back to the stack, a transverse baffle-plate in said expansion-chamber, and a blast pipe or pipes projecting inwardly into the chamber and directed toward the baffle-plate.

9. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly, a dust-pipe connected to said down-comer above the furnace-top and leading back to the stack, and valves in said dust-pipe.

10. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then leading downwardly, a dust-pipe connected to said down-comer above the furnace and leading back to the stack, and a spray-pipe for moistening the dust in said pipe.

11. A blast-furnace having a shaft and top provided with a gas-port, a down-comer connected to said gas-port, said down-comer projecting upwardly and extending above the furnace-top to a considerable distance and then making a sharp bend and leading downwardly, a funnel in the lower side of said bend, a dust-pipe connected to the funnel and leading back to the stack, and a spray-nozzle projecting into said funnel.

12. A blast-furnace having a shaft and top provided with a gas-port leading from the furnace-chamber, a pipe connected to said gas-port and projecting upwardly in a direct course, said pipe being enlarged to form an expansion-chamber, an explosion-valve at the upper end of said pipe, a down-comer connected to said pipe, and a dust-pipe leading from the expansion-chamber back to the furnace-top.

13. A blast-furnace having a masonry shaft, a feeding-hopper and bell in the top thereof, a gas-port extending through the masonry shaft with its inner end in position to receive the discharge of ore from the hopper, and a cast-metal thimble in said gas-port with its inner end projecting to the furnace-chamber, whereby the discharge of ore is prevented from wearing away the masonry.

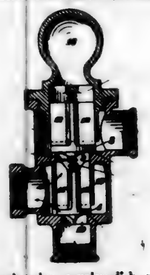
14. A blast-furnace having a masonry shaft, a cast-metal thimble embedded in the masonry at the top of the shaft to form a down-comer, said thimble having its inner end provided with a cored-out flange, and water connections thereto to cool the same.

15. A blast-furnace having a masonry shaft, a thimble embedded in the masonry at the top of the shaft, brackets supported by the shaft and connected to the thimble to support the same, and a down-comer connected to said thimble.

16. A blast-furnace having a masonry shaft, a thimble embedded in the masonry at the top of the shaft and leading from the furnace-chamber out at the top of the shaft, brackets supported by the shaft and engaging shoulders on the thimble to support the same, said thimble being also provided with shoulders to support the hopper-ring, and a down-comer connected to said thimble.

704,557. CHECK-VALVE. WILLIAM B. MICHENER, Oakland, Cal.

Filed Jan. 17, 1902. Serial No. 90,153. (No model.)



Claim.—1. In a check-valve, a valve-disk, a chamber above the same, closed at top, and a valve-stem secured to the disk, moving within the chamber, with means for guiding the stem parallelly therein, said disk being adapted to fit the mouth of the chamber and enter within it, and thus entrap and compress a portion of air at each rising, which by its resilience shall cushion the valve and obviate concussion and noise, substantially as specified.

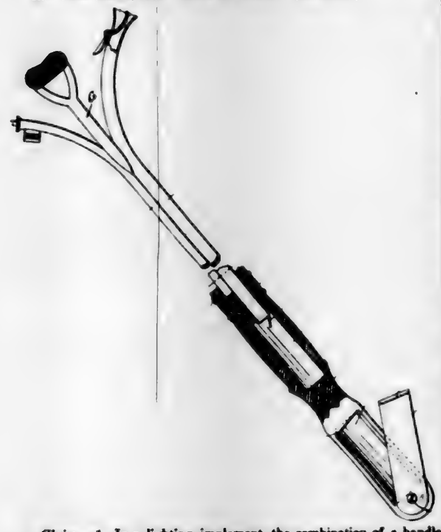
2. In a check-valve, a chamber closed at top, a valve-seat below the chamber, a valve moving within the chamber, and means for guiding the valve parallelly therein, said valve having a valve-disk seating upon the said seat, of a size to fit the mouth of the chamber and enter the same at each upward movement, whereby a portion of air is entrapped and compressed at each rising, to cushion the valve, substantially as specified.

704,558. PACKAGE FOR CARBON OR OTHER THIN PAPER.

JAMES T. MILLER, Rochester, N. Y. Filed Mar. 17, 1902. Serial No. 98,432. (No model.)

Claim.—A package for carbon or other thin paper, said package comprising a box having a cover one end of which is hinged to the other end thereof, and a plurality of removable paper-sheet holders placed therein, each of which consists of a sheet of stiff paper folded upwardly and backwardly thereof at one end to form a flap, substantially as shown and described.

704,559. LIGHTING IMPLEMENT. CHARLES MOLITOR, Chicago, Ill. Filed Mar. 1, 1902. Serial No. 96,212. (No model.)



Claim.—1. In a lighting implement, the combination of a handle having a receptacle for burned matches, a tube leading from the said receptacle, and means borne by the tube at its mouth for holding a match-splint within the tube and for releasing the said splint within the tube, substantially as described.

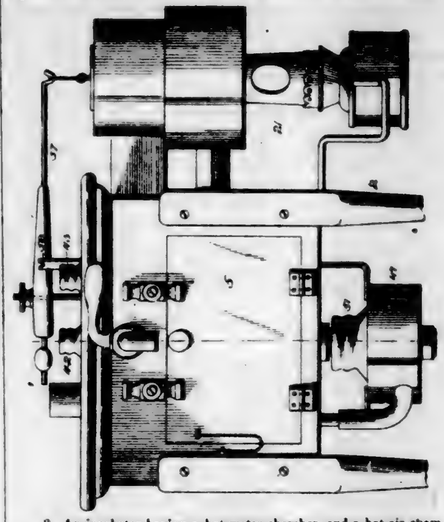
2. In a lighting implement, the combination of a handle provided with a receptacle formed therein, a tube leading from the said receptacle, a clip arranged in the mouth of the tube for holding a match-splint within the tube and for releasing the splint within the tube, and a valve arranged within the said tube at its opening into the said receptacle, substantially as described.

3. In a lighting implement, the taper-slide and clip J, having a curved lower jaw provided near its end with a hole *j* formed with a ragged edge, and a curved upper jaw having its end bent downwardly and directed toward the said ragged hole in the lower jaw, substantially as described.

704,560. INCUBATOR. ANDREW J. MOORE, Lebanon, Pa. Filed Dec. 9, 1901. Serial No. 85,265. (No model.)

Claim.—1. An incubator having a hot-water chamber in the upper part of the hatching-chamber, means for heating the same, a condenser provided with means for supplying fresh air thereto and communicating with the lower part of the hatching-chamber and with the hot-water chamber.

2. An incubator provided with a lamp, and a combustion-chamber, a hot-air chamber in the hatching-chamber, means for supplying hot air to said hot-air chamber, a connection between the combustion-chamber and said hot-air chamber, and an exit-pipe in said hot-air chamber affording draft to the lamp and an exit for foul air from the hatching-chamber.



3. An incubator having a hot-water chamber, and a hot-air chamber in the upper part of the hatching-chamber, means for heating both of said chambers, an exit for foul air communicating with the hot-air chamber, and a condenser connected to the hot-water chamber and discharging into the hatching-chamber.

4. An incubator provided with a lamp, and a combustion-chamber, a hot-air chamber in the hatching-chamber and having perforations in its walls, means for supplying hot air to said hot-air chamber, a connection between the combustion-chamber and said hot-air chamber, and an exit-pipe in the hot-air chamber affording draft to the lamp and an exit for foul air from the hatching-chamber, and means for supplying fresh air to the hatching-chamber.

5. An incubator having a hot-water chamber, and a hot-air chamber in the upper part of the hatching-chamber, the hot-air chamber having perforations in its walls, means for heating both of said chambers, a foul-air-exit pipe extending into the hot-air chamber, means for supplying air to the hatching-chamber through the casing of the incubator, and a condenser connected to the water-chamber and discharging moistened air into the hatching-chamber.

6. An incubator having a heater provided with a combustion-chamber, a hot-water chamber, and a hot-air chamber in the upper end of the hatching-chamber, a pipe communicating with the combustion-chamber and the hot-air chamber and extending through the hot-water chamber, an air-heating chamber surrounding said combustion-chamber, an air-chamber between the casings of the incubator, a pipe communicating therewith and with said hot-air chamber, means for discharging foul air through said hot-air chamber, means for supplying fresh air, and a condenser connected to the hot-water chamber and to the hatching-chamber.

7. An incubator having a heater provided with a combustion-chamber, a fresh-air-heating chamber, and a dead-air chamber concentric therewith; a hot-water chamber, and a hot-air chamber in the hatching-chamber, an air-chamber between the casings of the incubator communicating respectively with the air-heating chamber and the dead-air chamber of the heater, an exit for foul air through the hot-air chamber in the hatching-chamber, and a condenser connected to the hot-water chamber and discharging into the hatching-chamber.

8. An incubator provided with a hot-water chamber, means for heating the water therein; a condenser having a fresh-air supply and communicating with the hatching-chamber below the egg-tray, and a connection between said hot-water chamber and said condenser.

9. An incubator provided with a hot-water chamber, means for heating the water therein, and a condenser connected with the hot-water chamber for supplying fresh and moistened air to the hatching-chamber.

10. An incubator provided with a hot-water chamber, means for heating the water therein, a condenser having an upper and a lower chamber, a perforated partition separating said chambers, a condensing medium in one of said chambers, an air-supply and an air-distributer, and means for connecting the hot-water chamber and the condenser.

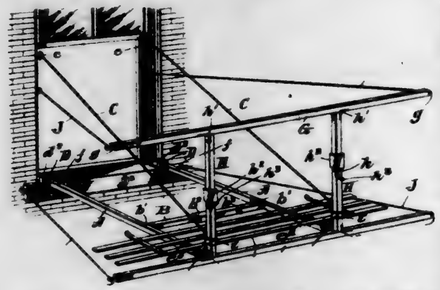
11. An incubator having a hot-water chamber in the hatching-cham-

ber, means for heating the water, a condenser provided with means for supplying fresh air thereto, and a liquid-arrester above the condensing-chamber, and means for connecting said hot-water chamber and condenser.

13. An incubator having a hot-water chamber, and a hot-air chamber in the upper part of the hatching-chamber, a heater connected to said hot-water chamber and hot-air chamber, a condenser connected to the hot-water chamber and provided with means for supplying fresh air to the hatching-chamber through the condenser, an egg-tray between the heating-chambers and the condenser, and a foul-air exit for the hatching-chamber communicating with said hot-air chamber.

15. An incubator provided with a hot-water chamber, a condenser having a fresh-air supply and connected to the hot-water chamber for supplying moist air to the hatching-chamber, an egg-tray provided with means for distributing heat over the upper surface of the eggs and moist air over the lower surface thereof.

704,561. CLOTHES-DRIER. KINGMAN C. MOORE, Macon, Ga. Filed Jan. 3, 1901. Serial No. 41,951. (No model.)



Claim.—1. In a clothes-drying frame of the character described, parallel rods or bars, and a foldable cross-bar, the latter comprising two parts of substantially equal length hinged at adjacent ends and foldable lengthwise upon each other in a plane at right angles to said parallel rods, said cross-bar being also hinged at opposite ends to the parallel rods and foldable lengthwise thereagainst in one direction only in a plane coincident with the latter, and means for preventing folding of said frame when in use, substantially as described.

2. In a clothes-drying frame of the character described, parallel rods or bars, and a foldable cross-bar comprising two parts of substantially equal length hinged at adjacent ends and foldable lengthwise upon each other in one direction only and in a plane perpendicular to said parallel rods, said cross-bar being also hinged at opposite ends to the two parallel rods and foldable lengthwise against each one thereof in a direction toward one end of the frame only and in a plane parallel with said rods; substantially as described.

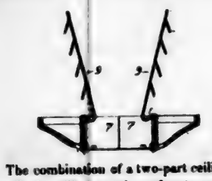
3. In a device of the character described, the main frame in the nature of a window shelf or scaffold in combination with the auxiliary frame or rack attachment therefor, one of said frames being provided with outwardly-flaring and downwardly-increasing vertical ribs or projections and the other frame with correspondingly-shaped grooves adapted to fit and slide over said ribs, whereby said auxiliary frame may be readily attached to and detached from said main frame; substantially as described.

4. In combination with the main frame or window-scaffold, consisting of a pair of parallel rods or bars and a cross-bar, said parallel bars having brackets fitted to their outer or forward ends and provided with vertical outwardly-flaring and downwardly-increasing ribs, the auxiliary frame or rack consisting of a pair of parallel rods and a pair of parallel cross-bars, the latter being about the same distance apart as the parallel rods of the main frame and having secured to their sides sleeves corresponding in shape and adapted to slide down over the said ribs on the brackets of the main frame, whereby said auxiliary frame may be readily attached or detached; substantially as described.

5. In a device of the character described, a pair of parallel rods, and a cross-bar connecting the same, each of said parallel rods being provided at its outer end with a bracket having a socket in which said rod is fitted and having an upstanding arm at the extremity of said rod provided at its upper extremity with an eye for the fastening-wire, said brackets having also rearward hooks or lugs adjacent the rods, substantially as and for the purposes described.

6. A clothes-drier adapted for attachment to a support, and constructed of collapsible bars and a suspensory device, in combination with an auxiliary collapsible frame detachably mounted upright upon said collapsible bars; substantially as described.

704,562. CEILING-PLATE ATTACHMENT. ARTHUR H. MUNN, Southington, Conn., assignor to the Benton and Corbin Manufacturing Company, Southington, Conn. Filed May 16, 1900. Serial No. 16,886. (No model.)



Claim.—1. The combination of a two-part ceiling-plate with a pair of the herein-described resilient retainers free to move laterally toward and from each other, each retainer having a pronged body, the said retainers being arranged with their prongs projecting outwardly from the outer sides of the said pair, while the retainers are adapted to spring outwardly away from each other, against the side of the hole through which the pipe passes, and have fastening devices for securing them to the inner edge of the ceiling-plate, substantially as described.

2. The combination of a ceiling-plate having a flange at its inner edge, with a pair of the herein-described attachments consisting of the resilient retainers, each having a pronged body, with hook-like shoulders near the lower end, and at the lower end a hook that confronts the said shoulder, the said retainers being detachably secured to the said ceiling-plate, with the said shoulder in engagement with the upper part of the said flange, and with the said hook in engagement with an opposing lower part of the said flange, substantially as described.

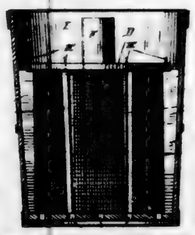
3. The combination of a ceiling-plate having a pipe-flange at its inner edge, with a pair of resilient retainers consisting of two independent arms, free to move laterally toward and from each other, and having at their lower ends interlocking devices for engaging the said pipe-flange, the said retainers being secured to the said flange by means of the said interlocking devices, the said retainers normally extending obliquely outwardly away from each other, and adapted when compressed, to spring outwardly against the side of the hole through which the pipe passes, and having on their bodies a series of prongs projecting from the outer sides of the said pair of retainers, whereby the ceiling-plate retains its position with reference to the ceiling, under varying expansions and contractions of the pipe, substantially as described.

4. An attachment for ceiling-plates consisting of the retainers having a pronged body with the hook-like shoulder at their lower end, and at their extreme lower end with a hook that confronts the said shoulder, in combination with a ceiling-plate having a supporting-wall at its inner edge upon which the lower ends of the said retainers are secured by the engagement of the said shoulder and hook, with the opposing end faces of the said supporting-wall, substantially as described.

5. The combination of a ceiling-plate with a pair of diametrically opposite resilient retainers secured thereto and having each a series of outwardly-projecting prongs, the said two series of prongs normally extending on outwardly-diverging oblique lines, substantially as described.

6. As an article of manufacture, a ceiling-plate having substantially the shape of an annulus and provided on its inner curved edge with a flange, in combination with a pair of retainers, each having a hook-like shoulder, resting on the said flange at its upper part, a portion extending downwardly from the said shoulder, along by the side of the said flange and with its lower end bent into a hook, acting in opposition to the said shoulder, whereby the retainers are secured to the ceiling-plate, substantially as described.

704,568. PACKAGE FOR LOBSTERS OR THE LIKE. ALBERT C. McLOON, Rockland, Me. Filed Apr. 8, 1902. Serial No. 101,939. (No model.)



Claim.—1. In a package for shipping lobsters and the like, a wooden repository, pail shape and flaring upwardly, preferably, a lining of wire or other screening forming a cage at the bottom of and equidistant from the sides of the wooden repository leaving space between the cage and wooden repository both at the sides and at the top adapted to be filled with ice, means for supporting said cage and attaching same to a wooden repository and a cover overhanging said cage to support ice and carry away drainage therefrom, substantially as described.

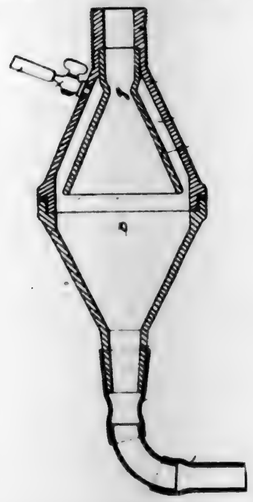
2. A wooden repository, an inner cage of wire or other screening, means for supporting and holding same in position, a cover therefor overhanging said cage, ice-spaces around and above said cage, and means comprising a tube extending from an opening in the cover for causing a direct and rapid circulation of cool air through the package substantially as described.

704,564. PICTURE OR DESIGN AND METHOD OF MAKING SAME. CHARLES HAYLOR, Mexico, Mexico. Filed July 3, 1901. Serial No. 67,070. (No model.)

Claim.—1. A transferable picture, design or transparency consisting of a plurality of transparent sheets laid one behind or upon the other, each sheet having deposited thereon a different-colored insoluble translucent pigment, toned or blended by transmitted light into one image forming the picture, the said sheets being formed of soluble material whereby the picture is made transferable upon bringing the pigmented sides of the sheets into contact with the surfaces to which the colors are to be transferred, by dissolving and floating off the sheets and leaving the colors adhering to said surfaces, substantially as described.

2. The herein-described method of making pictures which are transferable for reproduction, which consists essentially in depositing separately upon different transparent soluble sheets different translucent insoluble colors forming parts of the picture, and assembling the sheets one behind or upon the other so that said colors will be toned or blended by transmitted light into one image forming the picture, substantially as described.

704,565. RECEPTACLE-FILLING DEVICE. NELSE D. NELSON, Ann Arbor, Mich. Filed Apr. 7, 1900. Serial No. 11,971. (No model.)

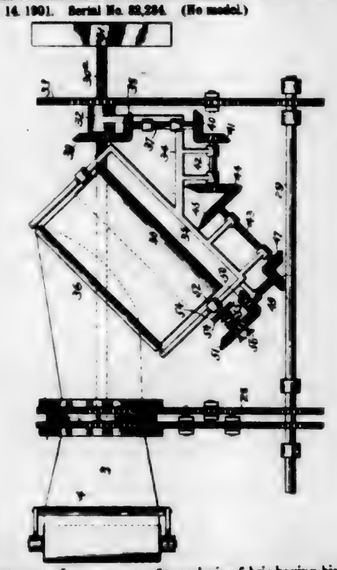


Claim.—1. A device for filling receptacles comprising a bulb or casing having an inlet and an outlet, and a flaring tubular structure having its smaller end secured to the inlet end of the casing and forming a continuation of the inlet of the casing, such tubular structure being extended into the chamber formed by the casing and terminating between the ends thereof so as to form between itself and the casing, a vacuum-chamber communicating with the interior of the latter.

2. The combination with a receptacle-filling device having a passage for the liquid, and also having a vacuum-chamber communicating with said passage, of means for producing a vacuum or partial vacuum, said means being connected with the receptacle-filling device so as to communicate with the vacuum-chamber thereof and arranged to draw the air out of said chamber in a direction opposite that in which the liquid passes through the device.

3. A bottle-filling device comprising a tubular casing having an inlet and an outlet, and made in two separable portions, screw-threaded together, said portions being largest at their meeting-points and tapering toward their ends; and a tubular flaring structure secured within the inlet end of one of said portions, and terminating near the large end of the same.

704,566. APPARATUS FOR PRODUCING FABRIC HAVING BIAS WEAVE. FRANK HEWELL, Lennia, N. J., assignor of three-fourths to Gilman S. Stanton and Frederick E. Stanton, New York, N. Y. Filed Nov. 14, 1901. Serial No. 82,234. (No model.)



Claim.—1. In an apparatus for producing fabric having bias weave, the combination of means for feeding a tube of fabric longitudinally, and cutting mechanism adapted to rotate around the fabric and cut it spirally.

2. In an apparatus for producing fabric having bias weave, the combination of means for feeding a tube of fabric longitudinally and holding it distended, and cutting mechanism adapted to rotate about the tube of fabric and cut it spirally.

3. In an apparatus for producing fabric having bias weave, the combination of a spreader for distending a tube of fabric, means for feeding the fabric over the spreader, and cutting mechanism rotated about the fabric and adapted to cut the same spirally.

4. In an apparatus for producing fabric having bias weave, the combination of means for feeding a tube of fabric longitudinally, cutting mechanism adapted to rotate about the fabric and cut it spirally, and means for winding the strip cut from the tube.

5. In an apparatus for producing fabric having bias weave, the combination of means for feeding a tube of fabric longitudinally, cutting mechanism adapted to rotate about the fabric and cut it spirally, a drum adapted to wind thereon the strip of fabric cut from the tube, and means for moving the drum to maintain it at all times in the same relative position to the cutting mechanism.

6. In an apparatus for producing fabric having bias weave, the combination of means for feeding a tube of fabric longitudinally, a ring adapted to rotate about the fabric, cutters carried by the ring and disposed at an angle thereto, and means for operating the cutters to cut the fabric tube spirally.

7. In an apparatus for producing fabric having bias weave, the combination of a spreader, a series of rollers for drawing a tube of fabric over the same, a ring mounted to rotate about the tube of fabric and spreader, and operate said rollers, another ring adapted to rotate about the tube of fabric at the rear of the spreader, cutting-disks carried by the last-men-

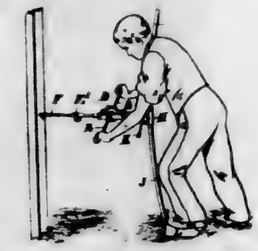
osed at an angle thereto, and means for operating said the tube of fabric.

ratus for producing fabric having bias weave, the com-ler, a series of rollers for drawing a tubular woven , a ring mounted to rotate about the tube of fabric erate said rollers, another ring adapted to rotate about the rear of the spreader, cutting-disks carried by the and disposed at an angle thereto, a movable frame, rein to receive the strip of fabric cut from the tube, motion-transmitting mechanism between all of said the drive-shaft.

ratus for producing fabric having bias weave, the com-r moving a tube of fabric longitudinally, cutting mech-e moved around the tube of fabric to cut the same spi-ns for moving the frame to maintain it at all times in osition to the cutting mechanism, a drum carried by e the strip out from the tube, means for revolving the m to compensate for the increasing diameter of the is wound thereon.

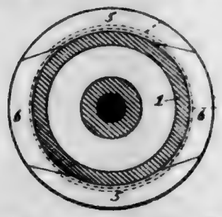
paratus for producing fabric having bias weave, the ns for moving a tube of fabric longitudinally, cutting l to rotate about the tube and cut it spirally, a drum of bias fabric as it is cut, means for moving the drum times in the same position relative to the cutting mech-sk secured on the drum-carrying shaft, a similar fric-the shaft, a gear-wheel loose on the shaft, a spring con-heel and loose friction-disk, to hold the latter in fric-the other disk, means for adjusting the tension of said for transmitting motion to said gear-wheel.

DRILLING-MACHINE. THOMAS E. O'BRIEN, Narrabri outh Wales, Australia. Filed Oct. 25, 1901. Serial No. odel.)



a drilling apparatus, the combination with the drill-frame cted therewith, an upright adjustably held in said sleeve ivotally connected to the lower end of said upright, the said upright extending up freely above the sleeve for shoulder of the operator, substantially as described.

. PACKING-RING. THOMAS OFFICER, Claremont, N. H., Sullivan Machinery Co., Chicago, Ill., a Corporation of New Filed Sept. 11, 1901. Serial No. 75,002. (No model.)



metallic piston-packing, comprising a plurality of seg-having inclined meeting faces, the end of alternate sec-g the ends of the adjacent sections, said sections having r inner faces, the grooves of the overlapping sections be-those in the other sections, and an annular spring-band rooves and tending to move said sections outward.

---

9. NECKTIE. DAVID OPPENHEIMER, New York, N. Y., Louis Auerbach, New York, N. Y., Incorporated Stock Com-w York. Filed Feb. 4, 1901. Serial No. 45,945. (No model.)

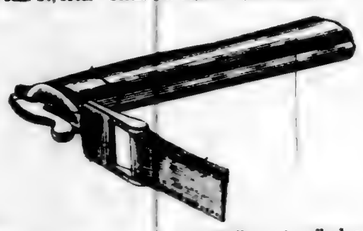
1. A reversible necktie consisting of a main section folded ts opposite edges, the folds extending partially across the tie and a strip of material suitable for an exposed face of the tie to close the space between the edges of said folds, the opposite edges of the folds overlapping the opposite edges of said strip and being secured together, the exposed surface of said strip being of a color different from the exposed surfaces of said folds and said main section and strip each being of textile fabric.

2. A reversible necktie consisting of a main section folded on itself along its opposite edges, the folds extending partially across the tie and a strip of material suitable for an exposed face of the tie to close the space between the edges of said folds, the opposite edges of the folds overlapping those of said strip and being secured thereto and the exposed surface of the main section being of a uniform color and the exposed surface of said strip being also of uniform color but different from that of the main section and said main section and strip each being of textile fabric.

3. A reversible necktie consisting of a main section folded on itself along its opposite edges, the folds extending partially across the tie and a strip or auxiliary section of material suitable for an exposed face of the tie closing the space between the edges of said folds, the strip or auxiliary section extending partially across said necktie and being stitched to said folds, and being of a color different than the main section and both said sections being of textile fabric.

4. A reversible necktie consisting of a main section folded on itself along its opposite edges, the folds extending partially across the tie and a strip or auxiliary section of material suitable for an exposed face of the tie closing the space between the inner edges of the folds and the latter having inturned hems secured to the strip.

704,570. TUG-FASTENER. HENRY J. ORMSBY, Eureka, Kans. Filed Jan. 27, 1902. Serial No. 91,413. (No model.)



Claim.—1. A tug-fastener substantially as described comprising a spring plate or bar having its inner end perforated and its outer end terminating in an outwardly and inwardly bent portion, the extreme edge of the inwardly-bent portion being recessed and the body portion of the inwardly-bent section being concaved, substantially as shown.

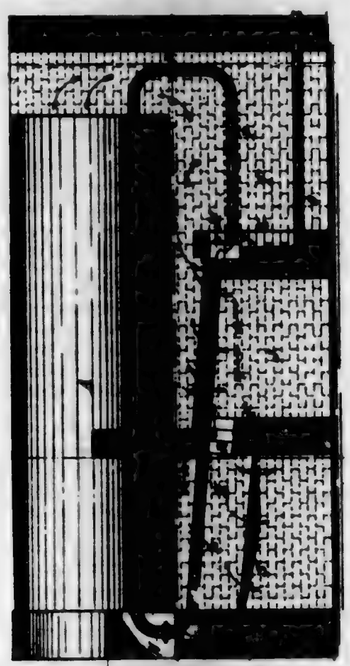
2. In a tug-fastener, the combination of the whiffletree having its ends provided with hooks that are adapted to receive the loops of the tugs, spring guards or plates secured to the ends of the whiffletree, each of the said plates having its free end terminating in an outwardly and inwardly bent portion, the extreme end of the inwardly-bent portion being recessed and the body portion of the inwardly-bent section being concave, the said free end being adapted for engagement with its respective hook and loop, the said plates also engaging the said hook at a point where the said outwardly-bent portion connects with the body portion, substantially as and for the purpose specified.

704,571. STEAM-GENERATOR. ORIN D. ORVIS, New York, N. Y. Filed Feb. 26, 1902. Serial No. 95,679. (No model.)

Claim.—1. In a steam-generator, a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall and inwardly from the opposite sides of the furnace forming an intermediate longitudinal space for the passage and direction of the greatest volume of flame and furnace-gases against the boiler; said sets of tubes being mantled over the chamber formed between the first bridge-wall and the second bridge-wall, and connections of said sets of water-tubes with the front and rear of the boiler for the purpose specified.

2. In a steam-generator, a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall and inwardly from the opposite sides of the furnace forming an intermediate longitudinal space for the passage and direction of the greatest volume of the flame and furnace-gases against the boiler; said sets of water-tubes mantled over the chamber formed between the first bridge-wall and the second bridge-wall, headers

located at the front wall of the furnace connecting the front ends of said sets of water-tubes and connections between said headers and the water-space in the boiler, and headers located in a recess in or behind the second bridge-wall connecting the rear ends of said sets of water-tubes and bent or bowed tubular connections between said headers and the water-space in the boiler substantially as and for the purpose set forth.



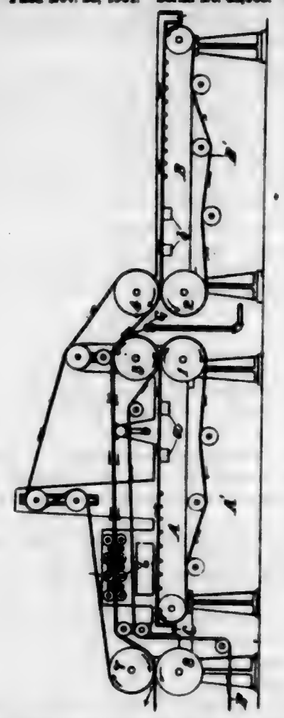
3. In a steam-generator, the combination of a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall, means of support for said sets of water-tubes upon the first bridge-wall and connections of said sets of water-tubes with the front and rear of the boiler for establishing water circulation.

4. A steam-generator comprising a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall, means of support for said sets of water-tubes upon the first bridge-wall, mantles or coverings upon said sets of water-tubes located over the chamber formed between the first bridge-wall and the second bridge-wall and connections of said sets of water-tubes with the front and rear of the boiler substantially as and for the purpose described and illustrated.

5. A steam-generator comprising a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall, mantles or coverings upon said sets of water-tubes located over the chamber formed between the first bridge-wall and the second bridge-wall, means of support for said sets of water-tubes and their mantles upon the first bridge-wall, headers located at the front wall of the furnace connecting the front ends of said sets of water-tubes and headers located at the second bridge-wall connecting the rear ends of said sets of water-tubes and connection of said headers with the front and rear of the boiler substantially as described.

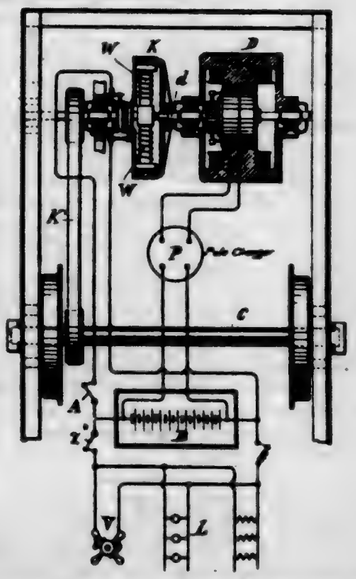
6. In a steam-generator, a furnace containing two bridge-walls, a continuous grate extending across the width of the front of the furnace, sets of water-tubes extending longitudinally from the front of the furnace to or beyond the second bridge-wall and inwardly from the opposite sides of the furnace forming an intermediate longitudinal flame-space, said sets of water-tubes mantled over the chamber formed between the first bridge-wall and the second bridge-wall, means of support for said sets of water-tubes upon the first bridge-wall, headers located at the front wall of the furnace connecting the front ends of said sets of water-tubes and connections between said headers and the water-space in the boiler and headers located at the second bridge-wall connecting the rear ends of said sets of water-tubes and bent or bowed tubular connections between said headers and the water-space in the boiler substantially as set forth.

704,572. PAPER-MAKING. ANDREW OUTERBRIDGE, Windsor Locks, Conn. Filed Nov. 20, 1901. Serial No. 83,063. (No specimens.)



Claim.—The herein-described method of making paper with both sides having the same degree of finish, consisting of forming separate sheets on Fourdrinier machines arranged adjacent to one another with their delivery ends opposite to each other, delivering the sheets with their wire sides together to a carrier, spraying the sheets as they are delivered to the carrier, passing the sheets to primary pressure-rolls for uniting the wire sides of the sheets, and finally passing the united sheets to secondary pressure-rolls to further solidify and unite into a single sheet.

704,578. DEVICE FOR GENERATING ELECTRICITY ON RUNNING CARS. RICHARD PFITZNER, Berlin, Germany. Filed Nov. 14, 1901. Serial No. 82,178. (No model.)

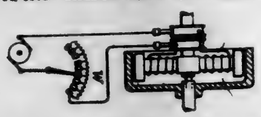


Claim.—1. In a plant in which power is transmitted from the running-gear of a car, to generate electricity, the combination of a power-

transmission train, an electromagnetic coupling interposed therein, an electric-current generator operated thereby, and a switch controlling the operation of said coupling, and, by means thereof, controlling the operation of said generator; all substantially as described and for the purpose specified.

2. In a plant in which power is transmitted from the running-gear of a car to operate mechanism mounted on said car, the combination of a power-transmission train, an electromagnetic coupling interposed therein, and an electric accumulator furnishing a current for energizing said coupling, with an automatic cut-out so operated as to prevent the electrical storage in the accumulator from falling below a tension sufficient for the purpose mentioned; all substantially as set forth and described.

704,574. POWER-TRANSMISSION REGULATOR FOR ELECTROMAGNETIC COUPLINGS. REINARD PFITSCH, Berlin, Germany. Filed Nov. 14, 1901. Serial No. 82,177. (No model.)



Claim.—1. In a magnetic transmission device, a permanently-energized member, an armature member and electromagnetic means for counteracting the magnetism of said permanently-energized member to a greater or lesser degree.

2. In a magnetic transmission device, a permanently-magnetized member, an armature member and electromagnetic means for counteracting the magnetism of said permanently-magnetized member to a greater or lesser degree.

3. In a magnetic transmission device, a permanently-energized electromagnetic field member, an armature member, and electromagnetic means for counteracting the magnetism of said electromagnetic field member to a greater or lesser degree.

4. In a magnetic transmission device a field member having two coils wound in opposite directions thereon, a slip-ring common to one terminal of each of said coils and separate slip-rings for the remaining terminals of said coils.

5. In a magnetic coupling comprising two members having a common magnetic field, the combination of means for varying the said magnetic field consisting of an auxiliary opposing electromagnetic field member and means for controlling the field of the same.

6. In a magnetic coupling comprising armature and field-producing members, the combination of an extra field-producing member and means for energizing the same to vary the whole magnetic field.

7. In a power-transmission controlling device, the combination with a generator and a driving member therefor, of a magnetic clutch intermediate said driving member and generator, a permanent field-producing agent and an electromagnetic field-producing member in said clutch, a source of exciting-current and a variable resistance in circuit with said electromagnetic field-producing member and electromagnetic means operated by the rise or fall of potential between the poles of said generator for actuating said variable resistance to create a resultant field varying in strength inversely as the pole tension of said generator.

8. In a magnetic power-transmission device, a permanent field-producing member, an armature member, and electromagnetic means for either augmenting or decreasing the strength of field of said permanent field-producing member.

9. In a magnetic power-transmission device, a permanently-energized field-producing member, an armature member and electromagnetic means for either augmenting or decreasing the strength of the field of said permanently-energized field-producing member.

10. In combination with a driven generator and driving means therefor of a magnetic power-transmission device between said driving means and generator consisting of a permanent field-producing member, an armature and an electromagnetic field-producing member and a variable-resistance device dependent for its operation upon the rise or fall of the pole tension of said generator for controlling the field strength of said electromagnetic field-producing member to modify the resultant field of said permanent and electromagnetic field-producing members inversely as the pole tension of said generator.

704,575. CENTRIFUGAL COUPLING. RICHARD PFITSCH, Berlin, Germany. Filed Nov. 14, 1901. Serial No. 82,178. (No model.)

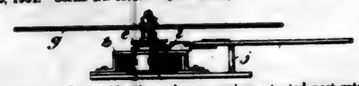
Claim.—1. In a coupling the combination of a housing fast to the driving-shaft, a series of coupling-cheeks mounted to move radially within said housing, springs circumferentially surrounding said cheeks and resiliently maintaining contact between said cheeks and a driven member; a contact-board having two pairs of contacts a lever oscillatably mounted on the driven member and having contacts at either end, said lever-contacts being adapted to reverse the poles of the current on the reversal of the direction of rotation of the driving-shaft in the manner and for the purpose substantially as described.

2. In a coupling, the combination of a housing keyed to the driving-shaft; a series of cheeks forming radial segments of a cylinder and severally and collectively engaging a driven member; springs circumferentially surrounding said cheeks and causing their engagement with the driven member, substantially as herein shown and described.

3. In a coupling, the combination with an integral member, a series of segmental coupling-cheeks surrounding said integral member, and a resilient band or bands circumferentially surrounding and normally maintaining said segmental member in close contact with said integral member but designed to be enlarged by and when said cheeks are acted upon centrifugally at high speeds, allowing said cheeks to disengage said integral member.

4. In a coupling, a driving clutch member having a series of segmental coupling-cheeks, a driven member, and a resilient band or bands circumferentially surrounding said cheeks, said cheeks surrounding and held in contact with said driven member by said bands, and designed to release said driven member when centrifugally acted upon by the high speed of said driving member.

704,576. RAT-KILLER. JOHN T. FRIDE, Friars, Ga. Filed Dec. 10, 1901. Serial No. 85,608. (No model.)



Claim.—1. In combination, a base, a spring actuated post rotatably supported thereon and carrying a killing arm or arms and also a circular plate provided with a spiral groove in its periphery, said groove being notched or shouldered at one or more points, a trigger having one end working in said groove and adapted to engage said notch or notches, and a death-board connected to said trigger and lying just under the path of the killing arm or arms, for the purpose set forth.

2. In combination, a base, a frame thereon, a spring-actuated rotatable post, a spirally-grooved nut or plate carried by said post, a killing-arm carried by said post and arranged horizontally, a trigger pivoted on the frame and engaging said spiral groove, and a spring-supported death-board connected to said trigger, for the purpose set forth.

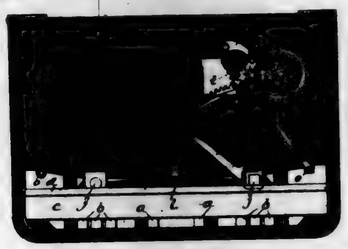
704,577. BUTTONHOLE-MOISTENER. EDWARD PUFF, Montgomery, N. Y. Filed Nov. 23, 1901. Serial No. 84,084. (No model.)

Claim.—1. A buttonhole-moistener comprising a tube provided at one end with a head and having a reduced neck connecting the head with the tube and adapted to lie within a buttonhole during the moistening operation and provided with a perforation, and means for forcing a liquid through the perforation, substantially as described.

2. A buttonhole-moistener comprising a tube open at one end and provided at its other end with a reduced neck, an annular shoulder disposed between said neck and tube, and a wedge-shaped guide attached to said neck, said neck having peripheral perforations therein.

704,578. DUMP-CAR. EDGAR M. RAY and ROBERT B. MCCONNEY, Denver, Colo.; said McConney assignor of one-half of his right to said Ray. Filed Mar. 11, 1901. Serial No. 50,868. (No model.)

Claim.—1. In a car of the class described, the combination of a fixed frame portion, a plurality of transversely-extending saddles arranged rigidly thereon, a plurality of dumping portions vibratingly mounted upon and connected by such saddles, a rigid side portion of the fixed frame extending above and outside of the dumping portions and connecting the ends of the fixed frame, swinging doors mounted beneath and upon such rigid side portions adjacent to the outer sides of the dumping portions and dumping mechanism for dumping the dumping portions, substantially as described.



2. In a car of the class described, the combination of a fixed frame portion, a saddle mechanism mounted thereon, a plurality of dumping portions having inner inclosing sides and open outer sides and pivotally mounted upon and connected together by the saddle mechanism, a rigid side portion of the fixed frame extending above and outside of the dumping portions and connecting the ends of the fixed frame, swinging doors mounted beneath and upon such rigid side portions adjacent to the outer sides of the dumping portions and dumping mechanism for operating the dumping portions, substantially as described.

3. In a car of the class described, the combination of a fixed frame portion, a dumping portion having one side, a bottom portion and two ends vibratingly mounted thereon, longitudinal beams extending above the dumping portion and connecting the upper portions of the ends of the fixed frame, a swinging door pivotally mounted on the frame portion and forming the outer side of the dumping-box portion to provide means for carrying a load, and means for holding the parts in carrying position, substantially as described.

4. In a car of the class described, the combination of a fixed frame portion provided with side posts and open at its sides and top, a longitudinal tie-plate securing the upper portion of the side posts together, a dumping-box portion substantially L-shaped in cross-section and U-shaped in longitudinal section arranged longitudinally of the car with its open sides arranged adjacent to the open sides of the frame, rock-shafts vibratingly mounted in the frame portion and secured to the dumping-boxes for tilting the same, swinging doors pivotally secured to each side of the car to complete the closure of such side and the open side of the dumping-boxes, and means for locking the parts in carrying position, substantially as described.

5. In a car of the class described, the combination of a fixed frame portion provided with side posts and open at its sides and top, a longitudinal tie-plate securing the upper ends of the side posts together, a dumping-box portion substantially L-shaped in cross-section and U-shaped in longitudinal section arranged longitudinally of the car with their open sides arranged adjacent to the open sides of the frame, rock-shafts vibratingly mounted in the frame portion and secured to the dumping-boxes for tilting the same, swinging doors pivotally secured to the upper portion of each side of the car to complete the closure of such side and the open side of the dumping-boxes, and locking-plates pivotally secured to the lateral outer edge of the dumping-boxes and adapted to be engaged with the swinging sides of the car to lock such parts in carrying position, substantially as described.

6. In a car of the class described, the combination of a fixed frame portion provided with side and end parts rigidly secured together at their upper ends, dumping-boxes arranged on each side of the car longitudinally thereof and provided with an open top and an outer open side, rock-shafts pivotally mounted in the supporting-frame and secured to the dumping-boxes to tilt the same, longitudinal swinging doors pivotally mounted on the upper portion of each side frame of the car to complete the closure thereof and the closure of the dumping-boxes, a plate pivotally secured to the outer lateral edge of the dumping-boxes to engage the swinging door of the car-frame, means for holding the locking-plate in its locked position, and means for operating the rock-shaft to tilt the dumping-box from carrying to dumping position and vice versa, substantially as described.

7. In a car of the class described, the combination of a fixed frame portion formed of longitudinal sills and U-shaped transverse metal members which form tie-beams for the sills and side posts for the car, metallic members for tying the upper ends of the posts together, rock-shafts arranged longitudinally of the car, one at each side of the longitudinal center thereof, dumping-boxes L-shaped in cross-section and substantially U-shaped in longitudinal section secured to the rock-shafts so that they may be tilted to dumping positions, swinging doors pivotally secured to the sides of the car-frame at or near the upper portion thereof with their free edge at or near the lower side of the car to form a closure therefor and for the outer side of the dumping-boxes, hooked plates provided with rock-shafts pivotally secured to the outer lateral edge of the dumping-boxes adapted to engage with the free end of the swinging doors and hold the same in locked position, a lever for operating this rock-shaft and means for holding it in locked position, and means for holding and rocking the main rock-shafts and thereby tilting the dumping-boxes into carrying or dumping positions, substantially as described.

8. In a car of the class described, the combination of a fixed frame portion formed of longitudinal sills, side and end posts, tie-beams securing the upper ends of such posts rigidly together, dumping-boxes arranged at each side of the car having an open top and outer open side, rock-shafts pivotally mounted on the car-frame and secured to such dumping-boxes to tilt them into their different positions, swinging doors pivotally secured to the upper sides of the car-frame to form a closure therefor and for the open sides of the dumping-boxes, a hooked plate provided with a rock-shaft by which it is secured to the outer lateral edge of the dumping-boxes and adapted to engage the swinging doors and hold the same in locked carrying position, an operating-lever secured to the rock-shaft of the hooked locking-plate, means for holding this operating-lever in locked position, and gear mechanism for operating the rock-shaft upon which the dump-boxes are tiltingly mounted, substantially as described.

9. In a car of the class described, the combination of a fixed frame portion, a dumping portion vibratingly mounted therein having an inclosing inner side and an open outer side, a rigid side portion of the fixed frame extending above the dumping portion and connecting the ends of the fixed frame, a swinging door mounted beneath and upon the rigid side portion adjacent to the open side of the dumping portion and adapted to form an outer inclosing side adjacent to such dumping portion, means for dumping the dumping portion and means for holding it in carrying position, substantially as described.

10. In a car of the class described, the combination of a fixed frame portion, a dumping portion vibratingly mounted therein an upper rigid side portion of the fixed frame extending above the dumping portion and connecting the ends of the fixed frame, a swinging door mounted beneath the rigid side portion, an upward-extending portion on the inner side of the dumping portion adapted to contact the fixed frame when the dumping portion is in position to discharge its contents, and means for holding the dumping portion in carrying position, substantially as described.

11. In a car of the class described, the combination of a fixed frame portion provided with longitudinal sills, saddles provided with rock-shaft bearings arranged upon such sills, rock-shafts vibratingly mounted in the rock-shaft bearings and extending beneath and throughout the entire length of the dumping portions mounted thereon, a plurality of dumping-portions mounted upon such rock-shafts and connected together by the saddles, and means for holding the dumping portion in carrying position, substantially as described.

12. In a car of the class described, the combination of a fixed frame portion, a plurality of saddles arranged thereon, a plurality of dumping portions pivotally mounted upon and connected by such saddles, a rigid side portion of the fixed frame extending along each side thereof above the dumping portions and connecting the ends of the fixed frame, a swinging door mounted beneath and upon the rigid side portions of the fixed frame adjacent to the dumping portions, and dumping mechanism for operating the dumping portions, substantially as described.

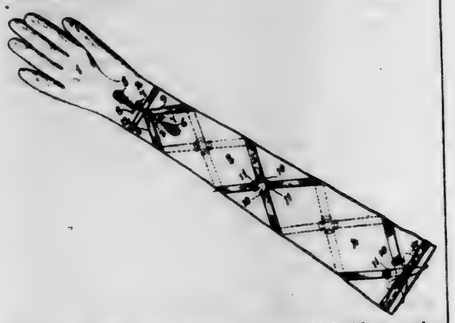
13. In a car of the class described, the combination of a fixed frame portion, saddle mechanism arranged thereon and provided with rock-shaft bearings adapted to support longitudinally-extending rock-shafts, a plurality of dumping portions pivotally mounted upon the rock-shafts and connected together by the saddle mechanism, a rigid side portion of the fixed frame extending along each side thereof above the dumping portions and connecting the ends of the fixed frame, a swinging door mounted beneath and upon the rigid side portions of the fixed frame adjacent to the dumping portions, a swinging door mounted beneath and upon each rigid side portion of the fixed frame adapted to form a yielding side for the adjacent dumping portion, and dumping mechanism for operating the dumping portions, substantially as described.

704,579. GLOVE. MINNIE R. ROLLASON, Brooklyn, N. Y. Filed Oct. 10, 1901. Serial No. 78,334. (No model.)

Claim.—1. As an article of manufacture, a glove, comprising hand, wrist, forearm and upper-arm portions, and provided with groups of apertures, and flexible members secured upon the wrist portion and wound spirally around the glove in opposite directions so as to cross each other and threaded through said apertures at the points where said flexible members thus cross.

2. As an article of manufacture, a glove, comprising hand, wrist

forearm and upper-arm portions, the wrist portion being provided with an opening, and with buttonholes and buttons for closing the same, the forearm and upper-arm portions being provided with groups of apertures, flexible members permanently secured to each side of said opening and wound spirally around the glove in opposite directions, so as to cross each other at intervals, and threaded through said apertures at the points where the ribbons thus cross.



3. As an article of manufacture, a glove provided with an opening and with buttonholes and buttons for closing the same, and also provided with distinct groups of apertures said groups being spaced asunder at definite intervals, and a pair of flexible members permanently secured adjacent to said opening and provided with tags for threading said ribbons through said apertures, the arrangement being such that said ribbons may be disposed spirally around the glove.

704,580. SASH-FASTENER. WILLIAM RUSSELL, Plymouth, England. Filed Aug. 18, 1900. Serial No. 26,764. (No model.)

Claim.—The improved means for fastening window-sashes in their closed or partly-open position comprising the combination with the sashes of, locking-catches consisting of brackets, such as *f*, fixed to the upper sash at a suitable distance apart, and formed with a vertical bar *f'* and a horizontal arm *f''*, and a hooked locking-bar *c* engaging with one or other of the said catches, and provided with a tightening-screw, substantially as described.

704,581. MACHINE FOR TREATING TUBES. JAMES H. RUSSELL, Philadelphia, Pa. Filed Nov. 15, 1901. Serial No. 82,466. (No model.)

Claim.—1. A machine of the class specified comprising the combination of rolls for flattening the tube, an opener located to one side of said rolls for opening and smoothing the tube preparatory to its passing through the rolls, a trough-like guide for positioning the opener near to and on one side of the rolls, a shear-trimmer for receiving the smoothed and flattened tube from the opener and rolls and for cutting it into lengths, and means for operating said parts, substantially as described.

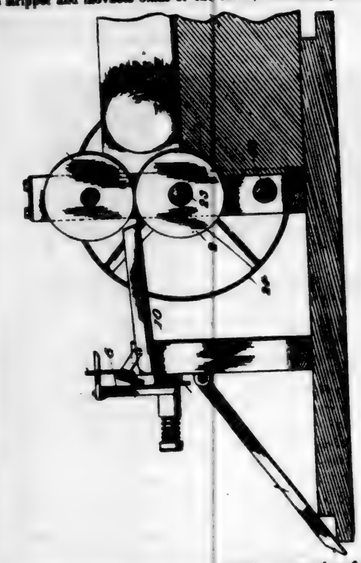
2. In a machine of the class specified the combination of rolls arranged to normally run in contact with each other for feeding the tube, and an opener wholly arranged to one side of said rolls which draw the tube over it and then between them, substantially as described.

3. A machine of the class specified comprising rolls, an opener, a trough-like guide for causing the opener to gravitate into contact with and remain to one side of the line of contact of said rolls, a cutter, a guide between the rolls and cutter, and means for operating the rolls and cutter, substantially as described.

4. In a machine of the class specified the combination of rolls, an opener, a guide for positioning the opener on one side of the rolls, a cutter, a guide between the rolls and cutter, and a blower arranged to discharge on the last-mentioned guide, substantially as described.

5. A machine of the class specified comprising rolls, an opener, a guide for causing the opener to gravitate to one side of the rolls, a cutter, a guide between the cutter and rolls, a blower arranged to discharge on the last-mentioned guide, an endless conveyor, and a guide from the cutter to the conveyor, substantially as described.

6. In a machine of the class specified the combination of rolls, a shear-cutter, a guide between the rolls and cutter, means for operating the rolls and shear-cutter, a pivotal stripper, and lost-motion connections between the stripper and movable blade of the cutter, substantially as described.



7. In a machine of the class specified the combination of rolls, a shear-cutter, a positively-driven shaft, a cutter-cam operatively connected with said shaft, mechanism between the cutter and the cutter-cam which is controlled by the latter, a clutch member of which one part is driven with said shaft and of which the other part is connected with said rolls, a clutch-cam driven from said shaft, and mechanism operated by the clutch-cam for positioning the clutch, substantially as described.

704,582. WRENCH. GEORGE SCHAUB, Lake Benton, Wis. Filed Dec. 12, 1901. Serial No. 85,562. (No model.)

Claim.—1. A wrench consisting of a rod having a yoke intermediate of its ends provided with a lateral arm, an arm and handle extending from opposite sides of the rod, crank and socket spindles having their bearings in the yoke and rod arms, and meshed gear-wheels fast on the spindles.

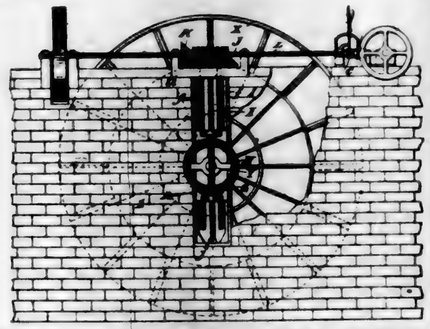
2. A wrench consisting of a rod having a yoke intermediate of its ends, annularly-bent arms extending laterally from the rod and yoke, a tang extending from that side of said rod farthest from its arm, a handle on the tang, crank and socket spindles having their bearings in the yoke and rod arms, and meshed bevel gear-wheels fast on the spindles.

704,588. HYDRAULIC MOTOR. CHARLES W. SCHINDLER and JOHN FREEMAN, New Albany, Ind. Filed July 15, 1901. Serial No. 68,407. (No model.)

Claim.—1. In a water-motor, the combination of a wheel, a vertical power-shaft turned thereby, a horizontal power-shaft turned by said vertical power-shaft, a clutch on said horizontal shaft, a connecting-shaft adapted to be operated by said horizontal power-shaft, bevel-gears on said connecting-shaft, clutches on said connecting-shaft, means for automatically operating said clutches, jacks adapted to raise or lower said water-wheel, and means for transmitting the motion of said beveled gears to said jacks, substantially as described.

2. In a water-motor, the combination of a water-wheel, bearings within which said wheel is journaled, jacks passing through said bearings, power-shafts turned by said wheel, a connecting-shaft turned by said

power-shafts, bevel-gears on said connecting-shaft, worm-screw shafts connected to said jacks and adapted to be turned by said beveled gears, and means for connecting either set of bevel-gears to said connecting-shaft for revolving said worm-screw shafts in either direction, substantially as described.



3. In a water-motor, the combination of a wheel, a main shaft, boxings for said shaft, power-shafts turned by said wheel, a connecting-shaft turned by said power-shafts, bevel-gears on said shaft, worm-screw shafts adapted to be turned by said bevel-gears, clutches on said connecting-shaft, a float adapted to operate said clutches whereby said bevel-gears alternately operate said worm-screw shafts, and jacks passing through and engaging said boxings and connected to said worm-shafts, substantially as described.

704,584. SKEWER FOR BOBBINS. ROBERT SCHOFIELD, New Bedford, Mass., assignor, by direct and mesne assignments, of two-thirds to Charles Burgess, New Bedford, Mass. Filed Oct. 26, 1901. Serial No. 79,894. (No model.)

Claim.—1. A skewer for bobbins provided at one end with two separate bearing-surfaces having different coefficients of friction, said bearing-surfaces being movable relative to each other, whereby either one may be brought into operative position to support the skewer.

2. A skewer for bobbins provided with two bearing-surfaces having different coefficients of friction, and means governed by the amount of material on the bobbin to determine which bearing-surface shall be brought into operative position.

3. A skewer for bobbins having a body portion and a tip portion adapted to be received in a step or cup bearing, the said tip portion having two bearing-surfaces of different coefficients of friction, and means governed by the amount of material on the bobbin to determine which bearing-surface shall have operative contact with the cup-bearing.

4. A skewer for bobbins having a body portion and a tip portion adapted to rest upon and engage a cup or step bearing, said tip portion being provided with two separate bearing-surfaces having different coefficients of friction.

5. A skewer for bobbins having a body portion and a tip portion adapted to rest upon and engage a cup or step bearing, said tip portion being provided with two separate bearing-surfaces having different coefficients of friction, and means to bring either of said bearing-surfaces into operative contact with the cup-bearing, the construction being such that when the bobbin is full the bearing-surface having the greater coefficient of friction is rendered operative to support the bobbin, while when the bobbin is partially empty the bearing-surface having the less coefficient of friction is brought into operative contact against the cup-bearing.

6. A skewer for bobbins having a tip portion provided with a wooden bearing-surface, and a supplemental metallic bearing-surface, and means governed by the amount of material on the bobbin to determine which bearing-surface the skewer shall rest upon.

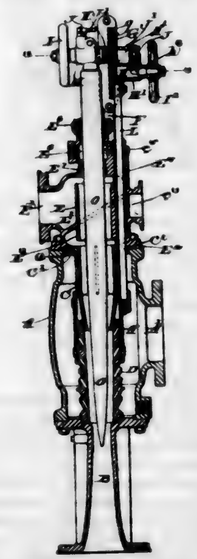
7. A skewer for bobbins having a tip portion provided with a central metallic bearing-surface, and an annular wooden bearing-surface surrounding the metallic bearing-surface, and means governed by the amount of material on the bobbin to determine which bearing-surface shall be brought into operative position against the cup or step.

8. A skewer for bobbins having a tip portion adapted to rest in and be supported upon a cup-bearing, said tip portion having a central metallic wooden surface and an annular wooden bearing-surface, and means governed by the amount of material on the bobbin to determine which bearing-surface shall be brought into operative contact against the cup-bearing, the construction being such that when the bobbin is full the skewer is supported upon the wooden bearing-surface, while when the bobbin is partially empty the said skewer is supported on the metallic bearing-surface.

9. A skewer for bobbins having a wooden tip provided with a central bore, a metallic pin in said bore, and means tending normally to cause the pin to project beyond the end of said tip, said means acting with a force which is less than the weight of a full bobbin, the construction being such that the weight of a full bobbin causes the pin to retract and allows the wooden tip to engage the bearing-cup, while the weight of a partially-filled bobbin is overcome by said means and the pin is projected.

10. A skewer or spindle for bobbins having a wooden tip portion provided with a central bore, a metallic pin in said bore, a spring acting against the inner end of said pin and tending normally to force the point thereof beyond the tip with a pressure less than the weight of a filled bobbin, the construction being such that the weight of a filled bobbin compresses the spring and allows the wooden tip to engage the bearing-cup, while when the bobbin is partially empty the spring raises the bobbin and forces the pin outwardly, the said pin supporting the weight of a partially-empty bobbin.

704,585. INDUCTION-CONDENSER. LOUIS SCHUTTE, Philadelphia, Pa. Filed Sept. 28, 1901. Serial No. 76,497. (No model.)



Claim.—1. In a condenser having a main body A with an opening *a* at its top, a combining-tube situated in said main body, an adjustable sleeve working over said combining-tube and a sleeve-adjusting rod extending from said tube, the combination with said parts of a nozzle C having a flange C' resting on the end of the opening *a* and having a perforation C² for the passage of the sleeve-adjusting rod, a head E angularly adjustable on the end of the main body and about the opening *a* said head being formed with a perforation E² for the sleeve-adjusting rod, a ram O extending through the head E and nozzle C into the combining-tube D and means for longitudinally adjusting the ram and sleeve-adjusting rod, said means being secured to the head F, all substantially as described and so that the head E and sleeve N can be adjusted in angular direction without interfering with the operativeness of the condenser.

2. In a condenser having an adjustable ram and sleeve, the combination with the condenser-body of racks G and G', bearings M and M' secured to the ram and sleeve-spindle and sliding on the racks, shafts H² H³ supported in said bearings and gear-wheels H H' secured to said shafts and engaging respectively the racks G and G'.

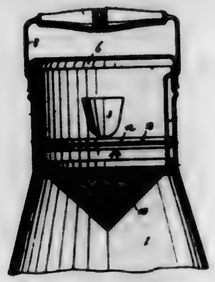
3. In a condenser having an adjustable ram and sleeve, the combination with the condenser-body of racks G and G' secured to said condenser-body by pivoted links F, bearings M and M' secured to the ram and sleeve-spindle and sliding on the racks, shafts H² H³ supported in

said bearings and gear-wheels H H' secured to said shafts and engaging respectively the racks G and G'.

4. In a condenser having an adjustable ram and sleeve, the combination with the condenser-body of racks G and G', bearings M and M' secured to the ram and sleeve-spindle and sliding on the racks, shafts H^2 H^2 supported in said bearings, gear-wheels H H' secured to said shafts and engaging respectively the racks G and G' and means for locking the shafts and gear-wheels in determined position.

5. In a condenser having an adjustable ram and sleeve the combination with the condenser-body of racks G and G' each having at top an extra-long tooth g, bearings M and M' secured to the ram and sleeve-spindle and sliding on the racks, shafts H^2 H^2 supported in said bearings and gear-wheels H H' secured to said shafts and engaging respectively the racks G and G', each of said gear-wheels having an extra-long space between teeth as h whereby the gears and racks are always engaged in the same way.

704,586. COFFEE-POT. MICHAEL H. SEXTON, Utica, N. Y. Filed Apr. 30, 1902. Serial No. 105,957. (No model.)



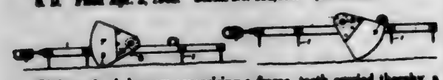
Claim.—1. The combination with a coffee-pot having a neck portion and a discharge-opening located in said neck portion, of a connected, removable cover and strainer, the strainer substantially fitting and being supported at such a distance below the cover as to take a position in the lower portion of said neck below the discharge-opening, substantially as set forth.

2. The combination of a coffee-pot having a neck portion, a discharge-opening in said neck portion, a cover, a lock or fastening for securing said cover, a strainer fitting said neck portion and supported from the cover at a point below the discharge-opening, and removable with the cover, substantially as set forth.

3. The combination of a coffee-pot having a cylindrical neck portion, a discharge-opening in said neck-portion, a cover, an inverted, cone-shaped strainer supported from and removable with the cover arranged to occupy a position with the larger end of the strainer fitting the lower end of said neck, substantially as set forth.

4. In a coffee-pot, the combination of the body having a neck portion with a discharge-opening therein, a set of removable strainers fitting the neck below the discharge-opening and a cover connected with, and removable with said strainers, substantially as set forth.

704,587. HARROW. CHARLES STARLEY, Wassington Springs, S. D. Filed Apr. 2, 1902. Serial No. 101,697. (No model.)

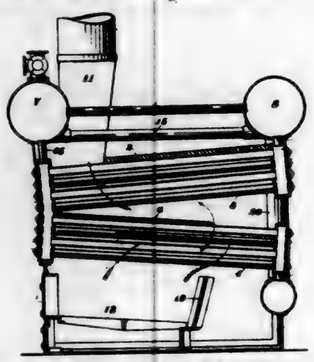


Claim.—1. A harrow comprising a frame, teeth carried thereby, a rotatable rod mounted on the frame, a series of ratchet-disks on said rod, a series of shoes mounted loosely on said rod adjacent to the ratchet-disks, a pawl carried by each shoe adapted to engage the ratchet-disks, means for rocking the rod and simultaneously swinging the shoes to bring the bases thereof to advance with the harrow, and cause the same to roll along the ground and elevate the frame, substantially as set forth.

2. In a harrow, a shoe having one end pivotally suspended to the harrow-frame, a curved base for the shoe, a depression formed along the upper edge of the shoe at a point contiguous with its junction with the curved base, and locking devices carried by the frame for engaging said depression and locking the shoes, substantially as set forth.

3. In a harrow, a frame, a swinging shoe adapted to be depressed below the frame, a series of loops carried by the frame, and a bar passed through said loops and held against the shoes while in their depressed position, substantially as set forth.

704,588. STEAM-BOILER. JOHN P. SIEBOHM, San Francisco, Cal. Filed Feb. 26, 1902. Serial No. 95,750. (No model.)



Claim.—In a steam-generator, an inclosing furnace, a header arranged at the front end thereof, and two headers, one above the other, arranged at the rear end thereof, superimposed groups of generating-tubes longitudinally arranged in said furnace and connecting said headers, said groups being set at oppositely-sloping angles, and steam-drums arranged at opposite ends of said furnace, directly connected with said headers at the water-spaces of said drums, substantially as specified.

704,589. SPARKING-COIL CASING. CHARLES F. SPLITDORF, New York, N. Y. Filed Apr. 30, 1902. Serial No. 105,307. (No model.)

Claim.—1. A sparking-coil casing comprising a shell composed of tough non-conducting material, and an inner lining therefor composed of material possessing the quality of non-conductivity to a higher degree.

2. In a sparking-coil casing, a cylinder composed of tough, non-conducting material, an inner lining therefor composed of a thin sheet of material rolled upon itself in several plies, and possessing the quality of non-conductivity to a higher degree, a cylinder-cap, an insulating-disk at its inner surface, and a body of plastic insulation interposed between said disk and the coil-winding.

3. In a sparking-coil casing having the usual terminal openings, an insulating-bushing within each of said openings, each of said bushings having an inward retaining-flange and an outwardly-projecting flexible extension.

704,590. PIELESS HINGE. DAVID S. STIMSON and AUGUSTUS STEVENSON, Kittery, Me. Filed Mar. 26, 1902. Serial No. 99,917. (No model.)

Claim.—1. A hinge comprising two members, one having a slotted curved extension and the other having a rounded end journaled in said curved extension, said rounded end being provided with a button engaging the slot of said extension and overlapping the edges thereof.

2. A hinge comprising two members, one having a slotted curved extension and the other having a rounded end journaled in said curved extension, said rounded end being provided with a button engaging the slot of said extension and overlapping the edges thereof, the overlapping edges of said button and said extension being rabbeted.

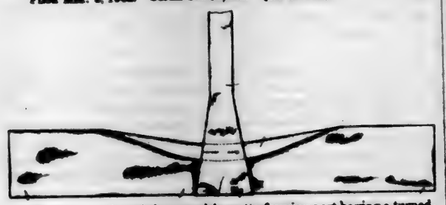
3. A hinge comprising two members, one having a depressed slotted curved extension and the other having a depressed rounded end journaled in said curved extension, said end being provided with a button engaging the slot of said curved extension and overlapping the edges thereof.

4. A hinge comprising two members, one of said members consisting of an attaching-plate and a fulcrum-plate at an angle thereto, said fulcrum-plate having a depressed slotted curved extension, and the other member having a depressed rounded end journaled in said curved extension, said rounded end being provided with a button engaging the slot of said curved extension and overlapping the edges thereof.

5. In a hinge the combination of a member comprising an attaching-plate and a fulcrum-plate, said fulcrum-plate having a slotted curved extension and a booked portion between said curved extension and attaching-plate, and a member provided with a rounded end journaled in said curved extension, said rounded end being provided with a button engaging the slot of said curved extension and overlapping the edges thereof.

6. In a hinge the combination of two members adapted to swing on each other and close at right angles, one of said members comprising an attaching-plate and a fulcrum-plate having a slotted curved extension, and the other member having a depressed rounded end journaled in said curved extension, said rounded end being provided with a button engaging the slot of said extension and overlapping the edges thereof, and said swinging member being provided with a stop for engaging the stationary member, whereby the parts are locked together when closed.

704,591. NECKTIE. HERBERT G. STRAAT, New York, N. Y. Filed Mar. 8, 1902. Serial No. 97,236. (No model.)



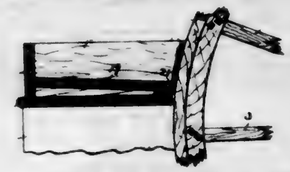
Claim.—1. A necktie comprising a tie-forming part having a turned-down upper edge, and a neckband detachably secured to the tie-forming part at a right angle thereto at approximately the center of such turned-down portion, as set forth.

2. A necktie comprising a tie-forming part having its ends folded toward its center and crossed, and a neckband secured in the fold of said tie-forming part and at a right angle to the top of the tie, as set forth.

3. A necktie comprising a tie-forming part having its ends folded toward its center as described, and a neckband detachably secured in the fold of said tie-forming part and at a right angle to the top of the tie, as set forth.

704,592. COATING-TRAY. PERCY B. TAYLOR, Newark, N. J., assignor to the Pure Food Company, a Corporation of New Jersey. Original application filed Nov. 2, 1899, Serial No. 736,244. Divided and this application filed Jan. 30, 1901. Serial No. 45,902. (No model.)

Claim.—1. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum and means for actuating the same, of a coating-tray, consisting, essentially, of a bottom and three inclosing sides, and open toward the drying-surface of said drum, and flexible contact-strips connected with the open edges of said tray for making a close contact between the tray and the drying-surface of said drum, substantially as and for the purposes set forth.



2. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, means for actuating the same, and a support, of a coating-tray adjustably arranged on said support, consisting, essentially, of a bottom and three inclosing sides, and open toward the drying-surface of said drum, and flexible contact-strips connected with the open edges of said tray for making a close contact between the tray and the drying-surface of said drum, substantially as and for the purposes set forth.

3. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, means for actuating the same, and a support, of a coating-tray arranged on said support, consisting, essentially, of a bottom and three inclosing sides, and open toward the drying-surface of said drum, flexible contact-strips connected with the open edges of said tray, brackets on each side of said tray provided with ribs, guide-plates on said support having ways in which said ribs are slidably arranged, and means connected with said brackets and said guide-plates for producing a close contact between said flexible strips of the tray and the drying-surface of said drum, substantially as and for the purposes set forth.

4. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, means for actuating the same, and a support, of a coating-tray arranged on said support, consisting, essentially, of a bottom and three inclosing sides, and open toward the drying-surface of said drum, flexible contact-strips connected with the open edges of said tray, brackets on each side of said tray provided with ribs, guide-plates on said support having ways in which said ribs are slidably arranged, and means connected with said brackets and said guide-plates for producing a close contact between said flexible strips of the tray and the drying-surface of said drum, consisting, essentially, of screw-rods having one end attached to a part of the guide-plates and extending through perforated lugs on said brackets at the sides of the tray, and an adjusting-nut on each rod, and a spring encircling each rod, substantially as and for the purposes set forth.

5. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, and means for actuating the same, of a support, guides on said support, having an upwardly-extending post on each guide, a coating-tray slidably arranged between said guides, and means connected with said posts on said guides and with the tray for causing a close contact between the tray and the drying-surface of the drum, substantially as and for the purposes set forth.

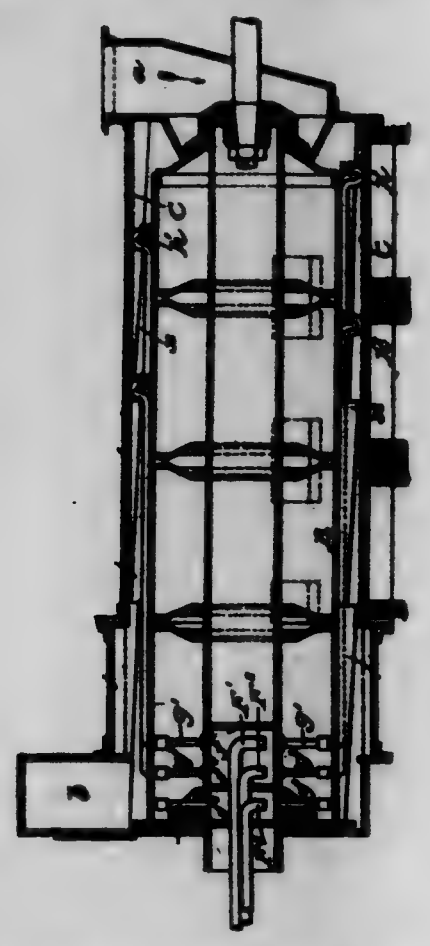
6. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, and means for actuating the same, of a support, guides on said support, having an upwardly-extending post on each guide, a coating-tray slidably arranged between said guides, and means connected with said posts on said guides and with the tray for causing a close contact between the tray and the drying-surface of the drum, consisting, of a rod secured on each post of said guides, a perforated lug on each side of the tray, through which said rod is passed, an adjusting-nut on each rod, and a spring encircling each rod between the said nuts and the lugs on the tray, substantially as and for the purposes set forth.

7. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, and means for actuating the same, of a support, guides on said support, having an upwardly-extending post on each guide, a coating-tray, brackets attached to the sides of said tray, a rib on each bracket slidably arranged in a way of each guide, a lug on each plate or bracket, and means connected with said posts of the guides and with said lugs of said brackets, for causing a close contact between the tray and the drying-surface of the drum, substantially as and for the purposes set forth.

8. In an apparatus for the desiccation of eggs, or other material, the combination, with a drying-drum, and means for actuating the same, of a support, guides on said support, having an upwardly-extending post on each guide, a coating-tray, brackets attached to the sides of said tray, a rib on each bracket slidably arranged in a way of each guide, a perforated lug on each plate or bracket, and means connected with said posts

of the guides and said perforated lugs of said brackets, for causing a close contact between the tray and the drying-surface of the drum, consisting, essentially, of a rod secured on each pair of said guides, said rods extending through said perforated lugs on said brackets, an adjusting-nut on each rod, and a spring encircling each rod on that portion between said adjusting-nuts and the said lugs, substantially as and for the purposes set forth.

704,598. APPARATUS FOR WASHING GASES. EDWARD THIESEN, Baden, Germany. Filed Oct. 26, 1900. Serial No. 734,738. (No model.)



Claim.—1. In an apparatus for washing gases and removing impurities therefrom, the combination of a horizontally-arranged stationary casing having liquid receiving and discharge openings therein, a liquid-container over which the casing rests, said casing and container being so arranged with relation to each other that the mouths of the openings in the former will be submerged in the liquid in the container, a rotary horizontally-arranged externally-bladed cylinder contained within said casing for conveying liquid from the liquid-receiving opening in the casing to the discharge-opening therein and means carried by said cylinder for continually supplying to the apparatus a washing or absorbing liquid other than that taken from the container.

2. In an apparatus for washing gases and removing impurities therefrom, the combination of a horizontally-arranged casing having liquid receiving and discharge openings therein, a liquid-container over which the casing rests, said casing and container being so arranged with relation to each other that the mouths of the openings in the former will be submerged in the liquid in the container, a rotary horizontally-arranged bladed cylinder contained within said casing for conveying liquid from the liquid-receiving opening in the casing to the discharge-opening therein, one or more supply-pipes carried by said rotary cylinder and each carrying a spraying-nozzle, one or more chambers within the cylinder in communication with the supply-pipes and means for supplying said chamber or chambers with liquid.

3. The combination of a stationary casing with a rotary cylinder having obliquely-disposed exterior blades, means for causing gases to pass between the casing and the cylinder, and means for spraying liquid in said space between the rotary cylinder and the stationary casing, to cause said liquid to pass outwardly from the cylinder to the casing and to cause in close contact with the gases.

4. The combination of a stationary casing, a rotary cylinder located within the casing and provided with external oblique blades, means for passing a current of gas between the casing and the cylinder, and spraying-devices located at different points longitudinal of the cylinder for discharging a liquid into the space between the cylinder and the casing, causing said liquid to be thrown outward against the casing and to pass through the current of gas.

704,594. WAGON-RACK FOR HAY-LOADERS. ABRAHAM E. THOMAS, Wooster, Ohio. Filed May 19, 1902. Serial No. 108,102. (No model.)

Claim.—1. The combination with a wagon hay-rack, having longitudinal rails for track, secured thereon from end to end; of a shorter, superposed movable platform-rack mounted thereon to move back and forth along said track; a standard erected upon said platform-rack, a windlass fitted to operate upon said standard; and means for propelling said movable rack from said windlass, substantially as set forth and for the purpose specified.

2. The combination of a wagon hay-rack, having a superposed movable platform-rack mounted thereon to move longitudinally from end to end thereof; said platform-rack having a standard erected thereon; a windlass fitted to operate upon said standard; means for locking said windlass; and means for propelling said platform upon and along the upper surface of said wagon-rack by the action of said windlass, substantially as set forth and for the purpose specified.

3. The combination of a wagon hay-rack having a shorter, superposed platform-rack mounted thereon to move longitudinally from end to end thereof; standards erected upon said platform-rack; a windlass mounted and fitted to operate upon said standards; a rope and tackle connecting said windlass and said wagon-rack and said platform-rack to propel the same upon said wagon-rack, and means for locking said windlass, substantially as set forth and for the purpose specified.

4. The combination of a wagon hay-rack having a shorter, superposed detachable platform-rack mounted and fitted to move along and upon on the upper surface of said wagon-rack; standards erected at the front end of said movable platform; two separate windlass-axles mounted thereon one above the other, a sliding rod extending between said axles, and having projecting ends to engage the cranks of said axles respectively when shifted laterally; rope and tackle connecting the front end of wagon-rack and platform-rack and one of said axles; rope and tackle connecting the front end of said platform-rack and said wagon-rack back of its middle, and the other of said axles, to actuate said platform-rack back and forth, substantially as set forth and for the purpose specified.

5. The combination of a wagon hay-rack having a shorter superposed rack mounted thereon and fitted to move longitudinally from end to end of said wagon-rack; a separate windlass mounted upon said superposed rack connected by rope and tackle with said several racks to propel the said movable rack along the upper surface of said wagon-rack; a separate windlass mounted upon said superposed rack connected by rope and tackle with said several racks to propel said movable rack in the opposite direction, and means for locking said windlasses respectively, substantially as set forth and for the purpose specified.

704,595. THERMO-ELECTRIC ELEMENT. CHARLES B. TWINING, Galesburg, Ill., assignor to Louis S. Longville, New York, N. Y. Filed June 14, 1901. Serial No. 64,982. (No specimens.)

Claim.—1. A thermo-electric couple, the negative element of which consists of an alloy of nickel and copper of the composition Ni_2Cu_3.

2. A thermo-electric couple having iron as the positive element, and an alloy of nickel and copper of the composition Ni_2Cu_3 as the negative element.

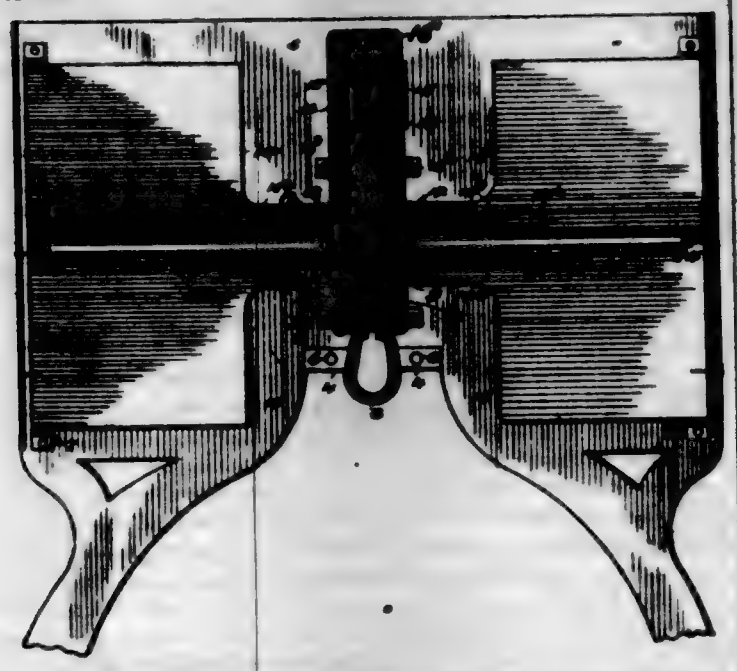
704,596. THERMO-ELECTRIC GENERATOR. CHARLES B. TWINING, Syracuse, N. Y., assignor to Louis S. Longville, New York, N. Y. Filed Oct. 21, 1901. Serial No. 79,498. (No model.)

Claim.—1. In a thermo-electric generator, a casing open at top and bottom, a burner, a chimney for said burner, and thermo-electric couples the joints of which project into the path of the products of combustion from said burner, the major portions of the couples being located in the casing beyond the burner; substantially as described.

2. In a thermo-electric generator, a casing open at top and bottom, a longitudinal burner, a chimney for said burner, and thermo-electric couples on each side of said burner the joints of which project into the path of the products of combustion from said burner, the major portions of the couples being located in the casing outside the chimney; substantially as described.

3. In a thermo-electric generator, a burner, a casing, insulating-strips supported by the casing, and thermo-electric couples supported by said insulating-strips and having their joints to be located directly in the

path of the products of combustion from the burner; substantially as described.



4. In a thermo-electric generator, a casing open at top and bottom, a longitudinal burner, a chimney for said burner, two sets of thermo-electric couples on each side of said burner, said sets having insulating-strips between their members and between each other, the strips, chimney and sides of the casing forming a heating-chamber above the burner, the joints of the couple to be heated projecting into said heating-chamber; substantially as described.

5. In a thermo-electric generator, a casing, a burner, a series of thermo-electric couples having their minor portions as to size constituting the joints to be heated projecting into the path of the products of combustion from said burner, and their major portions extending outwardly from and below the minor portions so as to constitute small compact heating-surfaces and wide extended cooling-surfaces; substantially as described.

6. In a thermo-electric generator, a casing, a burner, a series of thermo-electric couples having their minor portions as to size constituting the joints to be heated projecting into the path of the products of combustion from said burner, and their major portions extending outwardly from and below the minor portions, and a second series of couples similarly constructed arranged above said first series but reversely thereto, so as to constitute small compact heating-surfaces and wide extended cooling-surfaces; substantially as described.

7. In a thermo-electric generator, a casing, a longitudinal burner, a longitudinal series of thermo-electric couples arranged on each side of said burner and having their minor portions as to size constituting the joints to be heated projecting into the path of the products of combustion from the burner and their major portions extending outwardly from and below the minor portions, and two series of couples similarly constructed arranged above said first two series but reversely thereto, so as to constitute small compact heating-surfaces and wide extended cooling-surfaces; substantially as described.

8. In a thermo-electric generator, a lower series of couples the positive elements of which are in the form of wings projecting outwardly and downwardly from the joints to be heated, and an upper series of couples similarly shaped but reversely arranged with respect to the lower series, so as to constitute small compact heating-surfaces and wide extended cooling-surfaces; substantially as described.

9. In a thermo-electric couple, a metallic positive element, and a metallic negative element differing in composition from the positive element, the two elements being riveted and brazed together at the joint by brass or other copper alloy; substantially as described.

10. In combination, a thermo-electric couple having a slot in one of its elements, and a second couple having a portion of one of its elements interfitting with said slot, the two parts being brazed together at the joint; substantially as described.

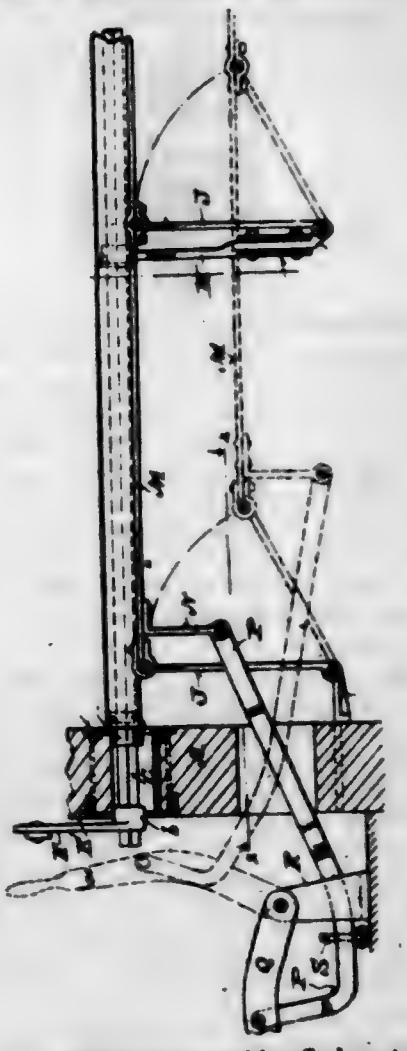
11. In a thermo-electric generator, a couple having a heating-joint composed of positive and negative elements riveted to a connecting-piece; substantially as described.

12. In a thermo-electric generator, a couple having a heating-joint composed of positive and negative elements riveted and brazed to a connecting-piece; substantially as described.

13. In a thermo-electric generator, a thermo-electric couple, the positive element of which has a wide extended body or cooling portion and a narrow portion to be heated extending therefrom, said heating portion being provided with a groove or grooves adapted to fit over insulating-strips on the generator-casing; substantially as described.

14. In a thermo-electric generator, a casing open at top and bottom, a longitudinal burner, a chimney for said burner, and two sets of thermo-electric couples on each side of said burner, said sets having insulating-strips between their members and between each other, the strips, chimney, and sides of the casing forming a heating-chamber above the burner, said heating-chamber being lined with asbestos and the joints of said couples to be heated projecting into the chamber; substantially as described.

704,597. MALT-KILN. PETER G. TOEPPER, Milwaukee, Wis. Filed Mar. 10, 1902. Serial No. 97,861. (No model.)



Claim.—1. A malt-kiln floor comprising tilt-dump trays, levers having transverse portions opposing under edges of frames constituting parts of the trays, a link-bar connecting the levers, and means for actuating the link-bar.

2. A malt-kiln floor comprising tilt-dump trays having shafts provided with journal-collars engaging vertically-elongated bearings, other collars rigid on the tray-shafts at intervals of the same, bearing-brackets stationary under the latter collars normally clear of the same, levers having transverse portions opposing under edges of frames constituting parts of the trays, a link-bar connecting the levers, and means for actuating the link-bar.

3. A malt-kiln floor comprising tilt-dump trays, levers having transverse portions opposing under edges of frames constituting parts of the trays, a link-bar connecting the levers, a bracket depending from the link-bar, a hand-lever in link connection with the bracket, and means for locking the trays in horizontal position.

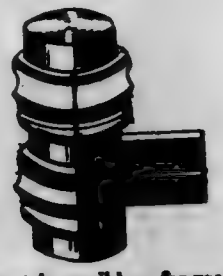
4. A malt-kiln floor comprising tilt-dump trays having shafts provided with journal-collars and rounded end bosses of link-connected cranks engaging vertically-elongated bearings, other collars rigid on the tray-shafts at intervals of the same, bearing-brackets stationary under the latter collars normally clear of the same, levers having transverse portions opposing under edges of the frames constituting parts of the trays, a link-bar connecting the levers, and means for actuating the link-bar.

5. A malt-kiln floor comprising tilt-dump trays vertically adjustable in horizontal position to be dropped from their normal level preliminary to dumping operation so as to avoid obstructions.

704,598. ROD-PACKING. SYVERT USTRAB, Aurora, Ill. Filed Apr. 26, 1901. Renewed June 18, 1902. Serial No. 112,174. (No model.)

Claim.—1. A pliable metallic strip or ribbon for use in making packing-rings, the strip or ribbon having, first, an exterior face compris-

ing a centrally longitudinal ridge or apex and an inwardly-curved or concave surface on each side of the ridge or apex, each inwardly-curved or concave surface adapted to receive a portion of the curved exterior of a compressible or fibrous packing-ring, and having, second, an interior face comprising a central longitudinal channel or depression in line with the exterior ridge or apex and an outwardly-curved or convex surface on each side of the channel or depression forming a longitudinal groove or passage, with the outer concave and inner convex surfaces on different lines of curvature to give an increased thickness to the outer edge on each side and furnish a narrow flat bearing or contact face on the interior of the ring, when in place, without destroying the curvature of the faces, substantially as described.



2. A pliable metallic strip or ribbon for use in making metallic packing-rings wound on itself into a roll and adapted to be unwound and cut into sections each section of a length for the diameter of ring desired, the strip or ribbon having, first, an exterior face comprising a central longitudinal ridge or apex and inwardly-curved or concave surfaces on each side of the ridge or apex and having, second, an interior surface comprising a central longitudinal channel or depression, and an outwardly-curved or convex surface on each side of the channel or depression forming a longitudinal groove or passage, with the concave and convex surfaces on different lines of curvature giving an increased edge thickness and furnishing on each side a flat narrow edge forming a bearing or contact face, substantially as described.

3. A pliable metallic strip or ribbon for use in making metallic packing-rings, the strip or ribbon having, first, an exterior face comprising a central longitudinal ridge or apex and an inwardly-curved or concave surface on each side of the ridge or apex and having, second, an interior face comprising a longitudinal channel or depression and an outwardly-curved or convex surface on each side of the channel or depression and forming a groove or passage in the inner face of the ring and having, third, a straight face on each side edge with a rounded corner at the juncture of each side edge face and the exterior curved surface leaving, when two rings abut each other on the side edge faces, a shallow channel or depression at the exterior corner edges, substantially as described.

4. A pliable metallic packing-ring having on its exterior two inwardly-curved or concave surfaces, one on each side of the transverse center, the curvature of the surfaces forming a central ridge or apex on the exterior face of the ring, and having on its interior face two outwardly-curved or convex surfaces, one on each side of the transverse center, the curvature of the surfaces forming a central channel or depression in the interior face of the ring, and having a straight face on each side edge when the ring is in place, said packing-ring being formed of a section cut from a continuous strip of pliable metal having an exterior and interior contour corresponding to the exterior and interior faces of the ring, substantially as described.

5. A series of pliable metallic packing-rings, each formed of a section cut from a continuous strip or ribbon of pliable metal and each having on its exterior two inwardly-curved or concave surfaces, one on each side of the transverse center, the curvature of the surfaces forming a central ridge or apex on the exterior face of each ring, and each having on its interior face two outwardly-curved surfaces, one on each side of the transverse center, the curvature of the two faces forming a central channel or depression on the interior face of each ring, the adjoining curved surfaces on the exterior of the rings forming between two rings a semicircular groove or recess and the curved surfaces on the interior face of each ring forming a groove or passage, in combination with a series of compressible or fibrous packing-rings, each ring having a curved exterior surface to enter and fit the semicircular groove or recess formed by the inwardly-curved or concave exterior surfaces of two abutting metal rings, for the compressible packing-ring to close the joint between the two metal rings, substantially as described.

6. A series of pliable metallic packing-rings, each having on its exterior face two inwardly-curved or concave surfaces, one on each side of the transverse center, the curvature of the faces forming a central ridge or apex on the exterior face of each ring and having on its interior face two outwardly-curved or convex surfaces, one on each side of the transverse center, the curvature of the two surfaces forming a central channel or depression on the interior face of each ring and having a straight face on each side edge of each ring, with a rounded corner at the juncture of each side edge face and the exterior curved surface, the exterior curved surfaces of two abutting rings forming a semicircular groove or channel and the curved surface on the interior of each ring forming a groove or passage, in combination with a compressible or fibrous packing-ring for each semicircular groove or recess, said ring having a curved exterior face fitting into the semicircular groove or recess of the exterior surfaces of two abutting metal rings and clearing the channel or depression formed by the rounded corner edges of the two rings, substantially as described.

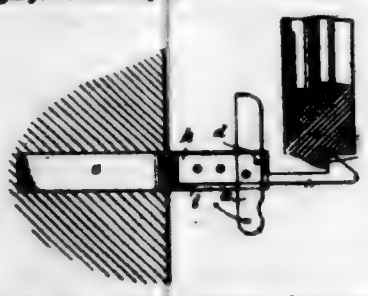
7. A pliable metallic strip or ribbon for use in making half packing-rings, the strip or ribbon having an exterior face with a curved surface, a narrow face on one side edge, a wide face having a curved surface on the opposite side edge an interior face having a straight surface, and having, at the juncture of the curved surface of the exterior face and the curved surface of the wide edge side face, an apex or ridge, substantially as described.

8. A pliable metallic strip or ribbon for use in making half packing-rings wound on itself and adapted to be unwound and cut into sections each section of a length for the diameter of half-ring desired, the strip or ribbon having an exterior face with a curved surface, a narrow face on one side edge, a wide face having a curved surface on the opposite side edge, an interior face having a straight surface and having at the juncture of the curved surface of the exterior face and the curved surface of the wide edge side face, an apex or ridge, substantially as described.

9. A pliable metallic half packing-ring having an exterior face with an inwardly-curved or concave surface, a side edge face with a narrow surface, a side edge face with an outwardly-curved or convex wide surface and an interior face having a straight surface, and formed from a section cut from a continuous strip or ribbon of pliable metal having faces corresponding to the contour of the faces of the ring, substantially as described.

10. A pliable metallic strip or ribbon for use in making packing-rings wound on itself into a roll said ribbon or strip provided on its exterior face with a central ridge or apex and an inwardly-curved or concave surface on each side of the ridge or apex and provided on its interior face with a central longitudinal channel or depression and an outwardly-convex surface on each side of the channel or depression and provided on each side edge with a straight face, the side edges when the strip or ribbon is first formed having their faces oppositely inclined giving the inner face a spread or opening for the entrance of the exterior face, in winding the ribbon on itself, without disturbing the continuity of the surfaces, substantially as described.

704,599. SHUTTER-FASTENER. KARL UFFELBOMER, Grisz, Austria-Hungary. Filed May 4, 1901. Serial No. 58,756. (No model.)



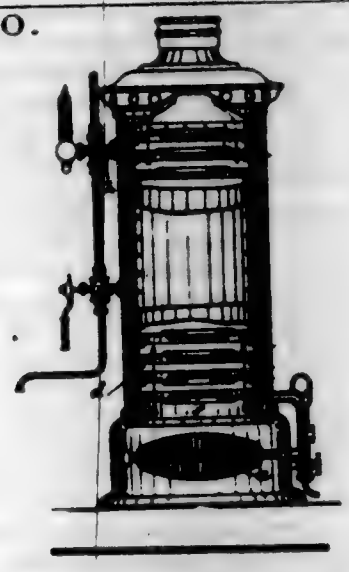
Claim.—Device for fastening windows, doors, sun-blinds, and the like, comprising in combination, a bar secured in a wall or the like; two arms connected together in the form of a cross, pivoted to said fixed bar, and adapted to assume such a position that one of the arms is normally horizontal and the other vertical; and a hook on the end of said horizontal arm adapted to automatically engage with the front of the window, or the like, on opening said window, the upper end of said vertical arm being adapted to strike against the frame of the window, or the like, when the lower end of said arm is turned to release the window, substantially as set forth.

704,600. APPARATUS FOR RAPIDLY HEATING LIQUIDS. HENRI VANDENBROEKE, Brussels, Belgium. Filed Dec. 10, 1901. Serial No. 85,294. (No model.)

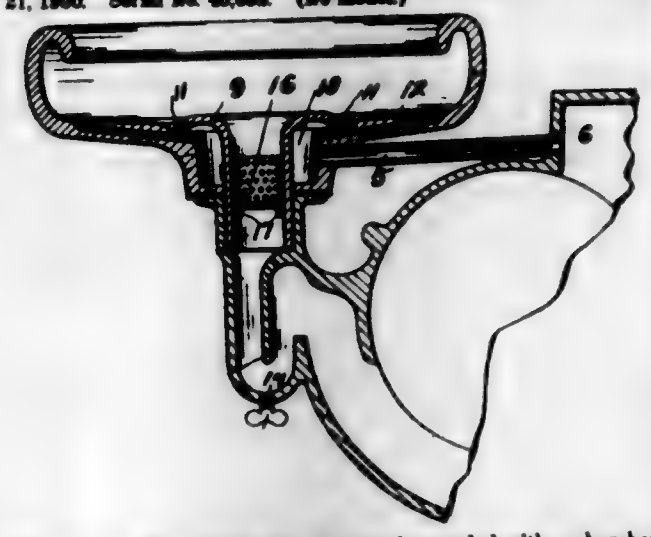
Claim.—1. In a liquid-heating apparatus, the combination of a hollow casing having vertical, relatively close-spaced walls forming a liquid-receiving space having an inlet-opening at the bottom and an outlet-opening at the top, and a series of superposed spaced plates arranged substantially horizontally and fitting within said casing, said plates being imperforate in their central or body portions and having openings near their edge portions, substantially as described.

2. In apparatus of the kind described a circular or other shaped heating-plate adapted to fit the inner diameter of the double-walled casing and to rest upon flanges or projections therein said plate having a series of radial slots near its circumference and a series of intermediate channel-shaped bridges or parts substantially as described.

704,600.



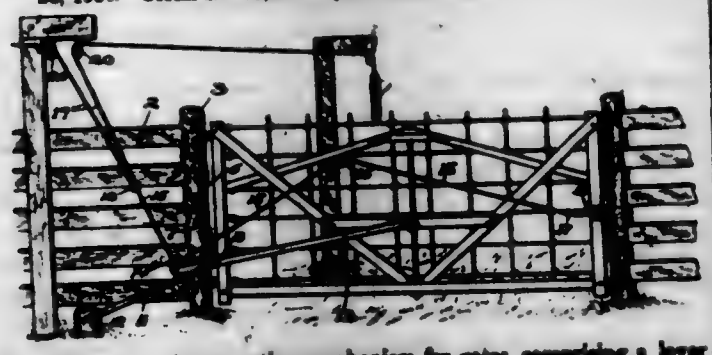
704,601. DENTAL CUSPIDOR. JOSEPH E. VAN HOUTAN, Canton, Ohio, assignor of one-half to Joseph J. Hahn, Canton, Ohio. Filed Dec. 21, 1900. Serial No. 40,632. (No model.)



Claim.—1. The combination of a bowl provided with a chambered flange or base located upon the bottom or under side of the bowl, the chamber thereof communicating with the bowl, a supply-pipe leading into the chamber of the flange, a pipe 7 located in the chamber and supported in fixed position, said portion of the pipe located in the chamber formed of less diameter than the diameter of the chamber and its upper end provided with a curved flange, said curved flange located over a portion of the bottom of the bowl and provided with apertures communicating with the chamber in the flange and the chamber of the bowl, substantially as and for the purpose specified.

2. The combination of a bowl provided with a chambered flange or base, a supply-pipe leading into the chambered flange, a pipe 7 located in the chambered flange and provided with a curved top and the bottom of the bowl provided with passages extended from the chambered flange outward and communicating with the bottom of the bowl all arranged, substantially as and for the purpose specified.

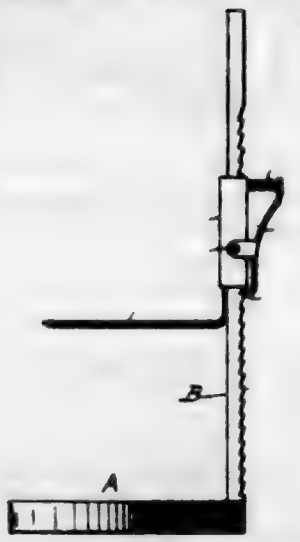
704,602. GATE. RANDALL T. VAN VALKENBURG, Laporte, Ind., assignor of one-half to William E. Crichton, Laporte, Ind. Filed Sept. 20, 1901. Serial No. 75,822. (No model.)



Claim.—1. An operating mechanism for gates comprising a lever pivotally secured at one end to the gate and having an extended free end for connection with an operating-rope, rods connected with the lever between its ends to form a toggle-joint connection to control the movements of said lever and gate, an adjustable latch on the gate and a rope connected to the free end of the lever and to the latch to operate both latch and lever simultaneously when the rope is pulled.

2. An operating mechanism for farm-gates comprising a lever pivotally secured at one end to the gate, a rod pivotally hung upon a post and carrying at its other end a bolt, a rod secured at one end to an anchor-post and its other end journaled to the bolt to form a toggle connection, said lever also journaled on the bolt, an adjustable spring-latch on the gate, a rope connected to the spring-latch and to the free end of the lever, bracket-posts positioned on each side of the gate opposite its hinges, a connection supported by the bracket-posts and secured to the rope for operating the latch, the lever, and the toggle connection simultaneously, and thereby open the gate, substantially as specified.

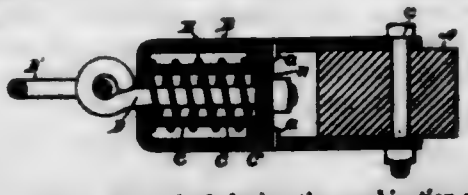
704,603. ADJUSTABLE STAND. GEORGE A. WADSWORTH, Montevideo, Minn. Filed Apr. 1, 1901. Serial No. 53,886. (No model.)



Claim.—1. In a supporting-stand of the class described, the combination with a vertical standard, of two telescoping rings, one carried by the bottom to serve as a base for said standard, and one slidable upon said standard, and means for holding said adjustable ring in adjusted position.

2. In a supporting-stand of the class described, the combination of a vertical standard, a ring carried by the bottom of, and forming a base for said standard, a casing inclosing said standard, a ring secured to said casing upon one side of said standard, serrations carried by the opposite side of said standard, a dog having fulcrum-support upon said standard, with an inwardly-turned lower end adapted to engage with said serrations, and a spring interposed between the upper end of said dog and said casing.

704,604. SPRING DRAFT ATTACHMENT. LORIN V. WARNER, Cassopolis, Mich. Filed Apr. 26, 1902. Serial No. 104,810. (No model.)



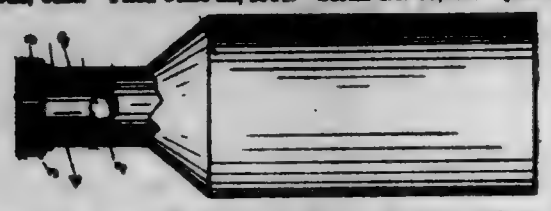
Claim.—1. In a spring draft device, the combination of a yoke B; a casing C arranged to reciprocate in said yoke and having a flange C' grooved to engage the arms of the yoke and be guided thereby; stops *a* on the said yoke; a coiled spring E about said casing adapted to engage said yoke; a bolt D adapted to reciprocate in said casing; a spring *e* about said bolt adapted to engage said casing, said springs E and *e* being of varying strength; all coacting for the purpose specified.

2. In a spring draft device, the combination of a yoke B; a casing C arranged to reciprocate in said yoke and having a flange C' grooved to engage the arms of the yoke and be guided thereby; stops *a* on said yoke; a coiled spring E about said casing adapted to engage said yoke; a bolt D adapted to reciprocate in said casing; a spring *e* about said bolt adapted to engage said casing, all coacting for the purpose specified.

3. In a spring draft device, the combination of a yoke; a casing arranged to reciprocate therein and be guided thereby; a coiled spring about said casing adapted to engage said yoke; a plunger adapted to reciprocate in said casing; a spring about said plunger adapted to engage said casing, said springs being of varying strength, all coacting for the purpose specified.

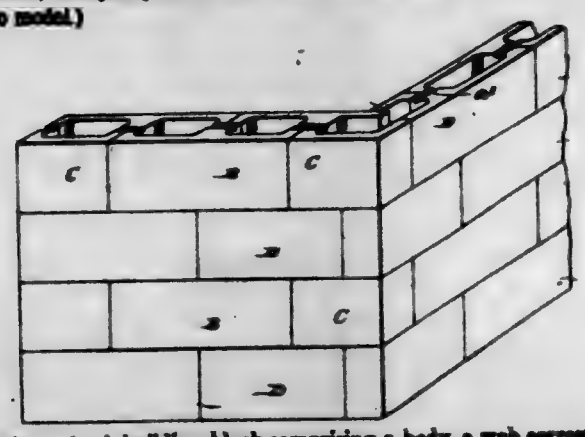
4. In a spring draft device, the combination of a yoke; a casing arranged to reciprocate therein and be guided thereby; a coiled spring about said casing adapted to engage said yoke; a plunger adapted to reciprocate in said casing; a spring about said plunger adapted to engage said casing, all coacting for the purpose specified.

704,605. NON-REFILLABLE BOTTLE. THOMAS P. WEIBLE, Columbus, Ohio. Filed June 22, 1901. Serial No. 65,557. (No model.)



Claim.—In a non-refillable bottle, the combination with the bottle-body having its neck portion provided with a peripheral flange 3 at its outer end and a casing 4 depending within said bottle-neck, said casing having its outer end flanged to bear upon said shoulder portion 3 and having its inner end within the bottle-neck provided with a central opening, of a cap comprising a central cup-like portion extending within the mouth of the bottle-neck and an outwardly and downwardly extending portion embracing and clamped beneath said bottle-neck shoulder, said cup portion having openings therein and a ball within said bottle-neck adapted to close the inner end opening of the casing, substantially as specified.

704,606. BUILDING BLOCK AND WALL. CHARLES F. WHITTLESEY, Albuquerque, N. Mex. Filed Feb. 24, 1902. Serial No. 95,996. (No model.)

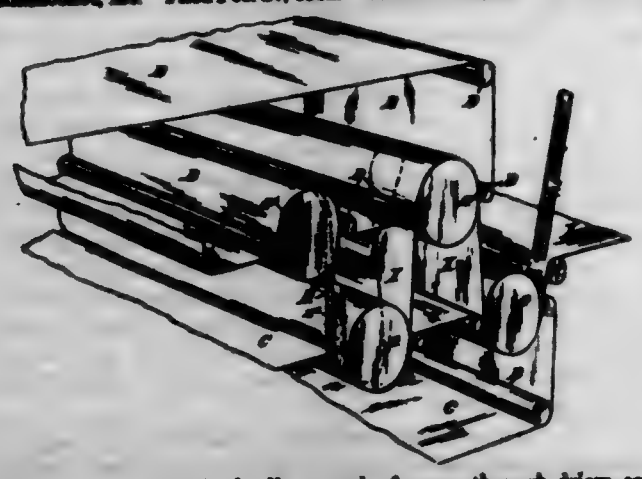


Claim.—1. A building-block comprising a body, a web corresponding in height to the body and extending at right angles from the middle thereof, and right-angle arms of a less length and half the width of the web extending from the ends of the body and in the same direction as the web.

2. A building-block comprising a body, a web corresponding in height to the body and extending at right angles from the middle thereof, and having longitudinal grooves in its upper and lower sides, and right-angle arms of a less length and half the width of the web extending from the ends of the body and in the same direction as the web.

3. A wall composed of building-blocks B having angular projections at their middles and ends, the building-blocks C having angular projections at their opposite ends, the building-blocks D having angular projections at an intermediate point of their length and at one of their ends, and the building-blocks E having angular projections at one end; the said blocks being arranged side by side in the courses of the wall with their projections extending inwardly and meeting each other, whereby a bond for all courses and finish for all corners is produced, the main portions of the blocks form the facings of the wall, and spaces are formed between the blocks.

704,607. PAPER-MAKING MACHINE. GEORGE E. WITHAM, Millinocket, Me. Filed Feb. 27, 1902. Serial No. 96,963. (No model.)



Claim.—1. A pilot for leading a web of paper through driers, consisting of a spring-metal plate adapted to reach from one drying-cylinder to another and having a device for engaging the end of the paper.

2. A pilot for leading a web of paper through driers, consisting of a spring-metal plate adapted to reach from one drying-cylinder to another, and having a lateral projection for engaging the end of the paper.

3. A pilot for leading a web of paper through driers consisting of a thin elastic plate or bar having smooth or rounded ends and a laterally-projecting arm between its ends for engaging the end of the paper.

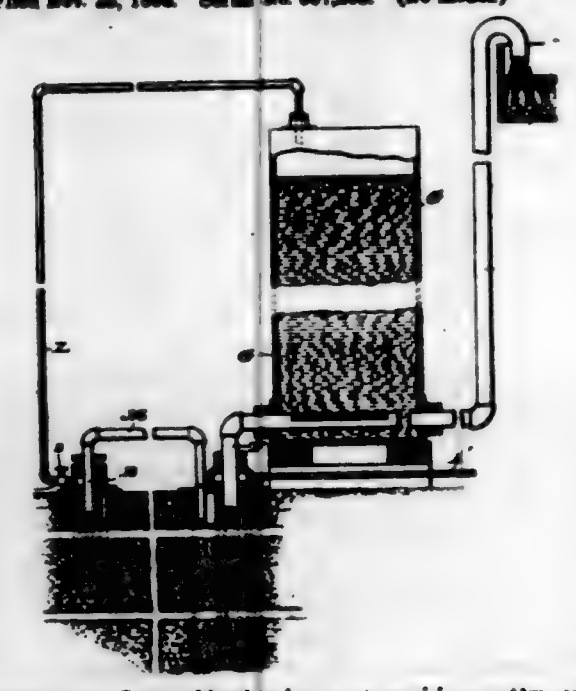
4. A pilot for leading the web of paper through driers, consisting of two spring-metal plates adapted to reach from one drying-cylinder to another and having a cross-piece for engaging the end of the paper.

5. The combination with the upper and lower series of drying-cylinders and their felts, of a pilot for threading a web of paper therethrough, consisting of a thin spring-metal plate adapted to reach from one drying-cylinder to another, and having a device for engaging the end of the paper.

6. The combination with the upper and lower cylinders and their felts, of a pilot for leading a web of paper therethrough, consisting of a thin sheet-metal plate adapted to reach from one drying-cylinder to another and having a laterally-projecting arm for engaging the end of the paper.

7. The combination of the drying-cylinders and felts, of a pilot for the paper consisting of a spring-metal plate adapted to reach from one drying-cylinder to another and having a device for engaging the end of the paper, and a guide for supporting the pilot and directing it into engagement with the first drying-cylinder and its felt.

704,608. APPARATUS FOR RAISING WATER. GEORGE R. YOUNG, Ridgewood, N. J., and CLIFFORD SHAW, New York, N. Y., assignors to the Ingom Air Lift Company, a Corporation of New Jersey. Filed Nov. 23, 1898. Serial No. 697,262. (No model.)



Claim.—1. In combination in a water-raising system, an air-lift well, an uptake therefor, means for aerating the column of water in the uptake to raise it, a separating vessel or tank to which the uptake delivers, a pipe for delivering water from the separating vessel or tank to a higher level without aeration, and means for discharging the air from the separating vessel or tank while maintaining the requisite pressure within the tank, the said separating vessel or tank being of such considerable height vertically as to act as a regulator or compensator as distinguished from a mere separating vessel or tank of height incapable of effecting such regulation or compensation, substantially as set forth.

2. In combination in a water-raising system, an air-lift reservoir-well, an uptake therefor, means for aerating the column of water in the uptake to raise it, a separating vessel or tank to which the uptake delivers, a pipe for delivering water from the separating vessel or tank to a higher level without aeration, an air-pipe delivering air from the said separating vessel or tank, one or more supply well or wells, an uptake for each, means for carrying water from such uptake or uptakes to the said reservoir-well, and connections from the said air-pipe for delivering air to the said uptake or uptakes of the supply well or wells to aerate and raise the water therein, substantially as set forth.

3. In combination in a water-raising system, an air-lift reservoir-well, an uptake therefor, means for aerating the column of water in the uptake to raise it, a separating vessel or tank to which the uptake delivers, a pipe for delivering water from the separating vessel or tank to a higher level without aeration, an air-pipe delivering air from the said separating vessel or tank, one or more supply well or wells, an uptake for each, means for carrying water from such uptake or uptakes to the said reservoir-well, and connections from the said air-pipe for delivering air to the said uptake

or uptakes of the supply well or wells to aerate and raise the water therein, the said separating vessel or tank being of considerable height to act as a regulator or compensator, for the system, substantially as set forth.

4. In combination in a water-raising system, a deeper air-lift well and a shallower air-lift well, an uptake in each, means for delivering compressed air to the uptake of the deeper well, means for separating the air from the water under pressure greater than the atmosphere, and means for delivering a portion at least of such air under pressure to the uptake of the shallower well, substantially as set forth.

5. In combination with a plurality of supply-wells, a relatively deeper reservoir-well, to which the said supply-wells deliver, an uptake for the reservoir-well and an air-pipe and connections delivering air under pressure to the uptake, a separating vessel or tank for separating under pressure the water and air delivered from such uptake, an uptake in each supply-well and air connections from the separating vessel or tank to such uptakes to aerate and raise the water therein, substantially as set forth.

6. In combination with a plurality of supply-wells, a relatively deeper reservoir-well, to which the said supply-wells deliver, an uptake for the reservoir-well, and an air-pipe and connections delivering air under pressure to the uptake, a separating vessel or tank for separating under pressure the water and air delivered from such uptake, an uptake in each supply-well, and air connections from the separating vessel or tank to such uptakes to aerate and raise the water therein, a connection from the first said air-pipe to the supply-wells, and regulating-valves for the several pipes and connections, substantially as set forth.

7. In combination with a plurality of supply-wells, a relatively deeper reservoir-well, to which the said supply-wells deliver, an uptake for the reservoir-well, and an air-pipe and connections delivering air under pressure to the uptake, a separating vessel or tank for separating under pressure the water and air delivered from such uptake, an uptake in each supply-well and air connections from the separating vessel or tank to such uptakes to aerate and raise the water therein, and regulating-valves for adjusting the supply-wells severally, substantially as set forth.

704,809. LACING-HOOK. WILLIAM P. BARTEL, Waltham, Mass. Filed Dec. 24, 1901. Serial No. 87,196. (No model.)

Claim.—1. A lacing-hook formed of a single piece of metal, comprising a shank, a neck extending therefrom, a head having corrugations extending over the entire upper and lower faces thereof, and a covering of plastic material molded around said head and entirely covering the same above and below.

2. A lacing-hook formed of a single piece of metal, comprising a shank a neck, a head having two sets of corrugations formed therein by two sets of parallel cuts intersecting each other at an angle and extending over the entire upper and lower faces thereof, and a covering of plastic material molded around said head and entirely covering the same above and below.

3. A lacing-hook formed of a single piece of metal, comprising a shank, a neck extending therefrom, a head having corrugations extending entirely over one face thereof, and a covering of plastic material molded around said head.

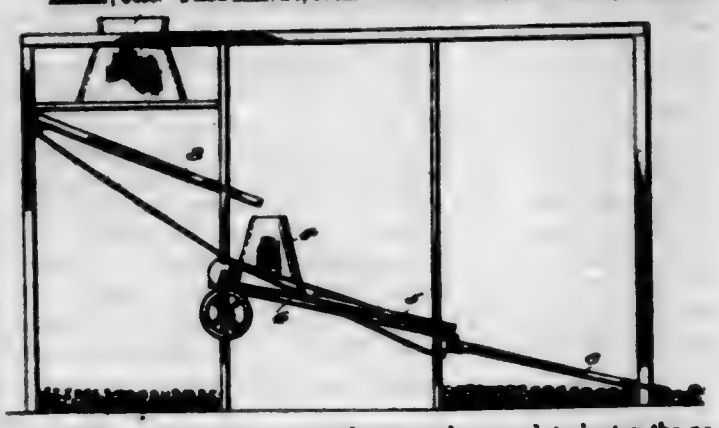
4. A lacing-hook formed of a single piece of metal, comprising a shank, a neck, a head, said neck bent upwardly to form a vertical shoulder near the line where said neck and head are joined together, said vertical shoulder extending transversely across said neck, and a covering of plastic material molded around said head and shoulder and entirely covering the same above and below.

5. A lacing-hook formed of a single piece of metal, comprising a shank, a neck, and a head, said head projecting beyond said neck and forming, at the line where said head and neck are joined together, two horizontal rearwardly-extended shoulders and a covering of plastic material molded around said head and shoulders.

6. A lacing-hook formed of a single piece of metal, comprising a shank, a neck, and a head, said neck bent upwardly to form a vertical shoulder near the line where said neck and head are joined together, said vertical shoulder extending transversely across said neck, and said head projecting beyond said neck and forming, at the line where said head and neck are joined together, two horizontal shoulders and a covering of plastic material molded around said head and shoulders.

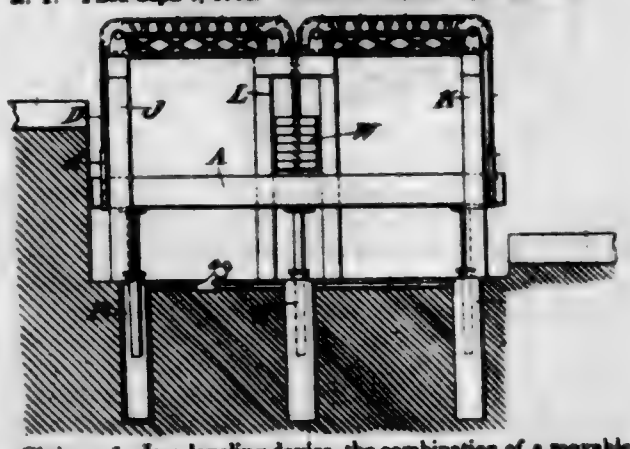
7. A lacing-hook formed of a single piece of metal, comprising a shank, a neck, and a head, said neck bent upwardly to form a vertical shoulder near the line where said neck and head are joined together, said vertical shoulder extending transversely across said neck and said head projecting beyond said neck and forming, at the line where said neck and head are joined together, two horizontal rearwardly-extended shoulders and a covering of plastic material molded around said head and shoulders.

704,810. PROCESS OF TREATING BEET-SEED. ARNO E. BLACK, Lamar, Colo. Filed Mar. 27, 1902. Serial No. 100,235. (No specimens.)



Claim.—The process of treating sugar-beet seed to hasten the period of germination and enable a seeder to drop and plant one seed at a time a given distance apart in the row, consisting of sizing and assorting the seed to render them approximately uniform in size and of an approximately round form, substantially as described.

704,811. LEVELING DEVICE. THOMAS E. BROWN, New York, N. Y. Filed Sept. 7, 1900. Serial No. 29,317. (No model.)



Claim.—1. In a leveling device, the combination of a movable platform, a weight, and a plurality of flexible connections connected at one end to the platform at opposing points with reference to the center of gravity thereof and at the other end to the weight at substantially the same point so that the preponderance of the weight tends to lift the low end of the platform, substantially as described.

2. In a leveling device, the combination of a movable platform, a plurality of weights, and a plurality of flexible connections operatively connecting each of said weights with said platform, and the connections which operatively connect the same weight and the platform being fastened at one end to points on said platform which are on opposite sides of the center of gravity thereof and at the other end to their respective weights, substantially as described.

3. In a leveling device, the combination of a movable platform, a weight, guide-sheaves above the platform, standards to support said sheaves, and a plurality of flexible connections guided over said sheaves and connected at one end to the platform at opposing points with reference to center of gravity thereof and at the other end to the weight at substantially the same point so that the preponderance of the weight tends to lift the low end of the platform, substantially as described.

4. In a leveling device, the combination of a movable platform, a plurality of weights, guide-sheaves above said platform and standards to support said sheaves, and a plurality of flexible connections operatively connecting said platform and each of said weights and guided over said sheaves, and the connections which operatively connect the same weight and the platform being fastened at one end to points on said platform which are on opposite sides of the center of gravity thereof and at the other end to their respective weight, substantially as described.

5. In a leveling device, the combination of a movable platform, one or more motors for raising and lowering the platform, a weight independent of said motors, and a plurality of flexible connections fastened at one end to points on said platform which are on opposite sides of the center of gravity thereof, and at the other end to the said weight, substantially as described.

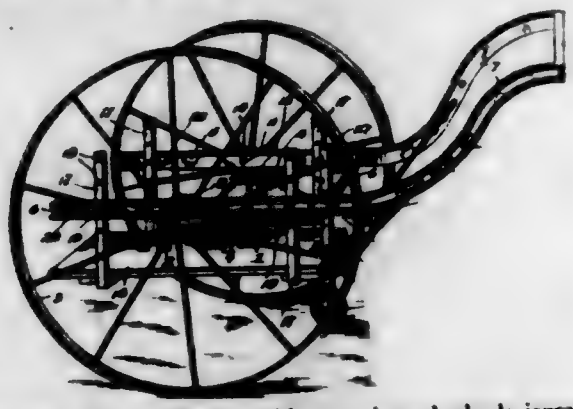
6. In a leveling device, the combination of a movable platform, one

or more motors for raising and lowering the same, a plurality of weights, and a plurality of flexible connections operatively connecting the platform with each weight, and the flexible connections which connect the platform with the same weight being fastened at one end to points on said platform which are at opposite sides of the center of gravity thereof, and at the other end to their respective weight, substantially as described.

7. In a leveling device, the combination of a movable platform, a weight, a plurality of flexible connections fastened at one end to opposing points on said platform with reference to the center of gravity thereof and at the other end to said weight, and supports adapted to maintain in a substantially straight line those portions of said flexible connections which are not vertical, substantially as described.

8. In a leveling device, the combination of a movable platform, a plurality of weights, a plurality of flexible connections operatively connecting each of said weights with said platform, and the connections which operatively connect the same weight and platform being fastened at one end to opposing points on said platform with reference to the center of gravity thereof and at the other end to their respective weight, and supports adapted to maintain in a substantially straight line those portions of said flexible connections which are not vertical, substantially as described.

704,612. HAND-CART. BERT BUTLER, Kennett, Iowa. Filed Apr. 10, 1902. Serial No. 102,224. (No model.)

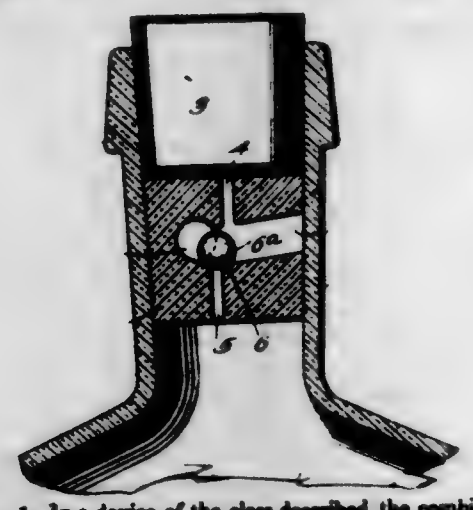


Claim.—1. The combination with an axle and wheels journaled thereon, of side bars fixed to said axle and extending in approximately the same horizontal plane, and a platform vertically and longitudinally adjustably connected to said side bars, substantially as set forth.

2. The combination with the axle and its supporting-wheels, of side bars connected to said axle, hangers adjustably connected to said side bars, a platform supported by said hangers, side-boards, and brackets adjustably connected to said side-boards for engaging the side bars and holding the side-boards in proper position, substantially as set forth.

3. The combination with a U-shaped axle lying in substantially a horizontal plane and provided with stubs at its ends, of wheels journaled on said ends, a loop or bail secured to the cross-piece of said axle, side bars fixed to said axle, a platform connected to said side bars, a bracket, a standard extending through said bracket and loop, a caster-wheel carried by the lower end of the standard, means for adjusting the platform, and means for locking it in adjusted position with respect to the standard, substantially as set forth.

704,613. NON-REFILLABLE BOTTLE. HENRY F. BUTTNER, Idaho Falls, Idaho. Filed Apr. 26, 1902. Serial No. 104,006. (No model.)

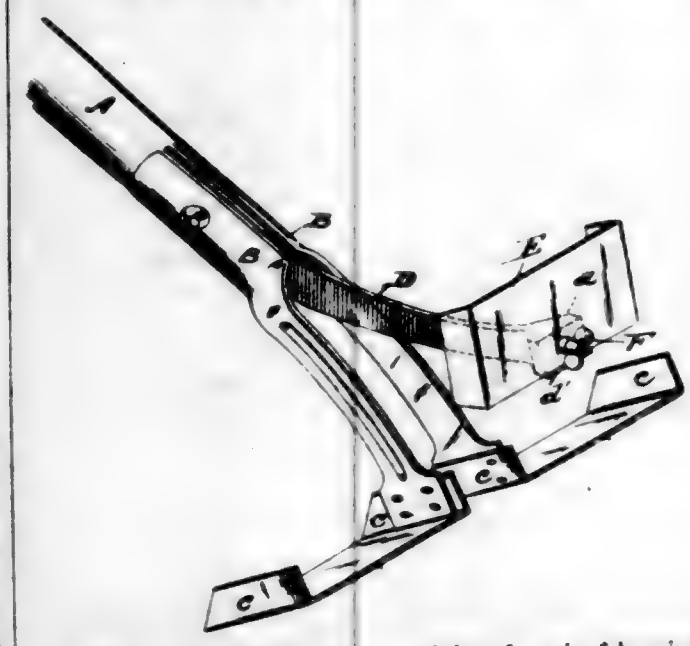


Claim.—1. In a device of the class described, the combination with a receptacle having a neck, of a plug or stopper provided with upper and lower passages and having an intermediate valve-seat, said plug or stopper being also provided with a transverse passage extending inward from one side of it to the valve-seat and closed by the neck of the receptacle when the stopper or plug is in position, and a valve arranged on the seat, substantially as described.

2. In a device of the class described, the combination with a receptacle having a neck, of a stopper or plug having upper and lower passages and provided with a valve-seat and having a recess located at one side of the valve-seat, said stopper or plug being also provided with a transverse passage extending inward from one side of the same, and a valve, substantially as described.

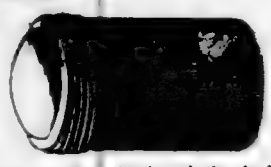
3. In a device of the class described, the combination with a receptacle having a neck, of a stopper or plug arranged in the lower portion of the neck and provided with upper and lower passages and having a transverse passage extending from the upright passages to one side of the stopper or plug, said upright passages being offset from and arranged out of alinement with each other, a ball-valve arranged within the stopper or plug and seated at the upper end of the lower upright passage, and a stopper arranged in the upper portion of the neck, substantially as described.

704,614. BEET-CULTURE IMPLEMENT. ARTHUR S. CAPPER, Detroit, Mich. Filed Apr. 28, 1902. Serial No. 104,960. (No model.)



Claim.—A weeding implement consisting of a pair of hoes in line with but separated from each other, and a shank designed to support a removable tool, a shoulder on the forward end of the shank, a flange *d'* on said shoulder and a set-screw F to engage the removable tool to the shank, substantially as described.

704,615. CLOTH-CLEANING DEVICE. FRANK O. CARLSON and BRIGHT J. HAALAND, Valley City, N. D. Filed Nov. 12, 1900. Serial No. 36,255. (No model.)



Claim.—In a cloth-cleaning device, hair-cloth and a layer of other fibrous material rolled together with their end edges coinciding, and secured as and for the purpose described.

704,616. SAFETY DEVICE FOR MOTOR-VEHICLES. HERMAN CHARLES, Koh, Ariz. Filed Feb. 7, 1901. Serial No. 46,408. (No model.)

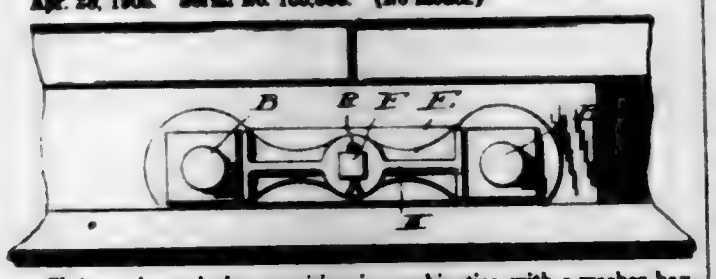
Claim.—1. The combination with a seat of a motor-vehicle; of a safety attachment comprising a platform yieldingly supported upon said seat; a rod depending from the under side of said platform and extending through an opening in the seat; means carried by said rod for controlling the supply of motor-power to the vehicle; and means for locking said rod against movement.

2. The combination with the seat of a motor-vehicle; of a plurality of pins secured to the upper surface thereof; a platform formed with openings through which said pins extend; springs for supporting said platform; a rod depending from the under surface of the platform formed with annular grooves; means carried by said rod for controlling the supply of power to the vehicle; and a locking device for said rod.

3. The combination with the seat of a motor-vehicle; of a safety attachment comprising a platform yieldingly supported on said seat; a rod depending from said platform and extending through an opening in the seat; oppositely-disposed brackets secured to the under side of the seat; contacts carried by said brackets and a bridge-block adapted to span the space between said contacts.

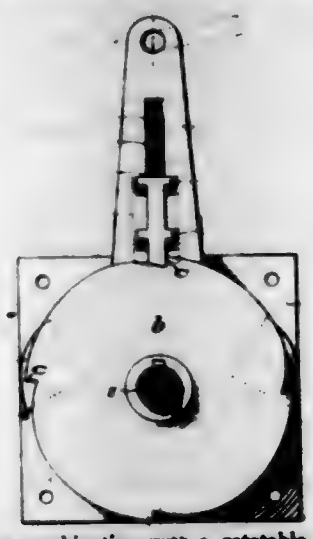
4. The combination with a seat of a motor-vehicle; of a safety attachment comprising a platform yieldingly supported upon said seat; a rod depending from the under surface of the platform, extending through an opening in the seat and formed with parallel annular grooves; oppositely-disposed brackets secured to the under side of the seat; contacts carried by said brackets; a bridge-block carried by said rod; and means for locking the rod in either its elevated or depressed position, comprising a slide formed at its inner end with a fork to engage the grooves of the rod.

704,617. NUT-LOCK. GEORGE COLEMAN, Streator, Ill. Filed Apr. 28, 1902. Serial No. 105,993. (No model.)



Claim.—A nut-lock comprising in combination with a washer having an integral lug projecting therefrom with apertured ends, and provided with a shoulder F', the under edge of said washer being cut away between its apertured ends, a locking-bar K mounted on said lug and designed to be held in contact with said shoulder and spaced from the outer face of said washer, as set forth.

704,618. STARTING DEVICE FOR EXPLOSIVE-ENGINES. CALEB F. COPE, Philadelphia, Pa. Filed Dec. 17, 1900. Serial No. 40,196. (No model.)



Claim.—1. In combination with a rotatable shaft of an explosive engine, a ratchet wheel, a device rotatable with respect to said wheel and adapted to be moved by the operator, a pawl mounted on said device and adapted to engage with said wheel, and two fixed trips arranged to be encountered by the pawl and located at different points in its path of movement, substantially as set forth.

2. In an explosive engine, in combination, a rotatable shaft, a ratchet wheel mounted thereon, two fixed cam surfaces arranged in proximity thereto, a crank arm, and a pawl mounted on said arm and free for sliding movement longitudinally thereof, and having one portion which overhangs the ratchet wheel and another portion which overhangs the cam surfaces, substantially as set forth.

3. In an explosive engine, in combination, a rotatable shaft, a ratchet wheel mounted on said shaft, a cam trip in adjacency thereto, a crank arm mounted for rotation in adjacency to said ratchet wheel, a slot formed in said crank arm, a pawl mounted in said slot and having a portion which overhangs the ratchet wheel and another portion which overhangs the cam trip, substantially as set forth.

4. In an explosive engine, in combination, a rotatable shaft, a ratchet wheel mounted thereon, a plate supported in adjacency thereto and provided with two fixed cam trips, a crank arm mounted free for rotation on said plate, a longitudinally extending slot with lateral notches formed in said crank arm, a pawl mounted in said slot, and having a lateral extension on one face, and lateral noses on the other face of the arm, substantially as set forth.

5. In an explosive engine, in combination, a rotatable shaft, a ratchet wheel mounted thereon, a plate supported in adjacency thereto and provided with two fixed cam trips, a crank arm mounted on said plate free for rotation, a longitudinally extending slot with lateral notches formed in said crank arm, a pawl mounted in said slot and having a lateral extension on one face, and lateral noses on the other face, of the arm, and a spring mounted on said arm, and bearing against the pawl, substantially as set forth.

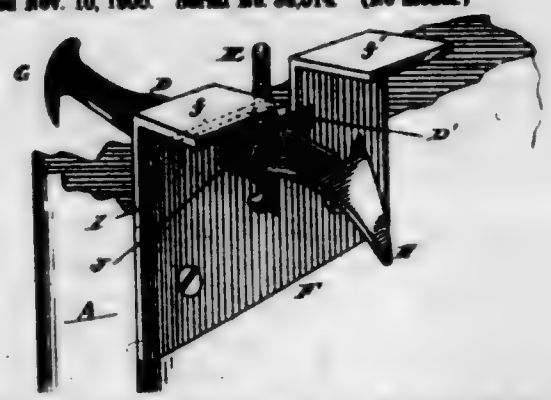
6. In combination, in an explosive engine, a rotatable shaft, a ratchet wheel, a trip, a rotatable device having a slot with a lateral recess or extension, a pawl mounted in said slot and having a lateral extension on one face of said rotatable device, and a laterally extending projection or nose on the other face of said rotatable device, said pawl working in association with said ratchet wheel and said trip, substantially as set forth.

7. In combination with a rotatable shaft of an explosive engine, a ratchet wheel, a crank arm, a device mounted on said crank arm and adapted to engage with the ratchet wheel, and a pair of trips having curved acting faces eccentric with respect to the ratchet wheel, substantially as set forth.

8. In an explosive engine, a rotatable shaft, a ratchet wheel mounted on said shaft, a support independent of said shaft, a pawl carrying device mounted on said support and free for rotative movement on an axis coincident with that of the wheel, a pawl mounted on said pawl carrying device and adapted to engage said ratchet, and a fixed trip adapted to be encountered by said pawl to elevate it out of engagement with the ratchet upon the reverse rotation thereof, substantially as set forth.

9. In an explosive engine, a rotatable shaft, a ratchet wheel mounted on said shaft, an independent support, a pawl-carrying arm mounted on said support and free for rotative movement in an axis coincident with that of the wheel, a pawl mounted on said arm and adapted to engage said ratchet, a fixed trip adapted to be encountered by said pawl to elevate it out of engagement with the ratchet upon the reverse rotation thereof, and a link connected to said arm and extending to a point in the vicinity of the operator's station, substantially as set forth.

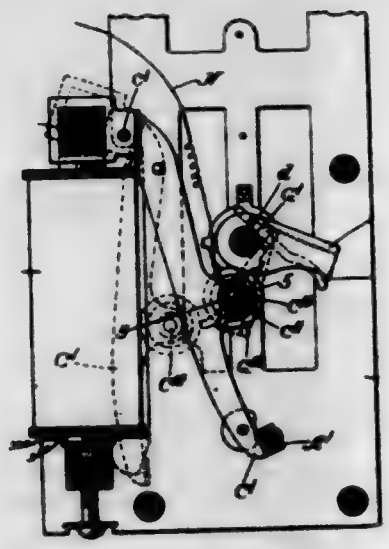
704,619. DOOR-FASTENER. GEORGE W. CRANER, Tivoli, Ill. Filed Nov. 10, 1900. Serial No. 36,014. (No model.)



Claim.—In a fastener for doors, a supporting-plate for the fastener the same adapted for attachment to a door, a horizontal lug J formed therewith and extending at right angles away from the said plate, a vertical pin E entered through said lug and bent at its lower end and passed through the plate F and there fastened, the fastener D supported on the said pin E, the hooks G and H at its ends each extending in a direction opposite to the other, the spring I coiled around the pin E but removable

therefrom and reversible thereon, one end of such spring attached to the fastener, the other adapted to bear against the plate F and arranged whereby the hooks G and H are normally in position to engage the locking means therefor, a stop D′ on the fastener to limit the movement of the latter member and adapted to rest against the plate F, and the overhanging extremities *ff′* of the latter for holding the free end of the spring from rising, in combination with a staple on the door-jamb for engaging the hook H when the door is closed, and a staple for engaging the hook G when the door is open all as set forth and described.

704,620. SELF-WINDING ELECTRIC CLOCK. CHARLES M. CROOK, Bristol, Conn., assignor to Charles S. Burton, trustee. Filed Sept. 26, 1901. Renewed May 28, 1902. Serial No. 109,306. (No model.)



Claim.—1. In an automatically-wound clock-train, a rigid stud projecting from the frame; a sleeve mounted on the stud and connected to the motor-spring for winding the latter; the prime-wheel staff of the train journaled in the end of the stud and a two-part clutch structure adapted to communicate rotation in one direction only, one part of such clutch being on the sleeve and the other on the staff.

2. In an automatically-wound train, a rigid stud projecting from the frame and a sleeve mounted on the stud and connected to the train-motor for winding the same, the prime staff of the train journaled in one frame-plate and in the end of the stud which projects from the opposite plate; a pawl and a ratchet coöperating therewith, one of said elements being mounted on the sleeve and the other on the staff, and arranged to transmit rotation from the sleeve to the staff in the running-down movement only of the motor.

3. In an automatically-wound train, the combination with the prime-wheel shaft of the train of a winding element coaxial therewith which is rotated in the winding; a rigid stud projecting from one frame-plate toward the opposite plate, the prime shaft being journaled in the end of said stud and in said opposite plate, the winding element being journaled on the stud and coöperating clutch parts one on the prime shaft and the other on the winding element communicating motion in the opposite of the winding direction.

4. In an electrically-wound clock, in combination with a motor (as a spring or weight,) a winding-electromagnet; a magnet-actuated lever and a motor-actuated lever; a magnet-energizing circuit which is closed by the contact of the two levers, the latter lever being carried into contact with the other by the running down of the motor, and being connected so as to wind up the motor by reverse movement, the magnet-actuated lever having its movement under the magnet impulse, toward the other lever, and giving the latter said reverse or motor-winding movement.

5. In an electrically-wound clock, in combination with a motor (as a spring or weight,) a winding-electromagnet; a magnet-actuated lever and a motor-actuated lever; a magnet-energizing circuit which is closed by the contact of the two levers, the latter lever being carried into contact with the other by the running down of the motor, and being connected so as to wind up the motor by reverse movement, the magnet-actuated lever having its movement under the magnet impulse toward the other lever, and giving the latter said reverse or motor-winding movement; the said movement of the magnet-actuated lever being limited, and the other lever having a range of motor-winding movement beyond such limit of the movement of the first lever; whereby the momentum of the motor-winding lever carries it out of contact with the other lever, and breaks the circuit.

6. In an electrically-wound clock, in combination with a motor adapted to be wound up (as a spring or weight,) and an electromagnet for winding it, a magnet-actuated element and a motor-winding element having back-and-forth movement toward and from each other and adapted to come into contact in such movement; a magnet-energizing circuit which is closed by such contact; the magnet-forced movement of the first element being adapted to cause the motor-winding movement of the second element while the two are in contact, whereby the resistance of the motor to winding increases the pressure at the contact of the two elements where the circuit is closed, and the pressure necessary for such contact is a part of the force operative in the winding.

7. In an electrically-wound clock, in combination with the motor to be wound and an electromagnet for winding it, a magnet-actuated element and a motor-winding element, having back-and-forth movement toward and from each other and adapted to come into contact in such movement; a magnet-energizing circuit which is closed by such contact; the magnet-forced movement of the first element being adapted to cause the motor-winding movement of the second element; said movement of the first element being limited, the second element having a range of winding movement beyond the limit of movement of the first element, whereby the contact and circuit is broken by the momentum of the winding movement.

8. In an electrically-wound clock, in combination with the motor to be wound and an electromagnet for winding it, a lever connected with the motor adapted by movement in one direction to wind said motor and to be carried in the reverse direction by the running down of the same, said lever having pawl-and-ratchet connections with the train and constituting the medium by which the running down of the motor drives the train; a lever actuated by the magnet when energized, the magnet-forced movement of said lever and motor-forced movement of the first lever being toward each other, and adapted to bring them into contact; a magnet-energizing circuit which is closed by such contact; and means for breaking such contact at the limit of said magnet-actuated movement.

9. In an electrically-wound clock, in combination with an electromagnet and an element for winding it by movement in one direction, adapted to be moved in reverse direction by the running down of the spring, and in such reverse movement to come into contact with the magnet-actuated element, said latter element being adapted in its magnet-forced movement to give winding movement to the winding element; an electric circuit in which the magnet is energized, which is closed by the contact of said motor-winding and magnet-actuated elements; one of said elements having a yielding terminal by the contact of which with the other element the circuit is first established; whereby the initial movement of the magnet-actuated element is made against the slight resistance of said yielding terminal.

10. In an electrically-wound clock, in combination with the motor and a lever which winds it by movement in one direction and which is moved in reverse direction by the running down of the motor; an electromagnet and a lever actuated thereby; said lever in its magnet-forced movement being adapted to encounter the winding-lever and give the latter its winding movement; said magnet-actuated lever having an insulated terminal by which its contact with the winding-lever is made; an electric circuit in which the magnet is energized and which is closed by such contact, comprising an insulated wire connected to said insulated terminal.

704,621. PROCESS OF MANUFACTURING ARTIFICIAL MARBLE. JOHANN CERBAK, Duesseldorf, Germany. Filed Apr. 19, 1901. Serial No. 56,571. (No specimens.)

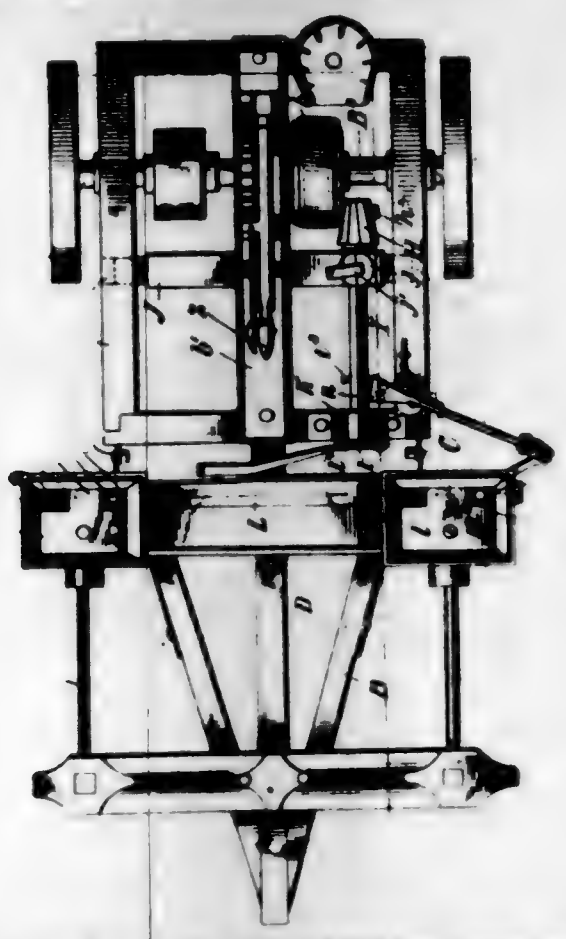
Claim.—The process of producing artificial marble which consists in forming a series of cracks through the entire thickness of a plastic body, filling said cracks with a differently-colored mass, allowing the mass to set, forming a second series of cracks in the plastic body, and filling said new cracks with a second differently-colored mass, substantially as specified.

704,622. CORN-PLANTER. ROBERT E. DIAL and MYLES E. GARWOOD, Pontanet, Ind.; said Garwood assignor to said Dial. Filed June 3, 1901. Serial No. 63,005. (No model.)

Claim.—1. In a corn-planter having a frame provided with shoes or furrow-openers, the combination with the supporting-wheels and the axle, of mechanism for feeding grain, a gear-wheel mounted on said axle, a small pinion meshing with said gear-wheel, a shaft carrying said small pinion for operating said feeding mechanism, and a cross-beam loosely mounted in said frame and carrying a bearing for said shaft, said beam being adapted to move said pinion in and out of contact with said gear-wheel, substantially as described.

2. In a corn-planter having a frame provided with shoes or furrow-openers, the combination with the supporting-wheels and the axle, of mechanism for feeding grain, a gear-wheel mounted on said axle, a small pinion meshing with said gear-wheel, a shaft carrying said small pinion for operating said grain-feeding mechanism, a cross-beam loosely mounted

in said frame, a cylindrical bearing in said cross-beam adapted to carry said shaft, said beam being adapted to move said pinion in and out of contact with said gear-wheel, substantially as described.



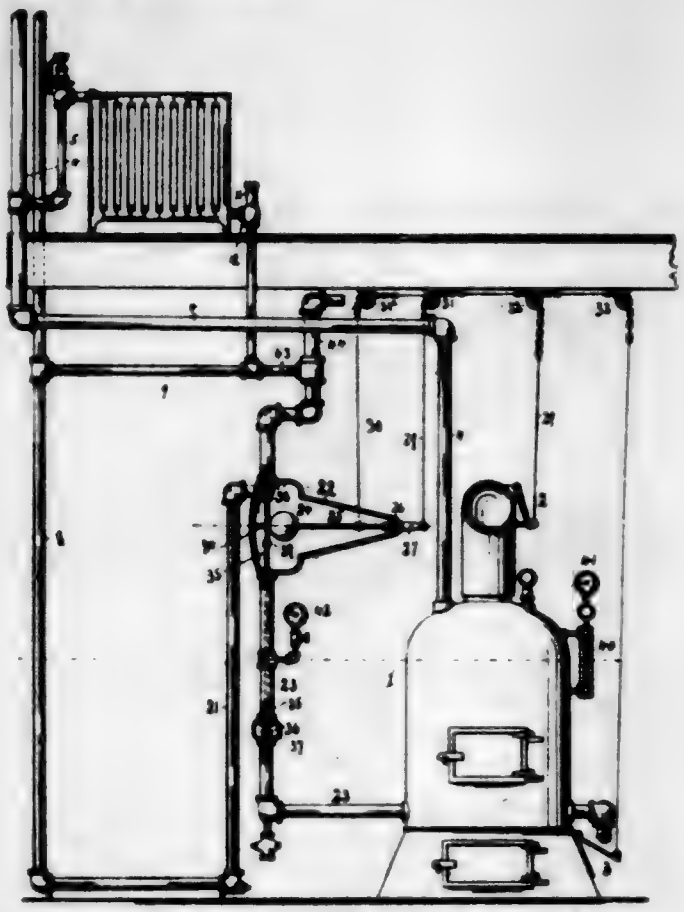
3. In a corn-planter having a frame divided into a front or runner section carrying shoes or furrow-openers and a rear or wheel section, the combination with the supporting-wheels and the axle, of mechanism for feeding grain, a gear-wheel mounted on said axle, a small pinion meshing with said gear-wheel, a shaft carrying said small pinion for operating said grain-feeding mechanism, and a cross-beam loosely mounted in the rear or wheel section of said frame and having a bearing therein for said shaft, said beam being adapted to move said pinion in and out of contact with said gear-wheel, substantially as described.

4. In corn-planter having a frame divided into a front or runner section carrying shoes or furrow-openers and a rear or wheel section, the combination with the supporting-wheels, of suitable mechanism for feeding grain, a gear-wheel mounted on said axle, a small pinion meshing with said gear-wheel, a shaft carrying said small pinion for operating the grain-feeding mechanism, a cross-beam loosely mounted in the rear or wheel section of said frame and carrying a bearing for said shaft, said beam being adapted to move said shaft with the pinion in and out of contact with said gear-wheel, a rearward extension or tongue rigidly secured to said front or runner section, an upwardly-extending arm secured to said extension or tongue and a cam provided on said arm for operating said cross-beam, substantially as described.

5. In a corn-planter having a frame divided into a front or runner section carrying shoes or furrow-openers and a rear or wheel section, the combination with the supporting-wheels, of suitable mechanism for feeding grain, a gear-wheel mounted on said axle, a small pinion meshing with said gear-wheel, a shaft carrying said small pinion and having connections with said grain-feeding mechanism, a cross-beam loosely mounted in the rear or wheel section of said frame and carrying a bearing for said shaft, said beam being adapted to move said pinion in and out of contact with said gear-wheel, a rearward extension or tongue rigidly secured to said front or runner section, an upwardly-extending arm rigidly secured to said extension or tongue, a cam provided on said arm for operating said cross-beam, and a resilient row-checking device, substantially as described.

704,623. STEAM-HEATING SYSTEM. HARRY A. R. DUTRIEUX, South Bethlehem, Pa. Filed Apr. 16, 1901. Serial No. 56,118. (No model.)

Claim.—1. In a steam-heating system, the combination of a boiler or generator, the supply and return pipes, a receiver located above the water-line of the boiler and connected with the return-pipes, a pipe extending from the receiver to the bottom of the boiler or generator a check-valve located at a point between the receiver and the boiler or generator in the pipe connecting the same, and a float located within the receiver and connected with and adapted to operate the check-valve, substantially as and for the purpose described.



2. In a steam-heating system, the combination of a boiler or generator, supply and return pipes, a receiver located above the water-line of the boiler and connected with the return-pipes, a pipe or connection extending from the receiver to the bottom of the boiler or generator and provided with a check-valve, a float located within the receiver and connected with and adapted to operate the said valve, and a damper connected with and operated by the float, substantially as described.

3. In a steam-heating system, the combination of a boiler or generator, supply and return pipes, a receiver connected with the return-pipes and located above the water-line of the boiler, a connecting-pipe extending from the receiver to the bottom of the boiler and provided with a check-valve, a rod or stem extending from the check-valve and provided with stops or buttons, located within the receiver, an arm or lever provided with a float and arranged to engage the stops or buttons, and a damper connected with and operated by the arm or lever, substantially as described.

704,624. PRINTING-PRESS. JOSEPH L. FIRM, Chicago, Ill., assignor to the Goss Printing Press Company, Chicago, Ill. Filed June 25, 1901. Serial No. 65,903. (No model.)

Claim.—1. A printing-press having an impression-cylinder and a pair of form-cylinders of the same diameter as the impression-cylinder for printing one side of a web, each form-cylinder having forms secured thereto to cover longitudinal sections thereof comprising substantially half the surface of the cylinder, the forms of each form-cylinder being adapted to print upon the space left blank by the forms of the other form-cylinder.

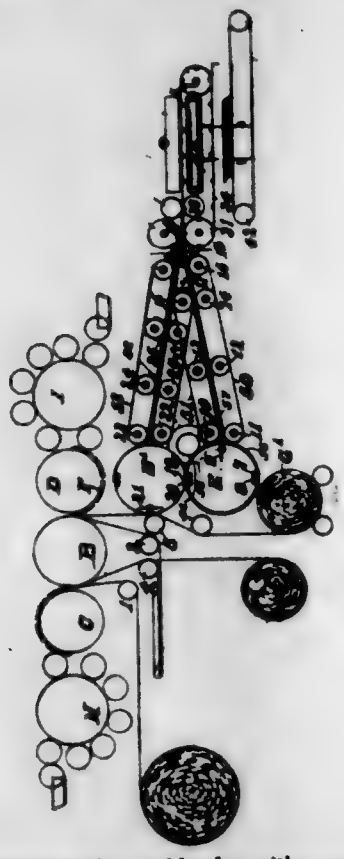
2. A printing-press having a single impression-cylinder and two form-cylinders of the same diameter as the impression-cylinder for printing one side of a web, each of said form-cylinders having forms covering a longitudinal belt extending half about the cylinder, the two form-cylinders being timed to print on alternate sections of the web.

3. A printing-press having a single impression-cylinder and two form-cylinders placed on opposite sides thereof, forms arranged on each of said cylinders to print one-half only of the web, the forms of one cylinder printing in the spaces not printed by the other cylinder, means for presenting a half-width web to one end of the impression and form cylinders to print one side thereof, and means for turning and presenting the web to the other end of the said cylinders to print the other side thereof.

4. In a printing-press the combination with means for perfecting a web, of a plurality of carriers adapted to each receive in turn the successive sections of the web, a folding and conveying mechanism for each carrier, said conveying mechanisms all leading to and delivering their web-sections at a common point and being speeded to deliver the sections of each series synchronously and superposed.

5. In a printing-press the combination with means for perfecting a

web, of two rotary carriers adapted to receive the web between them and provided with web-cutting mechanisms, means whereby successive signatures are taken alternately by said carriers, two folding and conveying mechanisms receiving the signatures each from its respective carrier and delivering them at a common point, and means for driving one of said conveying mechanisms at a speed in excess of the other whereby the signature from one conveyer is delivered superposed on the other to form a single product.



6. In a printing-press the combination with means for perfecting a web, of two rotary carriers adapted to receive the web between them and provided with web-cutting mechanisms, means whereby successive signatures are taken alternately by said carriers, a set of folding-rollers for each carrier adapted to receive the signatures therefrom, conveyers leading from said folding-rollers to a common delivery-point, and means for accelerating the passage of the signature through one conveyer whereby the signatures from both conveyers may be superposed to form a single product.

7. In a printing-press the combination with means for perfecting a web, of a plurality of primary folding mechanisms adapted to receive in turn the successive sections of the web, secondary folding mechanisms and means for simultaneously delivering in superposed position web-sections from all of the primary folding mechanisms to the secondary folding mechanisms to form a single product.

8. A paper-folding device comprising two rotary carriers having cooperating web-cutting members adapted to sever the web into semicircumferential sections or sheets, each carrier having sheet-holding and sheet-folding means, said carriers being timed so that the sheet-holding and sheet-folding means of the respective carriers alternately engage the successive semicircumferential web sections or sheets.

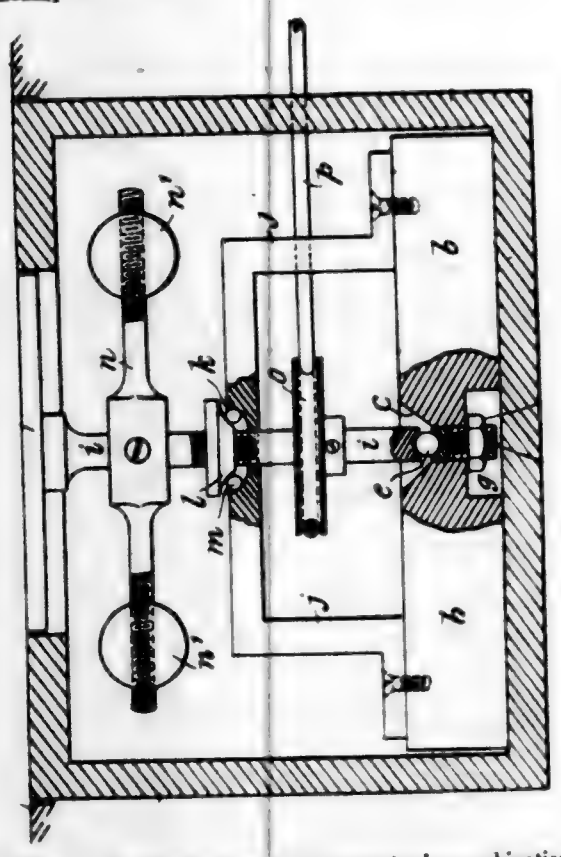
9. A paper-folding device comprising two rotary carriers having cooperating web-cutting members adapted to sever the web into semicircumferential sections or sheets, each carrier having sheet-holding means adjacent one of its cutting members, said carriers being timed so that the sheet-holding means of the respective carriers engage alternate sheets, a folding-blade upon each carrier located ninety degrees behind the sheet-holding means of the same carrier and folding-rolls receiving the sheets from said folding-blades.

10. In a printing-press the combination with two rollers adapted to receive the perfected web between them, and cutting mechanisms acting twice for each revolution of said rollers, of web retaining and folding mechanisms carried by said rollers and engaging alternate web-sections.

704,625. HOSPITAL-BED. WILLIAM H. FOX, Toronto, Canada, assignor to Harry L. Piper, Toronto, Canada. Filed Sept. 15, 1900. Serial No. 30,204. (No model.)

Claim.—A hospital-bed embracing in its construction a stationary bed-frame, vertical guides formed in the stationary bed-frame, a vertically-movable stretcher-frame supported above the stationary bed-frame, standards depending from the stretcher-frame movably held by the guides of the stationary bed-frame, a longitudinal shaft journaled in bearings connected to the stationary bed-frame intermediate the sides, winding-pulleys loosely mounted on the longitudinal shaft, idlers connected to the stationary bed-frame intermediate the longitudinal shaft and standards of the stretcher-frame, lifting-cords passing over the idlers and connected to the standards and winding-pulleys, clutch members on the side face of the winding-pulleys and movable clutch members mounted on and revoluble with the longitudinal shaft to engage with the clutch members of the winding-pulleys, substantially as specified.

704,626. PIVOTAL STAGE OR TURN-TABLE. AUSTIN FRYERS, Sydenham, England. Filed July 11, 1901. Serial No. 67,933. (No model.)



Claim.—In a pivotal stage or turn-table the combination of a platform carried by a vertical shaft, a base fitted with an adjustable bearing supporting the lower end of the shaft, a bridge-piece fixed to the base and fitted with a ball-race acting as a horizontal bearing to the shaft, a balance provided with adjustable weights and fitted to the shaft, a pulley also fixed to the shaft for operating the same, and an open-top box or case containing the apparatus, substantially as described.

704,627. APPARATUS FOR DECORATING SURFACES. WILLIAM E. GARD, New York, N. Y., assignor to Columbia Shade Cloth Company, New York, N. Y., a Corporation of New York. Filed Oct. 4, 1901. Serial No. 77,544. (No model.)

Claim.—1. In a decorating apparatus, the combination with a support having a yielding bed adapted to receive an object to be decorated, of a hinged pattern-frame which when in place on said support surrounds said yielding bed, said frame having a surface to which a flexible pattern may be secured, and which is below the face of an object on said bed when the frame is in place.

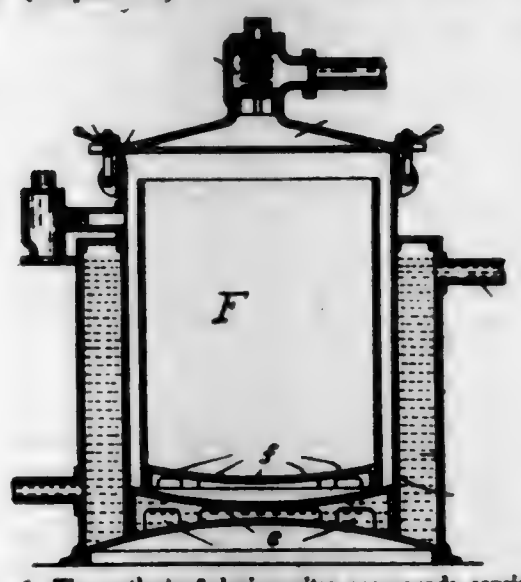
2. In a decorating apparatus, the combination with a support having a yielding bed adapted to receive an object to be decorated, of a hinged pattern-frame which when in place on said support surrounds said yielding bed, said frame having a section which is movable with respect to said frame and support and to which a pattern may be secured.

3. In a decorating apparatus, the combination, with a support for an object to be decorated, of a pattern-frame having a movable part to which a pattern may be secured, and eccentric mechanism for moving said part and the pattern carried thereby, relatively to the object to be decorated, for the purpose specified.

4. In a decorating apparatus, the combination with a yielding support for an object to be decorated, of a pattern-frame surrounding said support, and having a surface to which a flexible pattern may be secured, said surface being below the face of an object upon said support, when the frame is in place, whereby the pattern is held in contact with said object, and means for shifting a pattern carried by said frame.

5. In a decorating apparatus, the combination with a yielding support for an object to be decorated, of a pattern-frame surrounding said support and having a secondary frame movable with respect thereto in the plane of said frames, said secondary frame adapted to receive a flexible pattern and to hold the edges thereof below the face of an object on said support, whereby the pattern is held in contact with said object.

704,628. PROCESS OF SEPARATING SOLVENTS FROM NITRO COMPOUNDS. EMIL GATEHARS, Washington, D. C., assignor to George Whitman McMullen, Picton, Canada. Filed Apr. 12, 1902. Serial No. 102,496. (No specimens.)

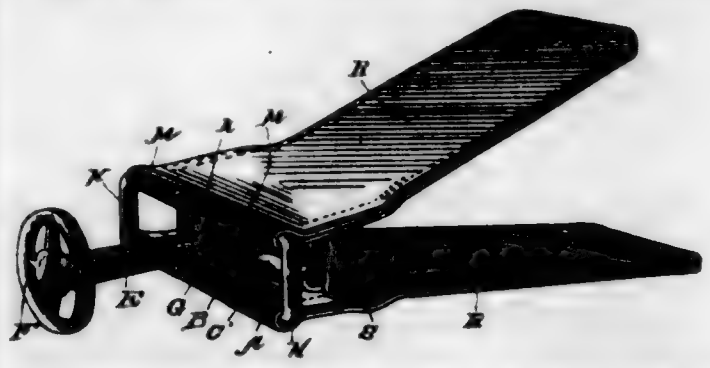


Claim.—1. The method of drying nitro compounds consisting in placing the compounds in a sealed vessel, heating and retaining the compound in the vessel in the presence of its solvent vapor until the solvent of the compound is practically completely liberated therefrom.

2. The method of drying nitro compounds consisting in subjecting the compound in a sealed vessel to the action of heat in the presence of a solvent, maintaining the compound in the presence of sufficient solvent vapor to keep it porous, and continuing the treatment until the compound is substantially dry.

3. The method of drying nitro compounds consisting in maintaining the compound in a bath of solvent vapor, applying heat, permitting portions of the vapor to escape, and adding additional solvent to maintain the porosity of the compound.

704,629. VETERINARY OBSTETRIC INSTRUMENT. CORNOO GILTZ, Lafargeville, N. Y. Filed Mar. 29, 1902. Serial No. 100,598. (No model.)



Claim.—1. A veterinary obstetric instrument, comprising two jaws hinged together, a plate having links secured thereto, a screw passing through a threaded aperture in said plate and having swivel connections with the hinged portions of said jaws, and a sheath for each of said jaws, and fastened to said loops, as set forth.

2. A veterinary obstetric instrument, comprising two jaws a plate to which said jaws are hinged, a plate having a threaded aperture therein, a screw swiveled to the plate to which said jaws are hinged and passing through the threaded aperture of the second plate, a sheath covering each of said jaws, a portion of each sheath sewed to form loops, links carried by the plate having a threaded aperture, about which links said loops are passed, and connections between said sheaths, as set forth.

3. A veterinary obstetric instrument, comprising a plate with central aperture therein, hinged jaws having integral arms, links carried by said plate to which arms are hinged, a plate K having a central threaded aperture a screw having swivel connection with the plate to which said jaws are hinged and passing through the threaded aperture of said plate K, a sheath for each of said jaws, each sheath having a strap bent to form a loop, links N carried by said plate K, and about which said loops pass, the inner faces of said sheaths made of a single piece of leather, as set forth.

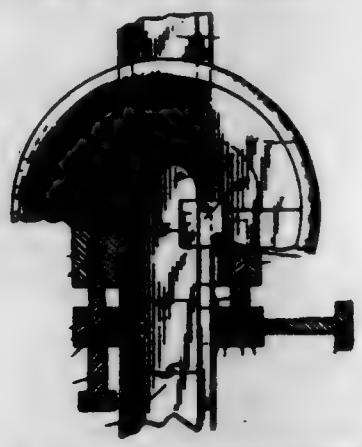
704,630. CLOTHES-POUNDER. PATRICK F. GLYNN, Adrian, Minn. Filed Apr. 19, 1902. Serial No. 103,748. (No model.)

Claim.—1. In a clothes-pounder, an external shell having imperforate side walls and perforated top, an internal shell of less length than said outer shell and spaced therefrom, whereby an annular chamber is formed between said shells, an annular perforated diaphragm connecting said shells near the bottom, and an inverted conical diaphragm intermediately disposed within said inner shell, said inner shell having perforations near said intermediate diaphragm and leading into said annular chamber, substantially as described.

2. In a clothes-pounder, an external shell having imperforate side walls and perforated top, an internal shell of less length than said outer shell and spaced therefrom, whereby an annular chamber is formed between said shells, an annular perforated diaphragm connecting said shells near the bottom, an inverted conical diaphragm intermediately disposed within said inner shell, said inner shell having perforations near said in-

termediate diaphragm and leading into said annular chamber, and a handle-socket passing centrally through said shells and secured thereto and rigidly engaging said diaphragm, substantially as described.

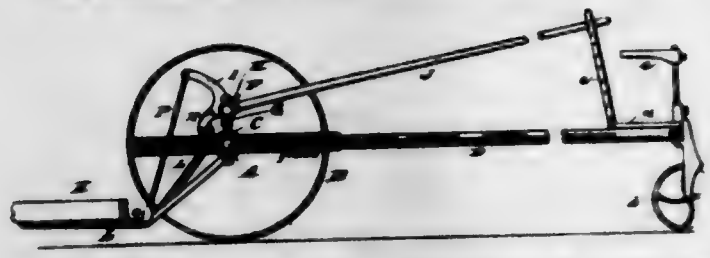
704,681. TARGET. GEORGE S. GOODALE, Houghton, Mich. Filed Oct. 17, 1901. Serial No. 79,004. (No model.)



Claim.—1. The combination with the leveling-rod, of a target-disk provided with blocks or lugs and mounted to slide thereon, one lug having a smooth socket and the other a screw-threaded socket, a collar mounted to slide upon said rod and provided with a stud or post to engage the smooth socket, a set-screw engaged with said collar for clamping it in adjusted position to the leveling-rod, a spring-plate interposed between the leveling-rod and the collar and adapted to be engaged by the set-screw and forced against the leveling-rod, and a screw swiveled to said collar and engaging the screw-threaded socket aforesaid by means of which said target may be set to exact adjustment after having been set approximately by the movement of the collar upon said rod, substantially as set forth.

2. The combination with a leveling-rod; of a target-disk sliding directly on the rod and provided with lugs, one lug having a smooth socket and the other a screw-threaded socket, a collar sliding upon said rod below the target-disk and provided with an upwardly-extending stud or post to engage the smooth socket, means for locking said collar in adjusted position, and a screw swiveled to said collar and engaging the screw-threaded socket aforesaid, by means of which said target-disk may be set to exact adjustment after having been set approximately by the movement of the collar upon said rod, substantially as set forth.

704,682. MECHANISM FOR CHANGING THE ELEVATION OF HEADER-PLATFORMS. HENRY GREEN, Pekin, Ill., assignor to the Acme Harvester Company, Pekin, Ill., a Corporation of Illinois. Filed May 25, 1900. Serial No. 18,002. (No model.)



Claim.—1. In mechanism for changing the elevation of the platforms of headers, the arms for carrying said platform, upturned ends for such arms, the same extending upward and rearward from the horizontal portions thereof which carry the said platform, means for carrying the arms in pivotal manner at the bend in said arms immediately behind the platform, and means for supporting the upturned ends of the arms to limit the downward movement of the platform, said last-named means permitting the platform to swing upward on the pivots formed by the first-named means to permit the said platform to rise and fall when contacting with obstacles as set forth.

2. In combination with the axle and platform of a header, arms beneath the platform for supporting the same such arms projecting upward and rearward therefrom, pivotal means for pivotally supporting the arms immediately behind the platform, a stop for the upper free ends of the arms, a lever for raising and lowering the pivot-point of the arms, and rearwardly-extending arms pivoted at one of their ends to the arms carrying the platform and supported at the other beneath the axle of the machine for the purposes set forth.

3. In mechanism for changing the elevation of header-platforms, arms for carrying said platform the same extending rearwardly therefrom, and having upturned extensions, stops for receiving said upturned ends and permitting them to slide thereon, depending rods pivotally supporting the arms at a point immediately behind the platform, a lever for carrying the upper ends of the rods and rearwardly-extending braces pivotally attached at one end to the arms carrying the platform and supported at their other ends on the machine-frame and adapted to shift thereon substantially as set forth, and arranged substantially as described whereby a vertical movement of said lever will change the elevation of the platform.

4. In mechanism for changing the elevation of header-platforms, arms for carrying the platform horizontally, the same extending rearwardly from said platform and turned up behind the same a stop for the upturned ends, a lever mounted on the machine-frame, rods attached to such lever forward of its fulcrum and attached to the arms behind the platform, and arms having pivotal connection with the arms carrying the platform and having contact with the machine-frame to sustain the platform in its level working position.

5. In mechanism for changing the elevation of header-platforms, arms L carrying said platform and having upward and rearward extensions, stops on the machine against which the upward extremities are adapted to have slidable contact, a lever pivoted on the said machine having connection with the arms L at a point just behind the platform, rearwardly-projecting arms Q having connection with such arm at one end and resting on the machine at the other end for sustaining the platform in its working position all arranged substantially as described whereby a vertical movement of the lever will change the elevation of the platform for the purpose set forth and described.

6. In mechanism for changing the elevation of header-platforms, the combination with the carrying-wheels and axle of the header, of a horizontal tube supported above said axle and adapted to rock in its supports, a lever attached to said tube, arms I and N on the tube, arms L supporting the platform of the header and bent behind the latter to slidably engage the arm N, rods P hung from the arms I and connected pivotally with the arms L, and arms Q pivoted to the latter arms and resting against the machine-frame all for the purpose set forth.

7. The combination of the carrying-wheels B, the axle A, tongue D, support G on the axle, tube F loosely held in said support, the lever J on the tube, arms I and N secured to the tube portion the platform K, arms L passing thereunder and secured thereto and having the rear ends turned up to engage with the arms N, rods P attached to the said arm L at the rear of the platform and the arm I substantially as and for the purposes set forth.

8. In mechanism for changing the elevation of header-platforms, the combination with the platform having the usual canvas carriers and cutting apparatus, of arms supporting the same in a horizontal position, such arms having upturned rear extensions, stops for engaging the tops of the arms at the upturned ends for holding such arms at said upturned ends, a lever having arm extensions pivoted on the machine, supporting-rods pivoted at one end to the said arm extensions and pivotally connected at their lower ends to the arms carrying the platform, and arms pivoted to the latter arms at the pivotal point of the supporting-rods, the same extending backward and adapted to bear upon the machine-frame for preventing the rearward displacement of the platform substantially as set forth and described.

9. In mechanism for changing the elevation of header-platforms, the combination of the axle of the machine having the usual carrying-wheels, of a tube above said axle the same being carried in bearings and adapted to rock therein for the purposes described, a lever for rocking said tube, upwardly-extending arms on said tube, rods pivoted thereto, downwardly-extending arms beneath said arms, a friction-roller on each of said downwardly-extending arms, a platform having the usual canvas carriers and cutting apparatus, arms beneath attached to and adapted to carry said platform, said arms having upward and rearward extensions engaging the said friction-rollers, and having an upward pressure thereon substantially as set forth, pivotal connection between the arms and the rods which are connected to the upward-extending arms on the tube above the axle, such point of connection being immediately behind the platform, arms pivoted at one end to the arms which carry the platform, the opposite ends thereof bearing against the machine-frame and adapted to keep the said platform in its normal position for working all being arranged substantially as set forth and described.

10. In a mechanism for changing the elevation of header-platforms, the combination of the axle A, the pipe F above it adapted to rock in its supports, a lever J for rocking such pipe, arms I projecting forward of the pipe and adapted to move therewith, the depending short arms N adjacent to said arms I and adapted to move with them, rods P suspended from the free ends of the arms I, the arms L having the horizontal portions, the platform K carried on such horizontal portions, said arms L extending upward and rearward from the rear of the platform and pivotally supported at the bend by the said rods P, the upper ends of the arms being curved and supported in the hollow of said curves by the ends of the said depending arms N, the relation of the parts being such that by

raising and lowering the lever J the arms I and N are made to move about the center of the pipe F as a pivot to vertically move the arms L and platform K in a horizontal position as set forth.

11. In a mechanism for changing the elevation of header-platforms, the combination of the axle A, the pipe F above it adapted to rock in its supports, a lever J for rocking such pipe, arms I projecting forward of the pipe and adapted to move therewith, the depending short arms N adjacent to said arms I and adapted to move with them, a friction-roller M on the end of each arm N, rods P suspended from the free ends of the arms I, the arms L having the horizontal portions, the platform K carried on such horizontal portions, said arms L extending upward and rearward from the rear of the platform and pivotally supported at the bend by the said rods P, the upper ends of the arms being curved and supported in the hollow of said curves by the ends of the said depending arms N, the relation of the parts being such that by raising and lowering the lever J the arms I and N are made to move about the center of the pipe F as a pivot to vertically move the arms L and platform K in horizontal position as set forth.

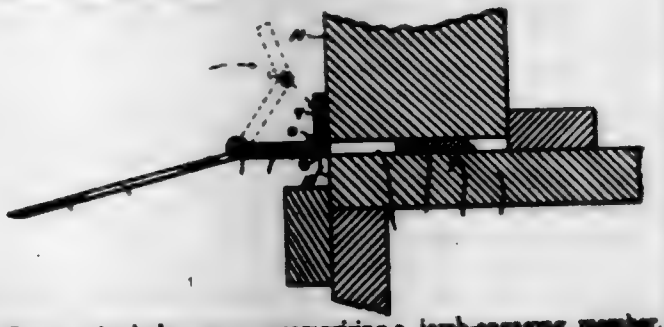
12. In a mechanism for changing the elevation of header-platforms, the combination of the axle A, the pipe F above it adapted to rock in its supports, a lever J for rocking such pipe, arms I projecting forward of the pipe and adapted to move therewith, the depending short arms N adjacent to said arms I and adapted to move with them, rods P suspended from the free ends of the arms I, the arms L having the horizontal portions, the platform K carried on such horizontal portions, said arms L extending upward and rearward from the rear of the platform and pivotally supported at the bend by the said rods P, the upper ends of the arms being curved and supported in the hollow of said curves by the ends of the said depending arms N, the relation of the parts being such that by raising and lowering the lever J the arms I and N are made to move about the center of the pipe F as a pivot to vertically move the arms L and platform K in a horizontal position, and arms Q pivotally connected to the arms L at one end and bearing against the machine for a support at the other end for the purpose set forth.

704,633. NUT-LOCK. AUGUST GRUEBE, St. Louis, Mo. Filed July 1, 1901. Serial No. 66,644. (No model.)

Claim.—1. In a nut-lock, the combination with a fish-plate, of a rib carried by said fish-plate and forming an acute angle with the face thereof, an externally-screw-threaded member passing through an opening in said fish-plate, an internally-screw-threaded member, a locking-plate connected with one of said screw-threaded members to prevent its rotation, and a wing carried by said locking-plate and adapted to have its face bent into engagement with the edge of said rib and its edge bent into engagement with the face of said fish-plate.

2. In a nut-lock, the combination with a fish-plate, of a rib carried by said fish-plate and forming an acute angle with the face thereof, a bolt passing through an opening in said fish-plate, a nut for said bolt, a locking-plate provided with a recess to receive said nut, and a wing carried by said locking-plate and adapted to have its face bent into engagement with the edge of said rib and its edge bent into engagement with the face of said fish-plate.

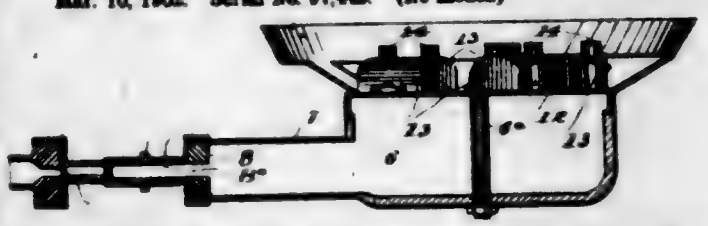
704,634. DOOR-SECURER. GEORGE F. HAMILTON, Council Bluffs, Iowa. Filed Apr. 23, 1902. Serial No. 106,021. (No model.)



Claim.—1. A door-securer comprising a jamb-engaging member, wedge points and gage-blocks on one face of said member, an adjusting member hinged to the said jamb-engaging member and adapted to be folded thereon or spread away therefrom in order to fill varying openings between a door and the jamb therefor, and a door-engaging member hinged in common with the aforesaid jamb-engaging and adjusting members, having a portion adapted to lie in a plane parallel to said other members and an end thereon extending at substantially right angles thereto, substantially as described.

2. A door-securer comprising a flat jamb-engaging member, wedge points and gage-blocks on one face of said member, the adjacent faces of said wedge points and gage-blocks being parallel to each other and perpendicular to the face of said member, an adjusting member hinged to the jamb-engaging member and adapted to be folded against the same or spread away therefrom in order to fill varying spaces between the edge of a door and the jamb therefor, a door-engaging member hinged in common with the aforesaid jamb-engaging and adjusting members, a hinged end on the door-engaging member, said hinged end being adapted to fold down parallel with the other members or to be turned to substantially right angles thereto, and a check-lug on said hinged end to prevent the same from being turned to an angle smaller than a right angle with the said door-engaging member, substantially as described.

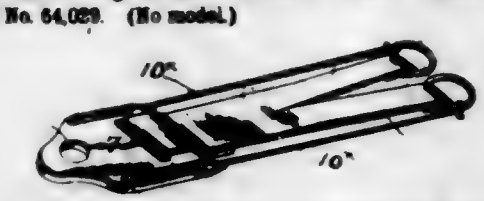
704,635. GAS-BURNER. JOHN HARRIS, Cleveland, Ohio. Filed Mar. 10, 1902. Serial No. 97,445. (No model.)



Claim.—1. The combination, in a gas-burner, of a mixing-chamber having discharge-openings in the top thereof, a slotted cover over each of said openings, and chambered caps fitted to the top of the mixing-chamber and entirely inclosing said covers, said caps having ignition-nipples spaced from the slotted covers.

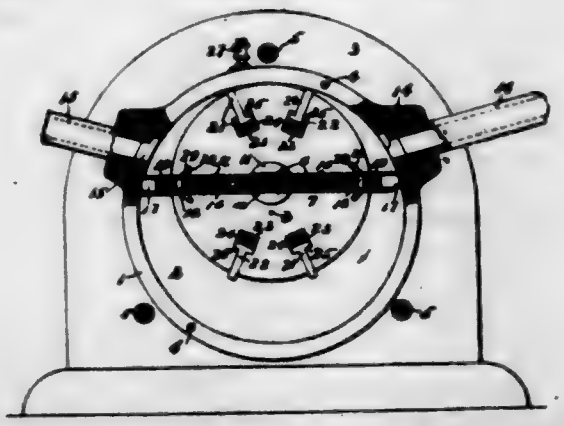
2. The combination in a gas-burner, of a mixing-chamber having discharge-openings, covers having small apertures over said openings, and chambered caps inclosing each of said covers and having ignition-nipples.

704,636. CHECKREIN. CURTIS R. HENRY, Akron, Ohio, assignor of one-half to George H. Ellis and Albert E. Baker. Filed June 10, 1901. Serial No. 64,029. (No model.)



Claim.—A checkrein comprising an extensible body portion having its forward end centrally slitted, thereby providing two branches; a ring-section for each branch, and an anchoring device having an aperture in its end connected to the rear end of the extensible body and having openings, in combination with rods 10^x extending from said rings to said openings, and adapted to limit the extension of the elastic body and its branches, all combined substantially as specified and for the purpose set forth.

704,637. ROTARY ENGINE. HERBERT R. HODGENS, Norfolk, Va., assignor of one-half to Wm. W. Old, Norfolk, Va., executor of Henry D. Van Wyck, deceased. Filed July 27, 1900. Serial No. 25,009. (No model.)



Claim.—1. In a rotary engine, the combination of a rotary guide, a piston transversely movable therein and an inclosing cylinder, said piston consisting of separate plates and means for holding said plates apart in directions transverse to the piston with a yielding pressure.

2. In a rotary engine, the combination of a rotary guide, separate piston-plates transversely and independently movable therein and extending to the surface of the cylinder, a packing-body between the said plates adapted to hold the latter against the sides of said guide, and an inclosing cylinder.

3. In a rotary engine, the combination of a rotary guide, a piston transversely movable therein and an inclosing cylinder by the action of which the piston is moved longitudinally in the guide, said piston consisting of separate plates movable independently of each other, and a yielding packing C between said plates.

4. In a rotary engine, the combination of a rotary guide, separate piston-plates movable independently of each other in said guide and engaging the same by sliding contact, means for holding said plates apart with yielding pressure toward and against the walls of said guide, and an inclosing cylinder.

5. In a rotary engine, the combination of a rotary guide, a piston transversely movable therein and an inclosing cylinder, said piston consisting of separate plates individually movable longitudinally and extending from side to side of the cylinder, and means for holding said plates apart in directions toward the engaging surfaces of said guide with a yielding pressure.

6. In a rotary engine, the combination of a rotary guide, a piston transversely movable therein and an inclosing cylinder by the action of which the piston is moved in the guide, said piston consisting of separate disconnected and individually-movable plates and a yielding packing-body between said plates adapted to hold the latter against the sides of said guide.

7. In a rotary engine, the combination of a rotary guide, piston-plates movable in said guide, a yielding packing between said plates, holding the latter in contact with the guide and furnishing a steam-tight packing along the edges of said plates at the heads of the cylinder, and an inclosing cylinder.

8. In a rotary engine, the combination of a rotary guide, a piston movable therein and an inclosing cylinder, said piston consisting of separate plates, means for holding said plates apart in directions transverse to the plates and in contact with the guide with a yielding pressure and endwise-movable packing-plates confined between the ends of said piston-plates.

9. In a rotary engine, the combination of a rotary guide, separate piston-plates individually movable therein, a packing-body between the said plates, endwise-movable packing-plates between the ends of said piston-plates, and an inclosing cylinder, said piston-plates extending from side to side of the cylinder, being movable relative to and adapted to engage the cylinder independently of said packing-plates.

10. In a rotary engine the combination of a rotary guide, a piston transversely movable therein and an inclosing cylinder by the action of which the piston is moved in said guide, said piston consisting of separate plates, a yielding packing C between said plates and endwise-movable packing-plates at the ends of the piston, said piston-plates extending from side to side of the cylinder, being movable relative to and adapted to engage the cylinder independently of said packing-plates.

11. In a rotary engine a piston composed of plates 16 adapted to engage a suitable guide, a packing C between said plates, blocks 18 at the ends of said packing, metal packings 17 between said plates and having lugs 20 and springs 19 between said lugs.

12. In a rotary engine, the combination of a rotary guide, a piston transversely movable therein and composed of separate plates adapted to slide longitudinally relatively to each other, each plate being substantially of a length equal to the operative diameter of the cylinder, extending from side to side of the latter and directly engaging the wall of the same, said plates being spaced apart, situated one at each side of the center of rotation and adapted to both engage the cylinder simultaneously at the same end of the piston and operate alternately as the steam-pressure-receiving means, substantially as set forth.

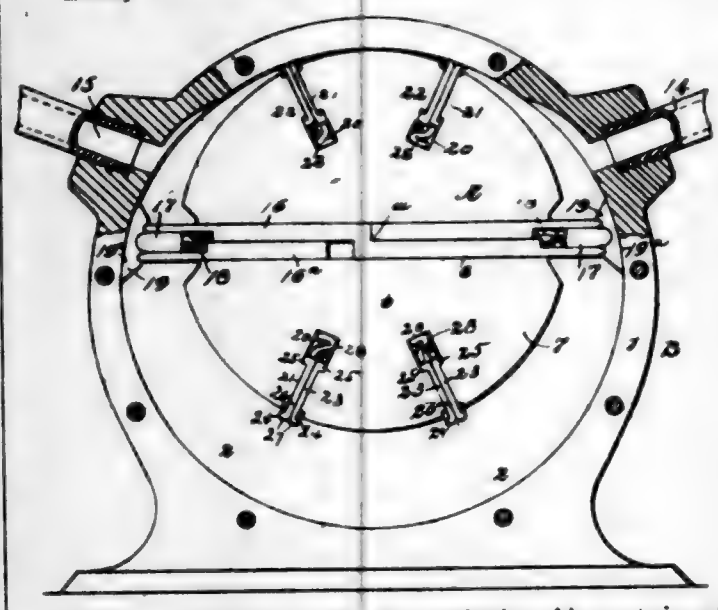
13. In a rotary engine, the combination with a cylinder, of a rotary guide, and a piston transversely movable therein comprising separate piston-plates extending from side to side of the cylinder and movable thereby, and packing-plates held and guided radially between the ends of said piston-plates, all of said plates being individually free and movable radially relative to each other.

14. In a rotary engine the combination with a cylinder, of a rotary guide, a piston transversely movable therein, comprising separate piston-plates extending from side to side of the cylinder and movable thereby, packing-plates held and guided radially between the ends of said piston-plates, all of said plates being individually free and movable radially relative to each other, and a packing carried by said guide intermediate of the ends of the piston and adapted to engage the cylinder.

15. In a rotary engine, a piston consisting of separate plates, a yielding packing-body between the same and springs acting inwardly on said packing-body whereby its outward pressure against said plates is maintained.

16. In a rotary engine, the combination, with a rotary-piston carrier and inclosing cylinder, of separate piston-plates mounted and freely and individually movable radially in said carrier, each plate being situated in a transverse plane outside the center of rotation and both plates being adapted to engage the cylinder simultaneously at the same end of the piston in each plane.

704,888. ROTARY ENGINE. HERBERT R. HODGSON, Norfolk, Va., assignor of one-half to Wm. W. Old, Norfolk, Va., executor of Henry D. Van Wyck, deceased. Filed May 8, 1901. Serial No. 59,374. (No model.)



Claim.—1. In a rotary engine, the combination with an exterior cylinder, of a rotary piston-guide, and a piston transversely movable therein, consisting of separate plates each extending from side to side of the cylinder-wall and adapted to shorten one of the side faces of the piston while the other side face remains relatively longer, substantially as set forth.

2. In a rotary engine, the combination of a cylinder, a rotary piston-guide therein, and a piston transversely movable in the guide, said piston consisting of separate plates extending continuously from side to side of the cylinder-wall and adapted to shorten one face of the piston and simultaneously elongate the other face, substantially as set forth.

3. In a rotary engine, the combination of a cylinder, a rotary piston-guide therein, and a piston transversely movable in the guide, said piston consisting of two separate plates extending from side to side of the cylinder-wall and each lying partly above and partly below the other and movable oppositely to each other, substantially as set forth.

4. In a rotary engine, the combination of a cylinder, a rotary piston-guide therein, and a piston transversely movable in said guide, said piston consisting of separate parts each having two end parts of which one end part is offset relatively to the other a distance substantially equal to the thickness of the other piston-plate, and each plate lying partly above and partly below the other, substantially as set forth.

5. In a rotary engine, the combination of a cylinder, a rotary piston-guide and a piston transversely movable in the guide, said piston consisting of separate plates each extending from side to side of the cylinder-wall, each having one end part offset as to the other, each cut away at one edge, and each lying partly above and partly below the other, substantially as set forth.

6. In a rotary engine, the combination of a cylinder, a rotary piston-guide, a piston transversely movable in the guide, said piston consisting of separate plates movable longitudinally as to each other, and packing-shoes between the ends of the plates and the cylinder-wall, each packing-shoe having a loose bearing engagement with the end of each piston-plate, substantially as set forth.

7. In a rotary engine, the combination of a cylinder, a rotary piston-guide therein, a piston transversely movable in the guide, consisting of separate plates extending continuously from side to side of the cylinder and adapted to shorten one face of the piston relatively to the other, and an independent packing-piece yieldingly secured between the two ends of the piston-plates, substantially as set forth.

8. In a rotary engine, the combination of a cylinder, a rotary piston-guide therein, a piston transversely movable in the guide, and having two plates extending continuously from side to side of the cylinder, a packing-shoe between the plates and the cylinder-wall and having a loose rocking bearing upon both plates, and a packing-strip between the ends of the piston-plates and also having a loose bearing against the shoe, substantially as set forth.

9. In a rotary engine, the combination of a cylinder, a rotary piston supporting and guiding head, provided with a packing-groove and an enlarged aperture or socket at the inner end of the groove, and a packing having two sections, 23, 23, with steps engaging with the socket-shoulders and with rounded heads constructed substantially as set forth to provide two remote lines of contact with the cylinder-wall, substantially as set forth.

10. In a rotary engine, the combination of a cylinder and a piston having four edges directed toward the interior of the cylinder and operative in directions toward and from the surface of the latter, each of said edges being connected with the diagonally opposite edge to move therewith and the two pairs of edges so connected being independent of each other and separately movable.

704,689. LEACHING AND EXTRACTION OF METALS FROM THEIR ORES.

CARL HOEPFNER, Frankfort-on-the-Main, Germany; Henry Orth, Jr., administrator of said Hoepfner, deceased.

Filed Sept. 27, 1899. Serial No. 731,852. (No specimens.)

Claim.—1. The process of treating ores and metallic compounds containing copper, which consists in leaching the same with a cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, and electrolyzing the resulting cuprous-chlorid solution while mechanically separating the electrode solutions, thereby depositing metal at the cathode and converting the cuprous into cupric chlorid, substantially as described.

2. The process of treating ores and metallic compounds containing copper, which consists in leaching the same with a cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, precipitating from the solution so obtained cuprous chlorid, and electrolyzing a solution of the latter at the cathodes and the mother-liquor at the anodes while mechanically separating the electrode solutions, thereby depositing copper at the cathode and converting the cuprous into cupric chlorid, substantially as described.

3. The process of treating ores and metallic compounds containing copper, silver and lead, which consists in leaching the same with a warm or hot cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, precipitating lead and silver therefrom, recovering those metals, reconverting the cuprous into cupric chlorid and returning the latter for leaching similar materials, substantially as described.

4. The process of treating ores and metallic compounds containing copper and lead, which consists in leaching the same with a warm or hot cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, precipitating lead chlorid by refrigeration, converting the cuprous into cupric chlorid by chlorin, and returning the solution hot for further leaching of similar materials, substantially as described.

5. The process of treating ores and metallic compounds containing copper and lead, which consists in leaching the same with a warm or hot cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, precipitating the lead chlorid formed by refrigeration, reconverting the cuprous into cupric chlorid in the anode compartment of an electrolytic apparatus, and returning the solution hot for leaching similar materials, substantially as described.

6. The process of obtaining copper, which consists in leaching a suitable material with a hot cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, electrolyzing the resulting cuprous-chlorid solution while mechanically separating the electrode solutions, whereby metallic copper is deposited and the cuprous chlorid converted into cupric chlorid, and returning the latter into the cycle of operations, substantially as described.

7. The process of obtaining copper and silver, which consists in leaching a suitable material with a hot cupric-chlorid solution containing a solvent of cuprous chlorid less than is required for saturation, partially precipitating the cuprous chlorid from the resulting solution by refrigeration, and electrolyzing the remainder of the solution to recover the silver and copper while mechanically separating the electrode solutions, substantially as described.

8. The process of obtaining copper, which consists in leaching a suitable material containing those metals and iron with a hot cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, partially precipitating cuprous chlorid from the resulting solution, oxidizing the latter and using a sufficient quantity of the resulting product for precipitating iron from the solutions and recovering the copper from the remainder, and returning the resulting liquor into the cycle of operations, substantially as described.

9. In the extraction of copper and silver from their ores containing iron, the step which consists in precipitating cuprous chlorid from hot solutions thereof, oxidizing the precipitate by means of air or oxygen and returning sufficient of the resulting product to the cuprous-chlorid solution under treatment to precipitate iron that may be present, substantially as set forth.

10. The process of obtaining copper, which consists in leaching a suitable material with a hot cupric-chlorid solution containing a solvent of cuprous chlorid, partially precipitating the cuprous chlorid from the resulting solution by cooling and electrolyzing the remainder of the solution to recover copper while mechanically separating the electrode solutions, substantially as described.

11. In the extraction of copper, the step which consists in precipitating cuprous chlorid from hot solutions thereof by cooling, removing and dissolving the precipitate by a suitable solution, and recovering the copper from the resulting solution in the cathode-cell of a suitable apparatus also containing an anode-cell and suitable anode solution, substantially as described.

12. The process of treating ores and metallic compounds, which consists in leaching the same with a warm cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation, precipitating lead and part of the silver chlorid formed by refrigeration, reconverting the resulting solution into a cupric-chlorid solution, returning the same at a higher degree of temperature to the material treated, thereby dissolving copper, precipitating any excess of iron by an oxygen compound of copper, electrolyzing the solution to recover the copper and zinc, and returning the resulting electrolyte into the cycle of operations, substantially as described.

13. In the extraction of copper, the step which consists in precipitating cuprous chlorid from hot solutions thereof by refrigeration, oxidizing the resulting solution at the anodes, using a solution of the precipitate in the cathode-cell of a suitable apparatus and depositing the copper, substantially as described.

14. The process of extracting metals, which consists in leaching a suitable material containing copper, lead and silver, with a warm cupric-chlorid solution containing a solvent of cuprous chlorid in quantity less than is required for saturation thereby dissolving lead and silver chlorids, precipitating them, reconverting the solution into cupric chlorid, using the same for leaching fresh quantities of ore, leaching the residues with a similar hot solution more concentrated in cupric chlorid, thereby dissolving copper and recovering those metals therefrom, reconverting the resulting solution into cupric chlorid, and returning the latter into the cycle of operations, substantially as described.

704,640. PROCESS OF EXTRACTING COPPER AND NICKEL FROM SULFID COMPOUNDS.

CARL HOEPFNER, Frankfort-on-the-Main, Germany; Henry Orth, Jr., administrator of said Hoepfner, deceased.

Filed July 27, 1900. Serial No. 25,060. (No specimens.)

Claim.—1. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, leaching the sulfate of copper formed, converting this into cupric chlorid and then into cuprous chlorid, dissolving the nickel salts in the residue by said cuprous chlorid, precipitating cuprous chlorid from the solutions formed and returning the resulting solution containing some cuprous chlorid into the cycle of operations, substantially as described.

2. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, thereby forming sulfurous-acid gas and sulfate of copper, dissolving the sulfate and converting this into cupric chlorid by means of alkali-metal chlorid, treating the cupric chlorid by means of roasted material containing nickel sulfid and oxid, thereby converting the cupric chlorid into cuprous chlorid and dissolving nickel compounds, precipitating and removing cuprous chlorid from the solution and returning the remaining solution containing alkali-metal chlorid, and some cuprous chlorid to treat fresh quantities of material, substantially as described.

3. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, thereby forming sulfurous-acid gas and sulfate of copper, dissolving the latter and converting it into cupric chlorid by means of an alkali-metal chlorid, converting the cupric into cuprous chlorid by means of incompletely-roasted material and sulfurous acid, thereby dissolving nickel salts from said roasted material and the leached residues, removing cuprous chlorid from said solution and treating new quantities of ore with the resulting solution containing some alkali-metal chlorid and cuprous chlorid, substantially as described.

4. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, thereby forming sulfurous-acid gas and copper sulfate, dissolving the latter and converting it into cupric chlorid by means of an alkali-metal chlorid, treating the cupric chlorid by means of incompletely-roasted material, thereby converting it into cuprous chlorid and dissolving nickel compounds, precipitating cuprous chlorid and sulfate of soda by cooling them recovering the nickel, returning the solution resulting from this last operation and treating new quantities of raw material, substantially as described.

5. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, thereby forming sulfurous-acid gas and sulfate of copper, dissolving the latter and converting it into cupric chlorid by adding an alkali-metal chlorid, converting cupric into cuprous chlorid by means of incompletely-roasted material at a temperature above normal, thereby dissolving nickel salts, cooling the solution and thereby precipitating cuprous chlorid and alkali-metal sulfate, finally precipitating nickel as oxid from said solution, substantially as described.

6. The process, which consists in oxidizing roasting copper and nickel sulfid ores or mattes, thereby forming sulfurous-acid gas and sulfate of copper, dissolving the latter and forming cupric chlorid by the addition of sodium chlorid and simultaneously forming sodium sulfate, converting cupric into cuprous chlorid by means of sulfurous acid and incompletely-roasted material at a temperature above normal, thereby dissolving nickel compounds, suitably lowering the temperature to precipitate first cuprous chlorid and then sodium sulfate and finally precipitating nickel as oxid by means of lime, substantially as described.

704,641. PROCESS OF EXTRACTING ZINC OR OTHER METALS FROM THEIR ORES. CARL HOEPFNER, Frankfort-on-the-Main, Germany; Henry Orth, Jr., administrator of said Hoepfner, deceased. Filed July 27, 1900. Serial No. 25,051. (No specimens.)

Claim.—1. The process, which consists in reacting on a material containing an oxygen compound of metals insoluble in water and whose chlorids are soluble in a solution of alkali-metal chlorid, with sulfurous acid and an aqueous solution of alkali-metal chlorid, whereby a solution is formed containing a chlorid of a metal, substantially as set forth.

2. The process, which consists in reacting on a material containing an insoluble oxygen compound of zinc, with water and sulfurous acid, sufficient to form monosulfite of zinc, and an aqueous solution of a chlorid of a metal of the alkalies, whereby a solution is formed containing chlorid of zinc and sulfite of the alkali metal, substantially as set forth.

3. The process, which consists in reacting on an ore or material containing an insoluble oxygen compound of zinc, with water, sulfurous acid and such proportion of a chlorid of a metal of the alkalies as will result in a concentrated solution of the latter, thereby producing a solution containing chlorid of zinc, and precipitating part of the sulfite of alkali thus formed, substantially as set forth.

4. The process, which consists in reacting on an ore or material containing an insoluble oxygen compound of zinc, with water, sulfurous acid and such proportion of a chlorid of a metal of the alkalies as will result in a concentrated solution of the latter, thereby producing a solution containing chlorid of zinc and simultaneously precipitating part of the sulfite of alkali thus formed, and removing the sulfite remaining in the solution by a suitable precipitant, substantially as set forth.

5. The process, which consists in reacting on a material containing zinc, with sulfurous acid and an excess of chlorid of a metal of the alkalies at a temperature above normal, thereby producing a solution containing chlorid of zinc and precipitating nearly all of the sulfite of alkali thus formed, removing the remaining sulfite by a suitable precipitant and recovering the zinc, substantially as set forth.

6. The process, which consists in reacting on an ore of zinc with sulfurous acid and a solution of a chlorid of a metal of the alkalies, thereby producing chlorid of zinc and sulfite of alkali metal, concentrating the resulting solution, thus precipitating the greater part of the alkali-metal sulfite, and removing the remainder by a soluble salt of a metal capable of forming insoluble sulfites, recovering zinc and returning the resulting solution into the cycle of operations, substantially as set forth.

7. The process, which consists in reacting on an ore or material containing an oxygen compound of zinc, with sulfurous acid and a solution of an alkali-metal chlorid, thereby producing chlorid of zinc and alkali-metal sulfite, removing the alkali-metal sulfite, recovering zinc by precipitation with lime, and using the resulting solution thus obtained for double decomposition with sulfite of alkali metal previously obtained, thereby regenerating alkali-metal chlorid, and returning the latter into the cycle of operations, substantially as described.

8. The process, which consists in reacting on an ore or material containing an oxygen compound of zinc, copper, cadmium and nickel, with sulfurous-acid gas, water and an alkali-metal chlorid, thereby producing a solution containing metallic chlorids and alkali-metal sulfite, precipitating the latter as solid sulfite on the ore residue and removing and treating the solution to remove any remaining sulfite with a suitable precipitant, recovering the metals as oxids by means of lime, returning the resulting calcium-chlorid solution into the cycle of operations, and smelting the ore residue and sulfite for metal, substantially as set forth.

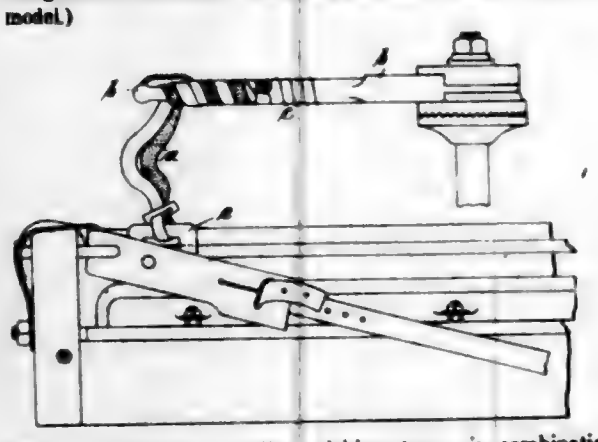
9. The process, which consists in reacting on oxygen compounds of those metals whose chlorids are soluble in solutions of alkali-metal chlorids, with soluble alkali-metal chlorid in the presence of water and sulfurous acid to form sulfites of the metals, thereby obtaining a solution containing chlorids of the metals and a precipitate of bisulfite of the alkali metal, sufficient sulfurous acid being used to form said bisulfite, substantially as set forth.

10. The process, which consists in reacting upon an oxygen compound of zinc with an alkali-metal chlorid in the presence of water and sulfurous acid to form sulfites of zinc, thereby obtaining a solution containing chlorid of zinc and precipitating bisulfite of a metal of the alkalies, sufficient sulfurous acid being used to form said bisulfite, substantially as set forth.

11. The process, which consists in reacting upon oxygen compound of zinc with alkali-metal chlorid in the presence of water and sulfurous acid to form sulfite of zinc, thereby obtaining a solution substantially concentrated in alkali-metal chlorid and containing zinc chlorid in solution and precipitating bisulfite of the metal of the alkalies, sufficient sulfurous acid being used to form said bisulfite, substantially as set forth.

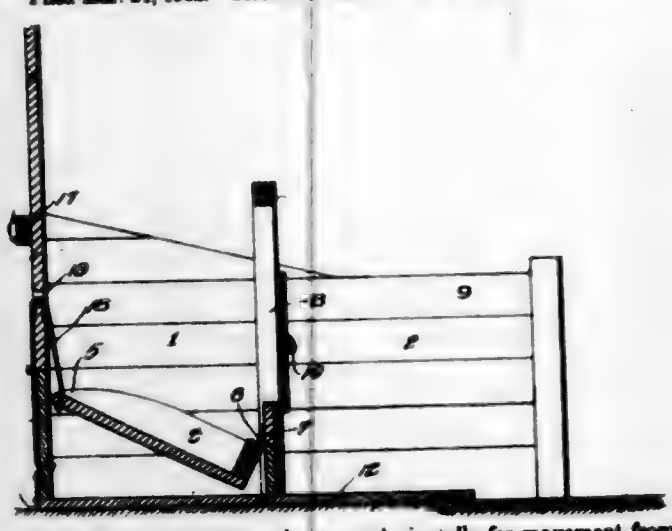
12. The process, which consists in reacting on oxygen compounds of those metals whose chlorids are soluble in solutions of alkali-metal chlorids with sulfurous acid to form sulfites of the metals, adding a sufficient quantity of an aqueous solution of an alkali-metal chlorid, thereby forming a solution containing chlorids of metals and solid bisulfite of the alkali metal, substantially as set forth.

704,642. SHAKING-STRAP FOR LOOMS. OSWALD HOFFMANN, Neugersdorf, Germany. Filed July 22, 1900. Serial No. 24,593. (No model.)



Claim.—In looms, an endless picking-strap *a* in combination with a picking-arm *b* around which the strap is wound several times, a picker *c* with which the strap engages and a cord *c* by means of which the strap is fastened to the picking-arm, substantially as described and for the purpose set forth.

704,643. CATTLE-STALL. GEORGE E. HOBB, Norway Lake, Me. Filed Mar. 21, 1902. Serial No. 99,383. (No model.)



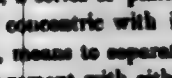
Claim.—1. A feed-trough mounted pivotally for movement from a horizontal to an inclined position, in combination with a door in a wall at the outer side of the trough and a connection between the door and trough, whereby the latter will be lowered when the door is opened and inclined when the door is closed, substantially as described.

2. A stall having a feed-trough in the head thereof mounted pivotally for movement from a horizontal to an inclined position, a door in the wall forming the head of the stall and a connection between the door and trough, whereby the latter will be lowered when the door is opened and inclined when the door is closed, substantially as described.

3. A stall having a cross-wall near its head whereby a crib is formed between said cross-wall and the head of the stall, the latter having an opening and a door to close the same, in combination with a feed-trough in said crib hinged to said cross-wall and a connection between the door

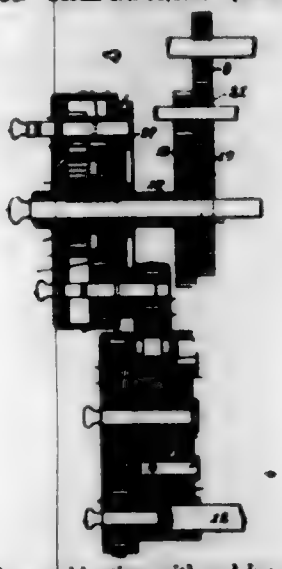
and trough whereby the latter will be turned to an inclined position with its hinged, inner side lowermost when the door is closed, substantially as described.

704,644. CUFF-HOLDER. CARL R. HULTQUIST, Rockford, Ill. Filed Aug. 13, 1901. Serial No. 71,821. (No model.)



Claim.—In a cuff-holder, in combination, a pair of jaws pivoted together by a pintle, a roller, of rubber or other yielding material, mounted on the inside of one of said jaws and at right angles to said pintle, substantially as and for the purpose specified.

704,645. DIFFERENTIAL-SPEED MECHANISM. HERMAN R. ISLER, Hamilton, Ohio, assignor to Charles P. Hilker, Hamilton, Ohio. Filed Nov. 4, 1901. Serial No. 81,132. (No model.)



Claim.—1. The combination with a drive-gear and a driven gear, of a plural number of casings each being rotatively adjustable and overlapping at their edges, a series of pinions of different sizes mounted in each casing on a circle concentric with its axis, a clutch-face formed on one end of each pinion, means to separately move the pinions in one casing into clutching engagement with either of the pinions in the adjacent disk when adjusted into registration therewith, the said engaging pinions forming parts of a train of gears between the drive and driven gears.

2. In a train of gears between a drive and a driven gear, the combination with a primary and secondary series of pinions of different sizes each series mounted equidistant from a common center and the pinion of each series successively adjustable around said center to a fixed point common to both series, of clutches formed on the end of one series of pinions adapted to engage with clutches formed on the adjacent end of the pinions of the other series, and means arranged to move the pinions of one series separately into clutching engagement with either of the pinions of the other series when both are adjusted to register with said fixed point.

3. The combination with a drive-gear, and a driven gear formed with a clutch-face, of a series of idle pinions of different sizes mounted equidistant from a common center and adjustable around said center, each of said pinions being formed with a clutch-face on one end, and movable endwise into engagement with said drive-gear and simultaneously into clutching engagement with the driven gear.

4. The combination with a drive-gear, and a series of driven gears movable around a common center and each formed with a clutch-face, of a series of idle pinions each formed with a clutch-face and movable around a common center and into registration with a corresponding driven gear, and means arranged to move either of the pinions endwise into engagement with the drive-gear and simultaneously into clutching engagement with the corresponding driven gear.

5. The combination with a drive-gear, and a driven gear formed with a clutch-face, of a series of pinions of different sizes each formed with a clutch-face and movable around a common center into successive registration with the driven gear, said pinions being separately movable endwise into engagement with the drive-gear and simultaneously into clutching engagement with the driven gear

---

704,646. CANE-GUN. FREDERICK H. JURY, New York, N. Y. Filed July 2, 1901. Serial No. 67,091. (No model.)

Claim.—1. The combination with a cane, of a plunger therein for ejecting a projectile, one end of said plunger constituting the tip or ferrule of the cane.

2. The combination with a tubular cane, of a spring-pressed plunger in said cane and normally projecting beyond one end thereof and means for holding the plunger in position to maintain the spring contracted.

3. The combination with a tubular cane, of a spring-pressed plunger in said cane and normally projecting beyond one end thereof, a catch carried by the plunger and adapted to hold the same in position to contract the spring, and a trigger for releasing said catch.

4. The combination with a tubular cane, of a plunger therein and normally projecting beyond one end thereof, a spring for forcing the plunger in one direction, a handle on one end of the plunger to limit its movement and serve as a handhold to draw the plunger outward and contract the spring, and means for locking said handle to the tubular cane and the plunger in its normal position.

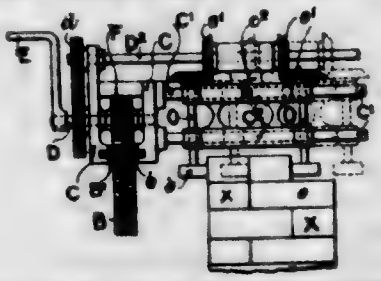
5. The combination with a tubular cane, of a spring-pressed plunger in said cane and normally projecting beyond one end thereof, a handle for the cane comprising a handhold for the plunger, a pin or lug on the cane and an L.-shaped slot in a metal cup in the handle to receive the pin or lug and lock the handle against accidental movement and the plunger in its normal position.

6. The combination with a tube, of a spring-pressed plunger in said tube and normally projecting beyond one end thereof, a catch secured to the plunger adapted to hold the plunger in position to contract the spring and a trigger on the tube adapted to release said catch.

7. The combination with a tubular cane, and means therein for ejecting a projectile, of a frame adapted to be removably secured on the cane, a spool removably connected to the frame and of a general conical shape, a cord secured at one end to the spool, wound thereon, and a projectile secured to the other end of said cord.

8. The combination with a tubular cane, and means therein for ejecting a projectile, of a sleeve adapted to be slipped onto the cane, an outwardly-projecting arm on the sleeve, a conical spool having loops or eyes on its larger end to receive the arm, a cord secured at one end to the larger end of the spool and wound thereon toward the smaller end, and a projectile secured to the free end of the cord.

704,647. MACHINE FOR LAYING BRICKS FOR BUILDING PURPOSES. JOHN H. KNIGHT, Barfield, near Farnham, England. Filed June 17, 1901. Serial No. 64,946. (No model.)



Claim.—1. A machine for laying bricks consisting of an adjustable guide-beam arranged parallel with and in close proximity to the position of the wall to be built, of a frame mounted on the said guide, of means to cause it to positively traverse the same including an axle carried by

the frame and rotated by a handle, and of brick-feeding rollers carried by a frame capable of independent transverse movement with respect to the traversing frame, as set forth.

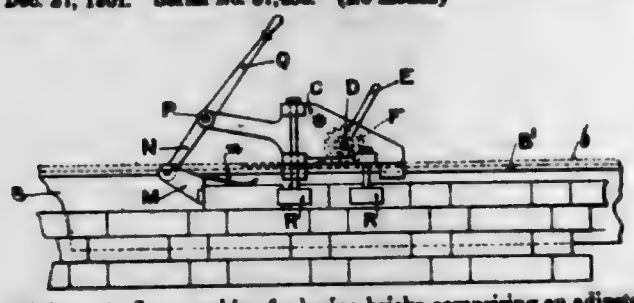
2. A machine for laying bricks consisting of an adjustable guide-beam arranged parallel with and in close proximity to the position of wall to be built, of a frame mounted on the said guide, of means to cause it to positively traverse the same including an axle carried by the frame and rotated by a handle, of a secondary frame capable of independent transverse movement with respect to the traversing frame, and of feeding-rollers arranged in pairs carried by the frame and operated from the axle through gearing, as set forth.

3. In a machine for laying bricks the combination with a frame traversing an adjustable guide-beam arranged parallel with and in close proximity to the position of the wall to be built of brick-feeding rollers *o* carried by a frame capable of independent transverse movement with respect to the traversing frame, as and for the purpose set forth.

4. In a machine for laying bricks, the combination with a frame traversing a guide-beam parallel with and in close proximity to the position of the wall to be built, of brick-feeding rollers arranged in pairs on each side of the wall, of a secondary frame carrying the said rollers mounted on the main frame so that its transverse position may be varied, as and for the purpose set forth.

5. In a machine for laying bricks the combination of a guide-beam B, arranged parallel with and in close proximity to the position of the wall to be built of a frame C mounted to slide thereon, of means to cause the frame to positively traverse the guide B, of a secondary frame C^2 mounted so as to be transversely adjustable on the frame C, and of brick-feeding rollers *o* carried by the frame and operated from the axle through gearing, as set forth.

704,648. MACHINE FOR LAYING BRICKS FOR BUILDING PURPOSES. John H. Knight, Barfield, near Farnham, England. Filed Dec. 27, 1901. Serial No. 87,482. (No model.)



Claim.—1. In a machine for laying bricks comprising an adjustable guide arranged parallel with and in close proximity to the position of the wall to be built, a frame mounted on the said guide, and means to cause it to positively traverse the same including an axle carried by the frame and rotated by a handle, a brick-feeding device consisting of a presser pivoted to a lever carried by a rocking shaft mounted in bearings formed on or carried by an extension of the said traversing frame and a hand-lever for operating the same, the arrangement being such that the presser on the forward travel of the machine slides over and engages the brick or bricks fed to the machine and presses them against the last-laid brick or bricks, as set forth.

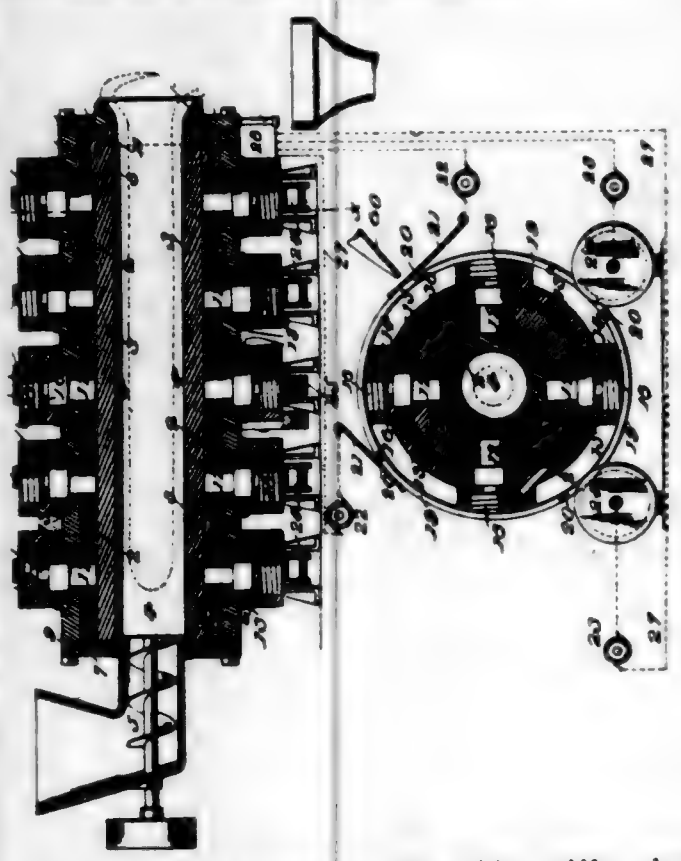
2. A machine for laying bricks consisting of an adjustable guide B arranged parallel with and in close proximity to the position of the wall to be built, of a frame C mounted on the said guide, of means to cause it to positively traverse the same including an axle D carried by the frame C and rotated by a handle E, of a brick-feeding device consisting of a presser M pivoted to a lever carried by a rocking shaft P mounted in bearings formed on or carried by an extension of the said traversing frame C and a hand-lever Q for operating the same, the arrangement being such that the presser on the forward travel of the machine slides over and engages the brick or bricks fed to the machine and presses them against the last-laid brick or bricks, and of side guides H^2 to keep the bricks square and level, as set forth.

704,649. ELECTRICAL FURNACE FOR TREATING HIGHLY-REFRACTORY SUBSTANCES. Hudson Maxim, Brooklyn, N. Y. Original application filed June 26, 1896, Serial No. 593,862. Divided and this application filed Oct. 30, 1901. Serial No. 80,532. (No model.)

Claim.—1. In an electrical apparatus for making calcium carbid, an electrical circuit, a carbid conductor included in said circuit, whereby said conductor is maintained incandescent, means delivering carbid-forming materials to the heating-field, and means uninterruptedly moving the calcium carbid from the heating-field as fast as formed.

2. In an electrical apparatus, for making calcium carbid, an electric circuit, a carbid conductor included in said circuit, whereby said conductor is maintained incandescent, and means moving the calcium carbid from the heating-field as fast as formed.

3. In an electrical apparatus for making calcium carbid, an electric circuit, a carbid conductor included in said circuit, whereby said conductor is maintained incandescent, and means continuously moving the calcium carbid from the heating-field as fast as formed.



4. In an electrical apparatus for making calcium carbid, an electric circuit, a carbid conductor included in said circuit, whereby said conductor is maintained incandescent, means moving the calcium carbid from the heating-field as fast as formed, and means supplying carbid-forming materials to the heating-field.

5. In an electrical apparatus for making calcium carbid, an electric circuit, a carbid conductor included between opposed electrodes in said circuit, whereby said conductor is maintained incandescent, and means moving the calcium carbid from the heating-field as fast as formed, thereby maintaining the electrical resistance between the electrodes approximately uniform.

6. An electrical apparatus for making calcium carbid provided with an inlet for the carbid-forming materials and an outlet for the calcium carbid when formed, an electric circuit, a carbid conductor included in said circuit, and means continuously moving the calcium carbid from the heating-field to the outlet as formed.

7. In a rotatable electrical apparatus for making calcium carbid, an electric circuit, a carbid conductor included in said circuit, and means rotating the apparatus and removing the calcium carbid as formed from the heating-field of the apparatus.

8. In a rotatable electrical apparatus for making calcium carbid, an electric circuit, a carbid conductor included in said circuit, and means continuously rotating the apparatus and thereby continuously removing the calcium carbid from the heating-field of the apparatus as formed.

9. In an electrical apparatus for making calcium carbid, a carbid conductor, a plurality of electric circuits in each of which said conductor enters as an element, and means for moving the calcium carbid from the furnace as formed.

10. Apparatus for electrothermally treating materials, comprising a revolvable structure having peripheral electrodes, retainers therefor, and packings interposed between the electrodes and retainers whereby the packings are tightened by centrifugal force and outward pressure.

11. In apparatus for electrothermally treating materials, the combination, with the furnace-body and its peripheral electrodes, of one or more rings encircling the body and having collars admitting the electrodes, insulation interposed between the furnace-body and rings, retainers for the electrodes at the ring-collars, and current-conveying devices in contact with said retainers.

12. In apparatus for electrothermally treating materials, the combination, with the recessed electric furnace-body and its peripheral electrodes, of insulation in the body-recesses for the electrodes, one or more rings encircling the body and having collars admitting the electrodes, retainers for the electrodes at the collars, packings interposed between the electrodes and the retainers, and current-conveying devices in contact with said retainers.

13. Apparatus for electrothermally treating materials, comprising a

revolubie furnace-body, a refractory lining therein, a tubular fluid-bed within said lining constituting a common return-electrode, and peripheral electrodes fitted in the body and lining and in contact with the fluid-bed, whereby said bed is electrically energized for treatment of material passing through it.

14. Apparatus for electrothermally treating materials, provided with outer electrodes, an inner common electrode in circuit therewith, an interior open-ended conduit of low electrical conductivity within the inner electrode, and a layer of carbon or equivalent material having relatively higher electrical conductivity within the interior conduit.

15. Apparatus for electrothermally treating materials, comprising a revolubie structure provided with outer peripheral electrodes, an inner common electrode in circuit therewith, an interior conduit of low electrical conductivity within the inner electrode and a layer of carbon or equivalent material having relatively higher conductivity within the interior conduit.

16. Apparatus for electrothermally treating materials, provided with outer electrodes, an inner common electrode in circuit therewith, and an interior open-ended conduit of low electrical conductivity within the inner electrode and out of contact with the outer electrodes.

17. Apparatus for electrothermally treating materials, provided with outer electrodes, an inner common electrode in circuit therewith, an interior open-ended conduit of low electrical conductivity within the inner electrode and out of contact with the outer electrodes, and a layer of carbon or equivalent material having relatively higher conductivity within the interior conduit.

704,650. PULVERIZING-MILL. GEORGE S. MAXWELL, Madison, N. J., assignor of one-half to H. D. Crippen, New York, N. Y. Filed July 3, 1901. Serial No. 67,008. (No model.)

Claim.—1. In a mill, the combination with a free ring, of two rolls supporting said ring, a driving-roll engaging with said supporting-rolls, and means for rotating the driving-roll.

2. In a mill, the combination with a suitable case and a free ring supported therein, of two supporting-rolls carrying the ring, a driving-roll engaging the supporting-rolls, and means for driving the driving-roll.

3. In a mill, the combination with a suitable case and a free ring arranged therein, of two supporting-rolls journaled in the case and carrying the ring, a driving-roll also journaled in the case and engaging with both supporting-rolls, and means for rotating the driving-roll, a tension-roll journaled in the case in contact with the free ring, and means for regulating the pressure of the tension-roll on the ring.

4. In a mill, the combination with a suitable case provided with an opening at the top for the introduction of the material and an opening near the bottom for the outflow of the pulverized material, of a free ring arranged in the case, two supporting-rolls journaled in the case supporting the free ring, a driving-shaft journaled in the case, means for rotating the shaft, and a driving-roll on said shaft arranged in contact with the supporting-rolls.

5. In a mill, the combination with a suitable case and a free ring arranged therein, of three rolls journaled in the case and having their peripheries in contact with the inner surface of the ring, means for exerting a yielding pressure on one of said rolls to regulate the tension of the ring, and a fourth roll engaging with one or more of said rolls to rotate the rolls and the ring.

6. In a mill, the combination with a suitable case having openings for the inflow and outflow of the material, of a free ring arranged in said case, two supporting-rolls journaled in the case and arranged to carry the free ring, a tension-roll also journaled in the case and arranged with its periphery in contact with the inner surface of the ring, means for exerting a variable spring-pressure on said tension-roll to regulate the tension of the ring and the mesh of the material, and a fourth roll also journaled in the case engaging with both supporting-rolls to drive the ring and the rolls, and means for rotating the fourth roll.

7. In a pulverizing-mill, the combination with a suitable case, of two supporting-rolls journaled therein having cylindrical central portions or crushing-surfaces and tapering ends, a free ring supported on said rolls and correspondingly formed with an annular crushing-surface equal in width to the crushing-surface of said rolls and with sides inwardly inclined toward the center, substantially fitting the tapering ends of the rolls, a driving-roll also journaled in the case and arranged to rotate in contact with said supporting-rolls, and means for rotating the driving-roll.

8. In a mill, the combination with a suitable case, of two supporting-rolls journaled therein having a cylindrical central portion or crushing-surface and tapering ends, a free ring carried on said rolls and having its inner surface formed with an annular crushing-surface and inwardly-inclined sides to fit said rolls, a driving-roll also journaled in the case and having its periphery in contact with said supporting-rolls, and of a chute for the introduction of the material to be crushed extending from the outside of the case inwardly with a mouth of substantially the same width as the crushing-surface of said supporting-rolls and arranged adjacent to the driving-roll.

9. In a mill, the combination with a suitable case composed of corresponding side plates bolted together, said side plates having outwardly-inclined ways in their upper portion, of boxes arranged to slide in said ways, shafts journaled in the boxes, supporting-rolls on the shafts, a free ring carried on the supporting-rolls, a driving-roll journaled in the side plates and in contact with the supporting-rolls, and means to operate the drive-roll.

10. In a mill, the combination with a suitable case, of two supporting-rolls journaled in the case, a free ring carried on the supporting-rolls, a tension-shaft arranged near the bottom of the free ring and extending outwardly through openings in the case, a suitable support pivotally journaled at one end, boxes on said support forming journal-bearings for the shaft, a tension-roll journaled on the shaft within the case and in contact with the inner surface of the free ring, springs engaging the boxes and the support to force downwardly said tension-roll, means to regulate the tension of the springs and thereby of the pressure of the tension-roll on the inner surface of the ring, and means to rotate the rolls.

11. In a mill, the combination with a suitable case composed of corresponding side plates bolted together, said side plates having outwardly-inclined ways in their upper portion, of boxes arranged to slide in said ways, shafts journaled in the boxes, two supporting-rolls on the shafts, a free ring carried on the supporting-rolls, a tension-shaft arranged near the bottom of the free ring and extending outwardly through openings in the case, a suitable support pivotally journaled at one end, boxes on said support forming journal-bearings for the shaft, a tension-roll journaled on the shaft within the case and in contact with the inner surface of the free ring; springs engaging the boxes and the support to force downwardly said tension-roll, means to regulate the tension of the springs and thereby of the pressure of the tension-roll on the inner surface of the ring, a driving-roll journaled between the side plates and in contact with the supporting-rolls, and means to rotate the driving-roll.

12. In a mill, the combination with a suitable case, of two supporting-rolls journaled in the case, a free ring carried on said rolls, a driving-roll engaging the supporting-rolls, means for rotating the driving-roll; a single tension-roll arranged within the case in contact with the inner surface of the free ring near its lowest point, a shaft carrying said tension-roll, said shaft extending outwardly through openings in the sides of the case; a yoke pivotally supported on arms on the outside of the case near one edge by its free ends and extending around the other edge of the case, said yoke being formed with vertical ways, boxes arranged to slide in said ways and forming roller-bearings for the tension-roll shaft, springs arranged within said ways to force said boxes downwardly, and a single bolt and adjusting-nut engaging with the integral end of the yoke to regulate the tension of the springs and the pressure of the tension-roll on the inner surface of the free ring.

13. In a pulverizing-mill, the combination with a case having side plates, and formed with openings for the inflow and outflow of the material, a main shaft journaled between the side plates, a driving-roll arranged on said main shaft within the case; boxes fitted to upwardly and outwardly inclined ways in the side plates above the driving-roll, two supporting-roll shafts extending across the case and journaled in said boxes, supporting-rolls on said shafts in peripheral contact with the driving-roll, said supporting-rolls being formed with cylindrical centers and tapering ends; a free ring sustained on the supporting-rolls and correspondingly formed with an annular central portion and inclined sides inclined in toward the center to fit said supporting-rolls; a U-shaped yoke pivotally supported by its separated ends on integral arms arranged on the base of the case near one edge and extending around the other edge of the case, a single screw and nut secured to the base and engaging with the integral end of the yoke to adjust its position and the tension of the free ring on its rolls, integral upward extensions on the legs of the yoke, on each side, formed with ways, boxes fitted to said ways, springs arranged in said ways to bear downwardly on said boxes; a tension-roll shaft journaled in the boxes, a tension-roll on said tension-roll shaft arranged within the case and in contact with the inner surface of the free ring at its lowest

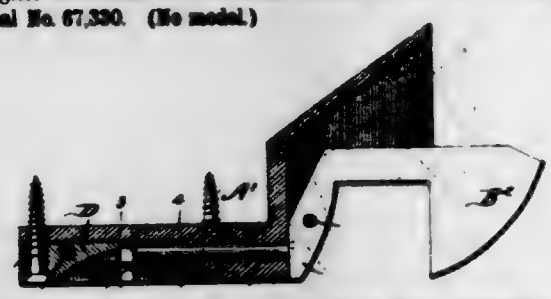
point, said tension-roll being of the same size and form as the supporting-rolls, and means to operate the driving-roll.

14. In a mill, the combination with a suitable case, of a free ring arranged in said case, of two supporting-rolls journaled in the case and carrying the ring, a driving-roll also journaled in the case and engaging the supporting-rolls, a yoke pivotally supported outside of the case by its free ends, a tension-roll arranged within the case in contact with the free ring and journaled in said yoke, and a single bolt and adjusting-nut engaging with the integral end of the yoke to regulate the pressure of the tension-roll on the free ring.

15. In a mill, the combination with a suitable case and free ring supported therein, of two supporting-rolls carrying the ring, a driving-roll engaging the supporting-rolls, means for driving the driving-roll, an external hopper for the material, and a chute extending from the hopper into the interior of the case and terminating in the open mouth arranged adjacent to the driving-roll, said mouth being extended outwardly and downwardly on one side in the direction of rotation of the driving-roll, substantially to fit the driving-roll and one of the supporting-rolls.

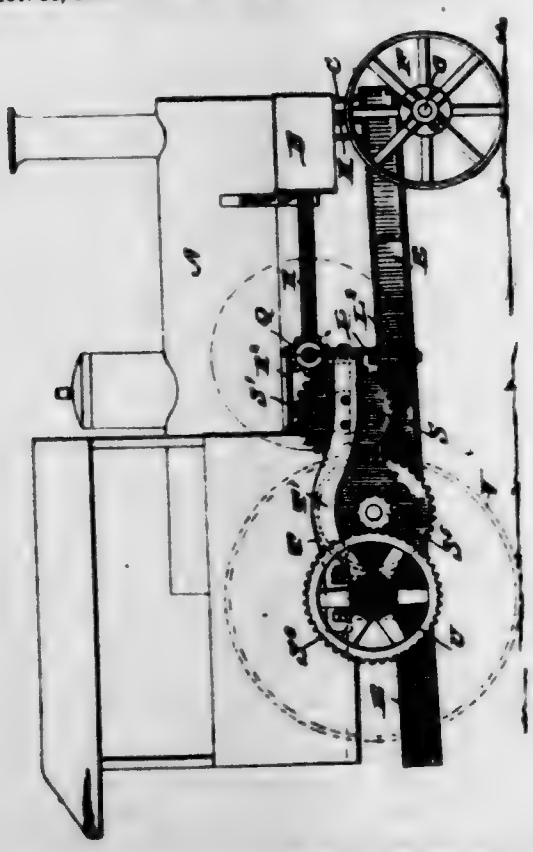
16. In a mill, the combination with a free ring, of a plurality of rolls supporting said ring, a driving-roll engaging with one or more of said supporting-rolls, and means for rotating the driving-roll.

704,651. DOOR-CATCH. CHARLES R. MERVIN, Mankato, Kans., assignor of one-half to J. M. Belt, Mankato, Kans. Filed July 6, 1901. Serial No. 67,330. (No model.)



Claim.—In a device of the kind described, the combination with the housing, of the dog pivoted therein, said dog comprising the nose or head portion, the heel portion and intermediate or connecting portion, the push-rod having a dovetailed head, and the dovetailed stop-block located in the housing and adapted to limit the movement of the push-rod and head, substantially as shown and described.

704,652. TRACTION-ENGINE. GIDEON D. MILLER, Tub, Pa. Filed Nov. 30, 1901. Serial No. 84,176. (No model.)



Claim.—1. In a traction-engine the longitudinal beams connected at their forward ends and carrying a supporting-yoke, a vertical post carried by the front axle and working in the supporting-yoke and a spring-pressed block against which the upper end of the post bears, said block being arranged within the yoke, substantially as set forth.

2. In a traction-engine, the combination with the longitudinal supporting-beams, of the connecting-plates connecting their forward ends, the supporting-yoke connected to the said plates, the block movable in the yoke and having a socket, a spring arranged within the yoke and bearing upon the block, and a vertical post having a ball at its upper end fitting into the socket, the lower end of said post being rigidly connected to the front axle, as set forth.

3. In a traction-engine the longitudinal beams having a cross-beam connected thereto, said cross-beam having bearing-brackets, and a power-shaft journaled in the said brackets, said power-shaft being connected with the pistons and imparting motion to the driving mechanism, as set forth.

4. In a traction-engine the combination with the longitudinal beams, of the cross-beam connected thereto and carrying the bearing-brackets, the power-shaft journaled in the said brackets, the operating-pitmen connected with the said power-shaft, the pinion carried by the said power-shaft, and the gearing mechanism driven from the said pinion, substantially as set forth.

5. In a traction-engine the combination with the cross-beam having the bearings M and N constructed as described, said bearing N having a semicylindrical extension at one side, the power-shaft journaled in the said bearings, the box-section, the semicylindrical extension N^3 and the pinion mounted upon the end of the power-shaft and turning upon the semicylindrical extension M^3 and N^3, as set forth.

6. In a traction-engine, the combination with the longitudinal supporting-beams having a supporting-yoke at its forward end, of the vertical post extending upwardly into the supporting-yoke, a spring-pressed block arranged within the yoke, the cross-beam attached to the longitudinal beams and having bearing-brackets arranged thereon, the power-shaft journaled in the said bearing-brackets, said power-shaft being connected to the driving-pitmen, the pinion carried from the end of the power-shaft, the idler with which said pinion meshes, parallel bars between which the idler is mounted, the forward ends of said bars being connected to the cross-beam, the traction-wheels, axle, gears and shaft whereby the motion of the power-shaft is transmitted to the traction-wheels substantially as set forth.

704,653. BURNER-CAP. WILLIAM H. MILLER and ROBERT W. MILLER, Henry Clay, Del. Filed May 7, 1901. Serial No. 59,170. (No model.)

Claim.—1. An attachment for gas or vapor burners, comprising a tube or nipple, and an inner conical ring having elongated lateral openings or spaces for the escape of gas or vapor against the inner surface of said nipple, the wider portion of the ring fitting the nipple snugly and the walls of said openings being beveled, substantially as described.

2. An attachment for gas or vapor burners, comprising a tube or nipple, and an inner conical ring closed at the top and having elongated lateral openings or spaces for the escape of gas or vapor against the inner surface of said nipple, the wider portion of the ring fitting the nipple snugly and the walls of said openings being beveled, substantially as described.

3. An attachment for gas or vapor burners, comprising a straight open-ended tube or nipple, an inner conical ring having vertically-elongated openings for the escape of gas or vapor against the inner surface of said nipple, and a deflector closing the upper end of the ring, the wider portion of the ring fitting the nipple snugly and the walls of said openings being beveled, substantially as described.

4. An attachment for gas or vapor burners, comprising a tube or nipple, and an inner conical ring closed at the top and provided with a depression or recess in the closure therefor, said ring also having elongated lateral openings the sides or walls of which are beveled, and the wider portion of the ring fitting the nipple snugly, substantially as described.

5. An attachment for gas or vapor burners, comprising a straight open-ended tube or nipple, and an inner conical ring, with the wider portion thereof snugly fitting said tube and formed with pendent ribs and intervening spaces, the vertical adjacent sides of said ribs being beveled inwardly, substantially as described.

6. An attachment for gas or vapor burners, comprising a straight open-ended tube or nipple, and an inner conical ring closed at the top and formed with pendent inclined ribs and intervening spaces, the vertical adjacent sides of said ribs being beveled inwardly and the closure for the ring being provided with a conical recess or depression in its upper surface, substantially as described.

7. An attachment for gas or vapor burners, comprising a tube or nipple, an inner conical ring with its under portion slidably fitting said tube, said ring having openings or spaces at the sides for the escape of gas or vapor against the inner surface of the tube, and a deflector closing the upper end of the ring and pendent within the latter, said deflector having in its upper part a recess or cavity.

8. An attachment for gas or vapor burners, comprising a tube or nipple, an inner ring having openings or spaces at the sides for the escape of gas or vapor against the inner surface of said tube, and a conical or tapering deflector closing the ring and pendent therein.

9. An attachment for gas or vapor burners, comprising a tube or nipple, an inner ring having openings or spaces at the sides for the escape of gas or vapor against the inner surface of said tube, and a conical or tapering deflector closing the ring and pendent therein, said deflector having a conical recess or cavity.

10. An attachment for gas or vapor burners, comprising a tube or nipple, a removable inner ring fitting therein and having oblique openings or spaces at the sides for the escape of gas or vapor against the inner surface of said nipple, and a deflector fitting within said ring.

11. An attachment for gas or vapor burners, comprising a tube or nipple, an inner ring having openings or spaces at the sides thereof for the escape of gas against the inner surface of said nipple, and provided interiorly with a flange, and a deflector within the ring against said flange.

12. An attachment for gas or vapor burners, comprising a tube or nipple, an inner ring having oblique openings or spaces at the sides thereof, and provided interiorly with a flange, and a conical deflector fitting within the ring against the flange, said deflector closing the upper end of said ring.

13. An attachment for gas or vapor burners, comprising a tube or nipple, a conical ring fitted therein having side openings or spaces for the escape of gas or vapor against the inner surface of said nipple, and means for closing the upper end of the ring.

14. An attachment for gas or vapor burners comprising a tube or nipple, an inner conical ring having oblique side openings or spaces for escape of the gas or vapor against the inner surface of said tube, and means for closing the upper end of said ring, substantially as described.

15. An attachment for gas or vapor burners comprising a tube or nipple, an inner conical ring having elongated inclined and oblique openings therein for escape of the gas or vapor against the inner surface of said tube, and means for closing the upper end of said ring, substantially as described.

16. An attachment for gas or vapor burners, comprising a tube or nipple, a conical ring therein having oblique openings or spaces in its sides for the escape of gas against the inner surface of said nipple, and a deflector within the ring.

17. An attachment for gas or vapor burners, comprising a tube or nipple, and a conical ring therein having a series of pendent fingers or ribs forming side openings or spaces, the sides of the said fingers or ribs being tangential to the ring and the ribs themselves being spirally disposed or circumferentially inclined with respect thereto.

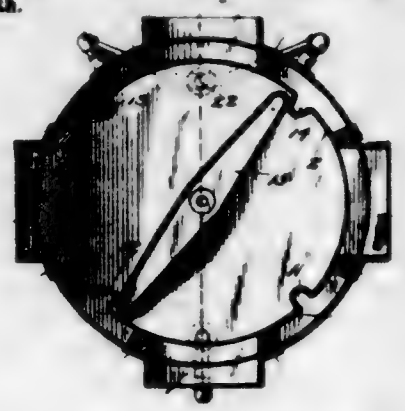
18. An attachment for gas or vapor burners, comprising a tube or nipple, a conical ring therein having ribs or fingers forming openings or spaces, the sides of which are tangential to the ring, said ribs being spirally arranged or inclined circumferentially, and a deflector closing the upper end of the ring.

19. An attachment for gas or vapor burners, comprising a tube or nipple, a conical ring therein having fingers forming side openings or spaces of gradually-increasing width toward the bottom, the sides of said openings or spaces being tangential to the ring and said fingers being spirally disposed or inclined circumferentially, and means for closing the upper end of the ring, said means having a conical cavity or recess therein.

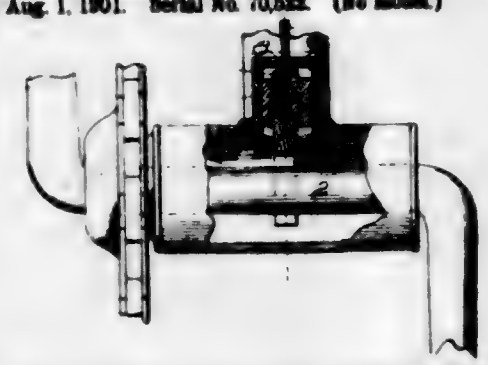
20. An attachment for gas or vapor burners, comprising a tube or nipple, a conical ring closely fitting therein and constructed circumferentially with pendent ribs or fingers having intervening spaces, and tapering toward their lower ends and beveled or tapered inwardly at the sides, and a deflector closing the upper end of the ring.

704,654. VALVE. SAMUEL B. MOFFITT and CHARLES O. WEINSHEIMER, Sharon, Pa. Filed Apr. 24, 1902. Serial No. 104,553. (No model.)

Claim.—A valve-casing, comprising concentric shells spaced apart to form an annular water-chamber and having a series of ports and transverse partitions located between said shells and forming a water-tight joint at the ports and coextensive with the length of the ports, heads secured to said shells and spaced apart to form water-chambers at the ends of the valve-casing, a pipe communicating with the upper portion of the water-chamber at one end of the valve-casing, a pipe communicating with the lower portion of the water-chamber at the same end of the valve-casing and with the lower portion of the annular water-chamber, a pipe communicating with the upper portion of the annular water-chamber at the opposite end of the valve-casing and with the upper portion of the water-chamber at the same end of the valve-casing, and an escape-pipe leading from the lower portion of the last-named water-chamber, substantially as set forth.

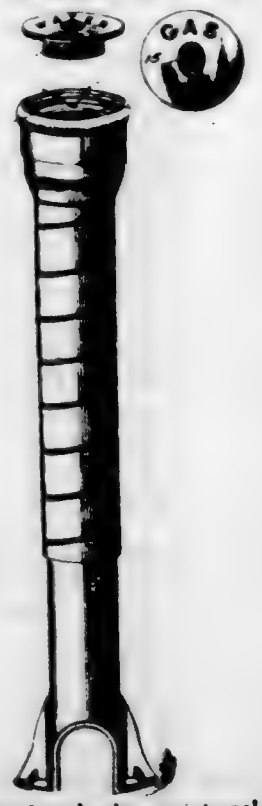


704,655. BICYCLE-LOCK. HENRY W. MORGAN, Lesterahire, N. Y. Filed Aug. 1, 1901. Serial No. 70,522. (No model.)



Claim.—In a bicycle or like machine, and in combination with the crank-hanger and crank-shaft, locking means located in the plane of the frame and comprising a pin fitted in a transverse opening of the crank-shaft and having its end portions extended, a casing secured to the crank-hanger in the angle formed between the front and rear reach-bars, an internally-threaded tube secured within the casing, a lock-bolt having screw-thread connection with the said tube, and a plate rotatably fitted in the outer end of the casing and having a keyhole in line with the said lock-bolt for the insertion of a key for projecting the lock-bolt into the path of an extended end of the aforesaid pin or for withdrawing said lock-bolt out of the path of the said pin, substantially as and for the purpose specified.

704,656. STOP-BOX. RANDOLF MCBEE, Washington, D. C. Filed Jan. 7, 1902. Serial No. 88,812. (No model.)



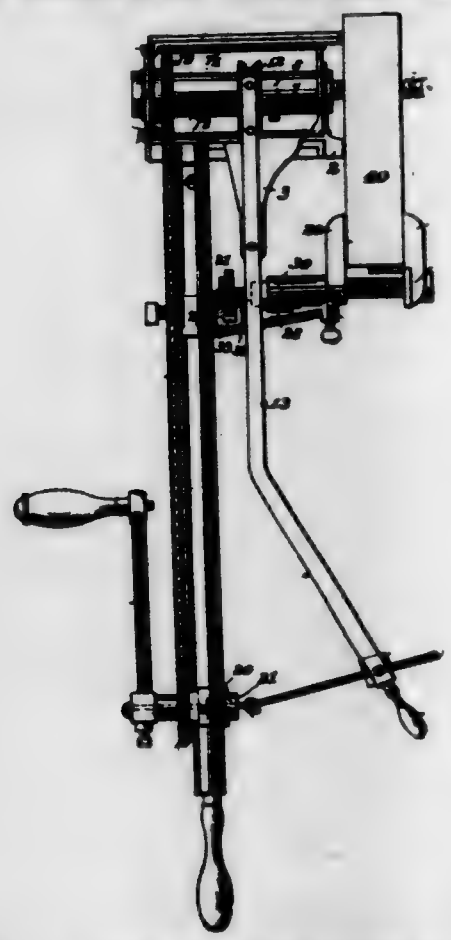
Claim.—1. A stop-box having an internal horizontal supporting-flange recessed upon its upper face, a ring removably supported in said recess against rotary and outward movement, and a cap having a depend-

ing screw-threaded portion screwed into said ring, substantially as described.

2. A stop-box having a flange with recess with enlargements, a ring independent of the box and having projections fitting said enlargements, means for detachably securing the ring in position, and a cap or cover having a depending screw-threaded portion to engage the threads of the ring, substantially as described.

3. As an improved article of manufacture, the stop-box herein described, the same comprising the box proper having enlargement at its outer end, an internal angular horizontal flange within said enlargement and having a recess upon its outer face with diametrically-disposed enlargements, a screw-threaded ring supported on said flange and having projections fitting said enlargements, means detachably securing said ring in position with its upper face flush with the upper face of the flange, and a cap or cover having screw-threaded depending portion engaged with the threads of the ring, the screw-threaded engaging portion, being of different metals, one of which is non-corrodible, substantially as described.

704,657. JOIST-BORING TOOL. STEPHEN MCCLELLAN, Brooklyn, N. Y. Filed Sept. 10, 1901. Serial No. 75,075. (No model.)



Claim.—1. A joist-boring machine, consisting of a rod; a rectangular frame secured on one end of said rod; said frame having through its end pieces perforations; a hollow slotted cylinder, journaled in the perforations of said end pieces; collars secured on said cylinder, preventing it from slipping to the right or left; a perforated grooved wheel encircling said cylinder and adapted to be moved longitudinally on said cylinder; a chuck situated inside of said cylinder, and adapted to be moved longitudinally therein, and to carry a boring device; screws passing through the perforations in the grooved wheel, through the slots in the slotted cylinder, and into the chuck, securing said chuck rigidly to said grooved wheel; fulcrum-arms secured to, and extending below the frame; a double lever fulcrumed to said arms, its upper ends, one passing up on one edge of said grooved wheel, and the other on the other edge thereof; pins secured in the upper ends of said double lever, and working in the groove of said wheel, the lower end of said lever extending downwardly and within reach of the operator; a sprocket-wheel rigidly secured on one end of said cylinder; a sleeve situated on said rod, near its lower end; a shaft journaled in said sleeve and rod; sprocket-wheel rigidly secured on said shaft; a sprocket-chain working on said sprocket-wheels; a crank-handle secured to the end of last-mentioned shaft, with means for securing the said machine to the joist, substantially as shown and described and for the purposes set forth.

2. A joist-boring machine, consisting of a rod; a rectangular frame secured on one end of said rod; said frame having through its end pieces perforations; a hollow slotted cylinder, journaled in the perforations of said end pieces; collars secured on said cylinder, preventing it from slipping to the right or left; a perforated grooved wheel encircling said cylinder and adapted to be moved longitudinally on said cylinder; a chuck situated inside of said cylinder, and adapted to be moved longitudinally therein, and to carry a boring device; screws passing through the perforations in the grooved wheel, through the slots in the slotted cylinder, and into the chuck, securing said chuck rigidly to said grooved wheel; fulcrum-arms secured to, and extending below the frame; a double lever fulcrumed to said arms, its upper ends, one passing up on one edge of said grooved wheel, and the other on the other edge thereof; pins secured in the upper ends of said double lever, and working in the groove of said wheel, the lower end of said lever extending downwardly and within reach of the operator, and adapted to be operated by any suitable means; a sprocket-wheel rigidly secured on one end of said cylinder; a sleeve situated on said rod, near its lower end; a shaft journaled in said sleeve and rod; sprocket-wheel rigidly secured on said shaft; a sprocket-chain working on said sprocket-wheels; a crank-handle secured to the end of last-mentioned shaft, with means for securing the said machine to the joist, substantially as shown and described and for the purposes set forth.

3. A joist-boring machine, consisting of a rod; a rectangular frame secured on one end of said rod; said frame having through its end perforations; a hollow slotted cylinder, journaled in the perforations of said end pieces; collars secured on said cylinder, preventing it from slipping to the right or left; a perforated grooved wheel encircling said cylinder and adapted to be moved longitudinally on said cylinder; a chuck situated inside of said cylinder, and adapted to be moved longitudinally therein, and to carry a boring device; screws passing through the perforations in the grooved wheel, through the slots in the slotted cylinder, and into the chuck, securing said chuck rigidly to said grooved wheel; fulcrum-arms secured to, and extending below the frame; a double lever fulcrumed to said arms, its upper ends, one passing up on one edge of said grooved wheel, and the other on the other edge thereof; pins secured in the upper ends of said double lever, and working in the groove of said wheel, the lower end of said lever extending downwardly and within reach of the operator, and a force-spring, adapted to feed the same; a sprocket-wheel rigidly secured on one end of said cylinder; a sleeve situated on said rod, near its lower end; a shaft journaled in said sleeve carrying a sprocket-wheel; a sprocket-chain working on said sprocket-wheels; a crank-handle secured to the end of the last-mentioned shaft, with means for securing the said machine to the joist, substantially as shown and described and for the purposes set forth.

4. In combination with a joist-boring machine, a sleeve vertically adjustably secured on the main rod below the boring device; an arm extending from said sleeve at right angle to said rod, and having a vertical projection extending from the outer end of said arm; an internally-threaded cylinder adapted to move back and forward in said arm, and having extending upwardly from its outer end a projection, corresponding to first-mentioned projection; said projections adapted to grasp and hold between them a joist; a threaded screw bearing a knurled nut journaled in the bearing of the first-mentioned arm, and turning in the cylinder; a thumb-screw working up through a threaded perforation in the first-mentioned arm, its point entering a longitudinal groove in last-mentioned cylinder, substantially as shown and described and for the purposes set forth.

5. In combination with a joist-boring machine, a sleeve vertically adjustably secured near the lower end of the rod; a shaft working horizontally through said sleeve; a threaded nut swiveled in the lower end of a double lever; a threaded rod working through said threaded nut, one end being swiveled to the adjacent end of the shaft; a ratchet-crank secured to the other end of said shaft, whereby said shaft and said last-mentioned rod may be rotated and the lower end of said double lever moved back or forward, substantially as shown and described and for the purposes set forth.

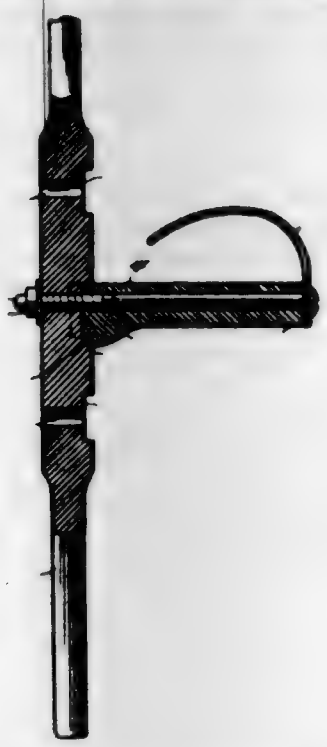
704,658. STILT. DENNISON MCDONOUGH, Eau Claire, Wis. Filed July 8, 1901. Serial No. 67,051. (No model.)

Claim.—1. A stilt comprising a standard, a step, and a resilient approximately U-shaped foot-engaging clip connected at its outer end to the step and curved upward and inward over the step and having its inner end free inclined downward and inward toward the inner end of the step and terminating at a point adjacent to the same in position for engaging the foot, substantially as described.

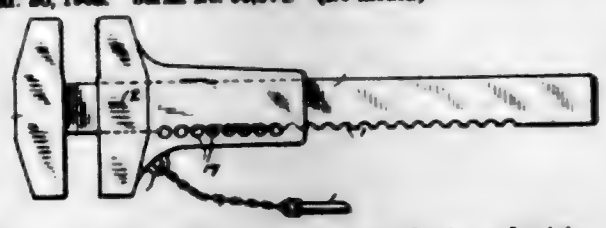
2. A stilt comprising a standard provided at intervals with recesses and having openings located between the ends of the same, a step having its inner end fitted in one of the recesses, said step being provided with a longitudinal bore registering with the adjacent opening of the standard, a foot-engaging clip having an opening arranged at the outer end of the bore of the step, and a continuous elongated bolt extending entirely through the bore of the step and passing through the openings of the clip and the standard and securing the step in its adjusted position to the standard and also fastening the clip to the step, substantially as described.

3. A stilt comprising a standard provided at intervals with horizon-

tal recesses and having openings, an adjustable step consisting of a horizontal bar provided with a longitudinal bore to register with the said openings and having its inner end enlarged and bifurcated vertically and recessed horizontally at the bottom of the bifurcation, said bifurcation forming parallel side flanges for embracing the sides of the standard and the recess at the bottom of the bifurcation forming shoulders for engaging the said standard, and a continuous elongated bolt passing entirely through the bore of the step and through one of the openings of the standard and holding the step interlocked with the standard, substantially as described.



704,659. WRENCH. WALTER WELSON, Bridgeport, Conn. Filed Mar. 20, 1902. Serial No. 99,074. (No model.)

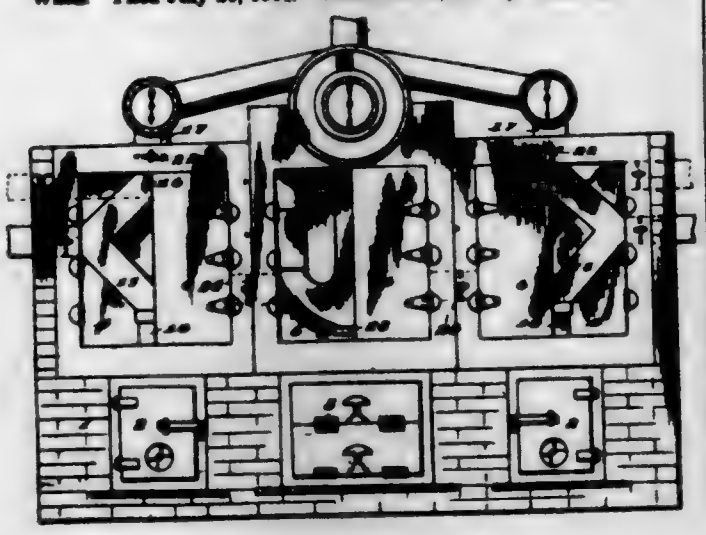


Claim.—1. A wrench comprising a shank having a fixed jaw and a series of recesses and a sliding jaw having a series of holes differing from the recesses in distance from center to center, either of said holes being adapted to register with one of the recesses.

2. A wrench comprising a shank having a fixed jaw and a series of recesses, and a sliding jaw having a series of holes, either of which is adapted to register with a recess, said recesses differing from the holes in distance from center to center.

3. A wrench comprising a shank having a fixed jaw and a series of recesses, a sliding jaw having a corresponding series of holes differing from the recesses in distance from center to center, and a pin adapted to register with either hole and either of the recesses.

704,660. PORTABLE BAKE-OVEN. JOHN HINTON, Tacoma, Wash. Filed July 29, 1901. Serial No. 70,175. (No model.)



Claim.—1. An oven, comprising in its construction baking-compartments, mounted above suitable fire-boxes, a baking-compartment interposed between the compartments above the fire-boxes, means for permitting communication of heat directly between all of said compartments, and means for conducting products of combustion from said fire-boxes through the interposed baking-compartment, substantially as described.

2. In an oven, the combination with a suitable support, forming a fire-box, of a baking-compartment mounted above the same, a pipe for conducting the products of combustion leading from the fire-box into the baking-compartment, bifurcated and extending in divergent lines, and then converging and being reunited, and extending beyond the baking-compartment, a second baking-compartment arranged at the side of the first-mentioned compartment, and means for leading the products of combustion from said pipe through said last-mentioned compartment for heating the same, substantially as described.

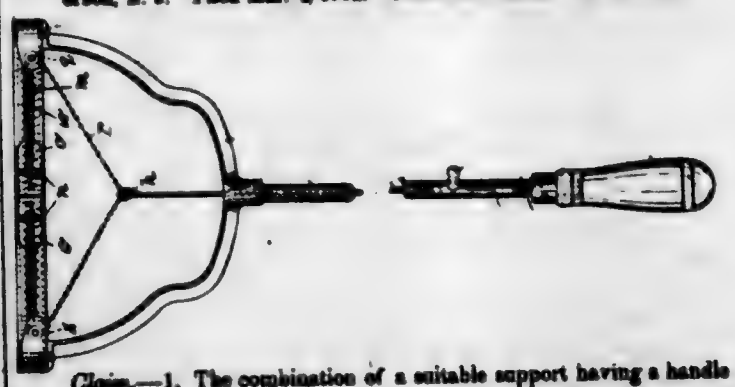
3. In an oven, the combination with a suitable support, forming fire-boxes, of baking-compartments mounted above said fire-boxes, a baking-compartment interposed therebetween, pipes leading from said fire-boxes for conducting the products of combustion, extending into said first-mentioned baking-compartments, and then extending into said second-mentioned baking-compartment and converging into a single pipe and extending outside the same, substantially as described.

4. In an oven, the combination with a suitable support forming fire-boxes, baking-compartments formed above said fire-boxes, a baking-compartment interposed therebetween, a pipe leading from each of said fire-boxes into its respective baking-compartment, the said pipe continuing above said baking-compartment, a pipe leading from each of said combustion-directing pipes within the respective baking-compartments and into the interposed baking-compartment, and then extending beyond the same, dampers arranged in the pipes leading into said interposed baking-compartment, whereby the products of combustion may be directed through the pipes within the said interposed compartment or be prevented from passing therethrough, substantially as described.

5. In a baking-oven, the combination with a suitable support, and fire-boxes, of a baking-compartment arranged above each of the fire-boxes, a baking-compartment interposed therebetween, a pipe leading from each of said fire-boxes through its respective baking-compartment and beyond the same, for conducting the products of combustion, a damper arranged in said pipe, a pipe communicating with each of said combustion-conducting pipes below the damper thereof and leading into said interposed chamber, the last-mentioned pipes converging and extending outside said last-mentioned chamber, and a damper arranged in each of the said last-mentioned pipes, substantially as described.

6. In an oven, the combination with a suitable support and fire-boxes, of a warming-compartment arranged between said fire-boxes, a baking-compartment arranged above each of said fire-boxes, a combustion-conducting pipe leading from each of said fire-boxes to its respective baking-compartment, each of the said pipes being bifurcated and extending in diverging lines and again extending in converging lines and forming a single pipe leading outside its respective baking-compartment, whereby a rhombus or diamond-shaped structure is formed in the oven, a pipe extending laterally from the upper corner of each of said diamonds, a pipe extending laterally approximately from the central corner to each of said diamonds, the two pipes of each respective oven converging into a single pipe within the interposed oven and the two pipes formed thereby converged into a single pipe, said pipe leading outside the interposed oven, a damper arranged in the upper portion of the pipe of each of the first-mentioned baking-compartments above the diamond thereof, and a damper arranged in each of the laterally-extending pipes, substantially as described.

704,661. ARTICLE-LIFTING DEVICE. FRANK G. NEUHARD, Paterson, N. J. Filed Mar. 4, 1902. Serial No. 96,657. (No model.)



Claim.—1. The combination of a suitable support having a handle at one end thereof, a casing arranged near the other end of said support, clips arranged to slide in said casing toward each other, springs pressing said clips toward each other, and means for moving said clips against the tension of their springs, substantially as described.

2. The combination of a hollow staff or pole, a handle arranged at one end of said pole, a pair of clips movable toward each other, mounting means for the clips carried by said pole at the other end thereof, springs pressing said clips toward each other and carried by said mounting means, and means for moving said clips against the tension of their springs, said means comprising a slide arranged in said staff, substantially as described.

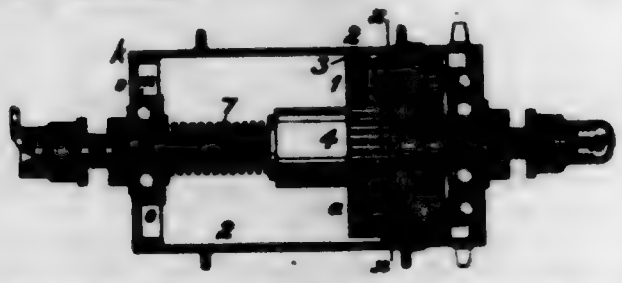
704,662. PROCESS OF PRODUCING OXIDIZED MILK-ALBUMEN. ERNESTON OPPENHEIMER, Berlin, Germany. Filed Dec. 26, 1901. Serial No. 87,253. (No specimens.)

Claim.—1. A process for making oxidized milk-albumen, which consists in treating casein with magnesium peroxid, substantially as set forth.

2. A process for making oxidized milk-albumen, which consists in mixing casein with water and then treating it with magnesium peroxid, substantially as set forth.

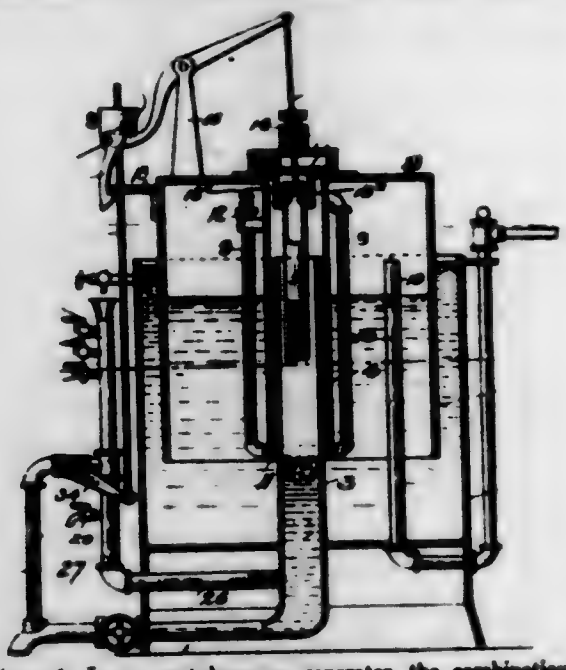
3. A process for making a preservative coating, which consists in treating casein with magnesium peroxid, and adding glycerin and cocoa-butter to render the coating more elastic, substantially as set forth.

704,663. TWO-SPEED DRIVING-GEAR FOR CYCLES. ALFRED PELLATT, London, England, assignor to The Hub Two Speed Gear Company, Limited, Salford, England. Filed June 28, 1901. Serial No. 66,088. (No model.)



Claim.—In a two-speed gear for cycle-wheels the combination with the hub 2 provided with internal teeth 3, the spindle 7 provided with teeth 8, and the loose gear-pinion 6 on the spindle of the sliding clutch formed of two parts *a* and *b*, the outer ring *a* provided with external teeth engaging with teeth 3 on the hub, pawls *c* pivoted thereto, and the inner part *b* provided with external ratchet-teeth *d* with which the pawls engage and internal teeth to engage the pinion 6 or teeth 8 on the spindle and the sliding clutch-sleeve 4 substantially as described.

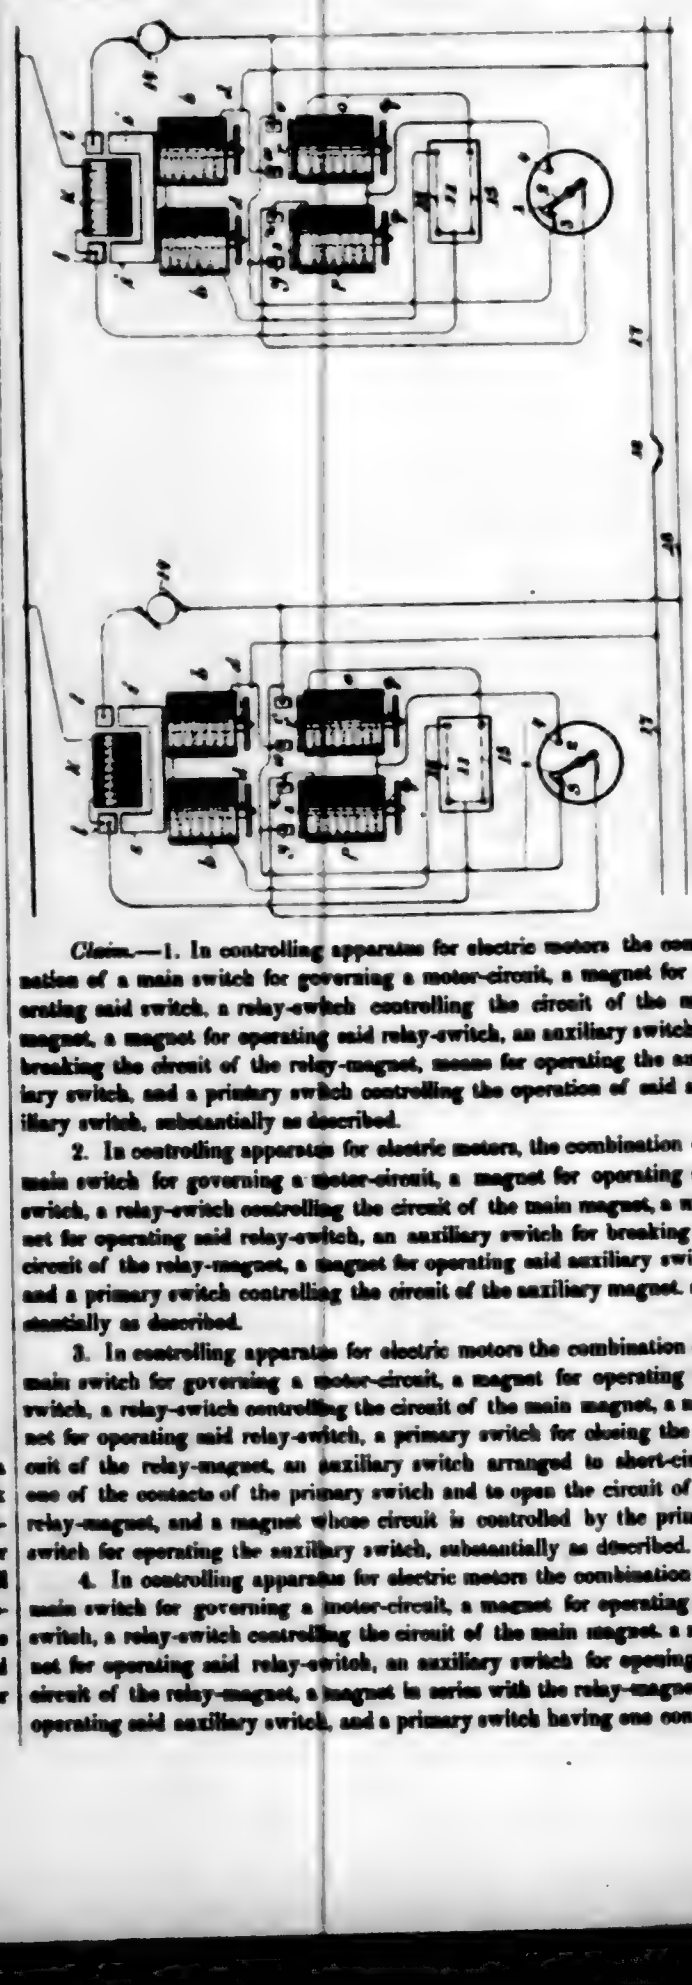
704,664. ACETYLENE-GAS GENERATOR. PAUL B. PERETTI, Los Angeles, Cal. Filed Apr. 26, 1901. Serial No. 57,575. (No model.)



Claim.—1. In an acetylene-gas generator, the combination of a water-tank, a movable bell or gas-holder, telescoping tubes in the tank and gas-holder coöperating to form a generating-chamber, a lever mounted upon the bell, a carbid-holder suspended in the generating-chamber from said lever, a catch carried by the lever, a projection upon the bell adapted to be engaged by said catch, and means whereby upon the elevation of the bell to its extreme limit the lever is operated to raise the carbid-holder above the level of the water in the generating-chamber and to bring the catch into engagement with said projection to lock the lever to hold said carbid-holder raised, substantially as described.

2. In an acetylene-gas generator, the combination of a water-tank, a bell movably mounted therein, tubes arranged within the tank and bell and telescoping to form a generating-chamber, a valved draw-off pipe connected with the generating-chamber, a feed and discharge pipe also connected with the generator and having a valve therein, an emergency exhaust-pipe connected with said feed and discharge pipe, means for drawing water from the tank and supplying it to said feed and discharge pipe, a carbid-holder suspended within the generating-chamber, a lever pivoted to the bell and having a short arm connected with said holder, a catch upon the free end of the locking-arm of the lever to engage the bell when the latter moves to the limit of its upward movement, a rod connected with the valve in said discharge and feed pipe, and a contact-piece on said rod adapted to be engaged by the long arm of the lever, substantially as described.

704,665. CONTROLLING APPARATUS FOR ELECTRIC MOTORS. WALTER J. RICHARDS, Milwaukee, Wis., assignor to Niels A. Christensen, Milwaukee, Wis. Filed Nov. 16, 1901. Serial No. 82,518. (No model.)



Claim.—1. In controlling apparatus for electric motors the combination of a main switch for governing a motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, an auxiliary switch for breaking the circuit of the relay-magnet, means for operating the auxiliary switch, and a primary switch controlling the operation of said auxiliary switch, substantially as described.

2. In controlling apparatus for electric motors, the combination of a main switch for governing a motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, an auxiliary switch for breaking the circuit of the relay-magnet, a magnet for operating said auxiliary switch, and a primary switch controlling the circuit of the auxiliary magnet, substantially as described.

3. In controlling apparatus for electric motors the combination of a main switch for governing a motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, a primary switch for closing the circuit of the relay-magnet, an auxiliary switch arranged to short-circuit one of the contacts of the primary switch and to open the circuit of the relay-magnet, and a magnet whose circuit is controlled by the primary switch for operating the auxiliary switch, substantially as described.

4. In controlling apparatus for electric motors the combination of a main switch for governing a motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, an auxiliary switch for opening the circuit of the relay-magnet, a magnet in series with the relay-magnet for operating said auxiliary switch, and a primary switch having one contact-

piece connected with the circuit between the auxiliary and relay magnets and another contact-piece connected with the other terminal of the auxiliary magnet for short-circuiting the auxiliary magnet, substantially as described.

5. In controlling apparatus for electric motors the combination of a main switch governing a motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating the relay-switch, a primary switch having minimum and maximum pressure contact-pieces, an auxiliary switch in a shunt or branch circuit in parallel with the minimum-pressure contact of the primary switch and in series with the relay-magnet, and a magnet controlled by the primary switch for operating the auxiliary switch, substantially as described.

6. In controlling apparatus for electric motors the combination of a main switch governing the motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, a primary switch having minimum and maximum pressure contact-pieces, an auxiliary switch in a short circuit around the minimum-pressure contact-piece, and a magnet for operating said auxiliary switch in series with the relay-magnet, substantially as described.

7. In controlling apparatus for electric motors the combination of a main switch governing the motor-circuit, a magnet for operating said switch, a relay-switch controlling the circuit of the main magnet, a magnet for operating said relay-switch, an auxiliary switch, a magnet for operating said switch, and a primary switch provided with minimum and maximum pressure contact-pieces, one contact-piece of the auxiliary switch being connected with one of the main conductors and with the minimum-pressure contact-piece of the primary switch, another contact-piece of said auxiliary switch being connected with one terminal of the auxiliary magnet and with a third contact-piece of the primary switch, one terminal of the relay-magnet being connected with the other main conductor and the remaining terminals of the auxiliary and relay magnets being connected with each other and with the maximum-pressure contact-piece of the primary switch, substantially as described.

8. In controlling apparatus for electric motors arranged in a multiple-unit system the combination of main switches governing the several motor-circuits, magnets for operating said switches, relay-switches for controlling the circuits of the main magnets, magnets for operating said relay-switches, primary switches controlling the circuits of the relay-magnets, auxiliary switches for opening the circuits of the relay-magnets, magnets whose circuits are controlled by the primary switches for operating the auxiliary switches, and an equalizing-conductor connecting the several controllers of the system between the main magnets and one of the main conductors, substantially as described.

9. In controlling apparatus for electric motors the combination with a suitable support of two insulated contact-pieces yieldingly connected with said support, two electrically-connected contact-pieces carried by a lever which is fulcrumed to said support, a solenoid-magnet having a vertically-movable plunger connected with said lever and arranged to throw its contact-pieces into engagement with said yielding and insulated contact-pieces when said magnet is energized, relay and auxiliary plunger-magnets mounted on said support and having vertically-movable plungers provided with contact-plates, a pair of insulated contact-pieces yieldingly mounted in the path of each contact-plate, and a primary switch controlling said relay and auxiliary magnets, substantially as described.

10. In controlling apparatus for electric motors the combination with a suitable base or support of two insulated contact-pieces yieldingly connected with said support, two electrically-connected contact-pieces mounted on a lever which is fulcrumed to said support, a solenoid-magnet whose plunger is connected with said lever and adapted when the magnet is energized to carry the movable contact-pieces into engagement with the yielding contact-pieces, relay and auxiliary magnets mounted on said base or support and having plungers provided with contact-plates, a pair of insulated contact-pieces yieldingly connected with each of said magnets, and a primary switch also mounted on said base or support and comprising two insulated contact-pieces, a pivoted contact-arm, and a curved tube connected with said contact-arm and having a fluid-pressure connection, substantially as described.

11. In controlling apparatus for electric motors the combination with a suitable base of a blow-out magnet mounted thereon, a pair of insulated contact-pieces yieldingly mounted on said magnet adjacent to its poles, a forked lever fulcrumed to said base and provided with two electrically-connected contact-pieces which are adapted to be engaged with and disengaged from said yielding contact-pieces by the vertical movement of said lever, two solenoid-magnets mounted on said base and having vertically-movable plungers provided with spring-catches for detachable engagement with said lever, relay and auxiliary magnets also mounted on said base and having vertically-movable plungers which are provided with insulated contact-plates, spring-retracted insulated arms pivotally mounted in pairs on said relay and auxiliary magnets, contact-pieces carried by said arms in the paths of said plates, and a primary switch controlling said relay and auxiliary magnets, substantially as described.

12. In controlling apparatus for electric motors the combination with a suitable base of a blow-out magnet mounted thereon, a pair of insulated contact-pieces yieldingly mounted upon said magnet adjacent to its poles, a forked lever fulcrumed to said base and provided with two electrically-connected contact-pieces adapted to be engaged with said yielding contact-pieces, two magnets mounted on said base and having plungers provided with spring-catches for detachable engagement with the arms of said lever, relay and auxiliary magnets also mounted on said base and having plungers provided with insulated contact-plates, spring-retracted pivoted arms mounted upon said relay and auxiliary magnets and insulated from each other, contact-pieces carried by said arms in position to be electrically connected by said plates when said magnets are energized, and a primary switch mounted on said base and comprising insulated minimum and maximum pressure contact-pieces, a pivoted contact-arm and a curved spring-tube connected with said arm and provided with a fluid-pressure connection, substantially as described.

704,666. CAMERA-SUPPORT. JOHN R. STEPHENS, Portland, Oreg. Filed Nov. 15, 1901. Serial No. 82,487. (No model.)

Claim.—1. In a camera-support, a main frame, a folding member provided with a penetrative point, means for clamping and releasing said folding member, and means for securing, clamping and releasing a camera or like instrument to said frame, substantially as specified.

2. In a camera-support, a main frame, provided with elastic extensions 8, 9, a clamping-screw therethrough, a folding member provided with a penetrative point secured between said elastic extensions, and a clamping-screw for securing a camera or like instrument to said frame, substantially as specified.

3. In a camera-support, a main frame having its periphery of trough-like form in section, to reduce weight while retaining strength, the inturned edges thereby forming flat bearing-surfaces on both sides for supporting the instrument thereon, and provided with a folding member, having a penetrative point, with means for clamping and releasing said folding member, substantially as specified.

4. In a camera-support, a main frame having its periphery made trough-like in section and provided with elastic extensions, a folding member adjustably secured between said extensions, said folding member provided with means for securing it to a penetrable substance, such as wood, a revolvable stem 14 within said frame, and a clamping-screw for securing a camera or like instrument to the frame, held in said revolvable stem, whereby it is capable of being folded within the thickness of the frame when not in use, substantially as specified.

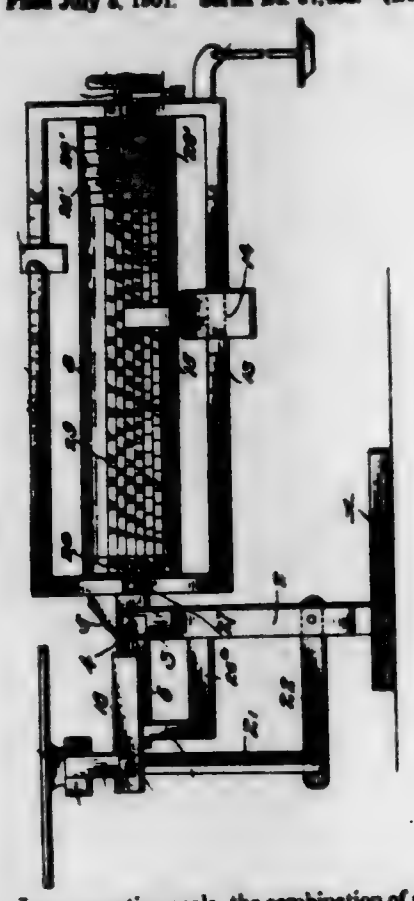
5. In a camera-support, a main frame, a revolvable stem fitted within said frame, having a squared section thereon, a clamping-screw held in the revolvable stem, for securing a camera or like instrument to the frame, and a spring pressing on the squared section of the revolvable stem, whereby the said clamping-screw is retained either in the erect position when in use, or in the folded position when not in use, substantially as specified.

704,667. HANGER FOR WINDOW-SCREENS. ARTHUR L. TABER, Corona, Cal. Filed Oct. 30, 1901. Serial No. 80,554. (No model.)

Claim.—The hanger comprising the longitudinally-adjustable threaded pintle provided with an upwardly-extending arm and adapted to be screwed into and out of a window to adjust the hanger, and the leaf or

plate provided at the top with an eye receiving the pintle, said leaf or plate being bent at the lower portion of the eye to outwardly offset the same from the body portion of the leaf or plate to enable a window-screen to fit within a window-frame and to prevent the leaf or plate from becoming accidentally disengaged from the pintle, substantially as and for the purpose described.

704,668. COMPUTING-SCALE. CORNELIUS T. TIPTON, Elizabethton, Tenn. Filed July 8, 1901. Serial No. 67,402. (No model.)



Claim.—1. In a computing-scale, the combination of a base, a standard rising therefrom and bifurcated at its upper end and carrying open bearings, an oscillating bar provided with trunnions mounted in said bearings, an open rectangular frame mounted upon the rear end of said bar and forming a scale-beam, a computing-cylinder mounted in said frame, a poise slidable on the frame, an indicator on the frame coöperating with the poise and the indice-numerals on the cylinder, an open horizontal supporting-frame upon the front end of the bar and provided with trunnions, a cross-bar provided with depending posts having open bearings to receive said trunnions, a pan-supporting rod provided at its upper end with a pin passing through said cross-bar, a scale pan or plate having a socket to receive said pin, and a link connecting the lower end of said rod to the standard, substantially as described.

2. In a computing-scale, the combination with a scale-beam, and a poise provided with a pointer, of a computing-cylinder rotatably mounted in said beam, and carrying a main computing-scale and an auxiliary computing-scale, the main computing-scale having price-per-pound numerals and cost-price numerals arranged in regular progression and within determined limits, and the auxiliary scale having price-per-pound numerals and cost-price numerals arranged in multiples in proper progression, a pointer on the beam coöperating with the poise and the main-scale numerals on the cylinder, and a bar carrying pound-indices supported by the beam and coöperating with the auxiliary scale, substantially as described.

704,669. CRUDE-OIL BURNER. HOLLINS G. TUCKER, Hereford, Tex., assignor of one-half to Reuben H. Berton, Hereford, Tex. Filed Jan. 31, 1902. Serial No. 92,063. (No model.)

Claim.—1. A crude-oil burner comprising a fire-pan forming a vessel to contain oil, having means to admit air thereto and an inturned flange extending around and partially covering the same, and a removable flame-spreader having downwardly-converging sides, said flame-spreader being supported in the said fire-pan, disposed within the opening formed by and with its sides in proximity to the inturned flange thereof and having supporting-legs which bear on the bottom of the fire-pan, substantially as described.

2. A crude-oil burner comprising a fire-pan forming a vessel to contain oil, having outwardly-flared sides, perforated for the admission of air, and an inturned flange extending inwardly from the flared sides of the pan, and partially covering the same, and a flame-spreader with downwardly-converging sides, supported in the fire-pan and extending through the opening formed by the inturned flange, and in proximity to said flange, substantially as described.

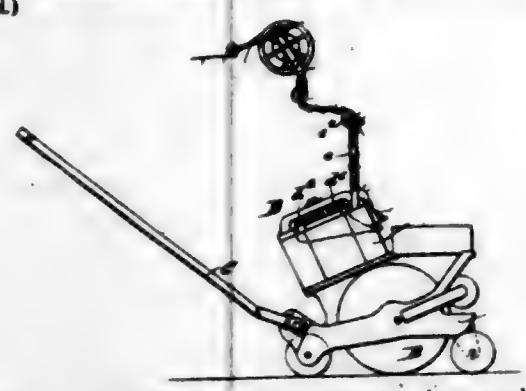
704,670. ELECTRICAL CONNECTOR. ALBERT J. WAYMAN, Dubois, Pa. Filed Jan. 16, 1902. Serial No. 89,984. (No model.)

Claim.—1. A device of the class described comprising a base having slots in its sides, clamping-plates each including spaced members and a connecting-web and having one member disposed in a slot and the other member disposed against the under face of the base, a retaining-screw passed through the base and engaged with both members of the plate, and means for holding a wire against the plate.

2. A device of the class described comprising a base, clamping-plates secured to the base and comprising spaced members and a connecting-web, one of said members having spaced openings and an intervening web, a clip including a hook having its stem passed through one of the openings and its bill engaged with the other opening, the bight of the hook lying transversely of the intervening web, and a clamping-screw passed through the second member and engaged with the hook for moving the bight of the hook toward the first member.

3. A device of the class described comprising a clamping-plate of spring metal including spaced members, one of said members having spaced openings and an intervening web, and a clip consisting of a hook having its stem engaged with one of the openings and its bill engaged with the other opening, the bight of the hook lying transversely of the web, and a screw passed through the second member and engaged with the hook to draw the bight in the direction of the web.

704,671. MOPPING DEVICE. HARMON F. ACKERMAN, Cleveland, Ohio. Original application filed May 13, 1901, Serial No. 60,104. Divided and this application filed Nov. 15, 1901. Serial No. 82,450. (No model.)



Claim.—1. In combination a reel adapted to have a cable coiled thereon, springs constraining said reel to coil said cable, and means for rotatably supporting said reel upon a vertical axis, substantially as set forth.

2. In combination, a reel adapted to have a cable coiled thereon, a bracket adapted to support said reel, springs constraining said reel so as to coil said cable, said bracket being supported upon a vertical axis and rotatable thereabout, substantially as set forth.

3. In combination, a standard, an arm rotatably mounted thereupon, a reel carried by said arm, and adapted to receive a cable, and a spring constraining said reel so as to coil said cable upon it, substantially as set forth.

4. In combination, a standard, an arm rotatable thereabout, a bracket rotatably mounted upon said arm, a reel rotatably mounted in said bracket, and adapted to carry a cable coiled thereon, and a spring constraining said reel so as to coil said cable, substantially as set forth.

5. In combination, a standard, a bracket carried thereby, and rotatable about a vertical axis, a reel carried by said bracket, said reel being adapted to have a cable led to and coiled thereon, a guide-bracket pivoted to said first bracket, and a guide-roller carried by said guide-bracket, substantially as set forth.

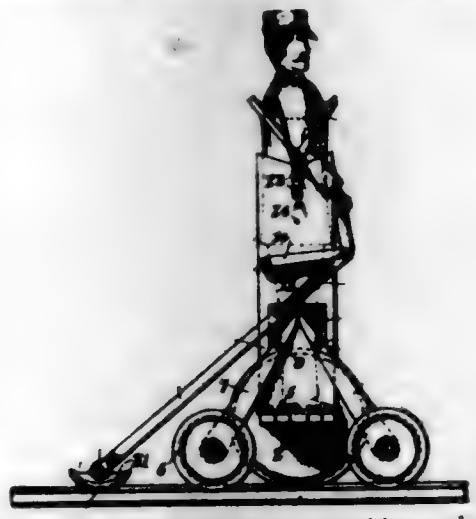
6. In combination, a standard, an arm rotatably mounted thereupon,

said arm having a collar adapted to be secured thereto, said standard and said collar having the one a stop and the other a finger adapted to contact therewith, substantially as set forth.

7. In mopping-machines, in combination, a movable and traveling mopping device, a motor supported thereby, a cable-reel carried thereon and rotatable in a vertical plane, automatic current-collecting devices interposed between said reel and motor, and a spring tending to coil said reel, substantially as set forth.

8. In an electrically-operated machine, a current-conductor reel, a standard therefor, a base-standard to receive the wheel-standard in pivoted relation thereto, and a movable stop secured to the wheel-standard, in combination with means on the base-standard for limiting the motion of the wheel-standard, substantially as set forth.

704,672. FOLDING RAILWAY-VELOCIPEDE. HENRY BARRY, San Francisco, Cal. Filed Sept. 26, 1901. Serial No. 76,473. (No model.)



Claim.—1. A railway-velocipede, comprising a wheeled platform, a standard foldably connected to the platform, and operating means carried by the standard.

2. A railway-velocipede, comprising a wheeled platform, a standard hinged to one end of the platform and capable of being folded downwardly thereupon, and operating means carried by the standard.

3. A railway-velocipede, comprising a platform having a wheel at one end, a standard foldably connected to the opposite end of the platform, supporting-wheels carried by the standard, and operating means mounted upon the standard.

4. A railway-velocipede, comprising a platform, a supporting-wheel at one end thereof, a standard foldably connected to the opposite end of the platform, oppositely-inclined hangers pivotally connected to the standard, supporting-wheels carried by the hangers, and operating means mounted upon the standard.

5. A railway-velocipede, comprising a platform, a supporting-wheel at one end thereof, a standard foldably connected to the opposite end of the platform, a pair of forwardly and rearwardly inclined wheel-hangers pivoted intermediate of their ends to the standard, the upper ends of the hangers being constructed to mutually abut when the velocipede is set up for use, supporting-wheels carried by the hangers, and operating means mounted upon the standard.

6. A railway-velocipede, comprising a wheeled platform, a standard rising therefrom, operating means carried by the standard, and an arm-rest carried by the upper end of the standard.

7. A railway-velocipede, comprising a wheeled platform, a standard rising therefrom, operating means carried by the standard, and a forked arm-support upon the upper end of the standard and having a strap or bolt supported between the opposite members of the fork.

8. A railway-velocipede, comprising a wheeled platform, a standard rising therefrom, operating means, and an adjustable arm-rest carried by the standard.

9. A device of the character described, having an intermediately-pivoted endwise-movable push-rod, a link pivotally connected to the upper portion of the rod and also pivotally supported independently thereof, and a vertically-reciprocating operating device pivotally connected to the upper end of the push-rod.

10. In a railway-velocipede, the combination with a wheeled platform, of a standard rising therefrom, an endwise-movable push-rod inclined downwardly and rearwardly across the standard and provided with a longitudinal slot, a pivot carried by the standard and fitting loosely in the slot of the push-rod, a link having its rear end pivotally connected to the standard and its forward end pivotally connected to the upper end of the push-rod, and an upstanding handle pivotally connected to the push-rod at the point of connection thereof with the link.

11. In a railway-velocipede, the combination of a platform having a trunk-wheel at one end, a standard rising from the opposite end of the platform and hinged thereto, front and rear track-wheels carried by the standard, an endwise-movable and intermediately-pivoted push-rod carried by the standard and having its lower end provided with a friction-shoe, a vertically-reciprocating operating-handle connected to the upper end of the push-rod, and an arm-rest at the upper end of the standard.

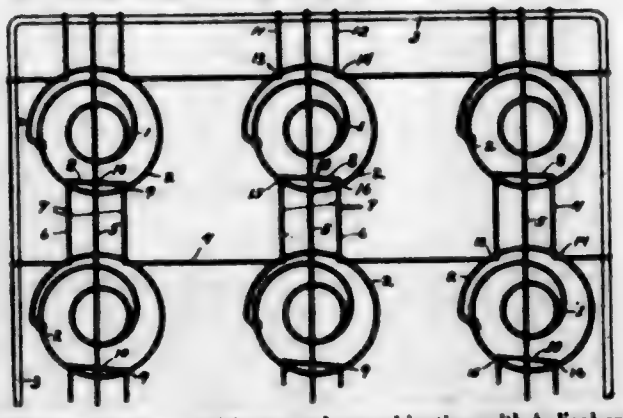
704,678. CORDING-SEAL. EDWARD J. BROOKS, East Orange, N. J. Filed May 12, 1902. Serial No. 106,988. (No model.)

Claim.—1. A two-part seal-disk of sheet metal composed of a face-piece and a back piece, permanently united with each other by a circumferential joint, and constructed with inwardly-projecting prongs integral with said face-piece and back piece respectively, said back piece being further constructed with threading-holes arranged for the insertion therethrough of the ends of the sealing-cord between the prongs of the respective parts of the seal-disk.

2. The combination with a knotted sealing-cord of a two-part seal-disk composed of a face-piece and a back piece permanently united with each other by a circumferential joint and provided with threading-holes at opposite edges of the seal-disk, one of said threading-holes being common to both ends of the cord and adapted to admit the knot of the cord into the interior of the seal-disk, the seal-disk being further provided with inwardly-projecting prongs adapted to interlock with said knot of the cord when the seal-disk is press-fastened.

3. The combination with a knotted sealing-cord of a two-part seal-disk comprising a face-piece provided with permanent distinguishing marks and having inwardly-projecting prongs integral therewith, and a dome-shaped back piece having inwardly-projecting prongs integral therewith, a pair of threading-holes and internal tongues formed of the partially-severed metal punched from said threading-holes at one edge of the disk, and a single threading-hole common to both ends of the cord and adapted to admit the knot of the cord at the opposite edge of the disk, substantially as hereinbefore specified.

704,674. SPRING BED-BOTTOM. JOHN F. BROWN, Knoxville, Pa. Filed Feb. 13, 1902. Serial No. 93,994. (No model.)



Claim.—1. In a bed-bottom, the combination with helical springs arranged in rows and having their ends formed into rings, tie-rods extending across said springs, said tie-rods being provided with laterally-extending loops having substantially parallel arms and a cross-bar uniting their outer ends, said cross-bar being provided with a bend or crimp near its middle and having straight portions on either side of said crimp, said loops extending through two adjacent springs and engaging each at two points, and key-rods arranged transversely to the tie-rods and extending along said springs and through said loops and being engaged by the crimp in the cross-bar.

2. In a bed-bottom, the combination with helical springs arranged in rows and having their ends formed into rings, tie-rods extending across said springs, said tie-rods being provided with laterally-extending loops having substantially parallel arms and a cross-bar uniting their outer ends, said loops extending through two adjacent springs and engaging each at two points and being provided with crimps or hooks near their outer ends where they engage the springs, and key-rods arranged transversely to the tie-rods and extending along said springs and through said loops.

3. In a bed-bottom, the combination with helical springs arranged in rows and having their ends formed into rings, tie-rods extending across said springs, said tie-rods being provided with laterally-extending loops

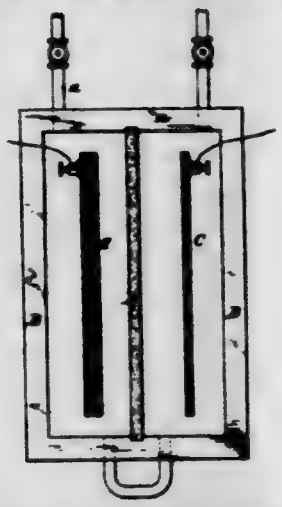
having substantially parallel arms and a cross-bar uniting their outer ends, said arms being provided near their outer ends with crimps or bends, and said cross-bar being also provided with a bend or crimp in the opposite direction, said loops extending through two adjacent springs and engaging each at two points and having the crimps near the outer ends of the arms engaging one of the springs, and key-rods arranged transversely to the tie-rods and extending along said springs and through said loops and being engaged by the bend or crimp in the cross-bar.

4. In a bed-bottom, the combination with helical springs arranged in rows and having their ends formed into rings, tie-rods extending across said springs, said tie-rods being provided with lateral loops extending through two adjacent springs and engaging each at two points and being provided with crimps or hooks near their outer ends where they engage the end rings of the springs, and key-rods arranged transversely to the tie-rods and extending along said springs and through said loops.

5. In a bed-bottom, the combination with helical springs arranged in rows and having their ends formed into rings, tie-rods extending across said springs, said tie-rods being provided with lateral loops extending through two adjacent springs and engaging each at two points and being provided with crimps or hooks near their outer ends where they engage the end rings of said springs, and key-rods arranged transversely to the tie-rods and extending over the end rings of the springs on one side thereof, under the same on the opposite side thereof and through said loops.

6. In a bed-bottom, the combination with helical springs arranged in rows and having both of their ends formed into rings, tie-rods extending across said springs both at the top and bottom thereof, said tie-rods being provided with lateral loops extending through two adjacent springs and engaging each at two points and being provided with crimps or hooks near their outer ends where they engage the end rings of the springs, and key-rods arranged transversely to the tie-rods both at the top and bottom of the springs and extending along said springs and through said loops.

704,675. PROCESS OF RECOVERING METALLIC TIN. DAVID H. BROWER, Cleveland, Ohio, and JAMES M. NEIL, Toronto, Canada. Filed July 27, 1901. Serial No. 69,914. (No specimens.)



Claim.—1. The herein-described process of extracting tin from materials containing the same, which consists in subjecting the material to a solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid, and precipitating the tin from such solution by an electric current passing between an insoluble anode and a suitable cathode, as set forth.

2. The herein-described process of extracting tin from materials containing the same, which consists in subjecting the material to an acidulated solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid, and precipitating the tin from such solution by an electric current passing between an insoluble anode and a suitable cathode, as set forth.

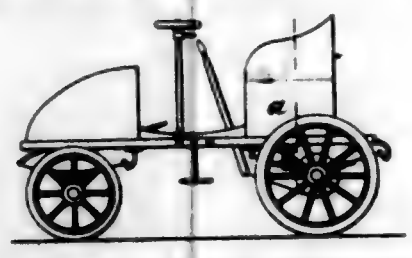
3. The herein-described process of extracting tin from materials containing the same, which consists in subjecting the material to a heated solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid, and precipitating the tin from such solution by an electric current passing between an insoluble anode and a suitable cathode, as set forth.

4. The herein-described process of extracting tin from materials containing the same, which consists in subjecting the material to a heated acidulated solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid, and precipitating the tin from such solution by an electric current passing between an insoluble anode and a suitable cathode, as set forth.

5. The herein-described process of extracting tin from materials containing the same, which consists in subjecting the material to a solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid and passing such solution successively past a suitable cathode to electrodeposit the tin, and an insoluble anode to regenerate the ferric-chlorid solution, as set forth.

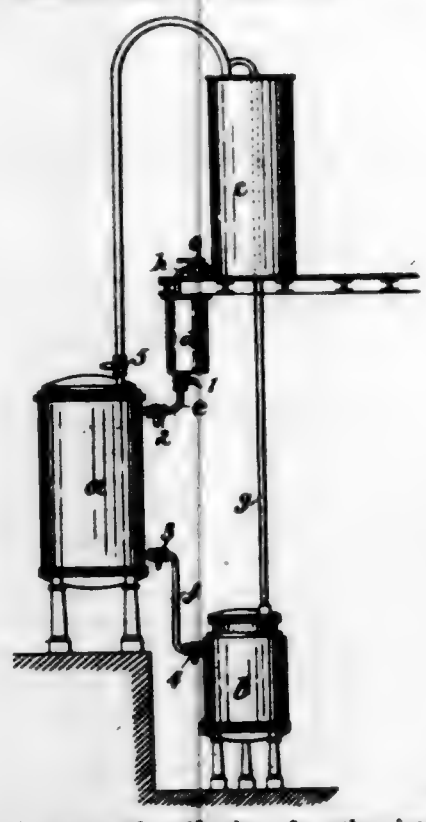
6. The herein-described continuous process of extracting tin from materials containing the same, which consists in subjecting the material to a solution of ferric chlorid, thereby forming a solution of chlorid of tin and ferrous chlorid, passing such solution successively past a suitable cathode to electrodeposit the tin, and an insoluble anode to regenerate the ferric-chlorid solution, and returning such regenerated solution to the tin-bearing material, as set forth.

704,676. METALLIC CHEST FOR MOTOR-VEHICLES. FERDINAND CHARRON and LÉONCE GIRARDOT, Paris, France. Filed Apr. 22, 1902. Serial No. 104,082. (No model.)



Claim.—A metallic wagon-chest for petroleum-motor road-vehicles formed of a sheet-metal plate cut out according to the contour 1, 2, 3, 16, the projecting portions of which are raised vertically and secured together by their adjacent edges, in combination with a second sheet-metal plate *f* which is horizontally secured to the walls of the chest thus formed so as to form a closed capacity of which three vertical walls extend above the top bottom, substantially as and for the purpose set forth.

704,677. PROCESS OF PURIFYING GUTTA-PERCHA. ADOLPHE COMBANAIRE and JEAN DE LA FRESNAYE, Paris, France. Filed Nov. 15, 1901. Serial No. 82,406. (No specimens.)

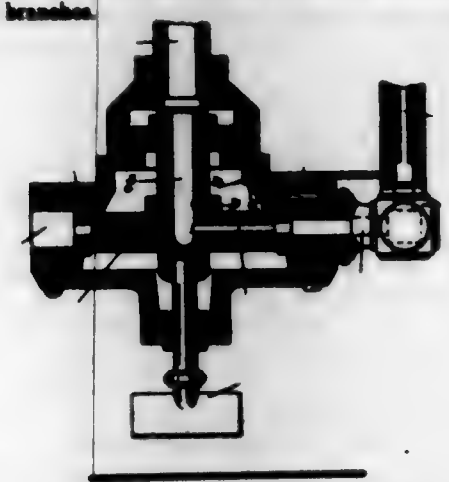


Claim.—A process of purification of, or the abstraction of resin from, gutta-percha, consisting of treating the gutta-percha previously reduced to fragments, in a solvent such as petroleum or one of its derivatives, at a temperature about 35° centigrade of stopping the operation before any coloration of the solvent takes place so that the resin only is dissolved and the cellular construction and principal essential components of the gutta are neither dissolved nor destroyed.

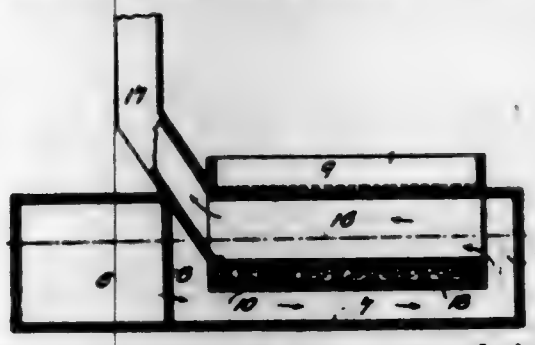
704,678. BY-PASS STOP-COCK FOR MULTIPLE-LIGHT GAS-BURNERS. WILHELM H. W. FAHRENHOLZ, Hamburg, Germany. Filed Nov. 26, 1901. Serial No. 83,553. (No model.)

Claim.—A casing arranged for attachment to a gas-supply pipe, and burner-supporting branches attached to said casing, each of said branches having a passage leading to the main jet and a second passage leading to

a pilot-jet, a plug within the casing arranged to leave a chamber therein, said plug having a central passage and an opening from said passage into said chamber, and said plug also having radial passages leading from said central passage, one for each branch connected to the casing, said radial passages terminating in ports in the side of the plug and said ports being of varying length, means to turn the plug in the casing, and means connecting the chamber in the casing with each of the secondary passages in the burner branches.



704,679. CANNING APPARATUS. JOHN T. GARREN, Grayrock, Tex. Filed Mar. 31, 1902. Serial No. 100,146. (No model.)



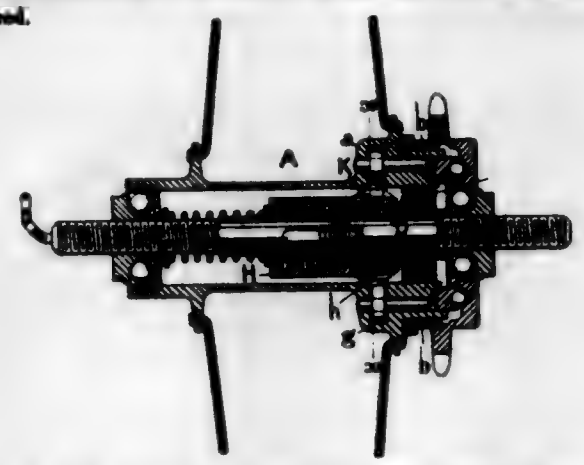
Claim.—1. In combination with a furnace having a fire-box and a heating-chamber in rear of and communicating therewith and having its upper side open, a boiler disposed in, closing the upper side of the heating-chamber and having an upper portion to overhang and bear upon the sides of the heating-chamber and thereby support the boiler, the latter being further provided with a lower portion of less length, breadth and depth than the corresponding dimensions of the heating-chamber, whereby flues are formed between the sides and bottoms of the lower portion of the boiler and the heating-chamber, the boiler being further provided with a return-flue extending therethrough and communicating with a smoke-exit, whereby a water-space is formed in the boiler around the said return-flue, substantially as described.

2. In combination with a furnace having a fire-box and a heating-chamber in rear of and communicating therewith and having its upper side open, a boiler disposed in the heating-chamber, closing the upper side thereof, having an upper portion forming a tray to overhang and bear upon the sides of the heating-chamber and thereby support the boiler, the latter being further provided with a lower portion of less length, breadth and depth than the corresponding dimensions of the heating-chamber, whereby flues are formed between the sides and bottoms of the lower portion of the boiler and the heating-chamber, the boiler being further provided with a return-flue extending therethrough and communicating with a smoke-exit, whereby a water-space is formed in the boiler around the said return-flue, substantially as described.

704,680. TWO-SPEED DRIVING-GEAR FOR BICYCLES. WALTER GOODMANS, Manchester, England. Filed Feb. 13, 1902. Serial No. 93,858. (No model.)

Claim.—1. In a hub two-speed gear the combination with the chain-wheel, planetary pinions, and stationary spindle, of a hub provided with a groove and pawls pivoted therein, and a sliding clutch provided externally with ratchet-teeth to engage the pawls, which when the chain-wheel is in action lock the mechanism through the medium of planetary pinions, and revolving hub, and prevent the rotation of the sliding clutch in relation to the hub, and which when the chain-wheel is out of action permit the hub to rotate around the clutch, substantially as described.

2. A hub two-speed gear comprising in its construction a chain-wheel with internal teeth, planetary pinions on the hub gearing therewith, a pinion loose on the spindle, engaging planetary pinions, a stationary spindle, on which the hub and loose pinions are placed, a clutch sliding on the spindle provided with external ratchet-teeth, a hub provided with a groove to carry the pawls, and pawls pivoted therein to engage the ratchet-teeth on the sleeve substantially as and for the purpose described.

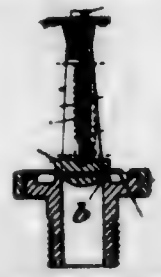


3. In a hub two-speed gear, the combination with the chain-wheel planetary pinions, engaging therewith, a stationary spindle and a hub, pawls pivoted to the said hub to which the planetary pinions are pivoted, of a clutch sliding on the spindle provided with external ratchet-teeth to engage the said pawls, and provided also with internal ratchet-teeth and a ratchet device inserted in a hole in the said spindle to engage the internal ratchet-teeth substantially as and for the purpose described.

704,681. FIRE-ALARM. CHARLES R. HARRIS, Williamsport, Pa., assignor to the Harris Safety Company, New York, N. Y. Filed May 2, 1898. Renewed Nov. 25, 1901. Serial No. 83,618. (No model.)

Claim.—As a new article of manufacture, an alarm device comprising a base, a striking mechanism secured thereto, a gong secured to the spring-shaft of said mechanism, a casing removably secured to the base and inclosing the striking mechanism and gong, a pivoted lever, an arm projecting from said lever and a cord or wire having a fusible section secured at one end to said lever and adapted to be secured to a fixed object at its other end to hold said arm of the lever against the escapement-verge with sufficient pressure to retain the striking mechanism normally at rest, said lever and its arm being so constructed and arranged that the verge will throw the latter out of its path of movement when the tension of the cord or wire is removed by the severance of the fusible section thereof.

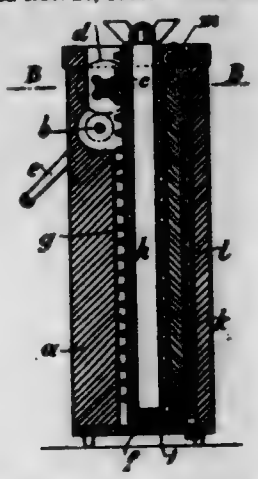
704,682. AUTOMATIC FIRE-EXTINGUISHER. OTTO HOFFMANN, Withington, England. Filed July 16, 1901. Serial No. 68,780. (No model.)



Claim.—In a strut for automatic sprinklers for fire-extinguishers to be placed between the valve and yoke of each sprinkler, the combination with a bar adapted to engage at one end one of said parts of the sprinkler, of a lever fulcrumed upon the other end of the bar and adapted to engage the other of said parts, said bar and lever being soldered to each other along their sides and having registering apertures near their ends opposite the fulcrum, a portion of the bar projecting into the aperture therein to form a fulcrum for a key, the key soldered to the face of the bar opposite the lever, the soldered portions of said lever and key ex-

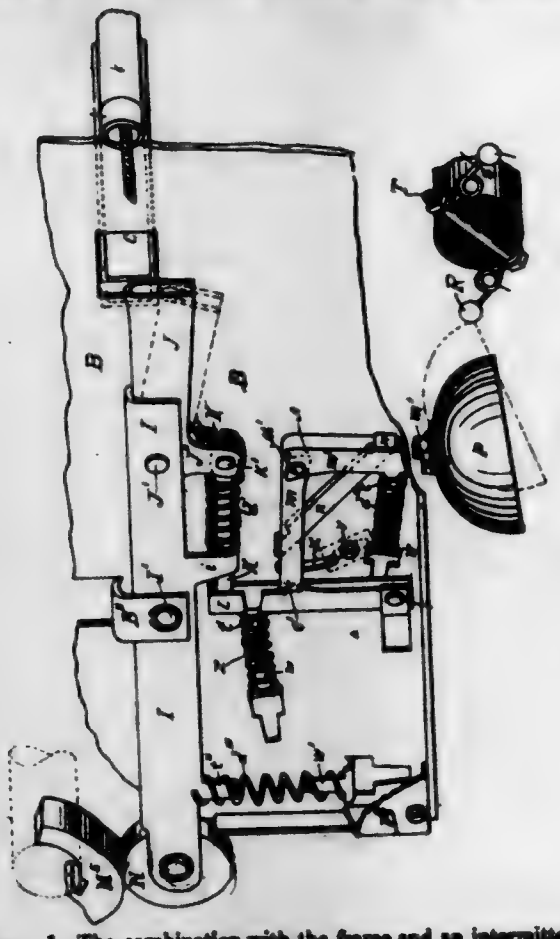
tending substantially the same distances lengthwise of the bar and directly opposite each other, said key engaging said fulcrum therefor and having a forked and bent end passing through the apertures and engaging the outer surface of the lever.

704,683. LIFTING-JACK. JOHANN HÜPPI, Rümlang, near Zurich, Switzerland. Filed Nov. 27, 1900. Serial No. 37,921. (No model.)



Claim.—In a lifting-jack, the jack-body *a*, the rack *g* and the bar *h* adapted to slide on each other, the pulley *m* mounted upon the top of the said rack and the chain *l* passing over the said pulley and having one end secured to the lower end of the said bar and the other end to the lower end of the said body, the pinion *c* mounted in the body *a* in gear with the said rack and means for rotating the said pinion by hand, all combined substantially as and for the purpose set forth.

704,684. ALARM DEVICE FOR BINDERS. HERBERT R. IRWIN, Galesburg, Ill. Filed Feb. 1, 1900. Serial No. 3,626. (No model.)



Claim.—1. The combination with the frame and an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, means for normally restraining the alarm mechanism, and means carried by the frame and under the joint control of said intermittently-movable part and the twine for releasing said restraining mechanism and permitting the alarm mechanism to be thrown into action, at a predetermined period in the binding operation whenever the twine is broken or the tension is removed from it, substantially as described.

2. In an alarm device for grain-binders, the combination with the frame and the needle-shaft, of an alarm mechanism supported by the frame, a movable part supported by the frame and deriving intermittent movement from the needle-shaft, a tripper independent of the needle, said tripper being supported by the frame and being under the control of the twine, and means supported by the frame and actuated by the coöperation of said movable part and tripper for conditioning the alarm to operate, substantially as described.

3. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, a tripper device controlled by the tension of the twine, an arm having an oscillating movement, a movable support, a bell carried thereby, and a latch normally restraining said support, the said tripper device being adapted to coöperate with the oscillating arm, at a predetermined period, when the tension of the twine is removed, and cause the latch to release the bell-support and allow the bell to be moved into the path of the strikers substantially as described.

4. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, means for normally restraining the alarm mechanism, a tripper engaged by the twine and thereby held out of operative position so long as the twine is under proper tension, means for moving the tripper into operative position when the tension of the twine is removed, and means deriving its movement from the intermittently-movable part aforesaid and coöperating with the tripper for releasing said restraining means whenever at a predetermined period in the movement of said intermittently-movable part the tripper is in operative position substantially as described.

5. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, a tripper engaged by the twine and thereby held out of operative position so long as the twine is under proper tension, means for moving the tripper into operative position when the tension of the twine is removed and mechanism deriving its movement from the intermittently-movable part aforesaid and adapted to coöperate with said tripper when the latter is in operative position for conditioning the alarm to operate substantially as described.

6. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, a tripper independent of the needle engaging the twine whereby it is held out of operative position when the twine is under proper tension, means for moving the tripper into operative position, and mechanism deriving its movement from the intermittently-movable part aforesaid, coöperating with the tripper, whenever, during a predetermined period in the movement of said part the tripper is in operative position, for conditioning the alarm to operate substantially as described.

7. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, a movable part independent of the needle adapted to derive movement from said intermittently-movable part, and a tripper adapted to coöperate with the part last aforesaid for conditioning the alarm to operate whenever during a predetermined period in the movement of said part the tripper is in operative position, said tripper being under the control of the twine, substantially as described.

8. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, a movable part independent of the needle adapted to derive movement from said intermittently-movable part and a tripper independent of the needle adapted to coöperate with the part last aforesaid for conditioning the alarm to operate whenever during a predetermined period in the movement of said part the tripper is in operative position, said tripper being under the control of the twine, substantially as described.

9. The combination with an intermittently-movable part of the binding mechanism of a grain-binder, of an alarm mechanism, a lever deriving its movement from said intermittently-movable part, a tripper independent of the needle under the control of the twine, and means actuated by the coöperation of said lever and tripper for conditioning the alarm to operate substantially as described.

10. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, an alarm device movable into the path of said strikers, a tripper device normally restrained from operation by the tension of the twine and having an operative connection with and adapted to set the alarm device in motion, and an oscillating lever located between the alarm device and the tripper and carrying a pivoted arm adapted to engage the tripper, substantially as and for the purposes described.

11. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, a bell normally out of the path of said strikers, a tripper device normally held in one position by the tension of the twine, a lever and means for oscillating the same, and a pivoted arm carried by said lever and adapted to be operated whenever the tension of the twine is removed to cause the bell to swing into the path of the strikers, substantially as described.

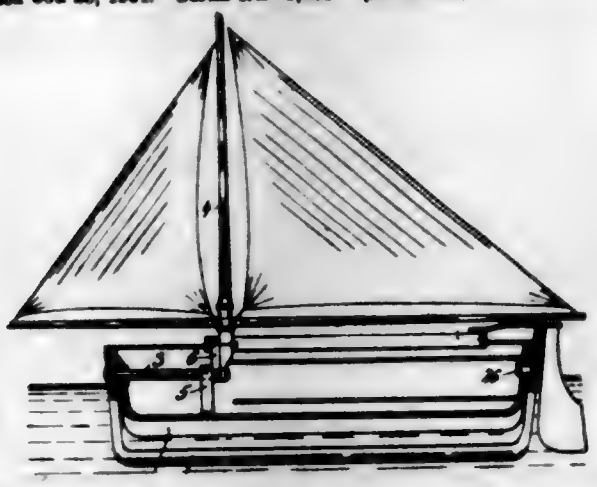
12. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, a bell normally out of the path of said strikers, a movable support for said bell, a tripper device normally held in one position by the twine, a lever and means for oscillating the same, a pivoted arm carried by said lever and adapted to engage the tripper device when

the tension of the twine is removed to cause the bell-support to move the bell into the path of the strikers, substantially as described.

13. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, a bell, a movable support for said bell, a tripper device normally held in one position by the twine, a latch device for holding the bell out of the path of the strikers, and devices for releasing said latch device when the tension of the twine is removed to cause the bell to move into the path of the strikers, substantially as described.

14. The combination with a revolving shaft of a grain-binder, of strikers carried by said shaft, a bell, a swinging support for said bell, a latch device normally locking said support to hold the bell out of the path of the strikers, an oscillating lever, a pivoted arm carried by said lever, a tripper normally held in one position by the twine and adapted to engage and limit the movement of the pivoted arm when the tension of the twine is removed to swing said arm on its pivot and thereby release the latch device and permit the support to swing the bell into the path of the strikers, substantially as described.

704,685. SAILING-BOAT. THOMAS JENSEN, Arendal, Norway. Filed Oct. 25, 1901. Serial No. 79,861. (No model.)



Claim.—1. In combination with the hull of the boat, a keel extending along the same and having upturned arms at its ends pivotally connected at the outer side of the bow and stern, a mast within the hull, a shaft 3 extending from the upturned arm of the keel at the bow to the mast and a bearing adjacent the mast for said shaft, substantially as described.

2. In sailing-boats of the kind described the combination with the hull, mast and pivoted ballast-keel of means whereby the mast can be adjusted and secured at the suitable angle with the ballast-keel in order that the reaction of the keel upon the mast can be regulated substantially as hereinbefore described.

3. In sailing-boats of the kind described the combination with the hull and pivoted ballast-keel and mast, of a shaft connected to said keel and rigidly connected at its inner end to a segment which, by means of pulleys and ropes, can be connected to the mast which loosely swivels upon the end of the shaft, the rope serving to turn the mast relatively with the segment and to secure the same in position, substantially as hereinbefore described.

704,686. ARMY-CANTEEN. THOMAS KEARNS and IRA C. COIN, Salt Lake City, Utah. Filed Sept. 16, 1901. Serial No. 75,566. (No model.)

Claim.—1. The combination with a canteen, of an interiorly-disposed suction device having its inlet end accessible from the exterior thereof.

2. The combination with a canteen, of an interiorly-disposed suction device having its inlet end projected outward therefrom.

3. The combination with a canteen, of an interiorly-disposed suction device and a filter, the suction device having its inlet end accessible from the exterior of the canteen.

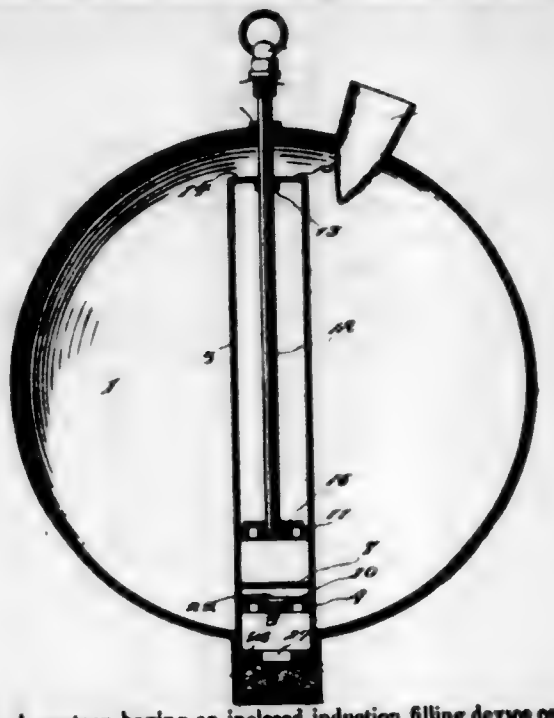
4. The combination with a canteen, of an interiorly-disposed suction device having its inlet end accessible from the exterior thereof, and filtering means associated with the said end.

5. The combination with a canteen, of an interiorly-disposed suction device having its inlet end projecting outward therefrom, and filtering means associated with the said end.

6. The combination with a canteen, of an interiorly-disposed suction device having its inlet end accessible from the exterior thereof, and detachable filtering means associated with the said end.

7. The combination with a canteen, of an interiorly-disposed suction device having its inlet end projected outward therefrom, and detachable filtering means associated with the said end.

8. A canteen having an inclosed induction filling device comprising a suction-tube arranged within the canteen with its inlet end exposed at the surface thereof, and means for causing a suction in said tube.



9. A canteen having an inclosed induction filling device comprising an inclosed suction-tube having its inlet end exposed at the surface of the canteen, and a reciprocatory suction-producing element coöperating with said tube and having a grip accessible at the surface of the canteen.

10. A canteen having an induction filling device comprising a cylinder or barrel and a piston arranged wholly within the contour of the canteen, with the inlet end of the cylinder or barrel, and the grip end of the piston exposed at the surface of the canteen.

11. A canteen having an induction filling device consisting of a pump having fixed and movable elements arranged wholly within the contour of the canteen, the fixed element having an exteriorly-exposed inlet, and the movable element having a grip or handle exposed at the surface of the canteen.

12. A canteen having an inclosed induction filling device comprising fixed and movable elements, and a canteen-supporting device mounted upon the movable element and having an interlocking engagement with the wall of the canteen to secure said supporting device and the movable element in a fixed position.

13. A canteen having an inclosed induction filling device comprising fixed and movable elements, and a canteen-supporting ring mounted upon the extremity of the movable element and having means for effecting an interlocking engagement with the wall of the canteen to secure the ring and said movable element in a fixed position.

14. A canteen having an inclosed induction filling device including a reciprocatory element, and a canteen-suspending device having a head swiveled on said reciprocatory element and provided with means for effecting an interlocking engagement with the wall of the canteen.

15. A canteen having an inclosed induction filling device including a reciprocatory element having a rod mounted for operation through a guide-opening in the wall of the canteen, and a canteen-suspending ring having a head swiveled upon said rod and provided with means for effecting an interlocking engagement with the wall of the canteen.

16. A canteen having an inclosed induction filling device including a reciprocatory member having a rod for operation through a guide-opening in the wall of the canteen, and the canteen being provided with a threaded socket concentric with said guide, and a canteen-suspending ring having a head swiveled on said rod and provided with a threaded portion for engagement with said socket.

17. The combination with a canteen, of a pump located therein and having an exteriorly-accessible piston-rod, a guide-collar in the canteen through which the piston-rod has movement, and a head swiveled on the piston-rod and adapted for engagement with said collar.

18. The combination with a canteen having an outlet-mouthpiece, of a pump attachment inclosed by and having one terminal exposed at the surface of the canteen, the said pump being located to one side of the outlet-mouthpiece for vertical disposition during the operation thereof.

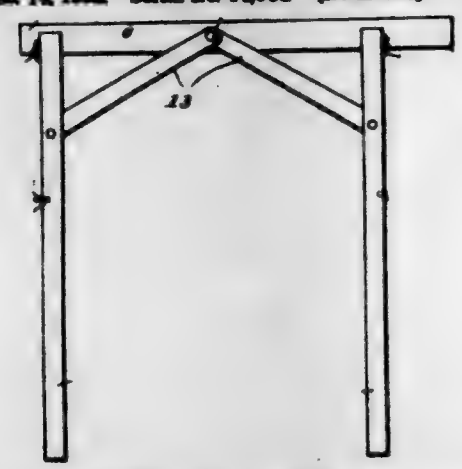
19. The combination with a canteen, of a pump attachment having one terminal disposed at the surface of the canteen, and a filtering attachment connected with said terminal of the pump attachment and having a closure removably applied to the outer end thereof.

20. The combination with a canteen, of a pump attachment having one terminal disposed at the surface of the canteen, and a filtering attachment connected with said terminal of the pump attachment and having a disk nut removably fitted in the outer portion thereof.

21. The combination with a canteen, of a pump attachment inclosed therein and having one terminal exposed at the surface of the canteen, said pump attachment including a piston and piston-rod, of which the latter projects through a guide in the wall of the canteen, a closing device applied to the extremity of the piston-rod to close the portion of the canteen through which said rod extends, and means for closing the exposed terminal of the pump.

22. A canteen having an inclosed induction filling device comprising fixed and movable elements of which their opposite extremities are exposed at opposite openings in the wall of the canteen, and movable closures for said opening.

704,687. TRESTLE. WILLIAM A. KISER, Leavenworth, Kans. Filed Feb. 14, 1902. Serial No. 94,044. (No model.)



Claim.—1. A folding trestle comprising a beam, spreading legs having jaws at the upper ends thereof to clamp the beam, and pivoted crossed links connected to said legs and taking the weight of the beam.

2. A folding trestle comprising spreading legs having jaws at the upper ends thereof, a beam clamped in said jaws and having a notch in the lower edge thereof, and pivoted links connected to said legs and engaging in said notch.

3. A folding trestle comprising a beam, two pairs of spreading legs the upper ends of which have connecting-links and jaws to clamp the beam, and braces pivotally connected to the legs and opposite sides of the beam, said beam having a short end which will pass within the connecting-links of one pair of legs, whereby said pair may be folded around along the upper edge of the beam.

4. A folding trestle comprising a beam, spreading legs having pivoted connecting-links and jaws to clamp the beam, said legs and beam being foldable to parallelism, and braces pivoted to the inside of the legs and to opposite sides of the beam, so as to lie between the beam and the legs when folded.

704,688. FOLDING BED-LOUNGE. NATHE LEVINE, Boston, Mass. Filed Feb. 24, 1902. Serial No. 95,308. (No model.)

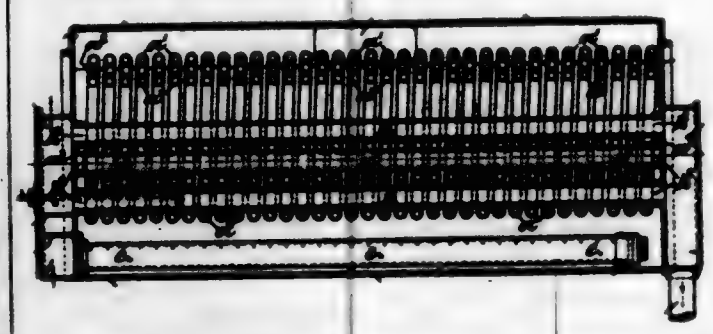
Claim.—1. In an apparatus of the class described, angle-iron end frames having in their side legs slots a^x, independent angle-iron bars sustained in said end frames and extended at their ends through said slots to the outer sides of said end frames, falls pivoted to the ends of said bars, the ends of said falls being composed of angle-iron bars, and mattress-supporting means sustained by said independent angle-bars and the angle-iron bars of the falls.

2. In apparatus of the class described, angle-iron end frames having in their side legs two slots a^x and a^s, independent angle-iron bars sustained in said end frames and extended at their ends through said slots to the outer sides of said end frames, falls pivoted to the ends of said bars, notched legs pivoted to said falls and free to be moved in slots a^s of the angle-iron end frames, said notches being in engagement with said bars serving to keep the falls elevated, and longitudinally-movable bars having inclines to act against said legs to release the legs from their engagement with the end frames when it is desired to lower the falls.

3. In a lounge-bed, angle-iron end frames, angle-iron bars connecting said end frames, independent angle-iron bars sustained in said end frames below their upper ends, falls connected with the said independent angle-iron bars, a wire fabric sustained by said independent angle-iron bars and the angle-iron end pieces of the falls, and notched legs pivoted to the opposite ends of said falls, means to limit the distance to which said falls may be lifted, and leg-disengaging means comprising a lever having bars connected to its opposite ends, and a spring to retain said bars in a position to enable the legs of the falls to engage a shoulder and keep the falls elevated, longitudinal movement of each bar against the stress of said spring acting to release the legs and permit the falls to drop.

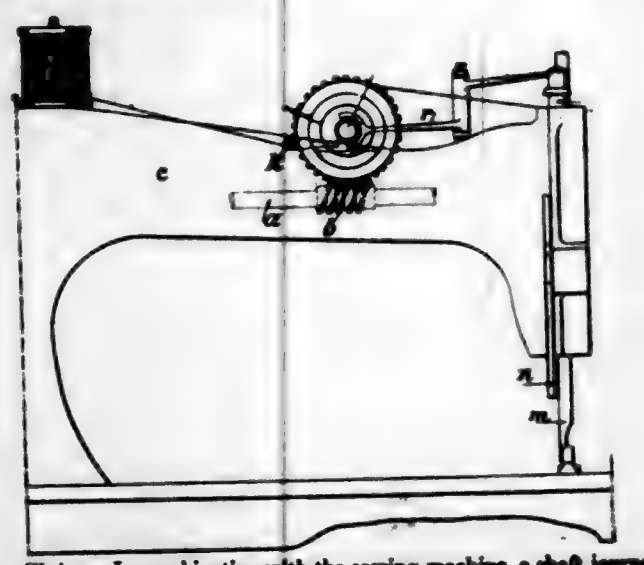
4. In an apparatus of the class described, angle-iron end frames having at each side two slots a^x and a^s, and having one flange at each end of each end frame bent toward the other flange to constitute strong stiff legs, independent angle-iron bars extended through the slots a^x, falls having angle-iron ends pivoted to the ends of said independent angle-iron bars, notched legs pivoted to said falls and working in the slots a^s, the notches of the legs engaging the end frames and retaining the falls outstretched, and longitudinally-movable bars to effect the disengagement of said legs from the end frames to enable the falls to be lowered.

704,689. STEAM-GENERATOR. CHARLES MUSKER, ARTHUR MUSKER, and WILLIAM G. HAY, Liverpool, England. Filed Mar. 5, 1901. Serial No. 49,903. (No model.)



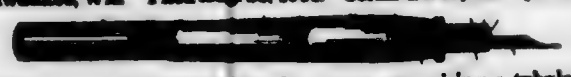
Claim.—The combination with a water-tube steam-generator, of an oil-vaporizing chamber at one end, an air-chamber at the opposite end with means for feeding air thereto, air-pipes extending from said air-chamber to said vaporizing-chamber and a burner-tube extending from said vaporizing-chamber beneath the air and water tubes, substantially as described.

704,690. AUTOMATIC THREAD-FEEDER FOR SEWING-MACHINES. JULES L. SAILLET, Paris, France. Filed June 7, 1901. Serial No. 63,645. (No model.)



Claim.—In combination with the sewing-machine, a shaft journaled in the frame thereof, a worm-wheel and worm for driving the same, a stepped pulley loose on said shaft over which said thread passes, a clutch-face on said shaft, a spring pressing said pulley into engagement with said clutch-shaft, a bell-crank lever having one arm bearing against said pulley, and a cone on the claw-rod for contacting with the other arm, substantially as described.

704,691. FOUNTAIN-HOLDER FOR PENS. ABRAHAM L. BAER, Milwaukee, Wis. Filed Aug. 26, 1901. Serial No. 73,294. (No model.)



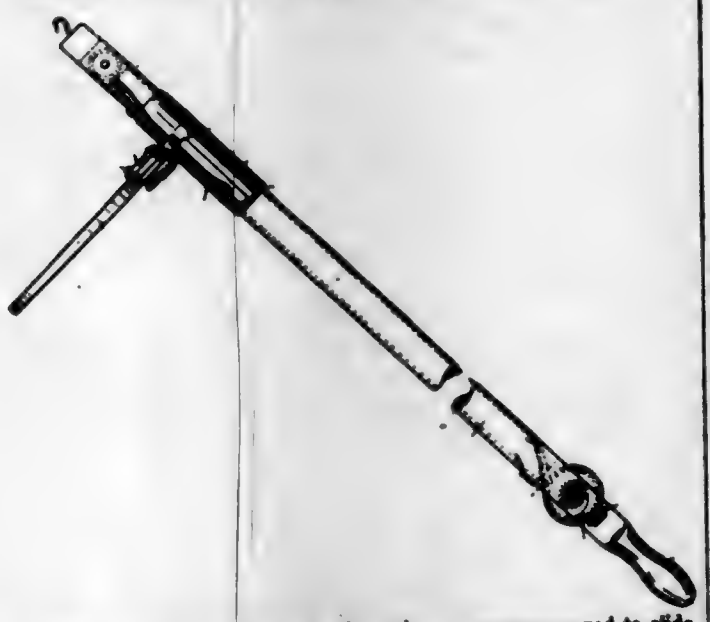
Claim.—1. A fountain-holder for a pen, comprising a tubular case having a lateral aperture, an elastic compressible ink-holding receptacle

in the case and accessible laterally through the aperture for pressure by the hand of the user, and a pen-holding plug inserted removably in the otherwise open end of the receptacle in the case and pressing the walls of the receptacle against the case thereby substantially closing the otherwise open end of the receptacle, the plug being provided with a duct longitudinally of the plug permitting the escape of ink limitedly through it from the receptacle to the pen.

2. In combination, a tubular case open at one end and having a lateral aperture at a little distance from the open end, an elastic compressible bag-like ink-receptacle in the case exposed at the lateral aperture permitting pressure thereof and fitting to the case near its open end, and a removable pen-holding plug in the open end of the receptacle in the case substantially closing the receptacle, the plug comprising a tubular shell and a therein-fitting cylindrical core split from its outer end a distance longitudinally and provided with an ink-duct longitudinally thereof adjacent to the shell and leading from the ink-reservoir to the inner concave surface of a pen when inserted in the plug.

3. In a fountain-holder for a pen, a tubular case open at its end, an elastic bag-like receptacle in the tubular case and provided with a terminal enlarged annular rib fitting against the open end of the case, and a pen-holding ink-discharging plug inserted removably in the open end of the case and within the open end of the bag-like receptacle substantially closing it.

704,692. **LIFTING DEVICE.** PETER BEIDER, Paterson, N. J. Filed Feb. 27, 1902. Serial No. 95,526. (No model.)



Claim.—1. The combination of a pole, a carrier arranged to slide on said pole, a reel journaled in said pole, and a flexible connection between said carrier and the reel, substantially as described.

2. The combination of a pole, a carrier guided on said pole, a spring-actuated reel journaled in said pole, a flexible connection between said carrier and the reel, and a brake for said reel, substantially as described.

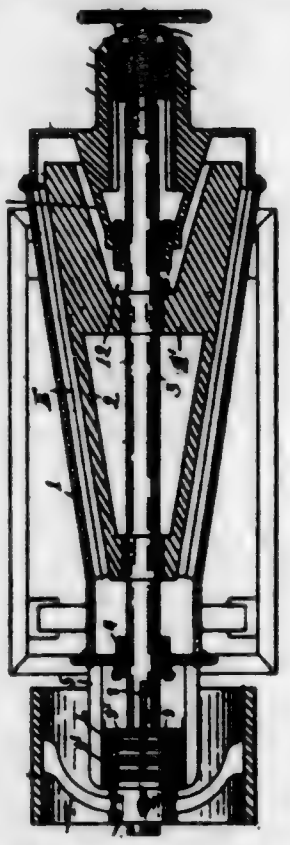
3. The combination of a pole, a carrier arranged to slide on said pole, said carrier comprising arms one of which is pivoted, a spring pressing said pivoted arm toward the other arm, means for elevating said carrier, and means, carried by said pole, for moving said pivoted arm against the tension of its spring as the carrier assumes its extreme elevated position, substantially as described.

704,693. **REFINING-ENGINE.** EDWIN CHURCHILL, Jr., and EDEN A. HALL, Lawrence, Mass. Filed Mar. 17, 1902. Serial No. 98,559. (No model.)

Claim.—1. A machine of the character described comprising a shell, a longitudinally-adjustable grinding-shaft arranged therein, a driving-pulley which is slidably connected with said shaft, but held to turn therewith, a stationary bearing within which said shaft rotates, and a swiveled connection between said pulley and bearing for holding said pulley from axial movement in both directions, substantially as described.

2. A machine of the character described comprising a shell, a longitudinally-adjustable grinding-shaft arranged therein, a driving-pulley slidably connected therein but held to turn therewith, a stationary bearing within which said shaft rotates, a circumferential rib on said pulley which engages a corresponding groove in said bearing and holds said hub from axial movement in both directions, substantially as described.

3. A machine of the character described comprising a shell, a longitudinally-adjustable grinding-shaft arranged therein, a driving-pulley which is slidably connected with said shaft, but held to turn therewith, a stationary bearing, an axially-projecting hub on said pulley which is journaled in said bearing and surrounds said shaft, and a circumferential rib on said hub which engages a corresponding groove in said bearing and holds said hub from axial movement in both directions, substantially as described.



4. A machine of the character described comprising a shell, a longitudinally-adjustable grinding-shaft arranged therein, a driving-pulley which is slidably connected with said shaft, but held to turn therewith, a stationary bearing within which said shaft rotates, and a swiveled connection between said pulley and bearing for holding said pulley from axial movement in both directions, said pulley having arms which extend obliquely from the hub and having its rim encircling said bearing, substantially as described.

5. A refining-engine comprising a shell, a plug therein, a shaft to which said plug is rigidly attached, a driving-pulley having its axis in alinement with the axis of said shaft, the hub of said pulley being slidably connected with said shaft, but held to turn therewith, a stationary bearing in which the hub of said pulley is journaled, said bearing being adapted to permit rotation of said pulley therein, while holding the same against lateral movement in either direction, arms which extend obliquely from said hub, a rim which is secured to the outer ends thereof and is arranged with its face opposite said bearing, and means for adjusting said shaft longitudinally, substantially as described.

6. A machine of the character described comprising a suitably-supported shell, a longitudinally-adjustable grinding-shaft partly arranged in said shell, a bearing-support rigidly connected to said shell, a bearing secured to said support and within which said shaft rotates, a driving-pulley slidably connected with said shaft but held to turn therewith, and a swiveled connection between said pulley and shell holding said pulley from axial movement in both directions, substantially as described.

7. A refining-engine comprising a shell, a plug therein, a shaft to which said plug is rigidly attached, a driving-pulley having its axis in alinement with the axis of said shaft, the hub of said pulley being slidably connected with said shaft, but held to turn therewith, a bearing portion which is rigid with said hub and projects laterally therefrom, a rigid support which extends longitudinally from one end of said shell, a bearing which is secured thereto, and in which said laterally-projecting hub portion is journaled, said bearing being adapted to prevent rotation thereof while holding the same from longitudinal movement in either direction, and means for adjusting said shaft longitudinally, substantially as described.

8. A refining-engine comprising a shell, a conical-shaped plug which is located therein, an axially-arranged shaft to which said plug is secured, said plug being provided with a recess which extends inwardly from its base end, a head which is secured to the adjacent end of said shell and extends into said plug-recess, thereby forming an external recess which extends toward the apex end of the plug, and a bearing for said shaft adjustable in said external recess, substantially as described.

9. A refining-engine comprising a shell, a conical-shaped plug which is located therein, an axially-arranged shaft to which said plug is secured, said plug being provided with a recess which extends inwardly from its base end, a head which is secured to the adjacent end of said shell and

extends into said plug-recess, thereby forming an external recess which extends toward the apex end of the plug, a combined thrust and journal bearing in which said shaft is journaled, said bearing being adapted and arranged to be adjusted and held in said external recess, and means for moving said bearing toward the shell, substantially as described.

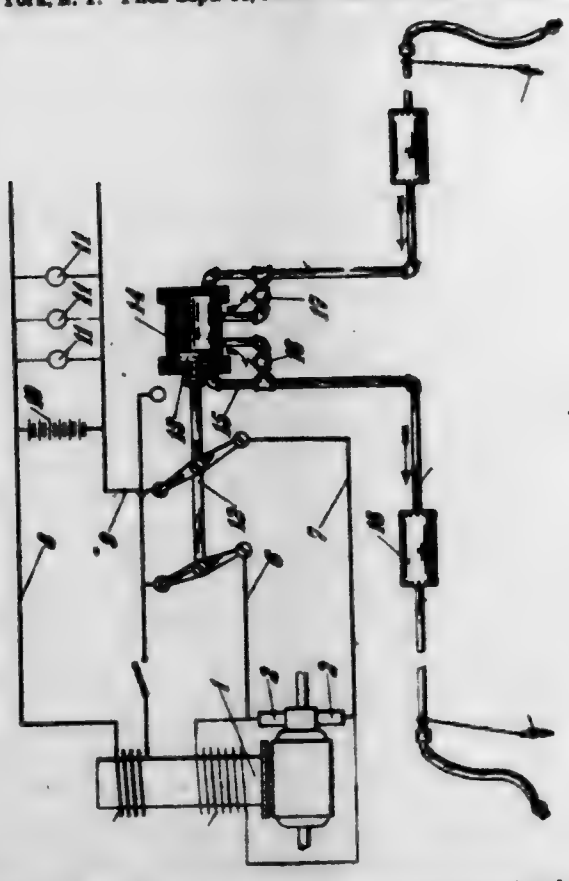
10. A machine of the character described comprising a longitudinally-adjustable grinding-shaft having an axial bore in one end, an adjustable thrust-bearing in which the bored end of said shaft is journaled, and an adjusting-screw for said bearing which is partly arranged in the bore of said shaft, substantially as described.

11. A refining-engine comprising a shell, a grinding means, and a shaft for operating the same, means for adjusting said shaft longitudinally, comprising an adjustable combined thrust and journal bearing in which one end of said shaft is journaled, a swiveled adjusting screw, a threaded connection between said bearing and screw, the journaled end portion of said shaft being axially bored and said adjusting-screw being partly located therein, the diameter of said bore being sufficient to permit said shaft to rotate independently of said screw, substantially as described.

12. A refining-engine comprising a shell, a conical-shaped plug which is located therein, an axially-arranged shaft to which said plug is secured, said plug being provided with a recess which extends inwardly from its base end, a head which is secured to the adjacent end of said shell, and extends inwardly into said recess thereby forming an external recess which extends toward the apex end of the plug, a longitudinally-extending bearing-support which is rigidly secured to said head and is provided with guideways which extend into said recess, a combined thrust and journal bearing which is slidably supported in said ways, and in which said shaft is journaled and held from longitudinal movement, means for adjusting said bearing within said external recess, and for holding it in its adjusted positions, substantially as described.

13. A refining-engine comprising a shell, a conical-shaped plug which is located therein, an axially-arranged shaft to which it is secured, said plug being provided with a conical-shaped recess which extends inwardly from its base end, a head which is secured to the adjacent end of said shell and is provided with a hollow frusto-conical portion which is located in said recess, a stuffing-box in the apex end of said frusto-conical portion through which said shaft passes, a combined thrust and journal bearing which is adapted and arranged to be adjustably supported within said frusto-conical portion, said shaft being journaled in said bearing, and means for holding said bearing in its adjusted positions, substantially as described.

704,694. SYSTEM OF DISTRIBUTION. JOHN L. CREVELING, New York, N. Y. Filed Sept. 11, 1901. Serial No. 75,015. (No model.)



Claim.—1. In a system of distribution for railway-trains the combination of a generator and current-utilizing devices and a pneumatic device for affording delivery of current to the current-utilizing devices always in the same direction, the said pneumatic devices being actuated by a change in the direction of the pressure in a pneumatic system on the train.

2. In a system of distribution for railway-trains, the combination of a generator and current-utilizing devices and a pneumatic controlling device for effecting controlling functions in the system, the said pneumatic controlling device being controlled by changes in the direction of pressure in a pneumatic system on the train.

3. In a system of distribution for railway-trains, the combination of a generator and current-utilizing devices, with means for controlling the flow of current, comprising in its structure a pneumatically-actuated device governed by a change in the direction of the pressure in a pneumatic system on the train.

4. In a system of distribution for railway-trains, the combination of a pneumatic system, a pneumatic device under the control thereof, the said pneumatic device being actuated by the change in the direction of flow of air in the system and a connection between the said pneumatic device and other functionating apparatus on the train, whereby by the movement of the said pneumatic device functions and effects may be brought about other than the normal function and effect of the movement of the pneumatic device.

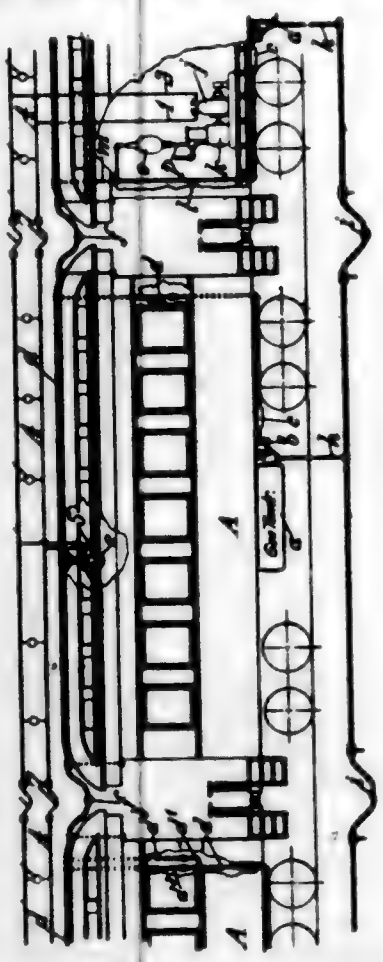
5. A system of distribution for railway-trains, and means for effecting functions therein comprising a single line of train-pipe, a reversible pneumatic device and means whereby the said reversible pneumatic device may be actuated by the change in the direction of flow of air in the single-train-pipe system.

6. In a system of distribution for railway-cars, the combination of an electric system, a pneumatic device for effecting functions therein, a single line of train-pipe and means whereby a reversal of the pneumatic device may be effected by the reversal of the direction of flow of air in the train-pipe system.

7. The combination with a fluid conduit or pipe system allowing the flow of fluid therethrough in either direction, of means for effecting a change in the flow of an electric current and a pneumatic device controlling the said means, the said pneumatic device responding to changes in the direction of flow of fluid in the said conduit or pipe system.

8. The combination with a fluid conduit or pipe system allowing a flow of fluid therethrough in either direction, of an electric switch and a pneumatic device responding to a change in the direction of flow of fluid in the said pipe system.

704,695. COMBINED ELECTRIC AND GAS CAR-LIGHTING SYSTEM. JOHN L. CREVELING, New York, N. Y., assignor to Safety Car Heating & Lighting Company, a Corporation of New Jersey. Filed Jan. 18, 1902. Serial No. 90,332. (No model.)



Claim.—1. A train-lighting system, comprising detachable cars, a gas-supply carried by the respective cars, a gas-lighting system in connection therewith, an electric system of distribution carried by the respective cars, and a gas-engine and dynamo, the dynamo being in elec-

trical communication with the systems of distribution of the respective cars and the gas-engine being in communication with the gas system of the respective cars.

2. A train system, comprising a series of cars carrying gas and electric lighting systems, and gas-storage reservoirs carried by the respective cars, the gas systems of the respective cars being in communication with each other through automatically-closing couplers, a gas-engine and dynamo, the dynamo being in electrical communication with the respective electric-lighting systems of the cars and the gas-engine being in communication with the gas systems of the respective cars.

3. A train-lighting system comprising in detachable cars, a series of gas-lighting systems, detachable one from the other and carried by the respective cars, electric-lighting systems for the respective cars, and a dynamo, driven from the gas system and supplying current to the electric system.
